PUNISHMENT.

PUNISHMENT, a penalty impofed upon the commiffion of fome crime or offence againft the laws.

It is effential to the nature of a law, that it import or decree a punifhment to the tranfgreffors of it.

Solon very juftly afferted, that the two great ftimulants of human action being hope and fear, a good government could not poffibly exift without an equitable fyftem of rewards and punifhments.

The forms and manners of punifhment are various in various countries and ages, and for various crimes; as treafon, felony, adultery, parricide, &c.

There was a time, fays Beccaria, when all punifhments were pecuniary. The crimes of the fubjects were the inheritance of the prince, fo that an injury done to fociety was a favour to the crown, and the fovereign and magiftrates, thofe guardians of the public fecurity, were interefted in the violation of the laws. Crimes were tried at that time in a court of exchequer, and the caufe became a civil fuit between the perfon accufed and the crown. The magiftrate then poffeffed powers that were not neceffary for the public welfare, and the criminal fuffered punifhments different from thofe which the neceffity of example required. The judge was rather a collector for the crown, an agent for the treafury, than a protector and minifter of the laws.

Among the Romans, the *pecuniary* punifhments were the *muleta* and *confifcatio*. The *corporal* punifhments were *capitis diminutio*, *aquæ et ignis interdictio*, *profcriptio*, *deportatio*, *relegatio*, *furca*, *crux*, *carcer*, *culeus*, *equuleus*, *fcalæ gemoniæ*, *damnatio ad gladium*, *ad metallum*, *flagellatio*, *talio*, &c. which fee defcribed under their refpective articles.

Among us the principal *civil* punifhments are, *fines*, *imprifonments*, *the ftocks*, *pillory*, *burning in the hand*, *whipping*, *ducking-ftool*, *hanging*, *beheading*, *quartering*, *burning*, *tranfportation*, &c.

The *ecclefiaftical* punifhments are, *cenfures*, *fufpenfions*, *deprivations*, *degradations*, *excommunications*, *anathemas*, *penances*, &c. The *military* punifhments are, *being fhot*, *running the gantelope*, *riding the wooden horfe*, *the bilboes*, &c.

Among the Turks, &c. *impaling*, *baftinadoes* on the foles of the feet, &c. obtain. See EMPALEMENT, &c.

The right of punifhing crimes againft the law of nature, as murder and the like, is in a ftate of mere nature vefted in every individual. Accordingly the firft murderer, Cain, was fo fenfible of this, that we perceive him (Gen. iv. 14.) expreffing his apprehenfions, that *whoever* would find him would flay him. In a ftate of fociety, this right is transferred from individuals to the fovereign power; and thus men are prevented from being judges in their own caufes, which is one of the evils that civil government was intended to remedy. The fword of juftice is now vefted by the confent of the whole community in the magiftrate alone. Every punifhment which does not arife from abfolute neceffity, fays the great Montefquieu, is tyrannical; and this propofition is rendered more general by Beccaria, who obferves, that every act of authority of one man over another, for which there is not an abfolute neceffity, is tyrannical. Upon this principle, the fovereign's right to punifh crimes is founded; that is, upon the neceffity of defending the public liberty, entrufted to his care, from the ufurpation of individuals; and punifhments are juft in proportion, as the liberty, preferved by the fovereign, is facred and valuable. It was neceffity that forced men to give up a part of their liberty, and it is certain, that every individual would chufe to put into the public ftock the fmalleft portion poffible; as much only as was fufficient to engage others to defend it. The aggregate of thefe, the fmalleft portions poffible, forms the right of punifhing: all that extends beyond this is abufe, and not juftice. The laws only can determine the

the punishment of crimes; and the authority of making penal laws can only reside with the legislator, who represents the whole society, united by the social compact. No magistrate, therefore, as he is one of the society, can, with justice, inflict on any other member of the same society, punishment that is not ordained by the laws, nor increase the punishment already determined by the laws. To the sovereign representing the society itself, who makes general laws to bind the members, it does not belong to judge, whether any individual has violated the social compact, or incurred the consequent punishment. In this case, there are two parties, one represented by the sovereign, who insists upon the violation of the contract, and the other is the person accused, who denies it. It is necessary then, that there should be a third person to decide this contest; that is to say, a judge or magistrate, from whose determination there should be no appeal. Judges, in criminal cases, says Beccaria, have no right to interpret the penal laws, because they are not legislators. The lawful interpreter is the sovereign, that is, the representative of society, and not the judge, whose office is only to examine, if a man have, or have not committed an action contrary to the laws. Many evils arise from the erring instability of arbitrary interpretation.

The lawfulness of punishing criminals, who are chargeable with offences against the laws of society, that are only "mala prohibita" and not "mala in se," is founded upon this principle, that the law by which they suffer was made by their own consent; it is a part of the original contract into which they entered, when first they engaged in society; it was calculated for, and has long contributed to, their own security. This right, conferred by universal consent, gives to the state exactly the same power, and no more, over all its members, as each individual member had naturally over himself or others. Hence some have doubted how far a human legislature ought to inflict capital punishments for *positive* offences;—offences against the municipal law only, not against the law of nature; since no individual has, naturally, a power of inflicting death upon himself or others for actions in themselves indifferent.

With regard to offences "mala in se," capital punishments are in some instances inflicted by the immediate command of God himself to all mankind, as in the case of murder, by the precept delivered to Noah, their common ancestor and representative (Gen. ix. 6.), "whoso sheddeth man's blood, by man shall his blood be shed." In other instances they are inflicted after the *example* of the Creator, in his positive code of laws for the regulation of the Jewish republic; as in the case of the crime against nature. But they are sometimes inflicted without such express warrant or example, at the will and discretion of the human legislature, as for forgery, for theft, and sometimes for offences of a lighter kind. None of these crimes are offences against natural, but only against social, rights. The practice of inflicting capital punishments, for offences of human institution, is thus justified by that great and good man, sir Matthew Hale (1 Hal., P. C. 13.) "When offences grow enormous, frequent, and dangerous to a kingdom or state, destructive or highly pernicious to civil societies, and to the great insecurity and danger of the kingdom or its inhabitants, severe punishment and even death itself is necessary to be annexed to laws in many cases by the prudence of lawgivers." It is, therefore, as judge Blackstone observes, the enormity, or dangerous tendency of the crime, that alone can warrant any earthly legislature in putting him to death that commits it. It is not its frequency only, or the difficulty of otherwise preventing it, that will excuse our attempting to prevent it by a wanton effusion of human blood. For, though the end of punishment is to deter men from offending, it can never follow from this circumstance, that it is lawful to deter them at any rate and by any means; since there may be unlawful methods of enforcing obedience even to the justest laws. Every humane legislator, as the learned judge remarks, will be therefore extremely cautious of establishing laws that inflict the penalty of death, especially for slight offences, or such as are merely positive. Nor will it avail to allege that no lighter penalty will be effectual, because experience has not taught us that capital punishments are more effectual. Was the vast territory of all the Russias, it may be asked, worse regulated under the empress Elizabeth, than under her more sanguinary predecessors? Or has it been since, under Catharine II., less civilized, less social, and less secure? And yet we are assured, that neither of these illustrious princesses have, throughout their whole administration, inflicted the penalty of death; and the latter, upon full persuasion of its being useless, and even pernicious, issued orders for abolishing it entirely throughout her extensive dominions. But if capital punishments, says Blackstone, were proved by experience to be a sure and effectual remedy, that would not prove the necessity (upon which the justice and propriety depend) of inflicting them upon all occasions, when other expedients fail. This reasoning would, as we may justly apprehend, extend much too far. Where the evil to be prevented is not adequate to the violence of the preventive, a sovereign that thinks seriously can never reconcile laws that inflict death to the dictates of conscience and humanity. To shed the blood of our fellow-creature, says the learned and humane judge, is a matter that requires the greatest deliberation, and the fullest conviction of our own authority; for life is the immediate gift of God to man; which neither he can resign, nor can it be taken from him, unless by the command or permission of him who gave it; either expressly revealed or collected from the laws of nature or society by clear and indisputable demonstration. Blackstone, however, would not be understood to *deny* the right of the legislature in any country to enforce its own laws by the death of the transgressor, though some persons of abilities have *doubted* it. To this class of persons we may refer the ingenious writer already cited. The useless profusion of punishments, which has never made man better, has induced Beccaria to enquire, whether the punishment of *death* be really just or useful in a well-governed state? What right, he asks, have men to cut the throats of their fellow-creatures? Certainly not that on which the sovereignty and laws are founded. The laws are only the sum of the smallest portions of the private liberty of each individual, and represent the general will, which is the aggregate of that of each individual. Did any one ever give to others the right of taking away his life? Is it possible, that in the smallest portions of the liberty of each, sacrificed to the good of the public, can be contained the greatest of all good, life? If it were so, how shall it be reconciled to the maxim which tells us, that a man has no right to kill himself? Which he certainly must have, if he could give it away to another. The punishment of death is not authorized by any right; for no such right exists. The death of a citizen cannot be necessary, but in one case; when, though deprived of his liberty, he has such power and connections as may endanger the security of the nation; when his existence may produce a dangerous revolution in the established form of government. But even in this case, it can only be necessary when a nation is on the verge of recovering or losing its liberty; or in times of absolute anarchy, when the disorders themselves hold the place of laws.

If the experience of all ages be not sufficient to prove, that the punishment of death has never prevented determined men

men from injuring ſociety; if the example of the Romans; if twenty years reign of Elizabeth, empreſs of Ruſſia, in which ſhe gave the fathers of their country an example more illuſtrious than many conqueſts bought with blood; if, ſays Beccaria, all this be not ſufficient to perſuade mankind, who always ſuſpect the voice of reaſon, and who chuſe rather to be led by authority, let us conſult human nature in proof of this aſſertion.

It is not the intenſeneſs of the pain that has the greateſt effect on the mind, but its continuance; for our ſenſibility is more eaſily and more powerfully affected by weak but repeated impreſſions, than by a violent, but momentary, impulſe. The power of habit is univerſal over every ſenſible being. As it is by that we learn to ſpeak, to walk, and to ſatisfy our neceſſities, ſo the ideas of morality are ſtamped on our minds by repeated impreſſions. The death of a criminal is a terrible but momentary ſpectacle, and therefore a leſs efficacious method of deterring others, than the continued example of a man deprived of his liberty, condemned, as a beaſt of burthen, to repair, by his labour, the injury he has done to ſociety. "If I commit ſuch a crime," ſays the Spectator to himſelf, "I ſhall be reduced to that miſerable condition for the reſt of my life." A much more powerful preventive than the fear of death, which men always behold in diſtant obſcurity.

The terrors of death make ſo ſlight an impreſſion, that it has not force enough to withſtand the forgetfulneſs natural to mankind, even in the moſt eſſential things; eſpecially when aſſiſted by the paſſions. Violent impreſſions ſurpriſe us, but their effect is momentary; they are fit to produce thoſe revolutions which inſtantly transform a common man into a Lacedæmonian or a Perſian; but in a free and quiet government they ought to be rather frequent than ſtrong.

The execution of a criminal is, to the multitude, a ſpectacle, which in ſome excites compaſſion mixed with indignation. Theſe ſentiments occupy the mind much more than that ſalutary terror which the laws endeavour to inſpire; but in the contemplation of continued ſuffering, terror is the only, or at leaſt predominant ſenſation. The ſeverity of a puniſhment ſhould be juſt ſufficient to excite compaſſion in the ſpectators, as it is intended more for them than for the criminal.

A puniſhment, to be juſt, ſhould have only that degree of ſeverity which is ſufficient to deter others. Now there is no man, who, upon the leaſt reflection, would put in competition the total and perpetual loſs of his liberty, with the greateſt advantages he could poſſibly obtain in conſequence of a crime. Perpetual ſlavery, then, has in it all that is neceſſary to deter the moſt hardened and determined, as much as the puniſhment of death: —it has even more. There are many who can look upon death with intrepidity and firmneſs; ſome through fanaticiſm, and others through vanity, which attends us even to the grave; others from a deſperate reſolution, either to get rid of their miſery, or ceaſe to live: but fanaticiſm and vanity forſake the criminal in ſlavery, in chains and fetters, in an iron cage; and deſpair ſeems rather the beginning than the end of their miſery. The mind, by collecting itſelf and uniting all its force, can, for a moment, repel aſſailing grief; but its moſt vigorous efforts are inſufficient to reſiſt perpetual wretchedneſs.

In all nations, where death is uſed as a puniſhment, every example ſuppoſes a new crime committed. Whereas in perpetual ſlavery, every criminal affords a frequent and laſting example; and if it be neceſſary that men ſhould often be witneſſes of the power of the laws, criminals ſhould often be put to death; but this ſuppoſes a frequency of crimes; and from hence this puniſhment will ceaſe to have its effect, ſo that it muſt be uſeful and uſeleſs at the ſame time.

We ſhall be told, that perpetual ſlavery is as painful a puniſhment as death, and therefore as cruel. To which we anſwer, that if all the miſerable moments in the life of a ſlave were collected into one point, it would be a more cruel puniſhment than any other; but theſe are ſcattered through his whole life, whilſt the pain of death exerts all its force in a moment. There is alſo another advantage in the puniſhment of ſlavery, which is, that it is more terrible to the ſpectator than to the ſufferer himſelf; for the ſpectator conſiders the ſum of all his wretched moments, whilſt the ſufferer, by the miſery of the preſent, is prevented from thinking of the future. All evils are increaſed by the imagination, and the ſufferer finds reſources and conſolations, of which the ſpectators are ignorant; who judge by their own ſenſibility of what paſſes in a mind, by habit grown callous to misfortune.

He who foreſees that he muſt paſs a great number of years, even his whole life, in pain and ſlavery; a ſlave to thoſe laws by which he was protected; in ſight of his fellow citizens, with whom he lives in freedom and ſociety; makes an uſeful compariſon between thoſe evils, the uncertainty of his ſucceſs, and the ſhortneſs of the time in which he ſhall enjoy the fruits of his tranſgreſſion. The example of thoſe wretches continually before his eyes, makes a much greater impreſſion on him than a puniſhment, which, inſtead of correcting, makes him more obdurate.

The puniſhment of death is pernicious to ſociety, from the example of barbarity it affords. If the paſſions, or the neceſſity of war, have taught men to ſhed the blood of their fellow creatures, the laws, which are intended to moderate the ferocity of mankind, ſhould not increaſe it by examples of barbarity, the more horrible, as this puniſhment is uſually attended with formal pageantry. Is it not abſurd, that the laws, which deteſt and puniſh homicide, ſhould, in order to prevent murder, publicly commit murder themſelves? What are the true and moſt uſeful laws? Thoſe compacts and conditions which all would propoſe and obſerve, in thoſe moments when private intereſt is ſilent, or combined with that of the public. What are the natural ſentiments of every perſon concerning the puniſhment of death? We may read them in the contempt and indignation with which every one looks on the executioner, who is nevertheleſs an innocent executor of the public will; a good citizen, who contributes to the advantage of ſociety; the inſtrument of the general ſecurity within, as good ſoldiers are without. What then is the origin of this contradiction? Why is this ſentiment of mankind indelible, to the ſcandal of reaſon? It is, that in a ſecret corner of the mind, in which the original impreſſions of nature are ſtill preſerved, men diſcover a ſentiment which tells them, that their lives are not lawfully in the power of any one, but of that neceſſity only, which with its iron ſceptre rules the univerſe.

What muſt men think, when they ſee wiſe magiſtrates and grave miniſters of juſtice, with indifference and tranquillity, dragging a criminal to death, and whilſt a wretch trembles with agony, expecting the fatal ſtroke, the judge, who has condemned him, with the coldeſt inſenſibility, and perhaps with no ſmall gratification from the exertion of his authority, quits his tribunal to enjoy the comforts and pleaſures of life? They will ſay, 'Ah! thoſe cruel formalities of juſtice are a cloak to tyranny, they are a ſecret language, a ſolemn veil, intended to conceal the ſword by which we are ſacrificed to the inſatiable idol of deſpotiſm. Murder, which they would repreſent to us as an horrible crime, we ſee practiſed by them without repugnance, or remorſe. Let us follow their example. A violent death appeared terrible in their descriptions, but we see that it is the affair of a moment. It will be still less terrible to him, who, not expecting it, escapes almost all the pain.' Such is the fatal, though absurd reasoning of men who are disposed to commit crimes; on whom, the abuse of religion has more influence than religion itself.

How happy were mankind, says this author, if laws were now to be formed; now that we see on the thrones of Europe, benevolent monarchs, friends to the virtues of peace, to the arts and sciences, fathers of their people, though crowned yet citizens; the increase of whose authority augments the happiness of their subjects, by destroying that intermediate despotism, which intercepts the prayers of the people, to the throne. If these humane princes have suffered the old laws to subsist, it is doubtless because they are deterred by the numberless obstacles, which oppose the subversion of errors established by the sanction of many ages; and therefore every wise citizen will wish for the increase of their authority.

It has long since been observed, says Voltaire, to whom the commentary on Beccaria's essay is attributed, that a man after he is hanged is good for nothing, and that punishments invented for the good of society, ought to be useful to society. It is evident, that a score of stout robbers, condemned for life to some public work, would serve the state in their punishment, and that hanging them is a benefit to nobody but the executioner.

There have been some judges, says this writer, who were passionately fond of spilling human blood; such was Jefferies in England, and such in France was the man whom they called *Coupe-tête*. Nature never intended such men for magistrates, but for executioners.

As to the *end*, or final cause of human punishments, this is not to be considered as an atonement or expiation for the crime committed, but as a precaution against future offences of the same kind. This purpose is accomplished in three ways; either by the amendment of the offender himself, with a view to which all corporal punishments, fines, and temporary exile or imprisonment are inflicted; or by deterring others by the dread of his example from committing similar offences, "ut pœna (as Cicero expresses it, pro Cluentio, 46) ad paucos, metus ad omnes perveniat;" or, lastly, by depriving the party who offends and injures, of the power to do future mischief, which is effected by either putting him to death, or condemning him to perpetual confinement, slavery, or exile. The method of inflicting punishment, however, ought always to be proportioned to the particular purpose it is meant to serve, and by no means to exceed it; and therefore the pains of death, and perpetual disability by exile, slavery, or imprisonment, ought never to be inflicted, but when the offender appears incorrigible.

The *measure* of human punishments must be left to the arbitration of the legislature, which should inflict such penalties as are warranted by the laws of nature and society, and such as appear to be the best calculated to answer the end of precaution against future offences. Some have recommended, and highly extolled for its equity, the "lex talionis," or law of retaliation; but judge Blackstone observes, that this can never be in all cases an adequate or permanent rule of judgment. Although there cannot be any regular or determinate method of rating the quantity of punishments for crimes, by any one uniform rule, applicable to all cases, and without ultimately referring to the will and discretion of the legislative power; yet there are some general principles, deduced from the nature and circumstances of the crime, that may afford some assistance in allotting to it an adequate punishment. One circumstance that serves in some measure to determine the nature and degree of punishment regards the object of it; for the more dignified in respect of rank, character, and influence, the object of an injury is, so much greater care should be taken to prevent that injury, and of course under this aggravation the punishment should be more severe. Accordingly treason in conspiring the king's death, is by the English law punished with greater rigour than even actually killing any private subject. Moreover, the violence of passion, or temptation may, in some cases, alleviate a crime; such is theft in case of hunger, contradistinguished from the same crime committed through avarice, and to serve the purposes of luxury. Homicide, in consequence of sudden and violent resentment, is less penal than upon cool deliberate malice. The age, education, and character of the offender; the repetition (or otherwise) of the offence; the time, the place, the company in which it was committed: all these, and a thousand other incidents, may aggravate or extenuate the crime. Thus Demosthenes (in his oration against Midias) finely works up the aggravations of the insults he had received: "I was abused," says he, "by my enemy, in cold blood, out of malice, not by heat of wine, in the morning, publicly, before strangers as well as citizens; and that in the temple, whither the duty of my office called me."

Farther, as punishments are chiefly intended for the prevention of future crimes, those should be most severely punished, which are the most destructive of the public safety and happiness; and, among crimes of an equal malignity, those which a man has the most frequent and easy opportunity of committing, which cannot be so easily guarded against as others, and which, therefore, the offender has the strongest inducement to commit; according to Cicero's observation (Pro Sexto Roscio, 40); "ea sunt animadvertenda peccata maximé, quæ difficillimé præcaventur."

We may also observe, that punishments of unreasonable severity, especially when indiscriminately inflicted, have less effect in preventing crimes, and amending the manners of a people, than such as are more mild or merciful in general, and yet properly intermixed with due distinctions of severity. Crimes, says Beccaria, are more effectually prevented by the *certainty* than the *severity* of punishment. The certainty of a small punishment will make a stronger impression, than the fear of one more severe, if attended with the hopes of escaping; for it is the nature of mankind to be terrified at the approach of the smallest inevitable evil, whilst hope, the best gift of heaven, hath the power of dispelling the apprehension of a greater; especially if supported by examples of impunity, which weakness or avarice too frequently afford.

If punishments be very severe, men are naturally led to the perpetration of other crimes, to avoid the punishment due to the first. The countries and times most notorious for severity of punishments, were always those in which the most bloody and inhuman actions and the most atrocious crimes were committed; for the hand of the legislator and the assassin were directed by the same spirit of ferocity; which, on the throne, dictated laws of iron to slaves and savages, and, in private, instigated the subject to sacrifice one tyrant to make room for another.

In proportion as punishments become more cruel, the minds of men, as a fluid rises to the same height with that which surrounds it, grow hardened and insensible; and the force of the passions still continuing, in the space of an hundred years, the *wheel* terrifies no more than formerly the *prison*. That a punishment may produce the effect required, it it is fufficient that the *evil* it occafions fhould exceed the *good* expected from the crime; including in the calculation the certainty of the punifhment, and the privation of the expected advantage. All feverity beyond this is fuperfluous, and therefore tyrannical.

There are yet two other confequences of cruel punifhments, which counteract the purpofe of their inftitution, which was, to prevent crimes. The *firft* arifes from the impoffibility of eftablifhing an exact proportion between the crime and punifhment, for though ingenious cruelty hath greatly multiplied the variety of torments, yet the human frame can fuffer only to a certain degree, beyond which it is impoffible to proceed, be the enormity of the crime ever fo great. The *fecond* confequence is impunity. Human nature is limited no lefs in evil than in good. Exceffive barbarity can never be more than temporary; it being impoffible that it fhould be fupported by a permanent fyftem of legiflation; for if the laws be too cruel they muft be altered, or anarchy and impunity will fucceed. The exceffive feverity of laws (fays Montefquieu, Sp. of Laws, b. 6. c. 13.) hinders their execution; when the punifhment furpaffes all meafure, the public will frequently, out of humanity, prefer impunity to it.

Thus alfo the ftatute 1 Mar. ft. 1. c. 1. recites in its preamble, "that the ftate of every king confifts more affuredly in the love of the fubject towards their prince, than in the dread of laws made with rigorous pains; and that laws made for the prefervation of the commonwealth without great penalties, are more often obeyed and kept, than laws made with extreme punifhments." Happy had it been for the nation, fays judge Blackftone, if the fubfequent practice of that deluded princefs, in matters of religion, had been correfpondent to thefe fentiments of herfelf and parliament, in matters of ftate and government. It may be farther obferved, that fanguinary laws are a bad fymptom of the diftemper of any ftate, or at leaft of its weak conftitution. The laws of the Roman kings, and the twelve tables of the *decemvirs*, were full of cruel punifhments: the Porcian law, which exempted all citizens from fentence of death, filently abrogated them all. At this period the republic flourifhed: under the emperors fevere punifhments were revived; and then the empire fell.

We may further add, that it is abfurd and impolitic to apply the fame punifhment to crimes of different malignity. Befides, a multitude of fanguinary laws (befides the doubt that may be entertained concerning the right of making them) proves likewife a manifeft defect either in the wifdom of the legiflative, or the ftrength of the executive power. Although it be much eafier to extirpate than to amend mankind; yet that magiftrate muft be efteemed both a weak and a cruel furgeon, who cuts off every limb, which through ignorance or indolence he will not attempt to cure. Beccaria therefore propofes to form in every ftate a fcale of crimes, with a correfponding fcale of punifhments, defcending from the greateft to the leaft; but if this idea be deemed romantic, a wife legiflator will at leaft mark the principal divifions, and not affign penalties of the firft degree to offences of an inferior rank. When men fee no diftinction made in the nature and gradations of punifhment, the generality will be led to conclude, there is no diftinction in the guilt. Much as we may be difpofed to admire and extol the excellence of the Englifh law in a variety of refpects, yet none can otherwife than regret the frequency of its capital punifhments; inflicted by a multitude of fucceffive and independent ftatutes, upon crimes very different in their natures; and we cannot forbear paying our tribute of refpect to fir Samuel Romilly, whofe talents and character far exceed our praife, and other legiflators, who are laudably exerting themfelves in fimplifying and mitigating our penal code.

It is a melancholy truth, fays judge Blackftone, that among the variety of actions, which men are daily liable to commit, no lefs than 160 have been declared by act of parliament to be felonies without benefit of clergy; or in other words, to be worthy of inftant death. So dreadful a lift, inftead of diminifhing, increafes the number of offenders. The injured, through compaffion, will often forbear to profecute: juries, through compaffion, will fometimes forget their oaths, and either acquit the guilty or mitigate the nature of the offence; and judges, through compaffion, will refpite one half of the convicts, and recommend them to the royal mercy. Among fo many chances of efcaping, the ready and hardened offender overlooks the multitude that fuffer; he boldly engages in fome defperate attempt, to relieve his wants or fupply his vices; and if, unexpectedly, the hand of juftice overtakes him, he deems himfelf peculiarly unfortunate, in falling at laft a facrifice to thofe laws, which long impunity has taught him to contemn.

Beccaria, whofe excellent effay we have often cited in this article, obferves, that the more immediately after the commiffion of a crime, a punifhment is inflicted, the more juft and ufeful it will be. It will be more juft, becaufe it fpares the criminal the cruel and fuperfluous torment of uncertainty, which increafes in proportion to the ftrength of his imagination, and the fenfe of his weaknefs; and becaufe the privation of liberty, being a punifhment, ought to be inflicted before condemnation, but for as fhort a time as poffible. Imprifonment, he fays, being only the means of fecuring the perfon of the accufed, until he be tried, condemned, or acquitted, ought not only to be of as fhort duration, but attended with as little feverity as poffible. The time fhould be determined by the neceffary preparation for the trial, and the right of priority in the oldeft prifoners. The confinement ought not to be clofer than is requifite to prevent his flight, or his concealing the proofs of the crime; and the trial fhould be conducted with all poffible expedition. Can there be a more cruel contraft than that between the indolence of a judge, and the painful anxiety of the accufed; the comforts and pleafures of an infenfible magiftrate, and the filth and mifery of the prifoner? In general, "The degree of the punifhment, and the confequences of a crime, ought to be fo contrived, as to have the greateft poffible effect on others, with the leaft poffible pain to the delinquent." If there be any fociety in which this is not a fundamental principle, it is an unlawful fociety; for mankind, by their union, originally intended to fubject themfelves to the leaft evils poffible.

An immediate punifhment is more ufeful; becaufe the fmaller interval of time between the punifhment and the crime, the ftronger and more lafting will be the affociation of the two ideas of *crime* and *punifhment;* fo that they may be confidered, one as the caufe, and the other as the unavoidable and neceffary effect.

It is, then, of the greateft importance, that the punifhment fhould fucceed the crime as immediately as poffible, if we intend, that in the rude minds of the multitude, the feducing picture of the advantage arifing from the crime, fhould inftantly awake the attendant idea of punifhment. Delaying the punifhment ferves only to feparate thefe two ideas; and thus affects the minds of the fpectators rather as being a terrible fight, than the neceffary confequence of a crime; the horror of which fhould contribute to heighten the idea of the punifhment.

There

There is another excellent method of strengthening this important connection between the ideas of crime and punishment; that is, to make the punishment as analogous as possible to the nature of the crime; in order that the punishment may lead the mind to consider the crime in a different point of view, from that in which it was placed by the flattering idea of promised advantages. This ingenious writer closes his essay with the following general theorem, as the result of his previous reasoning. "That a punishment may not be an act of violence, of one or of many against a private member of society, it should be public, immediate, and necessary; the least possible in the case given; proportioned to the crime, and determined by the laws." Montesq. Sp. of Laws. Beccaria's Essay on Crimes and Punishments. Blackst. Com. vol. iv.

A valuable work, comprising the subject of this article, was presented to the public in the year 1811 by M. Dumont of Geneva. It was formed of detached materials, furnished by the papers of Mr. Jeremiah Bentham, and the whole is executed with such judgment in the arrangement of the matter, and so much liveliness and elegance as to the style of the composition, that M. Dumont appears more like an original author than an editor. This work would have afforded us many instructive and interesting extracts, if our limits had allowed our making that use of it, which it deserves. This, however, is the less necessary, as the reader may have access to the original treatise, *viz.* "Theorie des Péines et des Recompenses; par M. Jeremie Bentham, Jurisconsulte Anglois; redigée in François d'apres les Manuscrits, par M. Et. Dumont de Génevè," 2 vol. 8vo. à Londres, 1811: or to the ample analysis of it in the Edinburgh Review, N° 43. A brief account of its contents may, however, be gratifying to our readers. This work consists of two great parts or branches; the theory of penal legislation, and the theory of remunerative legislation. The first contains in a systematical form all the principles that serve to regulate the choice of different modes of punishment and the apportionment of punishments to crimes. In the second are exhibited the principles upon which the lawgiver ought to proceed, when he holds out inducements either alone or attended with corresponding penalties, to influence the conduct of his subjects. The first book explains the general principles of the system, and opens with definitions and classifications.

Punishment, in its most general sense, is the infliction of some evil upon an individual, with an intention that he should suffer this evil, and with a reference to some act done or omitted. Punishment, in its legal sense, is the infliction of some evil, according to judicial forms, upon an individual convicted of some act forbidden by law, and with the intention of preventing the recurrence of such acts. Punishments, as well as crimes, are divisible into four classes, as they affect the *person*, the *property*, the *reputation*, or the *condition* of those upon whom they are inflicted. Those which affect the person, or corporal punishments, are subdivided into various species; they may be simply or complexly afflictive, or restrictive, or active (*e. g.* compulsory labour) or capital. The other three classes are all privative, affecting the delinquent with loss or degradation. Hence arises another general classification of punishments, by dividing them into corporal and privative.

From this definition it appears, that the object of all punishment is the prevention of the offence in future, either by the same delinquent or by other persons in similar circumstances. The first end is accomplished in three ways; by taking from the offender the physical power of committing the offence; by taking away the desire; or by deterring him. The other, and principal object of the infliction, that of restraining others, can only be effected as far as the punishment is concerned, by the threat which it holds out of similar infliction. These objects, as they form the only just motives, constitute also the only justification of punishments. Although the direct and primary object of punishment is prevention, the civil magistrate, having provided for that object, has another duty to perform, which is to provide as far as possible for the reparation of the injury sustained through the crime committed.

The *expence* or *cost* of any punishment is, in the language of this system, the whole evil of every kind occasioned by it, including the suffering of the delinquent, the loss of his labour or life to the state, the pecuniary cost of his punishment; and, in short, every thing endured, paid, or foregone, in order to obtain the double preventive which the punishment is intended to administer. The *gain* or *profit* of the punishment consists in this preventive, or in the tendency of the punishment to secure it. A punishment may be termed frugal or economical which produces the desired effect with as little suffering as possible; and it may be termed costly or prodigal, when the same effect might have been produced by a smaller degree of suffering. The *real value* is distinguished from the *apparent value*, of the suffering; the former being the actual amount of that which is inflicted; the latter, the portion of it which is exhibited, or otherwise made known to, and understood by the public. The expence of a punishment is equivalent to the real amount; the profit is in proportion to the apparent amount only; and hence are deduced these important maxims: 1. That, *cæteris paribus*, a punishment easily comprehended, is preferable to one of difficult apprehension: 2. That one which takes hold of the memory, is preferable to one easily forgotten: 3. That one which is as great or greater in apparent than in real amount, is preferable to one which is really greater than it appears to be:—the excess of real amount being in truth so much thrown away, so far as regards the principal object, of general example.

The next subject of discussion comprehends the principles that ought to regulate the extent of punishment, for the prevention of crimes. These are contained in the following propositions. 1. The evil of the punishment must exceed the advantage arising from the crime; so that, generally speaking, the stronger the temptation to commit any crime, the more severe ought to be the punishment, subject to exceptions in extreme cases. 2. When the criminal act evidently indicates a habit or practice, the punishment should be proportioned, not to the gain derived from a single offence, but to the probable amount of profit flowing from a course of such conduct. 3. An addition must be made to the punishment, in order to compensate its want of certainty and proximity. 4. In cases where a temptation offers for the commission of different crimes, a more severe punishment should be denounced against the greater crime. 5. The more pernicious any crime is, the more safely may a severe punishment be ventured upon, for the chance of preventing it. 6. The nominal amount of punishment for the same crime, must often be varied at the discretion of the judge, according to the circumstances of the delinquent, in order to preserve the real amount of suffering.

The qualities of punishment, the consideration of which naturally succeeds that of the measure or quantity, are such as follow: it should be *divisible; invariable*, or *certain* or *equal; commensurable* with others; *analogous* to the crime; *exemplary; economical; remissible;* that it should restrain the offender from doing harm; conduce to his *reformation;* yield a *profit*, in the ordinary sense of the word; be *simple* in its description;

defcription; and fo far *popular* as to fhock none of the eftablifhed feelings or prejudices of the community. Thefe qualities are, for the moft part, underftood as foon as they are mentioned. Some of them, however, undergo a more ample difcuffion than others. This is the cafe with refpect to the qualities of *analogy* and *popularity*. One of the fources of analogy fpecified by Mr. Bentham is that of employing the fame inftrument or operation in the punifhment, as the delinquent did in the crime, as, *e. gr.* burning an incendiary who had committed any aggravated act of *arfon*, by which lives were facrificed as well as property. Another method is that of inflicting on the delinquent the fame injury which he offered to the innocent perfon. A third confifts in fubjecting to punifhment the part of the body with which the offender committed the crime. A fourth, in affecting the face with fome disfigurement fimilar to difguifing, where part of the offence was the ufe of a difguife. Other analogies alfo are enumerated. In difcuffing the *popularity* of punifhment, the author adverts to the prevalence of falfe feelings and prejudices, and he reduces the errors proceeding from thefe caufes to four heads; as they confift in miftaken notions of *liberty*, *decency*, *religion*, and *humanity*. The author allows, however, that a lawgiver fhould, for a time at leaft, frame his inftitutions fo as to humour even the caprices and errors of his people, when he finds them too deeply rooted and widely fpread, to be overcome or difregarded. To any fpeculative arguments, founded upon falfe views of thofe different fubjects, of courfe no regard fhould be paid;—as to thofe fanatics in politics, religion, or fentiment, who would have no imprifonment becaufe it violates liberty, or abolifh capital punifhments becaufe they encroach upon the province of the Deity, or becaufe they are painful to the feelings.

The author mentions four cafes, in which punifhment is wholly inept, and ought not to be inflicted; *viz.* where the crime being either imaginary, or unfit for legiflative interference, may be faid not to exift, and the punifhment would be *unfounded*: where the punifhment would be wholly *inefficacious* on the delinquent, or others in the fame circumftances, as in the cafe of idiots: where the means being fufficient to accomplifh the end in view, punifhment would be *fuperfluous*: where more evil being likely to refult from punifhing the particular offenders than from letting them efcape, the infliction would be too *coftly*, as in the cafe of an extenfive mutiny or rebellion.

We have already ftated, that the author divides punifhments into two great claffes, *corporal* and *privative*; that he again fubdivides corporal punifhments into five kinds, and privative into three. 1. The *firft* clafs of corporal punifhments confifts of punifhments *fimply afflictive*, denoting thofe which caufe bodily fuffering, with little attendant injury; and even thofe moft fimple, as the lafh, are accompanied with a certain difgrace by their public exhibition, which is an effential part of the procefs. Of the various kinds of fimple infliction, our author gives the preference to the lafh, under certain modifications. 2. The *fecond* clafs confifts of punifhments *complexly afflictive*, or thofe in which the mere bodily fuffering is attended with, or followed by, fome other lofs, either of perfonal comfort or reputation. Thefe are fubdivided into three kinds, comprehending thofe that are inflicted by *deforming* the perfon, which is done either by *difcolouring*, *e. gr.* burning in the hand; or *disfiguring*, *e. gr.* flitting the nofe, or cutting the ear; by *difabling* a limb or organ, without deftroying it; by *mutilating* or deftroying the part. The *third* clafs comprehends *reftrictive* punifhments, which prevent the offender from doing or enjoying fomething agreeable or ufeful to him. The *reftrictions* thus impofed are of two kinds; *fimple* prohibitions, and reftraints upon *loco-motion*. The former are fo limited in their application, that we need not particularly fpecify them; but the latter are divided into five kinds; *viz. imprifonment*, in the ordinary fenfe of the word; *quafi-imprifonment*, or confinement within the diftrict to which the offender belongs: *relegation*, or confinement to fome other diftrict within the dominions of the ftate: *local interdiction*, or banifhment from a particular diftrict: *banifhment* from the territories of the ftate, either indefinitely, or to fome fpecific foreign part. *Imprifonment*, according to our author's ftatement, in order to be effectual, ought to place the offender, for a limited time, under the moft complete reftraint, inftead of being long and flight. Mr. Bentham enlarges in the enumeration of the evils comprehended under this mode of fuffering, of which fome belong *infeparably* and neceffarily to it; others fuch as are *acceffary*, but moft frequently accompany it; and others again fuch as arife from *abufes* of it. With imprifonment, he fays, in certain cafes, and always for a very limited time, may moft advantageoufly be joined *folitude*, *darknefs*, and *regimen*. Our author, having expofed the abfurd fyftem of "prifon-fees," infers from his general principles that there ought to be three kinds of prifon, adapted to the feveral purpofes of *fimple* detention, *penitentiary* confinement, and *perpetual* imprifonment. The firft being only applicable to the cafe of infolvent debtors guilty of imprudence or extravagance, and of accufed perfons kept for trial, fhould have no accompaniment whatever of rigour. The leading principle in diftinguifhing the two others is, that the fubjects of the former are to enter again into fociety; while thofe of the latter, being for ever excluded from it, the exemplary nature of their fufferings fhould be the principal object of attention. The names of the three prifons, for thefe feparate purpofes, fhould be different, as well as their external appearance; and every thing which can feize hold of the imagination, without awakening fympathy, fhould be prefented, both in the conftruction of the perpetual prifon, and in the fituation of its inhabitants. 4. The *fourth* clafs of punifhments comprehends thofe that are termed *active* or *laborious*. Punifhments of this clafs, when examined by the rules already premifed, are found to unite the greateft number of advantages with the feweft defects. In the difcuffion of this fubject, the author directs our attention to what may be called the extreme cafe of mifmanagement in this kind of punifhments. Here he alludes to Botany Bay. The tranfportation of convicts to America, which preceded the prefent plan, with feveral difadvantages of great moment, was, upon the whole, infinitely preferable. It was grofsly unequal, inafmuch as it became fervitude with exile to the poor, while it was only fimple relegation to thofe who could pay for their paffage. It was defective too in preventive power, the opportunities of efcape being neceffarily great. In both thefe particulars, the deportation now practifed has the manifeft advantage. All the convicts are equally under reftraint, and their efcape is much more difficult; but in every other point of view, it is either as bad, or a great deal worfe. It is as little as poffible exemplary: the difproportion between the real and apparent fuffering,—the excefs of the former,—is in truth a maximum. The community in this country fee a convict fent on a long voyage, to a fertile country, lying in a fine climate. This is the example. The reality is, that the miferable wretch, after rotting in the hulks for a year or two, is crammed with fome hundreds of his fellows into a floating prifon, or, it may be, a peft-houfe, in which, if he furvives the rifks of famine, peftilence, mutiny, fire, fhipwreck, and explofion, he is conveyed, through the in-

 fliction

fliction of a ten months' voyage, to a life of alternate flavery and rebellion, where guilty or cruel excefs fucceeds exquifite fuffering, without varying the uniform mifery, or changing the prevalent character of the body; and all this paffes at the oppofite extremity of the earth's diameter, from whence it operates no more in any manner of way upon the inhabitants of England, than if it were paffing in the moon. The tendency of difcipline in the colony to reform the convicts, fuppofing them to have arrived there, may eafily be eftimated. They are not feparated from their companions in guilt; they have no better examples before them, no eyes to watch them. The partial hiftorian of the rifing fettlement, himfelf the chief magiftrate, (Mr. Collins,) has fupplied us with the details; and, in fpite of his inclination to fee every thing in the faireft light, he has painted, if the pages of a journal for fixteen years may be faid to paint, by far the blackeft picture ever yet exhibited of human fociety. His book is a catalogue of crimes; it would be a record of convictions, but that perjury fo univerfally prevails as to enfure the efcape of all who are not taken in the fact. The vice at the root of all the reft, a rage for fpirits approaching to frenzy, can neither be cured, nor deprived of gratification. Far from improving by their refidence there, it was only at the firft eftablifhment that any remiffion of unfavourable fymptoms appeared. As foon as the firft convicts had finifhed their period of fervitude, their liberty brought along with it an influx of diforder and contamination, which each fucceeding year feems to increafe. If this fyftem, then, prevents the delinquent from repeating his crimes, it is only by transferring the fcene of them to a diftant fettlement, where it fofters and augments them; and although, with reference to one part of the empire, this may be termed prevention, the legiflator, whofe care fhould embrace the whole, has no right to give it fuch a name. As to the pecuniary expence, by which fo much evil is purchafed, we find it in the parliamentary reports eftimated at above a million in about ten years, or about thirty-eight pounds for each convict, befides the value of his labour. Laft of all, the punifhment inflicted is perfectly different from the one to which the fentence of the law has condemned the convict. Not to mention the detention before tranfportation, and the arrival fometimes when the term of punifhment has nearly expired, the power of returning at its expiration is poffeffed by few men, and no women; while of the voyage fome idea may be formed, from the average mortality between 1787 and 1795, being above one in ten; and from a jail fever, always a probable occurrence, on one occafion, in 1799, having carried off one hundred in three. If, in fuch a cafe, we could look to the fettlement as a colonial fpeculation, we fhould find its gains in a fimilar proportion; but this eftimate would be as fuperfluous after what has been faid, as it would be foreign to the defign of this inquiry.

In the work before us we have a general fketch of the author's plan of improvement upon this fyftem, together with a view of its connection with the principles which he has unfolded, and of the prodigious advantages accruing from it. The "Panopticon" is diftinguifhed by three leading properties. From the form of the building, and the difpofition of the cells, the infpector can fee each prifoner at all times, without being feen by them, and can direct them without leaving his poft: the management of the eftablifhment is carried on by contract, the government paying a fixed price for the whole expences of each convict, and the contractor having the whole profit, as he has the entire charge and regulation, of the work to be performed, but allowing a certain proportion of the gain to the convict: the contractor infures the lives and fafe cuftody of the convicts; he is allowed yearly a certain fum for the deaths, as calculated from the common tables, and he pays the fame fum for each death which actually does happen, and for every efcape which takes place. If we miftake not, Mr. Bentham, by his contract with government, further engaged to pay fo much for each prifoner who, after his difcharge, fhould afterwards be convicted of any offence. The entire publicity of his accounts was another condition, and one upon which he himfelf infifted. The Panopticon was to be open at all times to every magiftrate, and at certain hours to the public generally.

The moft ftriking points of the comparifon between both fyftems, as they are prefented to us by the anonymous author of the article on the fubject in the Edinburgh Review, are fuch as follow. The punifhment is in the higheft degree exemplary; it is all feen and underftood; it appears much greater than it really is; the comforts of the convicts, in their intercourfe with each other according to their improvement, and in the ftate of induftry, and cleanlinefs, and wholefome regimen, for which they have exchanged their ordinary habits, being, however real, by no means fuch as ftrike the multitude of fpectators, who only fee confinement, compulfory labour, and ignominy. The reforming effects of the plan are equally manifeft: the labour, to which they are in part allured by a fixed allowance of profit; the perfect temperance in which they live; the facility afforded of feparating them into claffes, according to their habits and behaviour; the means of eafy inftruction, both religious and other, which they give; all furnifh as good a chance of reclaiming thofe unhappy perfons who are not hardened in guilt, as from any fuch difcipline can reafonably be expected. The preventive powers of the Panopticon are complete, while the convict remains in it; and although a relapfe after liberation can only be guarded againft by reformation, a contrivance is added to this eftablifhment, admirably calculated to provide againft the firft dangers of the difcharge: the convict is transferred to another place of mitigated confinement, where he is rather under infpection than in cuftody, and from whence he is gradually allowed wholly to withdraw. With refpect to the coft of the plan, we may form fome eftimate of it from the terms of Mr. Bentham's contract. Each convict was to coft government 13*l.* 10*s.*, including 1*l.* 10*s.* for the proportion of the expences of building and ground. He was to provide a fund for indemnifying the parties injured; to allow the convicts one quarter of the profits of their labour; and, after the firft trial, to make a reduction in the charge. Practical men, well verfed in fuch matters, had no doubt that a very confiderable reduction might have been fpeedily afforded; and that, in a few years, the profits would entirely defray the expences of the eftablifhment to the ftate. While all manner of delays and difficulties were thrown in the way of this experiment; while wits and jobbers, or, as they termed themfelves, matter-of-fact men, averfe to theories, and deprecating novelties, were employed in running it down; trials were made in America of penitentiary houfes upon fimilar principles, though in a much lefs perfect fhape, and without fome of Mr. Bentham's chief improvements. We have the moft irrefragable teftimony borne to their fuccefs, by the interefting narratives of the duc de Rochefoucault Liancourt and captain Turnbull: the one a perfon eminently fkilled in the fubject of prifons; the other a mere practical obferver, imbued with no knowledge beyond that of the naval profeffion. Both thefe very different witneffes concur in their ftatement of the falutary confequences of the plan; and if we wifhed to find a perfect contraft to the melancholy

melancholy narratives of Mr. Collins, we could certainly nowhere ſo well be ſuited as in the deſcriptions which the French and Engliſh travellers have given us of the convicts in New York and Philadelphia.

5. Capital puniſhments compoſe the *fifth* claſs. This claſs conſiſts either of *ſimply* inflicting death with the leaſt poſſible degree of ſuffering, or in accompanying the deſtruction of life with *torments*. The latter method, at one period univerſally prevalent, and ſtill known in moſt countries, is happily almoſt aboliſhed in the two moſt civilized nations. In France, the Code Napoleon allowed it only in the caſes of parricide, and attempts againſt the ſovereign's life, where the addition made to the puniſhment of death is cutting off the right hand. In England, it is only in the caſe of high treaſon that ſuch augmentations are allowed: the puniſhment of the law is no doubt barbarous in the extreme, but in practice it is always remitted. All ſuch cruelties have the effect of inſpiring pity in the ſpectators towards the criminal, and of rendering criminals more hardened and ſavage.

The ingenious author of the critique on Mr. Bentham's theory, to whoſe analyſis of the work we are ſo much indebted in the compilation of this article, agrees with him in his objections to Beccaria, who maintains that a puniſhment of longer duration is more terrible to the ſpectator. Clearly there is none ſo dreadful as death. M. Dumont adds, that its apparent ſuffering is greater than its real, which applies only to the pains of it. On the other hand, it exceeds all others in ſome material defects; not only is it expenſive, and beginning to become unpopular; it is quite irremiſſible, and it is in the higheſt degree unequal, and incapable of diviſion or apportionment. A very ſatisfactory ſtatement is given under this head, of the evil tendency of frequent executions, of the kind of reaſoning by which offenders at the moment of temptation get rid of the fear of death, and eſpecially of the wide difference between encountering certain deſtruction, and yielding to impulſes which may lead to it. The evils ariſing from its being irremiſſible are alſo ably expounded; yet we think the author has neglected to conſider how much of its horror conſiſts in this quality. It is manifeſt that no other puniſhment can utterly exclude hope. In comparing capital with other puniſhments, our author is diſpoſed to give the latter the preference, almoſt to the excluſion of the former; chiefly becauſe, however exemplary to men in general the infliction of death may be, and how deep ſoever the impreſſion it makes on their minds, it has not the ſame terrors for the claſs of men moſt likely to commit the worſt offences, violent ſpirits and hardened delinquents. That its range ſhould be extremely limited, we are willing to admit; but we differ from him in the poſition, that for this claſs of men, perpetual confinement to hard labour would have more terrors than death. The total extinction of life, without chance of eſcape, pardon, or mitigation, ought ſtill to be denounced againſt the worſt offences; and, by being confined to theſe, will unqueſtionably become doubly terrible. The evils ariſing collaterally from the abuſe of this puniſhment, are ſo ably pointed out by ſir Samuel Romilly, that our author abridges a part of the treatiſe before us, by referring to his tract.

The other great diviſion of puniſhments in Mr. Bentham's theory, conſiſts more peculiarly in *privation*. Theſe may be arranged in three claſſes, as they impoſe a forfeiture of *reputation*, of *property*, or of *condition*. 1. Puniſhments which affect a man's reputation conſiſt of appeals to public opinion, and are thoſe meaſures which the lawgiver takes with reſpect to him, for directing that opinion againſt him. The lawgiver may inflict puniſhments of this kind, or rather may expoſe the offender to have them inflicted, either by ſimply *denouncing*, with the authority belonging to his functions, that certain acts ſhall be deemed infamous, or by treating the particular offender *judicially* in a certain way. The latter is the mode uſed in modern times; and it is practiſed in different ways; by *publication* of the offence;—by judicial *admonition*;—by inflicting *puniſhments* of the other claſſes, corporal as well as privative, the immediate object of which is not the deſtruction of reputation;—by inflicting what may be termed *quaſi-corporal* puniſhments, the ſole object of which is infamy;—by *degradation*, or depriving the offender of his rank, natural or conventional;—by *diſcrediting* him, or preventing his teſtimony from being received. 2. The deſcription of puniſhments affecting property conſiſts of thoſe which are *pecuniary*, and which are *quaſi-pecuniary*, as confiſcation of lands, &c. 3. The forfeiture of condition, or *ſtatus*, though a claſs of great extent, theoretically ſpeaking, is in practice reduced within narrow limits. Marriage may be diſſolved; children may be baſtardized; blood may be corrupted; the different kinds of truſt may be taken away; a perſon may be reduced to ſlavery; a community may be deprived of its rights and privileges. Outlawry may alſo be referred to this head.

There are other kinds of infliction, which every ſound principle teaches us to avoid where it is poſſible, and to diminiſh as much as poſſible, where, from the defects of all human contrivances, they inevitably mingle themſelves with the legitimate modes of puniſhment. Our author's ſyſtem arranges them in two claſſes; thoſe which are *miſplaced*, or which fall upon other perſons than the offender; and thoſe which are *complicated*, or preſent neither to the legiſlator, the judge, the party, nor the public, any fixed and definite idea. Thoſe puniſhments that are miſplaced, in the proper uſe of the term, or which the legiſlator enacts with the intention of puniſhing another perſon than the offender, either along with him, or in his place, conſiſt of four kinds; *viz. vicarious*, where the offender eſcapes;—*tranſitive*, where an innocent perſon is purpoſely puniſhed who is connected with the offender;—*collective*, where a body of innocent perſons ſuffer, in the preſumption of the guilty being among them;—and *fortuitous*, where an innocent perſon ſuffers as well as the offender, though unconnected with him. The only inſtance of *vicarious* puniſhments is that inflicted upon the families and creditors of ſuicides by the law of England. This, like all other abſurd and unjuſt laws, is evaded, in almoſt every inſtance, by perjury, and the exerciſe of diſcretion in a ſovereign. The example given of *tranſitive* puniſhment is the corruption of blood, the abſurdity of which is ably expoſed. The chief inſtances of *collective* puniſhments are thoſe in which corporations are puniſhed for the faults of certain individual corporations; a proceeding which can never be juſtified. The well-known examples of *fortuitous* puniſhments are taken from the law of England. The moſt notable is the forfeiture and eſcheat of freehold property, in caſes of attainder of treaſon and felony, where the confiſcation relates back to the commiſſion of the offence, and all meſne conveyances are avoided; ſo that a man may commit a ſecret crime, and ſell his eſtate to an ignorant and innocent purchaſer, in whoſe hands the crown or the lord afterwards ſeizes the eſtate upon the vendor's attainder; and as his goods and chattels are forfeited upon conviction, the only fund of compenſation is gone alſo. Deodands are another inſtance of ſimilar injuſtice; and the puniſhment of incapacitating a perſon from giving evidence, is manifeſtly one which may ſtrike more injuriouſly at parties wholly unconnected with the offender, than at himſelf; beſides, that it is by no means inflicted merely with the view of putting courts of juſtice on their guard againſt admitting a bad witneſs; for it is often the puniſhment of crimes which have no peculiar connection with violation of truth.

Among the evils of complicated puniſhments, we may reckon, beſides outlawry and incapacitation of giving evidence, *excommunication* and *felony*. Some groſs abuſes having occurred in the infliction of the puniſhment of excommunication, ſeveral diſtinguiſhed perſons have undertaken to ſubſtitute other procedure in its place; and ſir W. Scott brought a bill into parliament with this view, ſo that the evil is done away. The puniſhment of perſons as felons, comprehends a number of inflictions very different from each other, ſo that our author conſiders the puniſhing as a felon to be a vague and indefinite term. This comprehends two deſcriptions of puniſhment; the one capital, with forfeiture of lands and chattels; the other not capital, but conſiſting in forfeiture of chattels, and the form of burning in the hand; to which, by ſpecial enactment, impriſonment, tranſportation, or indeed any other puniſhment, may be ſuperadded. It muſt be acknowledged, that a much ſimpler and better manner of ſtating the puniſhment due to an offence would be, to tell at once of what it is to be compoſed; and inſtead of enacting that certain offences are felonies, which ſpecifies nothing, to prohibit them, and ſtate the preciſe inflictions which ſhall follow the commiſſion of them. For the general character and high commendation of the work, which has furniſhed the preceding materials, we refer to the Edinb. Rev. N° 43. p. 1—31.

Puniſhment, in *Theology*. It has been diſputed among divines, whether the puniſhment of the wicked in a future world be ſtrictly eternal or not. For the arguments on both ſides of the queſtion, ſee Hell.

PUNITORY Interest, in the *Civil Law*, ſuch intereſt of money, as is due for the delay of payment, breach of promiſe, &c.

PUNK, in *Natural Hiſtory*, the inward part of the excreſcence or exuberance of an oak. It is uſed by the Indians in Virginia for medicinal burning, as the Eaſt Indians uſe moxa. Phil. Tranſ. No. 454. ſect. 1.

PUNN. See Pun.

PUNO, in *Geography*, a town of Peru, now annexed to the viceroyalty of La Plata or Buenos Ayres, and capital of a diſtrict of the ſame name, called alſo Paucarcolla (not *Paucarcotta*, as it is miſprinted in that article). It is a rich and populous town, ſituated on the W. ſide of the lake Titicaca, and containing ſome illuſtrious families, as well as a beautiful church for the Spaniards, and another for the Indians, who weave great quantities of coarſe cloth, with which they ſupply the neighbouring countries. S. lat. 16° 20′. W. long. 70° 26′.

PUNT, in *Sea Language*, a ſort of oblong flat-bottomed boat, with a ſquare head and ſtern, whoſe floor reſembles the platform of a floating ſtage; and uſed by ſhip-wrights for breaming, caulking, or repairing a ſhip's bottom. It is alſo uſed in ſome canals.

PUNTA, in *Geography*, a town of South America, in the audience of Quito, and juriſdiction of Guayaquil.

Punta, *La*, a town of Mexico, in the province of New Biſcay; 40 miles N.N.E. of Durango.

Punta is alſo an epithet, diſtinguiſhing ſeveral capes, which are too numerous to be here recited; and this is the leſs neceſſary, as the principal of them occur under other appropriate titles.

Punta *Entornada*, a town on the N. coaſt of Spain. N. lat. 43° 34′. W. long. 5° 30′.

Punta *del Guda*, a ſea-port and capital of St. Michael, one of the Azores, defended by a caſtle.

Punta *de Tordera*, a town and cape of Spain, on the coaſt of Catalonia. N. lat. 41° 38′. E. long. 2° 37′.

PUNTO *del Monte*, a town of South America, in the province of Cordova; 15 miles S. of Cordova.

PUNUGGA, a village of Bootan, ſituated in a deep hollow, and ſurrounded with mountains, for the moſt part covered with pines, along whoſe ſides clouds are perpetually hovering. On the borders of this village are many large heaps of fir-leaves, which being left to ferment and rot, are uſed as excellent manure.

PUNUNAGUR, a town of Bengal; 10 miles W. of Nattore.

PUNWARY, a town of Hindooſtan, in the circar of Gohud; 18 miles E. of Raat.

PUOLANGO, a town of Sweden, in the government of Ulea; 40 miles S. of Cajana.

PUPA, in *Natural Hiſtory*, a name lately ſubſtituted in the room of chryſalis or aurelia, becauſe many inſects in this ſtate reſemble an infant in ſwaddling clothes; and all, except thoſe of the hemiptera order, take no nouriſhment. See Entomology.

PUPIGLIO, in *Geography*, a town of Etruria; 10 miles N. of Piſtoia.

PUPIL, Pupillus, in the *Civil Law*, a boy or girl not yet arrived at the age of puberty, *i. e.* under fourteen years of age for the boy, and under twelve for the girl.

While a minor remained under the direction of a tutor, he was called a pupil; after puberty, a curator being aſſigned him, he ceaſed to be called a pupil.

A tutor is obliged to pay intereſt for what monies of his pupil lie idle and unemployed. A tutor is allowed to do any thing for his pupil, but nothing againſt him.

Pupil is alſo uſed by way of extenſion, in *Univerſities*, &c. in the ſenſe of *alumnus*, for a youth under the education or diſcipline of any one.

Pupil, in *Anatomy*, the round opening in the iris, by which the rays of light are admitted into the eye. See Eye.

Pupil, in *Optics*. It is obſerved, that as we are forced to uſe various apertures to our optic glaſſes, ſo nature has made a like proviſion in the eyes of animals, whereby to ſhut out too much, and admit ſufficient light, by the changes in the aperture of the pupil.

The ſtructure of the uvea and iris is ſuch, as that, by their aperture, the pupil is contractible and dilatable at pleaſure, ſo as to accommodate itſelf to objects, and to admit more or fewer rays, as the object, being either more vivid and near, or more obſcure and remote, requires more or leſs light: it being a conſtant law, that the more luminous the object, the ſmaller the pupil; and again, the nearer the object, the ſmaller the pupil; and *vice verſâ*.

This fact has been long ago noticed by optical writers. B. Porta, about the middle of the ſixteenth century, in his treatiſe De Refractione, p. 74, obſerves, that the pupil is contracted involuntarily when it is expoſed to a ſtrong light, and opens of itſelf when the light is ſmall. A ſimilar obſervation was made by his countryman and contemporary, Father Paul of Venice. Galen, indeed, firſt obſerved the dilatation of the pupil of one eye, when the other was ſhut or loſt, and the contraction of it, when the other was opened or recovered; and in this opinion he was followed by all naturaliſts and philoſophers, till Fabricius ab Aquapendente, profeſſor at Padua, by obſerving the eye of a cat, found

found that the pupil not only dilated and contracted itself, when one of the eyes was shut, but also when both were open. F. Paul found, from repeated experiments, that the pupil not only of cats, but also of men, and other animals, always contracted itself when the eye was exposed to a bright light, and again dilated itself when the light was faint and languid. This he always observed, as well when both eyes were open, as when one of them was shut. The same remark had been made by Achillinus, in a treatise published in 1322; and the fact was known to the Arabians, Rhazes and Avicenna. That the pupil of the eye is enlarged, in order to view remote objects, and that it is contracted while we are viewing those that are near, is a fact with which Scheiner, in the beginning of the seventeenth century, was well acquainted, and which he proved by experiments, and illustrated by figures. When a needle, or any small object, is brought near to the eye of any person, who looks attentively at it, the pupil, he says, is plainly seen to contract; and it as constantly expands whenever it is withdrawn.

This alteration of the pupil is effected by certain muscular fibres on the outside of the uvea, which arrive from nerves detached hither from the sclerotica. These fibres proceeding straight from their origin towards the centre, terminate in the orbicular limb or verge of the pupil, which consists of orbicular fibres, whereby the figure and space of the pupil are defined. The first, or longitudinal fibres, dilate the aperture of the pupilla; the latter, or orbicular ones, constringe it.

Some authors, however, attribute the motions of the pupilla to the ligamentum ciliare; and others think, that both this, and the fibres of the uvea, concur herein. Dr. Derham adds, that while the pupil opens and shuts, the ligamentum ciliare dilates or compresses the crystalline, and brings it nigher to, or farther from, the retina, as the object is more or less remote.

There is no doubt that the change to which the pupil is subject is the effect of light upon the eye. Dr. Hartley, Obs. on Man, vol. i. p. 219, supposes, that the light which enters at the pupil has great efficacy in contracting both the greater and less rings of the iris, as may be concluded, he says, from the immobility of the pupil in a gutta serena; also because, on this supposition, the light which passes in at the pupil must, by contracting the less ring, become a check and guard against its own too free admission, which is agreeable to the tenor of nature in like instances. The retina, he observes, extends to the greater ring, and may send some nervous fibres to it, and even to the iris. Dr. Whytt also says, Essay on vital and involuntary Motion, p. 112, that the contraction of the pupil is not performed by the action of light upon the iris, but upon the retina; since whatever intercepts the rays of light, so as to prevent their reaching the retina, causes a preternatural dilatation of the pupil; because in a cataract, where the crystalline humour, being considerably opaque, intercepts a great part of the rays, the pupil loses a good deal of its contractile power. This author also observes, that the wideness of the pupil in a syncope, apoplexy, and confirmed gutta serena, shews that, in order to dilate the pupil to its largest size, no effort of the mind is necessary, but only the superior contractile power of the longitudinal fibres of the uvea, when its circular muscle is not excited into action by the stimulus of light on the retina. M. Mery informs us (Mem. Ac. Paris, for 1704) that, having plunged a cat in water, and exposing her eye to the strong light of the sun, the pupil was not at all contracted by it; whence he infers, that the contraction of the iris is not produced by the action of the light, but by some other circumstance. For he contends, that the eye in this situation receives more light than in the open air. M. de la Hire, in reply, endeavours to shew, (Mem. Ac. Par. for 1709) that fewer rays enter the eye under water, and that, in those circumstances, it is not so liable to be affected by them. Besides, it is obvious to be remarked, that the cat must be in great terror in this situation; and being an animal that has a very great voluntary power over the muscles of the iris, and being now extremely attentive to every thing about her, she might have her eyes open, notwithstanding the action of the light upon it, and though it might be very painful to her.

The figure of the pupil, in various animals, is wonderfully adapted to their various circumstances and occasions in some, *e. gr.* in man, it is round, that form being fittest for the position of our eyes, and the various uses we make of them in all directions.

In others, it is elliptical or oblong: in some of which, *e. gr.* the horse, sheep, ox, &c. the ellipsis is transverse, and the fissure large, to enable them to see laterally, and even with a little light; and thereby both to gather their food the better in the night, and to avoid dangers on either side. In others, *e. gr.* the cat, the ellipsis is erect, and is also capable of opening very wide, and shutting very close; by means of the latter of which states, that animal can exclude all, but, as it were, a single ray of light, and so avoid all the inconveniencies of the bright sun; and by the former, it can take in all the faintest rays, and thus avoid the inconveniencies of the night: an incomparable provision for these animals, which are to watch and way-lay their prey both by day and night, to see upwards and downwards, to climb, &c. See Eye and Vision.

Pupil, *Closure of.* A preternatural smallness of the pupil always renders the patient incapable of discerning objects well at night-time, and occasions a diminution of vision. The consequence of a complete closure of the pupil, a case termed *synizesis*, is total blindness. Both these affections only differ from each other in degree, and they originate from the same causes. The most frequent cause is a violent inflammation of the eyes, particularly when such disorder extends to the iris, and arises at a period when the anterior and posterior chambers of the aqueous humour contain none of this fluid. This case principally happens after the extraction of the cataract. Here the inflammation constantly affects the capsule of the crystalline lens, so as to make it opaque, and at the same time adhere behind the pupil to the iris; a circumstance which is well deserving attention. Not unfrequently, however, a closure of the pupil takes place during ophthalmy, notwithstanding both chambers of the eye are full of the aqueous humour. Wounds of the iris sometimes cause this unpleasant occurrence, especially when they continue open, and do not heal. It is observed to be most frequently produced by such wounds as divide the radiated fibres of the iris transversely. These wounds, however, do not invariably remain open: sometimes they close, and then the pupil undergoes no alteration. Even when such wounds do not unite, a closure of the pupil does not always follow. In these instances, the natural pupil has been remarked to become closed, and the preternatural aperture in the iris to be widened, when the eye was exposed to the light; and, on the contrary, immediately the light was diminished, the pupil became dilated, and the other opening was contracted and closed. Wounds of the iris in the other direction, even when they remain disunited, often cause little or no diminution of the natural motion of the pupil.

It sometimes happens, that a greater or lesser portion of the iris is detached from the circumference of the cornea;

 and,

and, in this situation, an oval aperture is produced, through which the rays of light pass into the eye. A complete closure of the pupil is usually the consequence of such detachment of the iris. A blow on the eye, a kick of a horse, or some other external violence, attended with a violent concussion of the eye, is the common cause of this detachment of the iris. Janin has seen it brought on by a prolapsus of the iris through an ulcerated opening in the cornea. The iris was kept in a state of tension, and the patient was suffering constant pain in the eye; but, after a time, this pain suddenly ceased, when it was remarked, that the iris was torn from the upper edge of the cornea at five different points. The patient, who had been deprived of his sight by the closure of the pupil, now recovered it again. Through the aperture, formed by a separation of the iris from the cornea, patients commonly see distant objects tolerably well, notwithstanding the opening is immoveable, and not in the centre of the eye; but, in general, they can see only a half of such objects as are near. In cases where the iris is thus detached, the pupil sometimes continues open. Janin once noticed an alternate motion in the pupil and the preternatural opening. Between them the iris was thrown into folds, or wrinkles. Immediately a strong light entered the eye, the wrinkles diminished, the pupil contracted, and assumed a long narrow shape, while the preternatural opening grew larger and wider. In dark places, the latter became smaller, the pupil larger, and the part of the iris situated between them more wrinkled.

Sometimes the pupil becomes closed, in consequence of a spasmodic contraction of the iris. At first, the pupil is merely lessened in diameter; the power of seeing decreases; and at length the eye is very sensible of the light, though not at all inflamed. At last, the pupil is entirely closed. This case presents itself most frequently after operations for the cataract. The pupil occasionally undergoes a gradual diminution after such operations, and in the end is totally obliterated, without any particular cause, inflammation, or pain; and this event may happen several weeks, months, or years, after the time of those operations. It is remarked by surgical writers, that such persons as frequently read for a long while, and attentively look at shining, bright, strongly illuminated objects, run a risk of being attacked with this disorder. The pupil, which contracts itself very much during the inspection of these objects, at length becomes habituated to a state of contraction, and loses all power of expanding itself. Richter observes, that this form of the complaint is termed *synizesis ex consuetudine*.

Infants are sometimes born without pupils. In this case, the situation of these openings is occupied by the membrana pupillaris. By some this affection has been erroneously called *cataracta pupillaris*: as Richter observes, the term *synizesis congenita* is much more applicable to it. A prolapsus of the iris is commonly attended either with a diminution, or a total closure of the pupil. When the iris is reduced in time, the pupil generally expands again; but when the reduction is not effected till after a certain period, this opening remains closed, and this notwithstanding every portion of the iris be now replaced. A prolapsus of the vitreous humour sometimes occasions, and leaves after it, a contracted state of the pupil. Every long continued deficiency of the aqueous, or considerable loss of the vitreous humour, by whatsoever cause produced, is accompanied with risk of a permanent diminution, or even a total closure of the pupil: hence it is often a symptom of *atrophia oculi*.

Sometimes, though the pupil is of proper dimensions, it is obstructed by extraneous matter. This case is termed *synizesis spuria*. The substance producing the obstruction, is either a portion of coagulated blood, which is the consequence of an extravasation of this fluid in the anterior chamber; thick matter from a suppuration within the eye; or the remains of a diseased lens continuing after the operation of extracting the cataract. A white opaque membrane, like a cyst, is sometimes seen protruding through the pupil into the anterior chamber. The capsular cataract is occasionally so moveable, that, when the head is inclined forwards, it enters the pupil, and partly comes into the anterior chamber; but returns into its former position, as soon as the head is inclined backward again. Mauchart asserts, that he has seen a fungous excrescence growing from the edge of the iris, and filling up the pupil.

When the diminution or closure of the pupil is of long standing, it can never be relieved, except by an operation, whatever may be the nature of the cause from which it originates. When the pupil has been for a long while in a diminished or closed state, it loses entirely the power of expanding again, and continues lessened, or shut, notwithstanding the removal of the cause of the disorder. If the affection be congenital, or the consequence of inflammation, it can never be obviated except by an operation, however short the period of its duration may be. When it arises from irritation of the iris, or from intense observation of shining, bright objects, and has not existed a long time, it may be cured without an operation. Also, in cases where the operation is necessary, the mode of performing it differs according to circumstances.

Patients who become afflicted, in consequence of frequently observing bright, glittering objects, may obtain relief by a timely avoidance of every light that is too strong, wearing green spectacles, viewing objects with an opera glass, and frequently washing the eye with some warm emollient liquor, especially a decoction of mallows, hemlock, and poppy-heads. The peculiar virtue of the extract of belladonna, in making the pupil dilate, might here also be turned to great advantage. It is to be diluted and rubbed over the eye-lids and eye-brow, and allowed to remain applied a certain length of time every day. The same means are likewise proper in cases, where the disorder depends upon irritation. Richter speaks favourably of the good effects of antimonial wine, and the extract of aconitum, as internal medicines, together with warm bathing and blisters. Here the outward application of the extract of belladonna unquestionably merits a careful trial.

There is a preternatural contraction of the pupil, which alternately arises and then ceases again. This case sometimes lasts only a few hours; sometimes several days. During the attack, patients see more weakly than usual, or cannot see but very little, according as the pupil happens to be more or less diminished. In particular instances, the attacks come on at fixed times, and the complaint is then periodical. During the disorder, the pupil seems to be affected with spasm. Occasionally, indeed, spasmodic complaints, says Richter, take place at the same time in other parts. Here the disease is most commonly the consequence of irritation seated in the abdominal viscera, and requires aperient, and especially emetic medicines. When these means prove ineffectual, it is at length necessary to resort to the external and internal use of anodyne tonic remedies, valerian, bark, and small doses of ipecacuanha. The outward application of the extract of belladonna to the eyebrow and eye-lids promises also, in such cases, to be an useful auxiliary means. This sort of closure of the pupil has been observed as a symptom of hysteria.

The eminent Mr. Cheselden first made the proposal of perforating the iris, and also first put such an operation in execution.

execution. He introduced a flender knife, about one line from the margin of the cornea, through the coats of the eye, into the pofterior chamber, and pufhed it through the iris in the fituation of the clofed pupil, fo as to form in that membrane a fmall longitudinal incifion. It is alleged that this operation of Chefelden's has been repeatedly performed, and for the moft part unfuccefsfully. According to the obfervations of Janin and Warner, the incifion did not dilate, and became fhut up again foon after it had been made. In one example, Janin was prevented from completing the operation with accuracy, in confequence of hemorrhage rendering the aqueous humour turbid. The plan of introducing the knife into the pofterior, inftead of the anterior chamber, feems alfo to be difadvantageous; for, in this laft mode, the iris can be more eafily got at, and nothing is injured except the infenfible cornea. On the other hand, in Chefelden's method, all the coats of the eye, the lens and its capfule, and the ciliary proceffes, are all wounded. Befides, as the point of the knife is concealed behind the iris, one can never be certain that it is precifely oppofite the place where the perforation of the iris ought to be made.

It was the opinion of Janin, that when the incifion in the iris was made in a parallel direction to the radiated fibres of this membrane, it always very foon clofed again; and, on the contrary, that when it was made acrofs thefe fibres, it not only dilated, but continued permanently open. He, therefore, ufed to operate as follows: he firft divided the lower half of the cornea, as in the operation for the cataract; he then pufhed a finely pointed pair of fciffors into the iris, about one line from the lower edge of the cornea, and the incifion was made in a perpendicular direction on the infide of the pupil, without touching the pupil itfelf. The cut ufually became dilated immediately, and remained open. But care muft always be taken to make the wound in the iris on the fide of the pupil next the inner canthus, as making it on the oppofite fide might occafion fquinting. See Janin's Mémoires fur l'Œil.

Wenzel's plan is more modern. The knife is introduced into the cornea in the manner ufually done in the operation for the cataract; but when it has approached within half a line of the place of the clofed pupil, its point is to be depreffed to the depth of half a line through the iris. Three-quarters of a line from this puncture, towards the inner canthus, the point is to be elevated again; and the incifion of the cornea is then to be finifhed, as in operating for the cataract. In this way, a cut is made in the iris, refembling on a fmall fcale the incifion on the cornea; that is to fay, it is of a femilunar fhape, and forms a fmall flap; but it is rarely fo fmooth and even as that in the cornea. The flap is to be cut away with a fmall pair of fciffors, fo that a roundifh aperture, which is fure to remain open, is produced in the iris. When the flap cannot be got hold of, fo as to admit of being removed with fciffors, a fmall piece of the iris is to be cut out.

The method which we have next to take notice of, is that propofed by the eminent Scarpa. He conceives, that the artificial pupil may be moft eafily made, by detaching a certain extent of the circumference of the iris, next the nofe, from the ciliary ligament, by means of a couching needle. Others object, however, that this mode is not only difficult, but that the aperture is hardly ever permanent.

The laft way of operating, of which it remains for us to fpeak, is that recommended by Mr. Gibfon. This furgeon begins by making a puncture in the cornea, with a broad cornea knife, within a line of the fclerotica, to the extent of about three lines. All preffure is now to be removed from the eye-ball, and the cornea knife gently withdrawn. The confequence of this is, that a portion of the aqueous humour efcapes, and the iris falls into contact with the opening in the cornea, and clofes it, like a valve. A flight preffure muft now be made upon the upper and inner part of the eye-ball, and be gently increafed, or varied in direction, till the iris gradually protrudes, fo as to prefent a bag of the fize of a large pin's head. This protruded portion muft be cut off with a pair of fine curved fciffors, and, at the fame time, all preffure is to be removed. The iris will then recede within the eye, and the piece that has been removed will leave an artificial pupil more or lefs circular.

When the centre of the cornea is fo opaque, that the rays of light cannot enter the pupil, and the circumference of that membrane is tranfparent, vifion may be materially improved by removing a portion of the iris oppofite the undifeafed part of the cornea.

There can be no doubt that, with refpect to the comparative merit of the preceding modes of operating, Gibfon's plan ought in general to be preferred, as being nearer and fafer than the others. Confult Sharp's Treatife of the Operations; Janin's Mem. fur l'Œil; Wenzel on the Cataract; Scarpa fulle Malattie degli Occhi, capo 16; Richter's Anfangfgrunde, &c. band. 3. kap. 9; Gibfon's Pract. Obf. on the Formation of an artificial Pupil, &c.

Pupil, *Preternatural Dilatation of.* This affection, which is termed *mydriafis*, is ufually a fymptom of fome other difeafe, and is hardly ever an original complaint. It occurs in very different degrees. Sometimes the pupil is fo confiderably expanded, that the iris can juft be difcerned, like a fmall fold at the inner circumference of the margin of the cornea. In fome cafes, the pupil is totally immoveable; in others, it retains a certain degree of motion. Not unfrequently, it has loft its round fhape, and become of an oblong, or angular figure. In particular cafes, the affection is only in one eye; in the majority of inftances, it takes place in both. It is often accompanied with total blindnefs; occafionally, though lefs commonly, the patient retains the faculty of feeing. In the latter cafe, the patient has an averfion to the light, or is even quite blind in the day. He is alfo in conftant danger of being totally deprived of vifion in a gradual way by the gutta ferena. (See Gutta Serena.) To fome patients of this defcription, all objects appear to be fmaller and more diftant than they are in reality. The following are the difeafes of which mydriafis is commonly a fymptom. 1. Amaurofis, or the gutta ferena. Of this complaint, however, it is not an infeparable and conftant fymptom, the pupil fometimes retaining the power of motion, and being quite free from blemifh; and in cafes where it is dilated and motionlefs, it now and then recovers its natural fize and moveablenefs, although the amaurofis continues unchanged. 2. The cataract. Here mydriafis happens under two different ftates; namely, either when the cataract is adherent to the iris; or when the opaque cryftalline lens is preternaturally thick and large. In the firft cafe, it ufually happens that the pupil is at the fame time incapable of motion, and irregular; in the fecond, it fometimes can move in a certain degree, and the iris is convex and preffed forward toward the cornea. 3. Hydrophthalmia, or dropfy of the eye. Here the dilatation of the pupil arifes immediately from the diftended ftate of the eye-ball, and with this the diforder increafes or fubfides. (See Hydrophthalmia.) 4. In patients who are troubled with worms; who are in fwoons, who are afflicted with hydrocephalus, apoplexy, or any comatofe difeafe, the pupils are in general preternaturally

ternaturally dilated. In all ſuch caſes, the only indication is to endeavour to remove the original diſeaſe, of which the mydriaſis is merely a ſymptom.

In the caſe where mydriaſis is to be regarded as the only diſorder, the complaint ſeems to depend upon a weakneſs or paralyſis of the fibres which cloſe the pupil. Here it is commonly the conſequence of apoplexy, a blow on the eye, or a violent and ſudden diſtention of the pupil, as, for example, ſometimes happens in the extraction of a cataract. When the diſeaſe is of long ſtanding, there is little hope of cure, whatever may be the cauſe from which the complaint ariſes. When it is recent, the pupil will ſometimes regain the power of moving and contracting under the uſe of internal and external ſtimulating tonic remedies. The chief means of this claſs are, bliſters applied to the eye-brows, ethereal oil rubbed into the ſkin around the orbit, electricity, emetic medicines in ſmall and full doſes, and other ſimilar remedies, which are uſually preſcribed for the relief of paralytic affections of other parts. When theſe means prove unavailing, the practitioner muſt be content with recommending a palliative plan, which will be preſently noticed.

As the pupil naturally dilates in the dark, it follows, that when a perſon is kept a long while away from the light, a *mydriaſis ex conſuetudine* is produced, the pupil becoming habituated to the expanded ſtate, and loſing the power of contraction. In moſt inſtances, it gradually recovers its motion after the eye has been for a certain time expoſed to the light again. The light, however, muſt be allowed to get to the eye only by degrees, or elſe its ſudden operation on the eye, in the expanded ſtate of the pupil, would be apt to impair, or even deſtroy viſion altogether. When the pupil does not recover its power of motion, the patient muſt be ſatisfied with reſorting to palliative means. It has been remarked, that mydriaſis is ſometimes a congenital defect. All attempts at a radical cure muſt here be attended with extreme difficulty. When the light cannot be endured without inconvenience, the palliative plan is neceſſary. A blow on the eye ſometimes tears the pupil. The rent moſtly remains open, and the patient is in the ſame ſtate as if affected with mydriaſis. Here, as the laceration cannot be repaired, the indication is to prevent, by palliative means, viſion from being hurt by the too great ſtrength of the light.

Through a preternaturally dilated pupil the light enters the eye in ſuch quantity, that the patient is blinded. He not only ſees things very indiſtinctly in light places, but he alſo runs a riſk of being gradually entirely deprived of viſion, in conſequence of the too ſtrong action of the light upon the eye. The prevention of ſuch miſchief is the object of the palliative treatment. By it the light which falls upon the eye is to be diminiſhed, ſo that the patient may be enabled to ſee not only plainly and without inconvenience in light places, but alſo without any danger of loſing his ſight altogether. The uſual means recommended for this purpoſe are, eye-ſhades, by which the light, coming principally from above, is kept from entering the eye; black veils over the face; green ſpectacles, which leſſen the quantity of rays of light coming from objects which the patient is looking at; ſpectacles made with black cards, in the centre of which is left an opening of the ſize of the natural pupil. But the beſt and moſt proper means is a pair of tube-ſpectacles. This is a common pair of ſpectacles, which, inſtead of glaſſes, has adapted to its two rings two conical tubes, the baſes of which are to be put towards the eyes, and the narrower parts towards the objects which are looked at. Theſe tubes ought to be made of black leather, and they ſhould be three or four inches long. Their diameter at the baſe muſt be equal that of the circumference of the orbit; but their other ends need not be quite ſo wide. The edge of their baſes is to be cut in ſuch a way, that they will fit cloſely on the circumference of the orbit. The uſe of theſe tubes conſiſts in their keeping off all the rays of light coming laterally, and only admitting thoſe into the eye, which proceed from objects in the axis of viſion. Every ſurgeon will be able, according to circumſtances, to multiply and vary the contrivance here deſcribed. See Richter's Anfangſgr. der Wundarzneykunſt, band 3. kap. 10.

PUPILLARIS Membrana, in *Anatomy*, a circular membrane, by which the pupil is cloſed during the greater part of utero-geſtation. See Eye.

PUPILLARITY, or Pupillage, the ſtate of a pupil; in oppoſition to *puberty*.

PUPPET, in *Natural Hiſtory*. See Aurelia.

PUPPISOS, a name given by ſome authors to the os frontis. The future in this bone is alſo called by many anatomiſts the *ſutura puppis*.

PUPPOLA, in *Geography*, a town of Sweden, in the government of Ulea; 45 miles S. of Ulea.

PUPULÆ, a name uſed by ſome to expreſs the extremities of the fingers.

PUR, in *Geography*, a river of Ruſſia, which runs into the Tazovſkaia gulf. N. lat. 67° 40'. E. long. 78° 34'.

Pur *autre vie*, in our *Law-Books*, is uſed where lands are held for the life of another. See Occupant, and Tenant.

PURA *Eleemoſyna*, *pure alms*, denotes a tenure, whereby the churchmen hold lands in Scotland, ſomewhat on the footing of the primitive clergy.

Pura *Haſta*. See Hasta.

PURALLA Bay, in *Geography*, a bay on the coaſt of Chili. S. lat. 42° 10'.

PURANA, the common name of a ſeries of poetical romances, conſidered among the Hindoos as ſacred works, the offspring of inſpired writers, communicated for the inſtruction and benefit of mankind. They are aſcribed, in their preſent form, to a celebrated man in the literary hiſtory of the Hindoos, whom they call Vyaſa. (See Vyasa.) He is ſuppoſed to have reduced an immenſe maſs of inſpired writings into eighteen works, and to have arranged them as they now appear. The following are the titles of theſe eighteen books, to which the common denomination of Purana is appended when ſpoken of or referred to. 1. Brahm, or the Great One. 2. Padma, or the lotos. 3. Brahmanda. 4. Agni, or fire. 5. Viſhnu. 6. Garuda. 7. The transformations of Brahma. 8. Siva. 9. Linga. 10. Nareda. 11. Skanda. 12. Markandeya, or the immortal man. 13. Bhawiſhya, or the prediction of futurity. 14. Matſya. 15. Varaha. 16. Kurma. 17. Vamana. 18. Bhagavata. Of theſe, the firſt four relate to coſmogony; the next nine to the attributes and powers of the Deity. The ſixth is named after the vehicle or bird of Viſhnu, called Superna, as well as Garuda. (See Superna.) See Linga, for the myſterious ſymbol whence the ninth derives its name. Nareda, whoſe laws and hiſtory are detailed in the tenth, is a mythological ſon of Brahma. Skanda, the hero of the eleventh, is a name of *Kartikya*; ſee that article. The fourteenth and three following relate the hiſtories of four of the principal incarnations of Viſhnu the preſerver, called *Matſyavatara*, *Varahavatara*, *Kurmavatara*, and *Vamanavatara*. Under theſe articles reſpectively will be found a brief notice of the outline of their hiſtories. The eighteenth, called Sri Bhagavata, is the life of Kriſhna, (ſee Krishna,) with

with which the poet Vyafa is popularly imagined to have crowned the whole feries; though fome reafonably affign them different compofers; and the feries is differently arranged and named by other authorities. Every Purana treats of five fubjects. 1. The creation of the univerfe. 2. Its progrefs, and the renovation of the worlds. 3. The genealogy of gods and heroes. 4. Chronology, according to a fabulous fyftem. 5. Heroic hiftory, containing the achievements of demigods and heroes. Since each Purana contains a cofmogony, with mythological and heroic hiftories, they may, not unaptly, be compared to the Grecian theogonies.

A copy of, we believe, all the eighteen mythological poems, is preferved in the library of the Eaft India houfe. It is eftimated that the whole cannot confift of lefs than half a million of ftanzas. Hitherto no tranflation of any of them, or of any confiderable portion of either, hath been made from the original into any European language. They are, of courfe, written in the Sanfcrit tongue. In fome articles of this work a ftanza, or a brief outline of fome of the Puranic tales, elucidatory of the character or fubject under difcuffion, is occafionally introduced, and may perhaps give fome little idea of the ftyle of thefe extravagant poems. The reader, in this view, may confult the following, in addition to the other articles herein and thence referred to; JAMBAVANTA, KALPA, KARSHAGNI, KRITIKA, LILESWARA, LOTOS, MERU, MUNI, NAKSHATRA, NARAMEDHA, PAVAKA, PAVANA, PIKESWARI, POLLEAR, PRITHU, &c. &c.

As to thefe extravagant, and not always decent, tales of the Puranas, the probability is that phyfical or hiftorical facts are thus connected under a veil of allegory, carried through a feries of poetical narratives and adventures, related of the perfonified attributes of the Deity. The facts are either forgotten, or unknown to the vulgar; but the fables remain, and are generally and commonly alluded to in compofition and converfation. Taken literally, as the tranfactions of divine or holy perfons, nothing (bating the invention, imagery, and other poetical merits) can be more contemptible than thefe Puranic romances; but if we defire to extract the grains of ore that the mafs may probably contain, we muft be content to examine them as they are; and in cafe of failure, many inquifitive refearchers will deem their labour not loft, in the invention and other poetical beauties abounding in thefe wild compofitions.

We fhall briefly give an abftract of the contents of two or three of the Puranas, whence a judgment may be formed of the others. The Agni Purana is feigned to have been delivered by Agni, or Pavaka, the god of fire. (See PAVAKA.) It contains a great variety of fubjects, and feems to have been intended as an epitome of Hindoo learning. The poem opens with a fhort account of the feveral incarnations of Vifhnu, an enumeration of which, with a brief outline of their hiftory, will be found in the article VISHNU of this work, and thofe thence referred to. It dwells, however, chiefly on the incarnations of *Krifhna* and *Rama*. (See thefe articles.) Then follow a hiftory of the creation; a tedious differtation on the worfhip of the gods, with a defcription of their images, and directions for conftructing and fetting them up; a concife defcription of the earth, particularly of thofe places which are efteemed holy, with the forms of worfhip to be obferved at them; a treatife of aftronomy, or rather aftrology; a variety of incantations, charms, and fpells, for every occafion. One fpecies of this is named *mantra*, under which article a fufficient account is given of them; computations of the periods called *manwantara*, *kalpa*, &c. (fee KALPA); a defcription of the feveral religious modes of life called *aframa*, and the duties to be performed in each; rules for penance (on this head fee TAPAS); feafts and fafts to be obferved throughout the year; rules for beftowing charity; a differtation on the great advantages to be derived from the myftic word OM (under which article of this work the reader will probably find fufficient of myfticifm), with a hymn to Varifhta, of whom fomething occurs under that article. The next head relates to the office and duties of princes; under which are given rules for knowing the qualities of men and women; for choofing arms and enfigns of royalty; for the choice of precious ftones; and a treatife on the art of war. The next head treats of worldly tranfactions between man and man, as to buying and felling, borrowing and lending, giving and receiving, &c. &c. Then follow certain ordinances, according to the Veda, refpecting fecurity from misfortunes, &c. and for the worfhip of the gods. Genealogies of the two races of folar and lunar kings, called Suryavanfa and Chandravanfa (fee SURYA); of the family of Yadu and of Krifhna, with a fhort hiftory of the twelve years' war, defcribed in the Mahabarat. (See MAHABARAT.) A treatife on the art of healing, as applicable to man and beaft, with rules for the management of elephants, horfes, and cows; charms and fpells for curing various diforders; and the mode of worfhipping certain divinities; on the letters of the Sanfcrit alphabet; on the ornaments of fpeech, as applicable to oratory, poetry, and the drama; on the myftic fignification of the fingle letters of the Sanfcrit alphabet; a grammar and fhort vocabulary of that language. The whole of this defultory work is divided into 353 fhort chapters.

The Siva Purana is fometimes called alfo, after one of the forms of his confort, the Kalika Purana. (See KALI.) It is a mythological hiftory of that goddefs, including her adventures under various names and characters. Many of thofe names and characters are enumerated under the article PARVATI, her more common name; and Mr. Moor has given an extract under *Naramedha*, which word means a man-facrifice, the rites and ceremonies of that horrid offering being minutely laid down in this Purana. It is a curious and entertaining work, including as epifodes feveral beautiful allegories, particularly one founded on the motions of the moon. See Moor's Hindu Pantheon.

The Vayu Purana, as one of thefe poetical romances is varioufly called, but *which* we have not the means at this moment of afcertaining, is attributed to the regent of wind Vayu, otherwife and more commonly called Pavana (fee PAVANA); where the reafon is furmifed why the Purana is not called after that name. It contains, among a variety of other curious fubjects, a circumftantial detail of the creation of all things, celeftial and terreftrial, with the genealogy of the firft inhabitants; chronological computations as to the grand periods *manwantara*, *kalpa*, &c. before fpoken of; a defcription of the earth, as divided into iflands, continents, &c. and its dimenfions, and alfo of other planets and fixed ftars, their diftance, circumference of orbits, &c. &c. Under the article PAVANA, an extract is given from the Matfya Purana, directing how images or pictures are to be made of the god of wind. Moft of the Puranas contain directions of that fort.

A brief notice of one other of thefe infpired works will fuffice. The Nareda Purana is believed to have been delivered by the infpired Nareda, a mythological fon of Brahma. Under the article *Nareda*, (fee Hindu Pantheon) an account is given of him, with his genealogy, and the derivation of his name, from the Varaha Purana. Like the others, this poem opens with defcribing "how heaven and earth rofe out of chaos;" but it treats principally of the unity of God, and as it fectarially is written with the Vaifhnava bias (fee VAISHNAVA),

nava), it defcribes Vifhnu as the Deity. On this point, fee Sects *of Hindoos.* It argues that all other gods are but emblems of the works of Maha Vifhnu, and the female deities, or faktis, emblems or perfonifications of his powers. Other Hindoo fects fay the fame of the deity of their exclufive worfhip, as noticed under Krishna, Rama, Siva, &c. It ftates that the worfhip of the Trimurti, or either of the triad (fee Trimurti), whether the creator, preferver, or regenerator, is in effect worfhipping of Vifhnu. This Purana concludes with rules for the feveral tribes in their fpiritual and temporal conduct through life.

Thefe voluminous and certainly curious poems, are held in the general eftimation of the Hindoos, as fecond only to the Veda, their immediate fcripture. (See Veda.) In each of the Vedas are certain paffages interfperfed, relating chiefly to cofmogony, which are called Purana, but are wholly different from the eighteen mythological poems, the fubject more efpecially of this article.

With refpect to the age of the Puranas, orientalifts differ widely. Sir W. Jones fatisfied himfelf that they have been written about 2500 years. He does not ftate precifely the mode of reafoning, by which he arrived at this conclufion; he gives, however, the outline of the procefs, and afks the public to give him credit for a few very curious facts, which, although, he fays, capable of ftrict proof, could then be only afferted. We are not aware that the proofs were ever fubmitted to the public; and whatever they were, they have not wrought conviction on the minds of all. Mr. Colebroke, however, (Af. Ref. vol. vii.) leaves us to infer that he thought them very little inferior in point of antiquity to the age affigned them by his illuftrious predeceffor in the chair of the Afiatic Society. Mr. Wilford exprefsly fays, that "the Puranas are certainly a modern compilation from valuable materials, that I am afraid no longer exift: an aftronomical obfervation of the heliacal rifing of Canopus, mentioned in two of the Puranas, puts this beyond doubt." (Af. Ref. vol. v.) Mr. Bentley, after giving various reafons and calculations for the foundation of his opinion, fays, "It muft be evident that none of the modern romances, commonly called the Puranas, at leaft in the form in which they now ftand, are older than 684 (now 1813, about 695) years, but that fome of them are the compilations of ftill later times." (Ib. vol. viii.) As far, indeed, as the eighteenth Purana, called Sri Bhagavat, is concerned, Mr. Colebroke countenances Mr. Bentley's opinion. "I am inclined," he fays, "to adopt an opinion fupported by many learned Hindoos, who confider the celebrated Sri Bhagavata as the work of a grammarian, fuppofed to have lived about 600 years ago." Ib. (See Sri Bhagavat.) Be this as it may, the orthodox Hindoos have implicit faith in, and great veneration for, thofe celebrated poems, or "facred hiftories," as they call them; and it is authoritatively afferted, that "the Veda, the revealed fyftem of medicine, the Puranas, and the code of Menu, are four works of fupreme authority, which ought never to be fhaken by arguments merely human. (See Menu.) There are, however, many individuals of all the four tribes of Hindoos, feweft certainly in that of Brahmana, who correfpond with the Levites of Ifrael, who deny the divine origin of the Puranas, looking upon them in nearly the fame light as a rational critic of Europe may do.

PURANGURRAH, in *Geography*, a town of Bengal; 20 miles S.E. of Iflamabad.

PURARI, a name of the Hindoo deity *Siva*; which fee.

PURARYA, in *Geography*, a town of Hindooftan, in Oude; 32 miles N. Kairabad.

PURBACH, George, in *Biography*, an eminent mathematician and aftronomer in the 15th century, was born at Purbach, a town on the confines of Auftria and Bavaria, in 1423. He was educated at Vienna, where he manifefted great talents, and took his degree of M. A. with great applaufe. He directed his attention principally to mathematics, and advanced in that fcience with almoft incredible rapidity. For farther improvement, he vifited the moft celebrated univerfities of Germany, France, and Italy. He found a particular friend and patron in cardinal Cufa, and he formed an intimacy with John Blanchini of Bologna, who admiring Purbach's extenfive knowledge, and his ready method of communicating inftruction, wifhed to prevail upon him to deliver lectures on aftronomy at Ferrara; but Purbach preferred returning to Vienna, where he obtained the mathematical profefforfhip in that univerfity. About this time he received offers from Ladiflaus, king of Hungary, to become his aftronomer, accompanied with promifes of liberal rewards and diftinguifhed honours, which he declined.

The fame of Purbach, as a mathematical profeffor, was foon widely diffufed, and brought numerous ftudents to attend his lectures at Vienna. Among others was the celebrated Regiomontanus, who fecured the efteem of his mafter, and was chofen the affiftant and companion in his labours. From this time they maintained an union of ftudies, in their endeavours to improve the different branches of mathematical fcience, and more particularly aftronomy. This fcience they would, no doubt, have materially improved by their joint labours, had Purbach's life been prolonged. His firft effay was to amend the Latin tranflation of Ptolemy's Almageft. After this he wrote "An Introduction to Arithmetic," and proceeded to draw up another "On Gnomonics," or dialling, with tables fuited to the difference of climates and latitudes. This was followed by a fmall tract "Concerning the Altitudes of the Sun," with a table, and "Aftrolabic Canons." After this he made folid fpheres, or celeftial globes, and not only explained their conftruction and ufes, but added to them a new table of fixed ftars, with the longitude by which every ftar had increafed, from the time of Ptolemy to the middle of the fifth century. He alfo invented various other inftruments, among which was a "gnomon," or geometrical fquare, with canons, and a table for the ufe of it, which he fent to the archbifhop Strigonia, who was himfelf a man of great erudition, and entertained a high opinion of Purbach. Our author made confiderable improvements in trigonometry; prepared tables of the fixed ftars, and undertook to reform thofe of the planets, and conftructed fome entirely new ones. When thefe tables were finifhed, he drew up a kind of perpetual almanack, chiefly for the moon, anfwering to the periods of Meton and Calippus: alfo an almanack for the planets, or, as it was afterwards called, an Ephemeris for many years. He finifhed his "Theoriæ Novæ Planetarum," (fee Muller,) which was made a textbook in all the fchools, and was commented upon by fome of the moft eminent mathematicians. Purbach died in the 38th year of his age, in 1461.

PURBECK, *Ifle of*, in *Geography*, a diftrict in the Blandford divifion of the county of Dorfet, England, is bounded on the weft by Luckford lake; on the fouth by the Britifh channel; and on the other fide by the river Frome, and the bay of Pool. It is improperly called an ifland, being in fact only a peninfula, as it may be entered from Eaft Lulworth by an ifthmus, between the head of Luckford lake and the fea. This diftrict extends twelve miles in length, and varies from feven to ten in breadth.

It

It includes two hundreds, called Hazler and Rowbarrow, the former comprehending the eastern division of the isle, and the latter the western. These are subdivided into nine parishes, and contain one town, Corfe-castle, and several large villages and hamlets. The soil is every where calcareous; but the surface is much diversified by hill and dale. The quarries, shores, and cliffs, on the south side of the isle in particular, afford an inexhaustible fund of natural curiosities. Near Kington, Worth, Langton, and Swanwich, are extensive quarries of freestone; and in many parts is a stone that rises thin, and is used for tiling; also a hard paving stone, much of which was used in rebuilding London after the fire, and in paving the streets and courts. At Swanwich is a white stone full of shells, which takes a high polish, and looks like alabaster; and near Dunshay is dug up marble of various colours, but chiefly a grey kind, formed by a congeries of shells, and anciently much used for grave stones and monuments. It was likewise very generally employed for small columns in the churches which were erected during the 13th century. The cornua ammonis are frequently discovered here, some of them two or three feet in diameter.

In ancient times the whole of this isle was a forest, and was well stocked with red and fallow deer, and stags, especially in the west parts; but these were almost entirely destroyed in the civil wars. James I. was the last of our kings who hunted here. The whole isle was till lately governed by a lord-lieutenant, who was admiral of the isle, and had power to raise and muster a militia; but this office ceased when the regular militia act was passed. Formerly there were many gentlemen's seats dispersed all over the isle; which were probably built for the reception and accommodation of the nobility and gentry who attended the royal hunts, as most of the owners of estates in this part of the country had their principal seats elsewhere, and only came hither in the hunting seasons. These are now almost, without exception, converted into farm-houses. For an account of the only town in Purbeck, see Corfe-castle. Hutchins's History and Antiquities of the County of Dorset, 2d edit. by Gough. Beauties of England and Wales, vol. iv. by John Britton, and E. W. Brayley.

Purbeck *Stone*, the *saxum arenarium cinereum Purbecense* of Da Costa, and *psadurium friabile albido fuscum* of Hill, is an alkaline sand-stone, which is harsh and rough, of a disagreeable ashen colour, very heavy, and moderately hard, of a texture not very compact, but somewhat porous, and is composed of an angular grit, cemented together by an earthy spar: it cuts freely, and with a tolerable even or smooth surface, but will not take a polish. It will not strike fire with a steel, and burns to a white colour. The quarries of this stone are in the island of Purbeck, in Dorsetshire, whence it is brought to London in great quantities, and used in building, and for pavements. Its specific gravity is 2.68. There is also another kind of Purbeck stone, the *saxum fusco-albidum* of Da Costa, and the *sympexium durissimum, splendidum albido-fuscum* of Hill, which is alkaline, of a dull, disagreeable, pale, brownish, white colour, and is not capable of a polish, though it cuts to a very smooth surface: it is of a fine, close, compact texture, not quite destitute of brightness, but full of sparks of pure spar, and intimately mixed with vast quantities of small pectunculi, which are often saturated and filled with the same substance; it is very heavy and hard, and water does not pervade its texture; it does not strike fire with steel, and when burnt, acquires a clear ashen colour. This stone is brought from Purbeck, and used in building, pavements, &c. Hill informs us, that it is likewise found in many other parts of the kingdom, and that there are large strata of it in Yorkshire. Da Costa's Fossils, p. 128—152.

PURBUTTY, in *Geography*, a river of Hindoostan, which runs into the Chumbul; seven miles W. of Suisopour, in the country of Agimere.

PURCARI, a town of European Turkey, in Bessarabia, on the Dniester; 4 miles S.E. of Bender.

PURCELAIN. See Porcelain.

PURCELL, Henry, in *Biography*, an English musician of more extensive genius than perhaps our country can boast at any other period of time, was born in 1658. His father, Henry, and uncle, Thomas Purcell, were both musicians, and gentlemen of the chapel royal, at the restoration of king Charles II. There is a three-part song in Playford's "Musical Companion," by Henry Purcell, which, being printed in 1667, when our great musician was but nine years old, must have been the production of his father. There is likewise a chant in the first volume of Boyce's Collection, p. 289, N° II, called the "burial chant," by Thomas Purcell, his uncle, who continued in the service of the chapel till the time of his death, in 1682. Though these compositions promise no great hereditary genius, they are mentioned here, as mankind is naturally curious concerning every thing that is connected with eminent persons.

From whom Henry received his first instructions in music, cannot be very clearly ascertained. But his father dying in 1664, when he was no more than six years old, it is probable he was qualified for a chorister by Capt. Cook, who was master of the children from the restoration till the time of his death, in 1672. For, as Purcell was appointed organist of Westminster Abbey at eighteen years of age, he must have learned the elements of his art before his fourteenth year, at which time Pelham Humphrey, brought up in the royal chapel under Capt. Cook, was appointed his successor, as master of the boys. Purcell certainly continued to sing in the king's chapel, and to receive lessons from Humphrey till his voice broke, an accident which usually happens to youth at sixteen or seventeen years of age: after this, perhaps, he had a few lessons in composition from Dr. Blow, which were sufficient to cancel all the instructions he had received from other masters, and to occasion the boast inscribed on the tomb-stone of Blow, that he had been

"Master to the famous Mr. Henry Purcell."

But there is nothing more common than this petit larceny among musicians: if the first master has drudged eight or ten years with a pupil of genius, and it is thought necessary, in compliance with fashion or caprice, that he should receive a few lessons from a second, he instantly arrogates to himself the whole honour, both of the talents and cultivation of his new scholar, and the first and chief instructor is left to sing, *sic vos non vobis*.

Purcell is said to have profited so much from his first lessons and close application, as to have composed, during the time of his being a singing boy in the chapel, many of his anthems, which have been constantly sung in our cathedrals ever since. Eighteen was a very early age for his being appointed organist; that is, maestro di capella of Westminster Abbey, one of the first cathedrals in the kingdom for choral compositions and performance. It was not likely he would stop here: the world is, perhaps, more partial to promising youth than accomplished age: and at twenty-four, in 1682, he was advanced to one of the three places of organist of the chapel royal, on the death of Edward Low, the successor of Dr. Christopher Gibbons, in the same station.

After this, he produced fo many admirable compofitions for the church and chapel of which he was organift, and where he was fure of having them better performed than elfewhere, that his fame was foon extended to the remoteft parts of the kingdom.

From this time, his anthems were eagerly procured, and heard with pious rapture wherever they could be performed; nor was he fuffered long to devote himfelf totally to the fervice of the church. He was, very early in life, folicited to compofe for the ftage, and chamber, in both which undertakings he was fo fuperior to all his predeceffors, that his compofitions feemed to fpeak a new language; yet, however different from that to which the public had been long accuftomed, it was univerfally underftood. His fongs feem to contain whatever the ear could then wifh, or heart could feel.

We have been affured by a very good judge of mufic, who was nineteen years of age when Purcell died, and remembered not only his perfon very well, but the effect which his fongs had on himfelf and the public at that time, when many of them were firft heard; and ufed to fay, that "no other vocal mufic was liftened to with pleafure, for near thirty years after Purcell's death; when they gave way only to the favourite opera fongs of Handel."

The unlimited powers of this mufician's genius embraced every fpecies of compofition that was then known, with equal felicity. In writing for the church, whether he adhered to the elaborate and learned ftyle of his great predeceffors Tallis, Bird, and Gibbons, in which no inftrument is employed but the organ, and the feveral parts are conftantly moving in fugue, imitation, or plain counterpoint; or, giving way to feeling and imagination, adopted the new and more expreffive ftyle of which he was himfelf one of the principal inventors, accompanying the voice-parts with inftruments, to enrich the harmony, and enforce the melody and meaning of the words, he manifefted equal abilities and refources. In compofitions for the theatre, though the colouring and effects of an orcheftra were then but little known, yet as he employed them more than his predeceffors, and gave to the voice a melody more interefting and impaffioned than, during the feventeenth century, had been heard in this country, or perhaps in Italy itfelf, he foon became the darling and delight of the nation. And in the feveral fpecies of chamber mufic which he attempted, whether fonatas for inftruments, or odes, cantatas, fongs, ballads, and catches, for the voice, he fo far furpaffed whatever our country had produced or imported before, that all other mufical productions feem to have been inftantly configned to contempt or oblivion.

As many of his numerous compofitions for the church, particularly thofe printed in the fecond and third volumes of Dr. Boyce's Collection, are ftill retained in the king's chapel, and in our cathedrals, we fhall here acquaint the mufical reader in what manner we have been affected by fome of thefe productions. in a late attentive perufal of them.

It appears by Dr. Bayley's "Collection of the Words of Anthems ufed in his Majefty's Chapel Royal," that ten of Purcell's are ftill performed there; and in the late Rev. Mr. Mafon's "Copious Collection of the Words of fuch Anthems as are ufed in the Cathedral of York," that nearly twenty of his choral compofitions are ftill fung in that choir.

Purcell's four-part anthem, "O God, thou art my God," (Boyce's Collection, vol. ii. p. 148.) muft certainly have been one of his juvenile productions, before he had fufficiently refined his ear, or exercifed his judgment; as there are many crude harmonies, and falfe accents in it, which in riper years he would not have tolerated.

Of his fix-part anthem, "O God thou haft caft us out," the firft movement, in which there are many bold harmonies, is extremely elaborate, yet fpirited and pleafing. The verfe, "O be thou our help," is not only full of new and fine effects, but touching. By thofe who object not to the confufion in the words which arifes from fugue and imitation, while the feveral parts are finging different portions of the fame fentence, at the fame time, the words will appear perfectly well accented and expreffed.

The firft movement of his full anthem in eight parts, "O Lord God of hofts," is a noble compofition, *alla Paleftrina*, in which all the laws of fugue upon two, and fometimes more, fubjects, are preferved inviolable; the harmony, though bold, is, in general, chafte, and the effect of the whole fpirited and majeftic. The fecond movement is extremely pathetic and expreffive; but, both in that and the laft movement, he feems trying experiments in harmony; and, in hazarding new combinations, he feems now and then to give the ear more pain than pleafure.

The two-part anthem, "Thy way, O God, is holy," continues to be excellent mufic ftill, in the flow movements; the quick, however, feems fomewhat antiquated, and the melody to thefe words, "the air thundered," &c. feem too light and dramatic for the church at any period.

The three-part anthem, "Be merciful unto me, O God," is admirable throughout. Indeed, to our conceptions, there feems no better mufic exifting, of the kind, than the opening of this anthem, in which the verfe, "I will praife God," and the laft movement, in C natural, are in melody, harmony, and modulation, truly *divine mufic*.

The complete fervice of Purcell, in B flat, printed by Boyce, is a moft agreeable and excellent piece of counterpoint, of which the modulation frequently ftimulates attention by unexpected tranfitions, yet of fo fober a kind as never to give the ear the leaft uneafinefs, till we come to the bottom of p. 110, and then the fame crudities of the fharp 3d and flat 6th, and flat 3d, 4th, and 5th, which we have already cenfured in the works of Dr. Blow, occur; which we hope, in fpite of our partiality for Purcell, the organifts of our cathedrals fcruple not to change for better harmony.

Thefe two or three combinations, like fome words and phrafes which Shakfpeare tried unfuccefsfully to render current, have been rejected by pofterity; and it is in vain to attempt at forcing them upon the public by the mere weight of authority. The ear will patiently bear very rough ufage from an artift who in general makes it fuch ample amends; however, there are limits, beyond which it is unfafe to exercife cruelty of all kinds; and the auricular fenfe will be deadened, difgufted, or rendered indifferent to mufic's powers, by too harfh treatment.

The "Benedictus," as well as "Te Deum," and all the reft of the fervice, muft be extremely pleafing, in all other refpects, to every ear fenfible to harmony. The words are, in general, accented with great accuracy (except the contracting *higheft* into a monofyllable, to which only one note is given); and the few points of imitation are fragments of agreeable melody. In p. 121 of Boyce, the A ♭ and A ♮, at the word *befeech*, in the Kyrie, are peculiarly beautiful, as are the 7th with the 9th at "before all worlds," in the creed, and the clofe at "by whom all things were made." The point at "throughout all generations," in the Magnificat, is what the Italians call *ben tirato*, well-worked. In the laft line, however, of page 132, fo many exceptionable combinations

nations occur, that we cannot pafs them over without a ftigma. Yet, upon the whole, the abilities of Purcell, as a profound contrapuntift, appear perhaps more in the courfe of this fervice than elfewhere; as he has manifefted deep ftudy and meditation in a fpecies of writing to which it was not likely that his creative and impetuous genius would fubmit, having had the patience, as well as abilities, to enrich it with no lefs than four different canons, of the moft difficult conftruction, as of two, three, and four in one, by inverfion.

The fuperior genius of Purcell can be fairly eftimated only by thofe who make themfelves acquainted with the ftate of mufic previous to the time in which he flourifhed; compared with which, his productions for the church, if not more learned, will be found infinitely more varied and expreffive; and his fecular compofitions appear to have defcended from another more happy region, with which neither his predeceffors nor contemporaries had any communication.

Befides the whole fervice, with three full, and fix verfe anthems, in Dr. Boyce's Collection, there are nine verfe and full anthems, wholly different, ftill fung in the cathedral at York. And in Dr. Tudway's Collection, Britifh Mufeum, there are, befides a whole fervice in B flat, different from that in Boyce, eight full and verfe anthems, different from all the reft, four of which were compofed for the chapel royal of Charles II., and are accompanied with inftruments. And ftill, exclufive of thefe and the hymns printed in the two books of "Harmonia Sacra," in a manufcript bequeathed to Chrift-church college, Oxon. by Dr. Aldrich, there are two motets, and a "Gloria Patri" for four and five voices, in Latin, with feven pfalms and hymns for three and four voices, by our fertile and diligent compofer, that have all their peculiar merit, but of which fome may, without hyperbole, be faid to reach the true fublime of facred mufic.

To enter into a minute examination of thefe, and his admirable Te Deum and Jubilate, compofed for St. Cecilia's day, 1694, would extend this article to too great a length; though they merit much praife as well as critical remark; for which, on the Te Deum we refer our readers to the ample account of him and his works, in Burney's Hiftory of Mufic, vol. iii.

Purcell's theatrical compofitions, if we recollect the number and excellencies of his productions for the church, and the fhortnefs of his life, will furprife by their multiplicity as well as fingular merit. Of thofe dramas which are called operas, and of which mufic and decorations were the principal allurements held out to the public, a detailed account is given in fpeaking of the origin and progrefs of the mufical drama in England, previous to the ufe of the Italian language, mufic, and performers on our lyric ftage. (See Masques, and Matthew Lock.) And of Purcell's detached and incidental fongs, dialogues, and fcenes that were performed at our national theatre, or playhoufe, the principal will be mentioned in fpeaking of his "Orpheus Britannicus," or pofthumous collection of his mifcellaneous compofitions. But before we enter on an examination of this work, it feems neceffary to acquaint the reader, that the chief part of his inftrumental mufic for the playhoufe is included in a publication that appeared two years after his deceafe, under the title of "A Collection of Ayres compofed for the Theatre, and on other Occafions, by the late Mr. Henry Purcell. London, printed for Frances Purcell, Executrix of the Author, 1697." Thefe airs are in four parts, for two violins, tenor and bafe, and were played as overtures and act-tunes in our own memory, till they were fuperfeded by Handel's hautbois concertos, and thofe, by his overtures, while Boyce's fonatas, and Arne's compofitions, ferved as act-tunes. In procefs of time thefe were fupplanted by Martini's concertos and fonatas, which were thrown afide for the fymphonies of Van Maldere, and fonatas of the elder Stamitz. About this time, the trios of Campioni, Zanetti, and Abel, came into play, and then the fymphonies of Stamitz, Canabich, Holtzbauer, and other Germans, with thofe of Bach, Abel, and Giardini; which, having done their duty many years very pleafantly, "flept with their fathers;" and at prefent give way to Vanhall, Boccherini, Haydn, and Pleyel. "Sic tranfit gloria muficorum!"

Purcell feems to have compofed introductory and act-tunes to moft of the plays that were brought on the ftage during his time. The publication of thefe, in four parts, contains his mufic to the following dramas:

"Abelazor," 1677. The mufic of this confifts of an overture, and eight airs or tunes.

"The Virtuous Wife," 1680. Overture and feven airs.

"Indian Queen." The firft movement of this overture is equal to any of Handel's. There are likewife two or three trumpet-tunes, well calculated for the inftrument, and a rondeau at the end, which would now feem new, if played in a concert by a good band.

"Dioclefian, or the Prophetefs," 1690. The inftrumental mufic of this Englifh opera given here, confifts of an overture of two movements, the firft excellent in the ftyle of Lulli, and afterwards of Handel, with better fugues; *preludio*, accompaniment to a fong, trumpet-tune, air, hornpipe, country-dance, and *canaries*.

"King Arthur," 1691. Overture and twelve tunes.

"Amphitrion," 1691. Overture and eight tunes.

"Gordian Knot untied," 1691. Overture and feven tunes.

"Diftreffed Innocence, or the Princefs of Perfia," 1691. Overture and feven tunes, all proofs of the author's original genius.

"The Fairy Queen," 1692. Two overtures and fixteen tunes of different kinds. N° 12, an air, 4 in 2, is a very curious canon on two fubjects: the firft treble and bafe performing one, and the fecond and tenor the other. There is as much accent and fpirit in this compofition, as if it were in free counterpoint.

"The Old Bachelor," 1693. Overture and eight tunes.

"The Married Beau," 1694. Overture and eight tunes, among which is a very agreeable air for the trumpet, a march, and a hornpipe, that are characteriftic. This laft is very much in the ftyle of a Spanifh fandango.

"The Double Dealer," 1694. Overture and ten tunes. N° 6 and 9, pretty and curious.

"Bonduca," 1695. Overture and eight tunes, including "Britons ftrike home," and "To arms," in four parts.

Thefe are the contents of this pofthumous publication; but befides the mufic for thefe dramas, he compofed overtures, act-tunes, and fongs, for "Timon of Athens," 1678; for "Theodofius, or the Force of Love," 1680; for Dryden's "Tempeft," 1620; and for "Don Quixote," 1694.

But few of Purcell's fingle fongs feem to have been printed during his life. He publifhed the mufic to a mafque fung in the tragedy of "Oedipus," when it was revived in 1692. And "a mufical entertainment, performed Nov. 22, 1683, on St. Cecilia's day, printed in fcore by John Playford, with a dedication to the gentlemen of the mufical fociety, and particularly the ftewards, written by Henry Purcell, compofer of the mufic."

There

There are ſeveral of his ſongs in Playford's Collection, called "The Theatre of Muſic, 1687, fourth and laſt Book;" and though theſe are not in his beſt manner, they are more original and intereſting than the reſt. Among theſe, p. 50, "A new ſong to a Scotch tune," by our author, ſeems to us more pleaſing and leſs ſtolen, than any ſpurious Scotch tune, or imitation of the national melody of the northern inhabitants of this iſland, that has been ſince produced.

Page 62 of the ſame Collection, there is an admirable piece of recitative, in a truly grand ſtyle: "Amidſt the ſhades," &c. But the collection of his ſecular vocal muſic, which did him the greateſt honour, and long rendered his name dear to the Britiſh nation, was publiſhed by his widow two years after his deceaſe, by the title of "Orpheus Britannicus." Here were treaſured up the ſongs from which the natives of this iſland received their firſt great delight and impreſſion from the vocal muſic of a ſingle voice. Before that period we had cultivated madrigals, and ſongs in parts, with diligence and ſucceſs; but in all ſingle ſongs, till thoſe of Purcell appeared, the chief effects were produced from the words, not the melody. For the airs, till that time, were as unformed and mis-ſhapen, as if they had been made of notes ſcattered about by chance, inſtead of being caſt in an elegant mould. Excluſive admirers of modern ſymmetry and elegance, may call Purcell's taſte barbarous; yet in ſpite of ſuperior cultivation and refinement, in ſpite of all the viciſſitudes of faſhion, through all his rudeneſs and barbariſm, original genius, feeling, and paſſion, are, and ever will be, diſcoverable in his works, by candid and competent judges of the art.

To this admirable collection are prefixed ſeven copies of verſes to his memory, at the head of which is an ode, written on his death, by Dryden, which was ſet by Dr. Blow, and performed at the concert in York Buildings.

There are few ſongs in the "Orpheus Britannicus" but what contain ſome characteriſtic marks of the author's great and original genius. The melody, however, will at firſt ſeem to many at preſent uncouth and antiquated; but by a little allowance and examination, any one poſſeſſed of a great love for muſic, and a knowledge of our language, will feel, at certain places of almoſt every ſong, his ſuperior felicity and paſſion in expreſſing the poet's ſentiments which he had to tranſlate into melody.

The favourite ſongs with Purcell's admirers in our youth, were the following; and upon a late attentive peruſal of the book, they ſeem to have merited particular diſtinction. "Celia has a thouſand charms:" the firſt movement of this, like many of Purcell's ſongs, ſeems only *recitative* graced, or embelliſhed with the faſhionable *volate*, or *flouriſhes* of the times, which are now as antiquated as the curls of his own perruque, or the furbelows and flounces of queen Elizabeth. The ſecond movement, however, of this ſong, is plaintive and graceful; and at "I ſhould my wretched, wretched, fate deplore," is ſtill new and pathetic.

"You twice ten hundred deities," opens with what ſeems to us the beſt piece of recitative in our language. The words are admirably expreſſed throughout this ſong, by modulation as well as melody. And there is a propriety in the changes of movement, which does honour to Purcell's judgment, as much as the whole compoſition to his genius. The change of ſtyle and ſluggiſh motion given to the notes at theſe words, "from thy ſleeping manſion riſe," is a model of muſical imitation and expreſſion. The modulation is ſtill ſo excellent, that the beſt modern maſters are obliged to adopt it on almoſt all great occaſions.

Of the muſic to "King Arthur" we ſhall ſay but little, as it has been lately revived, well performed, and printed. If ever it could be ſaid with truth of a compoſer, that he has *devancé ſon ſiecle*, outſtript his age, Purcell is entitled to that praiſe; as there are movements in many of his works which a century has not injured, particularly the duet in King Arthur, "Two daughters of this aged ſtream," and "Faireſt iſles all iſles excelling," which contain not a ſingle paſſage that the beſt compoſers of the preſent times, if it preſented itſelf to their imagination, would reject. The dialogue in the "Propheteſs," "Tell me why, my charming fair," is the moſt pleaſing and ingenious of all the compoſitions of the kind which the rage of faſhion produced during fifty years. The firſt part of "O lead me to ſome peaceful gloom," is truly elegant and pathetic.

"From roſie bow'rs," is ſaid to have been "ſet in his laſt ſickneſs," at which time he ſeems to have realized the poetical fable of the ſwan, and to have ſung more ſweetly as he approached nearer his diſſolution; for it ſeems to us as if no one of his productions was ſo elevated, ſo pleaſing, ſo expreſſive, and throughout ſo perfect, as this. The variety of movement, the artful, yet touching modulation, and, above all, the exquiſite expreſſion of the words, render it one of the moſt affecting compoſitions extant to *every Engliſhman* who regards muſic not merely as an agreeable arrangement and combination of ſounds, but as the vehicle of ſentiment, and voice of paſſion.

There is more elegant melody, more elaborate harmony, more ingenious contrivance, in the motion and contexture of the ſeveral parts than in the works of many great compoſers; but to the natives of England, who know the full power of our language, and feel the force, ſpirit, and ſhades of meaning, which every word bears according to its place in a ſentence, and the ſituation of the ſpeaker, or ſinger, we muſt again repeat it, this compoſition will have charms and effects, which, perhaps, Purcell's muſic only can produce.

"When Mira ſings," is a duet that will ever be captivating, as long as the words remain intelligible; of which he has augmented the force, particularly at the end, by notes the moſt ſelect and expreſſive that the muſical ſcale can furniſh.

"Loſt is my quiet," another duet, which ſtill lives. And "Celebrate this feſtival," a birth-day ſong for queen Mary, which is graceful and pleaſing through all its old-faſhioned thoughts and embelliſhments. "I'll ſail upon the dog-ſtar," has all the fire of Handel's prime.

"Mad Beſs" is a ſong, or rather a cantata ſo celebrated, that it needs no panegyric, or renewal of public attention, as every captivating Engliſh ſinger in our memory has revived its favour. The firſt Mrs. Sheridan and Mrs. Bates never gave more exquiſite delight by their admirable performance, than when they regaled their friends with this ſong. Beard, forty years ago, uſed to acquire great applauſe by ſinging Purcell's "Roſy Bowers;" and Fraſi, by her performance of "Mad Beſs," in the concerts at Hickford's rooms, the Caſtle, and Swan concerts, where Stanley was juſtly admired for his ingenious and maſterly manner of accompanying them. "'Tis Nature's Voice," is an enigmatical ſong, ſeemingly on muſic, in which Purcell has crowded all the faſhionable paſſages of taſte and vocal difficulties of the times. Indeed, he ſeems to have anticipated many fantaſtical feats of execution and articulation in which great performers have ſince rioted; and this is the more wonderful, as the Italian opera was not eſtabliſhed, or even attempted here, during the life of Purcell; whoſe deceaſe preceded the arrival of Valentini and Nicolini, the firſt great ſingers imported from Italy, at leaſt ten years.

"Blow,

"Blow, Boreas, blow," was in great favour, during our youth, among the early admirers of Purcell; but this feems now more fuperannuated than any of his popular fongs.

"Let Cæfar and Urania live," was a duet in a birth-day ode, during the reign of king William and queen Mary, which continued fo long in favour, not only while thofe fovereigns jointly wielded the fceptre, but even when George II. had loft his royal confort, and there ceafed to be a queen, or Urania, for whom to offer up prayers, that Dr. Green, and afterwards Dr. Boyce, ufed frequently to introduce it into their own and the laureate's new odes. This duet, like many other productions of Purcell, was built on a *ground-bafe* of only two bars, which are invariably repeated to different paffages of the voice-parts that are in harmony with it, throughout the movement. The latter part of this duet is extremely beautiful, and does not feem at all to have fuffered from the voluntary reftraint under which the compofer laboured.

The compofing fongs on a ground-bafe, was an exercife of ingenuity, in which Purcell feems to have much delighted; but though it was as much a fafhion in his time, as the compofing maffes on the fubjects of old tunes in the days of Jufquin, and variations upon thofe tunes in the days of Bird and Dr. Bull, in which they all manifefted fuperior abilities, yet the practice was Gothic, and an unworthy employment for men poffeffed of fuch genius and original refources. The Italians ftarted this, as well as moft other mufical fafhions; for it appears by the works of Tranquinio Merula, publifhed 1635, that writing upon a ground-bafe was a favourite occupation with that capricious compofer, as well as our ingenious countryman.

Judges of mufical defign, modulation, and expreffion, will meet with many places to admire in fongs that have never been popular, yet have local beauties, and mark the fuperior powers of the compofer; particularly in the "Sighs for the death of king Charles II." In the "Dialogue in tyrannic Love," p. 158, there is a paffage upon which the late Mr. Bach has conftructed a favourite movement in one of his *Quartetti concertanti*.

"I attempt from love's ficknefs," is an elegant little ballad, which, though it has been many years dead, would foon be recalled into exiftence and fafhion, by the voice of fome favourite finger, who fhould think it worth animation.

"Let the dreadful engines:" this is the laft fong in the firft volume of the "Orpheus Britannicus," of which, though both the words and mufic of the firft movement are wild and bombaft, yet the fecond and laft difcover a genius for the graceful comic, as well as the tender and fublime ftyle of compofition; and there are feveral paffages in this cantata fufficiently gay and new for a modern burletta.

In 1702, a fecond, and more correct, edition, of the firft volume of this work was publifhed, with more than thirty fongs that were not in the firft impreffion; but, in order to make room for which, fome of the former were excluded.

The fame year was likewife publifhed a fecond volume of "Orpheus Britannicus," by Henry Playford, which he dedicated to the earl of Hallifax. The fong of this fecond volume, p. 4, beginning, "Ah! cruel nymph!" has great ingenuity in the firft movement, and grace in the fecond. And the next air, "Crown the altar," feems the moft pleafing of any that he has compofed on a ground-bafe. "May the god of wit infpire," for three voices, is natural and pleafing, and the echoes in the fecond part are very ingenioufly contrived.

"Thus the gloomy world," accompanied with the trumpet, and violin alternately, is mafterly, and well defigned to difplay the trueft and moft brilliant tones of the trumpet, though but little is given to the violin, which fo much better deferves employment, than an inftrument of fuch falfe intonation as the trumpet.

Thofe that can relifh good mufic of every age and country, and have no exclufive partiality to individuals of either, will find amufement in the performance or perufal of Purcell's "Four Seafons," in the "Fairy Queen," which comprehend merit of various kinds.

"To arms, to arms," is an admirable military fong, accompanied by a trumpet, which is fo confined an inftrument, that nearly the fame paffages muft be ufed in all ages, fo that time has robbed this fong of but little of its novelty. Indeed, the divifions of this air have been revived of late years, and are now as fafhionable, in frivolous and unmeaning melody, as ever.

There are many excellent fongs in this volume; however, thefe and their peculiar beauties we muft pafs over, or our commentary will encroach too much on the limits of our biographical articles, as well as on the time and patience of thofe readers to whom the name and productions of our Britifh Orpheus are alike unknown or indifferent. Yet we muft obferve, that there is a compofition in Purcell's "Bonduca," in which he has anticipated a fpecies of dramatic mufic, which has been thought of late invention; the words are "Hear ye gods of Britain!" which he has fet in an *accompanied recitative, á tempo*, or *aria parlante*. The beginning, however, with the bafe *à pedale*, has the true characteriftic of recitative. Afterwards, when the bafe is put in motion, the whole has the properties of an air, ingenioufly and fpiritedly accompanied by two violins and a bafe. Befides the true dramatic caft of this compofition, there are new harmonies hazarded, which we do not recollect having feen in anterior contrapuntifts, at leaft of our own country.

We dare proceed no further in analyzing the works of our illuftrious countryman, though it would afford us great pleafure, as we never look at them without feeing a merit very fuperior to that of any of his contemporaries out of Italy, and even there, only the vocal compofitions of Cariffimi and Stradella feem to furpafs them in grace and elegance. Cariffimi appears to have been his model in his beft recitatives, and Lulli in the worft; and it is manifeft that he was fond of Stradella's manner of writing, though he never pillaged his paffages.

We muft not quit his vocal mufic without an honourable and grateful memorial of his catches, rounds, and glees, of which the humour, ingenuity, and melody, were fo congenial with the national tafte, as to render them almoft the fole productions of the facetious kind that were in general ufe for near fourfcore years. And though the countenance and premiums beftowed of late years upon this fpecies of compofition, as well as modern refinements in melody and performance, have given birth to many glees, of a more elegant, graceful, and exalted kind, than any which Purcell produced; yet he feems hardly ever to have been equalled in the wit, pleafantry, and contrivance of his catches.

Of fifteen anthems, with fymphonies and inftrumental parts, with innumerable odes and mifcellanies, we have room to fay nothing, though much praife is due to many of them.

An abfurd cuftom prevailed in Purcell's time, which he carried to greater excefs, perhaps, than any other compofer, of repeating a word of one or two fyllables an unlimited number of times, for the fake of the melody, and fometimes before the whole fentence has been heard. Such as no, no, no, —all, all, all—pretty, pretty, pretty, &c. *ad infinitum*. But there is equal redundance and obfcurity in the ufe which the Italians make at prefent of *sì, sì, sì*, and *nò, nò, nò*, in their fongs.

Purcell

Purcell was ſo little acquainted with the unlimited power of the violin, that we have ſcarcely ever ſeen a becoming paſſage for that inſtrument in any one of his works; the ſymphonies and ritornels to his anthems and ſongs being equally deficient in force, invention, and effect. And though his ſonatas contain many ingenious, and, at the time they were compoſed, new traits of melody and modulation, if they are compared with the productions of his contemporary, Corelli, they will be called barbarous. But Corelli wrote for an inſtrument of which he was a great maſter: and who ever entirely ſucceeded in compoſing for one of which he was ignorant? When a great performer on keyed inſtruments condeſcends to compoſe for the violin, upon which he has never been a good player, or the voice, without knowing in what good ſinging conſiſts, the paſſages all come from the head, and none from the hand, except the hand of a harpſichord player, which is ever unfit to ſuggeſt ideas either for a voice, or for any other inſtrument than his own. Such a compoſer for the violin muſt inevitably embarraſs the player with perpetual aukwardneſſes and difficulties without effect, which diſcover an utter ignorance of the finger-board.

If Purcell, by travelling, or by living longer at home, had heard the great inſtrumental performers, as well as great ſingers, that arrived in this country ſoon after his deceaſe, and had ſuch to compoſe for, his productions would have been more regular, elegant, and graceful; and he would certainly have ſet Engliſh words better than it was poſſible for any foreigner to do, for our feelings, however great his genius, or excellent, in other reſpects, his productions. But Purcell, like his ſucceſſor, Arne, and others who have compoſed for the playhouſe, had always an inferior band to the Italian opera compoſers, as well as inferior ſingers, and an inferior audience to write for.

The diligent and candid Walther, by not having aſſigned to Purcell a niche in his Muſical Dictionary, ſeems never to have heard of his exiſtence; but Purcell was ſo truly a *national* compoſer, that his name was not likely to be wafted to the continent; and the narrow limits of his fame may be fairly aſcribed, not only to the paucity and poverty of his compoſitions for inſtruments, for which the muſical productions are an intelligible language to every country, but to his vocal compoſitions being ſolely adapted to Engliſh words, which render it unlikely for their influence to extend beyond the ſoil that produced them.

We ſhould, however, have known as little of Lulli, as the French or Italians of Purcell, but for the partiality which Charles II. acquired, by his long reſidence on the continent, for the arts and amuſements of France. The firſt attempts at operas here, after the Reſtoration, were either in French, or on the model of thoſe that were then in high favour at Verſailles. And whoever is equally acquainted with the recitative, we had almoſt ſaid the general melody of Lulli and Purcell, muſt perceive a ſtrong reſemblance.

Purcell, however, having infinitely more fancy, and, indeed, harmonical reſources, than the Frenchified Tuſcan, his productions now afford far greater pleaſure and amuſement to a liberal lover of muſic, than can be found, not only in the productions of Cambert and Grabu, whom Charles II. and to flatter his majeſty, Dryden, patronized in preference to Purcell, but in all the noiſy monotony of the rhapſodiſt of Quinaut.

Let thoſe who ſhall think Purcell has ſacrificed the national honour by confeſſing his reverence for the productions of Italy, compare the ſecular productions of Engliſh muſicians, from the death of queen Elizabeth to the year 1683, with thoſe of Cariſſimi, Ceſti, Stradella, and innumerable others of great abilities, and if they do not equally hate muſic and truth, they will admire Purcell's probity, as well as his genius.

Indeed, muſic was manifeſtly on the decline, in England, during the ſeventeenth century, till it was revived and invigorated by Purcell, whoſe genius, though leſs cultivated and poliſhed, was equal to that of the greateſt maſters on the continent. And though his dramatic ſtyle and recitative were formed in a great meaſure on French models, there is a latent power and force in his expreſſion of Engliſh words, whatever be the ſubject, that will make an unprejudiced native of this iſland feel, more than all the elegance, grace, and refinement of modern muſic leſs happily applied, can do. And this pleaſure is communicated to us, not by the ſymmetry or rhythm of modern melody, but by his having fortified, lengthened, and tuned, the true accents of our mother-tongue; thoſe notes of paſſion, which an inhabitant of this iſland would breathe, in ſuch ſituations as the words he has to ſet deſcribe. And theſe indigenous expreſſions of paſſion Purcell had the power to enforce by the energy of modulation, which, on ſome occaſions, was bold, affecting, and ſublime.

Theſe remarks are addreſſed to none but Engliſhmen: for the expreſſion of words can be felt only by the natives of any country, who ſeldom extend their admiration of foreign *vocal* muſic, farther than to the general effect of its melody and harmony on the ear; nor has it any other advantage over *inſtrumental*, than that of being executed by the human voice, like *ſolfeggi*. And if the Italians themſelves did not come hither to give us the true expreſſion of their ſo•gs, we ſhould never diſcover it by ſtudy and practice.

It has been extremely unfortunate for our national taſte and our national honour, that Orlando Gibbons, Pelham Humphrey, and Henry Purcell, our three beſt compoſers during the laſt century, were not bleſt with ſufficient longevity for their genius to expand in all its branches, or to form a ſchool, which would have enabled us to proceed in the cultivation of muſic without foreign aſſiſtance.

Orlando Gibbons died 1625, at forty-four.

Pelham Humphrey died 1674, at twenty-ſeven.

And Henry Purcell died 1695, at thirty-ſeven.

If theſe admirable compoſers had been bleſt with long life, we might have had a muſic of our own, at leaſt as good as that of France or Germany; which, without the aſſiſtance of the Italians, has long been admired and preferred to all others by the natives at large, though their princes have uſually foreigners in their ſervice. As it is, we have no ſchool for compoſition, no well-digeſted method of ſtudy, nor, indeed, models of our own. Inſtrumental muſic, therefore, has never gained much by our own abilities; for though ſome natives of England have had hands ſufficient to execute the productions of the greateſt maſters on the continent, they have produced but little of their own that has been much eſteemed. Handel's compoſitions for the organ and harpſichord, with thoſe of Scarlatti and Alberti, were our chief practice and delight for more than fifty years; while thoſe of Corelli, Geminiani, Albinoni, Vivaldi, Teſſarini, Veracini, and Tartini, till the arrival of Giardini, ſupplied all our wants on the violin, during a ſtill longer period. And as for the hautbois, Martini and Fiſher, with their ſcholars and imitators, are all that we have liſtened to with pleaſure.

If a parallel were to be drawn between Purcell and any popular compoſer of a different country, reaſons might be aſſigned for ſuppoſing him ſuperior to every great and favourite contemporary muſician in Europe.

Cariſſimi and Stradella, if more poliſhed in their ſtyle, were certainly leſs varied, and knew ſtill leſs of inſtruments, than

than our countryman. They had both, perhaps, more grace and regularity, but infinitely lefs paffion and fire.

The elder Scarlatti was more *recherché* and learned, but never fo natural and effecting.

In Germany, if Keifer, during an active and much longer life, furpaffed him in the number and excellence of his dramatic compofitions, his productions for the church, could they be found, would, we believe, bear no comparifon.

Lulli, bleft likewife with fuperior longevity, compofed alfo more operas than Purcell, and was the idol of the nation for which he laboured; but though his overtures long ferved as models, even to Purcell, as well as to the compofers of all the reft of Europe, and his mufic was performed by better fingers, and a more numerous band, fupported by the patronage of a court, and all the fplendour of ingenious and coftly exhibition; it is eafy to fee that even his theatrical works are more *manierées*, monotonous, and uninterefting in themfelves, than thofe of Purcell; but in relinquifhing the ftage, and ftepping on holy ground, we fhould have found, even in France, during all his glory, and the enthufiafm he raifed, none of his votaries who would attempt to put his facred mufic in comparifon with that of our countryman.

Rameau, the fucceffor of Lulli in court and popular favour, and who had more learning and theoretical knowledge in the art, than perhaps any practical mufician of modern times; yet, in pathos and expreffion of words and the paffions, he was Purcell's inferior, even upon the ftage; and in the church, he had no claim to celebrity.

Handel, who flourifhed in a lefs barbarous age for his art, has been acknowledged his fuperior in many particulars; but in none more than the art and grandeur of his chorufes, the harmony and texture of his organ fugues, as well as his great ftyle of playing that inftrument; the majefty of his hautbois and grand concertos, the ingenuity of the accompaniments to his fongs and chorufes, and even in the general melody of the airs themfelves; yet in the accent, paffion, and expreffion of *Englifh words*, the vocal mufic of Purcell is, fometimes to our feelings, as fuperior to Handel's as an original poem to a tranflation.

PURCHAS, Samuel, was born at Thaxtead, in Effex, in 1577. He was educated at Cambridge, and was prefented to a vicarage in his native county. This cure he refigned to his brother, and came to live in London, for the purpofe of conducting the great work he had undertaken. The firft volume folio appeared in 1613, under the title of "Purchas his Pilgrimage, or Relations of the World and the Religions obferved in all Ages and Places difcovered from the Creation unto this Prefent:" the other four volumes were publifhed in 1625. To thefe the general title is "Hakluytus Pofthumus, or Purchas his Pilgrims: containing a Hiftory of the World in Sea-voyages and Land-travels by Englifhmen and others:" the name of Hakluyt is introduced, becaufe Purchas became poffeffed of the papers which he left behind him. This great work, of which the object is to connect ancient and modern hiftory, was well received, but probably involved the author in debt. He had been collated to the rectory of St. Martin's Ludgate, and was chaplain to Abbot, archbifhop of Canterbury. He died about the year 1628, at the age of fifty-one. Biog. Brit.

PURCHASE, in *Law*, in its largeft and moft extenfive fenfe, is defined by Littleton to be the poffeffion of lands and tenements, which a man hath by his own act or agreement, and not by defcent from any of his anceftors or kindred. In this fenfe, it is contradiftinguifhed from acquifition by right of blood, and includes every other method of coming to an eftate, but merely that by inheritance; in which the title is vefted in a perfon, not by his own act or agreement, but by the fingle operation of law. (Co. Litt. 18.) Purchafe, in its vulgar and confined acceptation, is applied only to the acquifition of goods, lands, tenements, or the like, by means of money, or fome other valuable confideration.

What we call *purchafe*, *perquifitio*, the feudifts call *conqueft*, *conquæftus*, or *conquifitio*, (fee Conquest); both denoting any means of acquiring an eftate out of the common courfe of inheritance; and this is ftill the proper phrafe in the law of Scotland. The difference, in effect, between the acquifition of an eftate by defcent and by purchafe, confifts principally in thefe two points. 1. That by purchafe the eftate acquires a new inheritable quality, and is defcendible to the owner's blood in general, and not the blood only of fome particular anceftor. 2. An eftate taken by purchafe will not make the heir anfwerable for the acts of the anceftor, as an eftate by defcent will. According to this legal fignification of the word *perquifitio*, or purchafe, it includes the five following methods of acquiring a title to eftates, viz. *efcheat*, *occupancy*, *prefcription*, *forfeiture*, and *alienation*, conveyance, or purchafe, in its limited fenfe: under which latter head may be comprifed any method in which eftates are voluntarily refigned by one man, and accepted by another: whether that be effected by fale, gift, marriage-fettlement, devife, or other tranfmiffion of property, by the mutual confent of the parties. See the feveral articles, and Title.

Natural perfons, incorporate perfons, fole or aggregate, deaf, dumb, and blind perfons, minors, and all reafonable creatures, may purchafe, except in fome cafes; but fome have capacity to purchafe, and not to hold, as aliens, felons, &c.; and others have ability to hold or not to hold upon a purchafe, at the election of themfelves or others, as infants, and feme coverts. 1 Inft. 2, 3. 11 Rep. 77. 7 Rep. 17.

Purchase *and value of land*. See Valuation *of Land*, and Political *Economy*.

Purchase *of writs*. See Writ.

Purchase, in the *Sea Language*, has the fame fignification with *draw in*, at land. Thus, they fay, the capftern purchafes apace, *i. e.* draws in the cable apace; and when they cannot draw or hale any thing in with the tackle, they fay, the tackle will not purchafe.

Purchase is alfo a name given by failors to any mechanical power employed in raifing or removing heavy bodies, or in fixing or extending the fhip's rigging. Such are the tackles, windlaffes, capfterns, fcrews, and handfpikes.

Purchase-*Book*, among *Traders*, is the name given to a book, which is a kind of journal, containing an account of all the purchafes made, or things bought in the day.

PURCHASER, First, *Perquifitor*, in *Law*, denotes the perfon who firft acquired an eftate to his family, whether the fame was transferred to him by fale or by gift, or by any other method, except only that of defcent. See Descent.

PURCHASING *of Eftates*, in *Agriculture*, the bufinefs of buying landed property. In order to perform this fort of bargain with propriety, and to the beft advantage, attention is neceffary to be had to a great variety of circumftances of different kinds, which refpect the nature, quality, fituation, condition, value, and conveniences of the property. See Valuation *of Land*.

But it is probably beft done, when to any extent, by a furveyor or other perfon who is perfectly converfant with the nature of the bufinefs, and fully acquainted with the real value of landed property in the diftrict where the purchafe may be fituated or met with.

It has been obferved by Mr. Marfhall, that there are two methods of making bargains of this kind, the one by public biddings, the other by private treaty or contract: in either of which, a certain degree of caution is common prudence. In the former, however, the conditions being fixed, an accurate valuation is the beft fafeguard; and, in the latter, among honeft men little more is required.

In purchafing by private contract, the particulars which may be previoufly required to be furnifhed by the feller, are the quantities of the feveral pieces of the lands which are on fale, together with the maps, or rough drafts, of the fame; the tenure under which they are held; fome affurance as to the title of the feller; and his right of alienation; the tenancy under which the feveral farms are let; and, if on lives, the ages of the nominees; if for a term of years, the number which are unexpired; if at will, the notices with which the tenants have been ferved, if any have been given.

An abftract of the covenants under which they are let; particularly of thofe which relate to taxes and repairs, to the expenditure of produce, to the ploughing of grafslands, &c. &c.

The exifting rents and profits receiveable; whether for tenanted lands, appurtenances, or abftract rights; with the eftimated value of the demefne, and the woodlands in hand; together with the eftimated value of the timber growing upon the eftate on fale; as well as of the minerals and foffils which it may contain.

The outgoings to which the eftate is liable; the propofed time of the delivery of poffeffion; the price and the mode of payment which are expected.

And next, it will be proper to fet down the particulars of the inftructions to be given to a furveyor, or other valuer, of the eftate to be purchafed. It will be right, however, to premife, that much, in this refpect, depends on the probability of purchafing; and on the time which is allowed for making the eftimate. In cafes of fale by public auction, when there can be no certainty as to purchafe, and where the time for valuation is limited, a rough eftimate of each farm, and a general idea of the value of the timber and other appurtenances, may be all that can be prudently afcertained. But in a fale by private contract, where the refufal of an eftate is granted, and time allowed for deliberate furvey, a more minute inveftigation may be proper; efpecially where there is every reafon to believe that a bargain will take place. For the fame report will not only ferve as a guide to the purchafe, but will become a valuable foundation, on which to ground the future management of the eftate. And for thefe and other reafons, a purchafe by private contract is moft to be defired by one who is not in the habit of perfonally attending public fales, and is unacquainted with the bufinefs of an auction room.

It may be noticed, that the particulars to be required from a furveyor, or furveyors, in thefe cafes, are principally thefe: the rental value of each field or parcel of land, with the ftate in which it lies, as to arable, meadow, pafture, or woodland: the value of the timber and other appurtenances: the characteriftic, and the ftate of management of each farm or tenement, with the eligibility of the occupier; together with the ftate of repair of buildings, gates, fences, water-courfes, and roads, the amount of the encumbrances and outgoings. And, laftly, the probable value of the improvements of which the eftate may appear to be capable; whether by the feveral means that are commonly practifed, or by new regulations and improved modes of agricultural management, that may admit of being introduced.

It is added, that thefe feveral particulars of information being procured, the fubjects of treaty are few. The two ftatements having being duly compared, fo that no mifunderftanding can take place between the parties, the price, and the times and mode of payment, are the principal matters of agreement. A clear underftanding refpecting the cuftody of title deeds and the expences of conveyance, require, however, to be enumerated among the preliminaries of purchafe.

In thefe tranfactions, it is alfo fuppofed, the bufinefs of negociation is beft carried on by letters; which become vouchers of facts. Whatever is done by interview, requires to be reduced to writing, and to be read by or to the parties before they feparate, that no poffibility of mifconception may arife. And, added to thefe precautions, it is proper in large purchafes, and when abftracts of intricate title deeds are to be made out, and examined, that a legal contract or memorandum of agreement fhould be entered into, for the mutual fatisfaction and furety of the parties. This contract and the deed of conveyance, which is the inftrument which is legally to transfer the property from the feller to the purchafer, may be faid to conclude and ratify the bufinefs of purchafe. And in this part of it, legal affiftance is effentially neceffary; to examine exifting deeds, and fee that the feller has a legal right and clear title to the land, and a legal power to difpofe of it; as well as to draw up or examine the frefh deed of conveyance, and fee that it is fufficient to transfer the property legally and adequately to the purchafer.

PURCHENA, in *Geography*, a town of Spain, in the province of Grenada; 60 miles E. of Grenada. N. lat. 37° 19′. W. long. 2° 30′.

PURE, fomething free from any admixture of foreign or heterogenous matters.

PURE *Fire*. See FIRE.

PURE *Hyperbola*, in *Conics*, is an hyperbola without any oval, node, fpike, or conjugate point. See CURVE.

PURE *Mathematics*. See MATHEMATICS.

PURE *Propofition*. See PROPOSITION.

PURE *Quadratics*. See QUADRATIC.

PURE *Refignations*. See RESIGNATION.

PURE *Villenage*. See VILLENAGE.

PUREA, or PURAN, in *Geography*, a town of Chili; 80 miles S.S.E. of La Conception.

PUREEWAR, a town of Hindooftan, in Oude; 10 miles N. of Bahraitch.

PUREG, anciently *Pura*, once the capital of Gedrofia (Mekran), and termination of the toilfome march of Alexander towards the frontiers of Caramania, is now a mean village.

PURENDERA, in *Mythology*, a name of Indra, the Hindoo regent of the firmament. (See INDRA.) The word is faid to mean *deftroyer of towns*, the Indian Jupiter having, in revenge for facrificial flights or negligences, frequently, according to the Hindoo books, affumed that character. The ancient city of Ougein, the capital of Malwa, was, according to tradition, deftroyed by Indra. See OUGEIN.

PURESIL, in *Geography*, a town of Hindooftan, in the circar of Cicacole; 40 miles N.W. of Vizniagram.

PURETTA, a name given by fome writers to the common fhining black fand, ufed to ftrew over writing, and erroneoufly called by fome *fteel-duft*.

It is a natural mineral fubftance, found on the fhores near Genoa, and in other places.

PURFLED,

PURFLED, ornamental work, whether in ftone or other materials, reprefenting embroidery or lace work.

PURFLEW, a term in *Heraldry*, expreffing ermines, peans, or any of the furs, when they compofe a border round a coat of arms.

Thus they fay, he beareth gules a border, purflew, vairy; meaning, that the border is vairy.

PURG, or Forg, in *Geography*, a town of Perfia, in the province of Lariftan; 60 miles N.E. of Lar. N. lat. 28° 30′. E. long. 54° 40′.

PURGATION, Purgatio, the act of purging, fcouring, or purifying any thing, by feparating and carrying off any impurities found therein.

Purgation, in *Pharmacy*, is the cleanfing of a medicine by retrenching its fuperfluities; as taking the wood and feeds out of caffia, and the ftones out of dates, tamarinds, and other fruits.

Purgation is alfo ufed, in *Chemiftry*, for feveral preparations of metals and minerals, intended to clear them of their impurities; more ufually called *purification* and *refining*.

The ordinary purgation of mercury is performed, by paffing it through a chamois fkin. (See Mercury.) Gold is purged by the coppel, cementation, &c. See Gold, Coppel, &c.

Purgation, in other metals, is performed by repeated fufion, &c.

Purgation, *Catharfis*, in *Medicine*, the evacuation of the alimentary canal of its fæcal contents, by means of fubftances which ftimulate its fibres, and excite them to a more active periftaltic motion. Purgation is alfo fometimes carried farther, and, by caufing a copious difcharge of fluids from the exhalent veffels of the inner furface of the bowels, produces a confiderable evacuation from the fyftem at large. For an elucidation of the doctrine of purgation, fee Cathartic.

Purgation, in *Law*, is the clearing one's felf of a crime, whereof publicly fufpected or accufed before a judge, called alfo *judicium Dei*.

Of thefe purgations there was anciently much ufe in England, efpecially touching matters of felony charged on clerks; and there is fomething of them ftill retained in the ecclefiaftical court on fufpicion of incontinency, &c. Purgation is either *canonical* or *vulgar*.

Purgation, *Canonical*, is that prefcribed in the canon law, the form of which, obtaining in the fpiritual court, is, that the party fufpected fhall take his oath that he is clear of the fact objected againft him; and bring fo many of his honeft neighbours, not above twelve, as the court fhall affign him, to fwear, on their confciences, that they believe he fwears truly.

The canonical doctrine of purgation, whereby the parties were obliged to anfwer upon oath to any matter, however criminal, that might be objected againft them, continued till the middle of the 17th century to be upheld by the fpiritual courts; when the legiflature was obliged to interpofe, to teach them a leffon of fimilar moderation. By the ftatute of 13 Car. II. cap. 12. it is enacted, that it fhall not be lawful for any bifhop, or ecclefiaftical judge, to tender or adminifter to any perfon whatfoever, the oath ufually called the oath *ex officio*, or any other oath whereby he may be compelled to confefs, accufe, or purge himfelf of any criminal matter or thing, whereby he may be liable to any cenfure or punifhment. But this doth not extend to oaths in a civil fuit; and, therefore, it is ftill the practice both in the fpiritual courts, and in equity, to demand the perfonal anfwer of the party himfelf upon oath. Yet if in the bill any queftion be put, that tends to the difcovery of any crime, the defendant may thereupon demur, and refufe to anfwer. Anciently, upon the allowance of the benefit of clergy, the perfon accufed was delivered to the ordinary, to make his purgation, which was to be before a jury of twelve clerks, by his own oath affirming his innocence, and the oaths of twelve compurgators as to their belief of it. But now, by the ftat. 18 Eliz. cap. 7. this kind of purgation is alfo taken away; and the perfon admitted to his clergy fhall not be delivered to the ordinary.

Purgation, *Vulgar*, being the moft ancient manner, was by fire, or water, or combat; ufed by infidels, and by Chriftians too, till abolifhed by the canon law. See Ordeal, and Corsned.

Combat, though now difufed, may yet be ftill practifed by the laws of the realm, in cafes where evidence is wanting, and where the defendant rather choofes combat than any other trial. See Combat.

Terris bonis, &c. *redhabendis poft Purgationem*. See Terris.

Purgation, in *Rhetoric*, is ufed for that kind of defence which takes place when the accufed perfon owns the fact, but denies that he did it with defign, or with any bad intention.

Purgation, in *Tragedy*, is a term which Ariftotle ufes for the effect of tragedy on the mind.

That philofopher obferves, that tragedy, by means of the terror and compaffion which it excites, purges paffions out of the foul.

Indeed, Corneille adds, that tragedy frequently creates paffions, inftead of purging them; fo that he takes Ariftotle's purgation to be no more than a chimera.

Purgations, *Menftrual*, the catamenia or menfes of women.

PURGATIVE, or Purging-*Medicine*, a medicament, which evacuates the contents of the bowels by ftool. See Cathartic.

PURGATORY, Purgatorium, in the Romifh church, a place where the juft are fuppofed to fuffer the pains due to their fins, for which they have not fatisfied in this world.

It is by the mercy of God, the indulgences of the church, and the prayers of the faithful, that people are fuppofed to be delivered out of purgatory.

This doctrine of purgatory, which fome derive from the Platonic fancies of Origen, the Montanifm of Tertullian, pretended vifions, and pagan ftories, rhetorical flourifhes, and doubtful expreffions of the later fathers, and in which we may difcern an obvious refemblance to the famous pagan doctrine, concerning the purification of departed fouls by means of a certain kind of fire, was partly introduced, at leaft in the fpirit of it, towards the clofe of the fifth century, and by Gregory the Great in the fixth century; but it was not, however, pofitively affirmed till about the year 1140, nor made an article of faith till the council of Trent. Seff. 25. Decret. de Purgat. See Papists and Popery.

In Ireland is a place called "St. Patrick's purgatory," where, as the legend has it, at the prayers of St. Patrick, bifhop of the place, there was made a vifible reprefentation of the pains which the wicked undergo after death, in order to deter finners, &c.

PURGATTY, in *Geography*, a town of Hindooftan, in the circar of Cicacole; 40 miles N.W. of Vizniagram.

PURGE, in *Medicine*, a term frequently ufed for a dofe of fome purgative medicine.

PURGING Ale, *Butler's*. See Ale.

Purging *Grain, Oily*, in *Botany*. See Sesamum.

Purging *Nut*, in *Botany*. See Jatropha.

Purging *Thorn*. See Buckthorn.

PURGLITZ, or Krziwoklad, in *Geography*, a citadel of Bohemia, in the circle of Rakonitz, where the royal treaſures were anciently kept, and ſtate priſoners confined; ſeven miles S.E. of Rakonitz.

PURGOT, a town of Hindooſtan, in Coimbetore; 35 miles W. of Ardenelle.

PURGOW, a town of Hindooſtan, in Baglana; 25 miles E.N.E. of Baſleen.

PURGSTALL, a town of Auſtria; four miles N. of Scheibs.

PURIFICATION, in *Chemiſtry*, &c. the act of purifying or refining natural bodies; or of ſeparating the fæces and impurities from them.

For the methods of purifying metals, gold, ſilver, iron, copper, tin, &c. ſee Gold, Silver, &c. and Refining.

For the purification of ſemi-metals, minerals, and other matters, as antimony, ſulphur, camphor, ſaltpetre, &c. ſee Antimony, Sulphur, Camphor, &c.

Purification, in *Pharmacy*. See Trying.

Purification, in *Matters of Religion*, denotes an offering made the prieſt by women riſing out of child-bed, before they are re-admitted into the church.

By the law of Moſes, a woman, after bringing forth a male child, was unclean forty days; after a female, eighty days; during which time, ſhe was not to touch any thing holy, nor to go near the temple, but was to continue within doors, ſeparate from all company, and commerce of others.

This term expired, ſhe was to preſent herſelf at the temple, and at the door of the tabernacle, to offer a lamb, as an holocauſt, and a pigeon or turtle; which the prieſt taking, offered to God, and prayed for her, that ſhe might be purified.

This ceremony, which conſiſted of two things, an holocauſt, and a ſacrifice of expiation, was called טהר טהרה, *purificatio, purgatio.*

The holy Virgin, though, according to the fathers, exempt from the terms of the law, yet complied with it, and, at the time preſcribed, went to the temple, and accompliſhed the law; in commemoration of which the church yearly ſolemnizes the feaſt of the Purification of the Virgin, on the ſecond of February; called alſo the Feaſt of Candlemas.

Purification, *The Feaſt of the*, ſeems to be very ancient. It is ordinarily ſaid to have been inſtituted in the time of Juſtinian, in the year 542, and this on occaſion of a mortality, which that year diſpeopled almoſt the whole city of Conſtantinople. Yet there are ſome, who imagine it to have been obſerved before, though in another manner, and on a different day from that fixed by Juſtinian; *viz.* between the Circumciſion and Epiphany. See Candlemas.

The ſame day is the preſentation of our Saviour in the temple.

Purification, in *Geography*, a town of Mexico, in the province of Xaliſco; eight miles S. of Compoſtella Nuova. N. lat. 19° 58′. W. long. 105° 46′.

PURIM, a ſolemn feaſt held among the Jews on the fourteenth and fifteenth of March, in memory of their deliverance from the conſpiracy of Haman by Eſther. See Esther.

This feaſt, which derives its name from the Perſian word *purim*, q. d. *lots*, becauſe it was by the caſting of lots that Haman determined this time for the deſtruction of the Jews, is the Bacchanals of theſe people, which they celebrate with all manner of rejoicing, mirth, and jollity; indulging themſelves with every kind of luxury, eſpecially in drinking wine even to drunkenneſs, which they conſider as part of the duty of the ſolemnity; becauſe it was by means of the wine banquet (they ſay) that Eſther made the king's heart merry, and brought him into that good humour, which inclined him to grant the requeſt preſented by her for their deliverance; and, therefore, they think they ought alſo to make their hearts merry, when they celebrate the commemoration of it. During this feſtival the book of Eſther is ſolemnly read in all their ſynagogues from the beginning to the end, at which they are all to be preſent, men, women, children, and ſervants, becauſe all ſhared in the benefit of the deliverance which Eſther obtained for them. And as often as the name of Haman occurs in the reading of this book, the cuſtom is for all to clap with their hands, and ſtamp with their feet, and cry out, Let his memory periſh. Prideaux's Conn. vol. ii. p. 456.

PURITANS, in *Eccleſiaſtical Hiſtory*. See Cathari and Novatians.

Puritans is alſo a term anciently uſed for the Calviniſts of Great Britain, from their profeſſing to follow the pure word of God, in oppoſition to all traditions, human conſtitutions, and other authorities.

The ſeparation, whence this diſtinguiſhing appellation took its riſe, commenced on the following occaſion. Upon the acceſſion of queen Mary, it is well known that popery revived in this kingdom; the ſtatutes of king Edward were repealed, and the penal laws againſt heretics were put in execution againſt the reformers. Many ſuffered at home; and others eſcaped the fury of perſecution by ſeeking refuge in foreign countries. Some went into France and Flanders; ſome to Geneva; and others into thoſe parts of Germany and Switzerland, where the reformation had taken place, and where the magiſtrates received them with great humanity, and allowed them places for public worſhip. The exiles were moſt numerous at Frankfort; and there that conteſt and diviſion began, which gave riſe to the Puritans, and to that ſeparation from the church of England, which continues to this day. In the year 1554, ſome of the Engliſh fugitives ſettled in this city; and agreed to conduct their worſhip, without anſwering aloud after the miniſter, and without uſing the liturgy and ſurplice; to begin the public ſervice with a general confeſſion of ſins, then to ſing a pſalm, after which the miniſter prayed for the divine aſſiſtance, and next proceeded to the ſermon; after ſermon, a general prayer for all eſtates, and particularly for England, at the end of which was ſubjoined the Lord's prayer, and a rehearſal of the articles of belief; then the people were to ſing another pſalm, and the miniſter to diſmiſs them with a bleſſing. Such was the order which they had unanimouſly adopted; and having choſen a miniſter and deacons, they invited their diſperſed brethren to join with them. In the year 1556, Dr. Cox, afterwards biſhop of Ely, came to ſettle at Frankfort with ſeveral of his friends; who interrupting the public ſervice by anſwering aloud after the miniſter, and reading the whole litany, in violation of the agreement upon which the congregation was formed, overpowered the firſt ſettlers; and obtaining leave of the magiſtrates for the free uſe of king Edward's ſervice-book, performed divine worſhip according to the rites that had been authoriſed by that prince; while others, who preferred the Genevan method of worſhip, as more pure and ſimple, left the city of Frankfort, and removed to Baſil and Geneva. Thus commenced the diſtinction of Puritans and Conformiſts, by which the two parties were afterwards known. The former were called Conformiſts, on account of their compliance with the eccleſiaſtical laws enacted by Edw. VI. and the denominations of Nonconformiſts and Puritans were given to the latter, from their inſiſting upon a form of worſhip, more exempt from ſuperſtition, and of a purer kind than the liturgy of Edward feemed to them to be. Upon the acceffion of queen Elizabeth, the exiles returned to England, where each party ftrove to advance the reformation according to their own ftandard. The queen, with thofe who had weathered the ftorm at home, were only for reftoring king Edward's liturgy; but the majority of the exiles were for the worfhip and difcipline of the foreign churches, and refufed to comply with the old eftablifhment, declaiming loudly againft the popifh habits and ceremonies. However, the queen's party prevailed; and in 1559 a committee of divines was appointed to review king Edward's liturgy, who were inftructed to ftrike out all offenfive paffages againft the pope, and to make people eafy about the belief of the corporal prefence of Chrift in the facrament. But no alterations were made in favour of thofe who now began to be called Puritans, from their attempting a purer form of worfhip and difcipline than had yet been eftablifhed; and whofe fentiments in many points were agreeable to thofe maintained by John Wickliffe, the firft reformer. For they agreed with him in opinion, that in the facrament of orders there ought to be but two degrees, prefbyters or bifhops, and deacons; that all human traditions are fuperfluous and finful; that we muft practife and teach only the laws of Chrift; that myftical and fignificant ceremonies in religious worfhip are unlawful; and that to reftrain men to a prefcribed form of prayer is contrary to the liberty granted them by God. The old feftivals, with their eves and the popifh habits, were continued as they were in the fecond year of king Edward VI. In 1558 the act of fupremacy was paffed, in which there is a remarkable claufe, that gave rife to the court of high-commiffion, which proved afterwards fo oppreffive; and in 1559 was paffed an act for the uniformity of common prayer, and fervice in the church, and adminiftration of the facraments. The Puritans remonftrated againft thefe proceedings, and complained, that the grofs fuperftitions of popery, which they had looked upon as abrogated and abolifhed, were now revived, and even impofed by authority. Some required nothing lefs than that the church of England fhould be exactly modelled after that of Geneva; others only defired liberty of confcience, with the privilege of celebrating divine worfhip in their own way; but neither party obtained the object of their wifhes. The queen, intent upon the fuppreffion of this troublefome fect (as fhe was ufed to call it), permitted its enemies to employ for that purpofe all the refources of artifice, and all the feverity of the laws. The court reformers pleaded, that every prince had authority to correct all abufes of doctrine and worfhip within his own territories; the Puritans, on the other hand, whilft they difowned all foreign authority and jurifdiction over the church, could not admit of that extenfive power which the crown claimed by the fupremacy; apprehending it unreafonable, that the religion of a whole nation fhould be at the difpofal of a fingle lay perfon. However, they took the oath, with the queen's explication in her injunctions, as reftoring her majefty only to the ancient and natural rights of fovereign princes over their fubjects.

Farther, the court reformers allowed, that the church of Rome was a true church, though corrupt in fome points of doctrine and government; that all her miniftrations were valid, and that the pope was a true bifhop of Rome, though not of the univerfal church. But the Puritans affirmed the pope to be antichrift, the church of Rome to be no true church, and all her miniftrations to be fuperftitious and idolatrous; they renounced her communion, and durft not fufpend the validity of their ordinations upon an uninterrupted line of fucceffion from the apoftles through her hands. Moreover, it was agreed by all, that the holy fcriptures were a perfect rule of faith; but the bifhops and court reformers did not allow them to be the ftandard of difcipline or church government; affirming that our Saviour and his apoftles left it to the difcretion of the civil magiftrate, in thofe places where Chriftianity fhould obtain, to accommodate the government of the church to the policy of the ftate. But the Puritans apprehended the holy fcriptures to be a ftandard of church difcipline as well as of doctrine; at leaft that nothing fhould be impofed as neceffary but what was exprefsly contained in, or derived from them by neceffary confequence, and, befides, they maintained that the difcretionary power was not lodged with the civil magiftrate, but with the fpiritual officers of the church. Farther, the court reformers maintained, that the practice of the primitive church for the firft four or five centuries was a proper ftandard of church government and difcipline, and in fome refpects a better than that of the apoftles, which (according to them) was only accommodated to the infant ftate of the church while it was under perfecution, whereas theirs was fuited to the grandeur of a national eftablifhment. Whereas the Puritans were for adhering to the bible in the main principles of church government, and for admitting no church officers or ordinances, but fuch as are herein mentioned; and they apprehended, that the apoftles, in eftablifhing the firft Chriftian church on the ariftocratical plan then obferved in the Jewifh fanhedrim, defigned it as an unchangeable model to be followed in all times and places. The court reformers alfo maintained, that things indifferent in their own nature, which are neither forbidden nor commanded in the holy fcriptures, fuch as rites, ceremonies, habits, &c. might be fettled, determined, and made neceffary by the command of the civil magiftrate, and that in fuch cafes it was the indifpenfible duty of all fubjects to obferve them. But the Puritans infifted, that thofe things which Chrift had left indifferent, ought not to be made neceffary by any human laws, and that fuch rites and ceremonies as had been abufed to idolatry, and had a manifeft tendency to lead men back to popery and fuperftition, were no longer indifferent, but to be rejected as unlawful. Neverthelefs, both parties agreed too well in afferting the neceffity of an uniformity of public worfhip, and of calling in the fword of the magiftrate for the fupport and defence of their feveral principles; which they made an ill ufe of in their turns, as they could grafp the power into their hands. The ftandard of uniformity, according to the bifhops, was the queen's fupremacy, and the law of the land; according to the Puritans, the decrees of provincial and national fynods, allowed and enforced by the civil magiftrate; but neither party was for admitting that liberty of confcience, and freedom of profeffion, which is every man's right, as far as is confiftent with the peace of the government under which he lives.

In the year 1564, upon a report that the habits, enjoined on the clergy, were generally neglected, and alfo of inattention to other impofed forms, the queen directed the ecclefiaftical commiffioners to confult fome proper methods to reduce them to an exact uniformity; upon which they agreed on certain *advertifements* (as they were called), partly for due order in preaching and adminiftering the facraments, and partly for the apparel of ecclefiaftical perfons. To thefe advertifements certain proteftations were annexed, to be made, promifed, and fubfcribed by fuch as fhould hereafter be admitted to any office or cure in the church. The queen, though fhe would give no authority to the advertifements, which had occafioned much remonftrance and complaint, iffued out a proclamation in 1565, peremptorily requiring uniformity in the habits, upon pain of prohibition from preaching, and deprivation. Parker, the archbiſhop of Canterbury, was violent and unrelenting; and by various methods of ſeverity, haraſſed, ſilenced, and deprived many of thoſe who ſcrupled the uſe of the habits. The ſuſpended miniſters, finding that renewed applications to the queen and her commiſſioners were ineffectual, publiſhed, in 1566, a ſmall treatiſe in vindication of their conduct; in which they allege, that neither the prophets of the Old Teſtament, nor the apoſtles of the New, were diſtinguiſhed by their garments; that a diſtinction of garments in the Chriſtian church did not generally obtain till long after the riſing of antichriſt; that the garments againſt which they objected, had been abuſed to idolatry, ſorcery, and all kinds of conjurations; that they were an offence to weak Chriſtians, an encouragement to ignorant and obſtinate papiſts, and the uſe of them an affectation of returning to their communion; that at beſt they were only human appointments, ſubject to the apoſtle's reproof, Col. ii. 20—22; that allowing them to be indifferent (which they did not grant), yet they ought not to be impoſed, becauſe it was an infringement of the liberty with which Chriſt had made them free; and finally they urged the ſuffrage of foreign divines, who all condemned the habits, though they were not willing to hazard the reformation in its infancy, on account of them.

If, at this time, the habits and a few ceremonies had been left indifferent, both miniſters and people would have acquieſced; but it was the compelling of theſe things by law that made them ſeparate from the eſtabliſhed church. Accordingly, in 1566, they came to a reſolution, alleging it to be their duty, in their preſent circumſtances, to break off from the public churches, and to aſſemble, as they had opportunity, in private houſes, or elſewhere, to worſhip God in a manner that might not offend againſt the light of their conſciences; and it was debated among them, whether they ſhould uſe as much of the common prayer and ſervice of the church as was not offenſive, or reſolve at once, ſince they were cut off from the church of England, to ſet up the pureſt and beſt form of worſhip, moſt conſonant to the holy ſcriptures, and to the practice of the foreign reformers. The latter of theſe meaſures was concluded upon; and accordingly they laid aſide the Engliſh liturgy, and made uſe of the Geneva ſervice-book. However, it is neceſſary to obſerve, that though all the Puritans of theſe times would have remained in the church, if they might have been indulged in the habits and a few ceremonies, yet they were far from being ſatiſfied with the hierarchy. They had other objections beſides thoſe for which they were deprived; of which we ſhall here ſubjoin a ſummary. They complained of the biſhops affecting to be thought a ſuperior order to preſbyters, and claiming the ſole right of ordination, and the uſe of the keys; and aſſuming, in connection with their office, temporal dignities, titles, and employments. As long, however, as the Engliſh biſhops pretended to derive their dignity and authority from no other ſource than the laws of their country, and pleaded a right, merely human, to the rank they held in the church and ſtate, the controverſy was carried on without exceſſive animoſity and zeal; but the flame broke out with redoubled fury in the year 1588, when Bancroft, afterwards archbiſhop of Canterbury, ventured to aſſert that the order of biſhops was ſuperior to the body of preſbyters, not in conſequence of any human inſtitution, but *jure divino*, or by the expreſs appointment of God himſelf. Farther, the Puritans excepted againſt the titles and offices of archdeacons, deans, chapters, and other officials, belonging to cathedrals, as having no foundation in ſcripture, or primitive antiquity, and intrenching upon the privileges of the preſbyters in the ſeveral dioceſes. They complained of the exorbitant power and juriſdiction of the biſhops and their chancellors in their ſpiritual courts, as derived from the canon law of the pope, and not from the word of God, or the ſtatute law of the land. They lamented the want of a godly diſcipline, and were uneaſy at the promiſcuous and general acceſs of all perſons to the Lord's table. Though they did not diſpute the lawfulneſs of ſet forms of prayer, provided a due liberty was allowed for prayers of their own compoſure before and after ſermon, yet they diſliked the frequent repetition of the Lord's prayer in the liturgy, the interruption of the prayers by the frequent reſponſes of the people, ſome paſſages in the office of marriage, as *With my body I thee worſhip*, and in that of burial, as *In ſure and certain hope of the reſurrection to eternal life*, pronounced over the worſt of men, if not excommunicated, &c. They alſo objected againſt the reading of the apocryphal books in the church, while ſome parts of canonical ſcripture were omitted; and though they did not diſlike the homilies, they thought that no man ſhould be ordained a miniſter in the church who was not capable of preaching and expounding the holy ſcriptures. They diſapproved of ſeveral of the church feſtivals or holidays, as having no foundation in ſcripture, or primitive antiquity; and they diſallowed of the cathedral mode of worſhip; nor did they approve of muſical inſtruments in the church ſervice. Finally, they ſcrupled conformity to certain rites and ceremonies, which were enjoined by the rubric, or the queen's injunctions; as the ſign of the croſs in baptiſm, baptiſm by midwives, or other women, in caſes of ſickneſs, and the mode of churching women; the uſe of god-fathers and god-mothers, to the excluſion of parents from being ſureties for the education of their own children; the cuſtom of confirming children, as ſoon as they could repeat the Lord's prayer and their catechiſm, by which they had a right to come to the ſacrament, without any other qualification, and the impoſition of hands, as a ſign of the divine favour, which ſeemed to them to imply a ſacramental efficacy in this ceremony; kneeling at the ſacrament of the Lord's ſupper, whilſt they conſidered that Chriſt gave it to his diſciples rather in a poſture of feaſting than of adoration; that it had no foundation in antiquity; that it had been groſsly abuſed by the papiſts to idolatry in their adoration of the hoſt; and that, if the poſture were indifferent, it ought not to be impoſed as a neceſſary term of communion; nor did they approve of adminiſtering either of the ſacraments in private, even in caſes of danger; bowing at the name of Jeſus; giving the ring in marriage, which they conſidered as derived from the papiſts, who made marriage a ſacrament, and the ring a ſort of ſacred ſign or ſymbol; the prohibition of marriage during certain times of the year, and the licenſing it for money; and, laſtly, the wearing of the ſurplice, and other veſtments to be uſed in divine ſervice.

In points of doctrine there was, at this time, no difference between the Puritans and Conformiſts; and if we add one article more to the preceding, we ſhall have the principal heads of controverſy between the church of England and the Proteſtant Diſſenters, at this day; *viz.* the natural right which every man has to judge for himſelf, and make profeſſion of that religion he apprehends moſt agreeable to truth, as far as it does not affect the peace and ſafety of the government under which he lives; without being determined by the prejudices of education, the laws of the civil magiſtrate, or the decrees of councils, churches, or ſynods. See *Proteſtant* DISSENTERS.

Towards the latter end of queen Elizabeth's reign, there aroſe a party, which were firſt for ſoftening, and then for overthrowing,

overthrowing, the received opinions concerning predeftination, perfeverance, free-will, effectual grace, and the extent of Chrift's redemption. The clergy of the epifcopal church began to lean towards the notions concerning thefe intricate points, which Arminius propagated fome time after this; while on the other hand, the Puritans adhered rigoroufly to the fyftem of Calvin. Several epifcopal doctors remained attached to the fame fyftem in the reign of James I. &c. and all thefe abettors of Calvanifm, whether epifcopal or prefbyterian, were called *doctrinal* Puritans. At length, according to Mr. Fuller, (Church Hift. book ix. p. 97. book x. p. 100.) the name was extended to ftigmatize all thofe who endeavoured in their devotions to accompany the minifter with a pure heart, and who were remarkably holy in their converfation; fo that a Puritan was a man of fevere morals, a Calvinift in doctrine, and a Non-conformift to the ceremonies and difcipline of the church, though he did not totally feparate from it.

Queen Elizabeth was violent in her oppofition to the Puritans through the whole courfe of her reign; and befides the ordinary courts of the bifhops, fhe erected, as we have already obferved, a new tribunal, called the court of high-commiffion, which fufpended and deprived men of their livings, not by the verdict of twelve men upon oath, but by the folemn determination of three commiffioners of her own nomination, founded not upon the ftatute law of the realm, but upon the canon law; and inftead of producing witneffes in open court to prove the charge, they affumed a power of adminiftering an oath *ex officio*, by which the prifoner was obliged to anfwer all queftions the court fhould put to him, though never fo prejudicial to his own defence. If he refufed to fwear, he was imprifoned for contempt; and if he took the oath, he was convicted upon his own confeffion.

During the reign of James I. from whom the Puritans expected more indulgent treatment, they were treated with great feverity, and many of them were obliged to leave the kingdom, and retire to Holland; and from thence confiderable numbers migrated to America in the year 1620. All were Puritans, in the eftimation of king James, who adhered to the laws of the land in oppofition to his arbitrary government, though otherwife ever fo good churchmen. Thefe were called *Puritans in the ftate;* and thofe who fcrupled the ceremonies, and adhered to the doctrines of Calvin, were *Church* Puritans, who, though comparatively few, yet being joined by thofe of the other clafs, became the majority of the nation. The fuccefs that attended the firft emigrators, who fettled in that part of America afterwards called New Plymouth, engaged great numbers of Puritans, who groaned under the oppreffion of the bifhops, and the feverity of a court, by which this oppreffion was authorifed, to follow the fortunes of thefe religious adventurers; and this produced a fecond emigration in the year 1629, which gave birth to the fecond grand colony, commonly known by the name of the Maffachufett's Bay. The colony of Connecticut was formed by emigrants of the fame clafs in 1636, and that of New Haven in 1637, who fled from the perfecution of Laud, and the oppreffions of the ftar-chamber and high-commiffion courts. Afterwards, when the Puritans were not allowed to tranfport themfelves to New England, many of them removed, with their families, into the Low Countries.

After the reftoration of Charles II. in the year 1662, the name of Puritans, fays bifhop Burnet, was changed into that of Proteftant Non-conformifts, who were fubdivided into Prefbyterians, Independents, Anabaptifts, and Quakers. At this time a public law, called the Act of Uniformity, was enacted, by which all who refufed to obferve the rites, and fubfcribe the doctrines of the church of England, were entirely excluded from its communion. From this period until the reign of king William III. the Non-conformifts were in a precarious and changing fituation, fometimes involved in calamity and trouble, and at other times enjoying fome intervals of tranquillity and certain gleams of hope, according to the varying fpirit of the court and miniftry, but never entirely free from perplexities and fears. But in the year 1689, their affairs took a favourable turn, when a bill for the toleration of all Proteftant Diffenters from the church of England, except the Socinians, paffed in parliament, almoft without oppofition, and delivered thofe who could comply with the conditions it impofed, from the penal laws to which they had been fubjected by the act of uniformity, and other acts paffed under the houfe of Stuart. For the prefent ftate of the toleration, fee Toleration. See alfo Corporation *Act* and Test. Neal's Hift. of the Puritans, in 4 vols. 8vo. paffim.

PURITY, in *Oratory*, is one of the conftituent parts of elegance, and denotes the choice of fuch words and phrafes as are fuited and agreeable to the ufe of the language in which we fpeak. Grammarians reduce the faults which they oppofe to it to two forts, which they call barbarifm and folecifm; the former of which refpects fingle words, and is an offence againft etymology, and the reproach of it is incurred by the ufe of words entirely obfolete, by the ufe of words entirely new, or by new formations and compofitions, from fimple and primitive words in prefent ufe. The latter refpects the conftruction of words, and is an offence againft fyntax: to which Dr. Campbell adds a third clafs of faults, under the denomination of *impropriety*, which is an offence againft lexicography, the bufinefs of which is to affign to every word of the language the precife meaning or meanings which ufe hath affigned to it. This impropriety occurs both in fingle words and in phrafes. Dr. Ward recounts the principal things that vitiate the purity of language. It often happens, he fays, that fuch words and forms of fpeaking, as were introduced by the learned, are afterwards dropped by them, as mean and fordid, from a feeming bafenefs contracted by vulgar ufe: and it is common to language, with all other human productions, that it is in its own nature liable to a conftant change. (Hor. Art. Poet. v. 68.) We muft, therefore, no lefs abftain from antiquated, or obfolete words and phrafes, than from fordid ones. On the other hand, we fhould refrain from new ones, or fuch, whofe ufe has not been yet fufficiently eftablifhed, at leaft among thofe of the beft tafte. Befides, any miftake in the fenfe of words or their conftruction, is oppofed to purity: for to fpeak purely is to fpeak correctly. And farther, a diftinction ought to be made between a poetic diction, and that of profe writers: for poets in all languages have a fort of peculiar dialect, and take greater liberties, not only in their figures, but alfo in their choice and difpofition of words: fo that what is a beauty in them, would often appear unnatural and affected in profe. Ward's Or. vol. i. p. 308, &c. Campbell's Phil. of Rhet. vol. i. p. 409, &c.

PURKI, in *Geography*, a town of Hindooftan, in Bahar; 33 miles N. of Ramgur.

PURLIEU. See Purlue.

Purlieu-*Woods*, fuch as formerly conftituted parts of the royal forefts, but of which the owners have obtained grants from the crown, and permiffion to disforeft them, and which not being now fubject to any of the laws or regulations by which different interefts in foreft woods are conducted, may, Mr. Donaldfon fays, be to all intents and purpofes confidered as private property. And, he adds, that

that the manner in which these woodlands are occupied is exactly the same as that of many of the royal forests, with the exception of the right of pasturage, and for that reason much more productive and beneficial. See Woods and Royal *Forests*.

PURLINS, in *Building*, those pieces of timber that lie across the rafters on the inside, to keep them from sinking in the middle of their length.

PURLUE, Purlieu, or Pourallee, formed from the French *pur*, *pure*, and *lieu*, *place*, is all that ground near any forest, which, being added to the ancient forest by our kings, was, by perambulation, granted by some of their successors, severed again from the same, and made purlieu, *i. e.* pure and free from the laws and obedience of the forest.

A purlieu, or pourallee, is defined a circuit of ground adjoining to the forest, and circumscribed with immoveable boundaries, known only by matter of record; which compass of ground was once forest, and afterwards was disafforested by the perambulations made for severing the new forest from the old.

Purlieus, or pourallees, commenced after the manner following. King Henry I. at his accession to the crown in 1154, took so much delight in the forests of this kingdom, that, not being contented with those he found here, though many and large, he began to enlarge divers of them, and to afforest the lands of his subjects nearly adjoining to the same.

His successors, Henry II. and Richard I., far from retrenching or restoring any thing, made still farther encroachments: and thus did the lands continue till the 17th year of king John; at which time, the grievance being grown notorious, and generally felt by all degrees of people, divers noblemen and gentlemen besought the king to grant, that they might have all those new afforestations made by his predecessors aforesaid, and by himself, disafforested again; and the king, after much solicitation, was at length prevailed on to subscribe and seal such articles concerning the liberties of the forest, as they then demanded; being, for the most part, such as are now contained in the Charter of the Forest.

Hereupon choice was made of divers noblemen, &c. to the number of twenty-five, who were sworn, with others their assistants, to see the said liberties, so granted and confirmed by the king, to be in every point observed.

But, before any thing was done to the purpose, king John died; and king Henry III. succeeding, fresh solicitations were made to him; who, for the better accomplishing of the said disafforestation, ordered inquisitions to be taken, by substantial juries, for severing all the new forests from the old: upon which, two commissioners were sent to take those inquisitions; in virtue whereof, many great woods and lands were not only disafforested, but were improved to arable lands by the owners thereof. After this charter was made and confirmed, some of these new afforestations were perambulated, and proper inquisitions taken, and the certainty was determined by matter of record, which were the old, and which the new: though it appears, that the greatest part of the new afforestations were still remaining during the life of king Henry III.

Under Edward I. fresh petitions and solicitations being set on foot, three bishops, three earls, and three barons, were at length appointed to see those perambulations performed and continued; who caused them to be made accordingly, and inquisitions to be taken thereupon, and returned into the court of chancery; and all those that were ancient forest to be meered, and bounded with irremoveable boundaries, to be known by matter of record for ever.

Those woods and lands, that had been newly afforested, the king likewise caused to be separated from the old, and to be returned into the chancery by marks, meres, and bounds, to be known in like manner by matter of record for ever.

Thus it appears how the purlieus, or pourallees, had their first beginning; for all such woods and lands as were afforested by Henry II. Richard I. or king John, and, by perambulations, severed from the ancient forests, were, and yet are, called *pourallees*, *q. d.* woods and lands severed from the old forests, and disafforested by perambulation; *pourallee* being the same as *perambulatio*, in Latin.

But, notwithstanding such new afforestations were disafforested by perambulation, whereby the same became pourallee, or purlieu, yet they were not thereby so disafforested as to every man, but that they do, in some sense, continue forest still as to others. For, by the words of *Charta de Foresta*, if the king has afforested any woods or lands of his subjects, to the damage of the proprietors, they should forthwith be disafforested again; that is, only as to those persons whose woods and lands they were: who, as the proper owners thereof, might fell and cut down their woods at their own pleasure, without any licence from the king; as also convert their meadows and pastures into tillage, or otherwise improve their ground to the best advantage. So also they might hunt, and chase the wild beasts of the forest towards the same, &c. But no other person should claim such benefit of hunting in the pourallee, besides the proper owner of the soil thereof, who is left at liberty to suffer the pourallee to remain forest still, as some, in effect, have thought most expedient, because hereby entitled to the benefit of the common within the forest, which otherwise they were excluded from. Hence, if the beasts chance to wander out of the forest into the pourallee, the king hath a property in them still, against every man, but the owner of the ground wherein they are, who hath a special property in them, *ratione soli*; yet so as he may only take them by hunting, or chasing with his greyhounds or dogs, without any forestalling or foresetting them in their course again towards the forest.

Beside what hitherto has been said of the difference between forest and purlieu, or pourallee, there is this farther diversity, that all the woods and lands within the regard of the forest are absolutely within the bondage or charge of the forest, as well in respect to the owners thereof, as of any other person; for no one may cut down his own woods, or improve his own lands, within the regard of the forest, without licence from the king or his chief justice in eyre of the forest. Neither shall any person hunt, chase, or molest the wild beasts of the forest in his ground, within the regard of the forest, without licence or warrant from the king, or his chief justice of the forest so to do.

But those, whose grounds are within the pourallees, are not subject to these restrictions. Yet are not the woods and lands in the pourallees absolutely freed from the bondage of the forest, in respect of the wild beasts having their haunts therein, when they happen to stray out of the forest; but as they were once absolutely forest, so they are still conditionally so.

Purlue-*Man*, or *Purlieu-man*, or *Pourallee-man*, is one who has land within the purlue; and is allowed or qualified to hunt or course within the same, though under certain restrictions.

By stat. 13 Ric. II. he who may lawfully hunt in any pourallee, ought to have woods or lands of freehold within the pourallee, to the yearly value of 40*s.* By stat. Jac. I. he ought to have lands of inheritance of the yearly value of 10*l.* or lands of freehold of the yearly value of 30*l.* or have

have goods worth 200*l.* or be the fon of a knight or baron, or perfon of a higher degree, or fon and heir apparent of an efquire. But, by a later act, Car. II. no man may keep greyhounds within the pourallee, or elfewhere, within England or Wales, unlefs he have a free warren, or be lord of a manor, or fuch a freeholder as is feifed, in his own right, or in right of his wife, of lands, tenements, or hereditaments of the clear yearly value of 40*l.* over and above all charges and reprifes of fuch eftate of inheritance; or of lands, tenements, or hereditaments, in his own right, or in right of his wife, for term of life or lives, of the yearly value of 80*l.* over and above all charges and reprifes, or that is worth in goods or chattels 400*l.*

The pourallee, or purlieu, then, is faid to be for him that is fo qualified: others, not qualified, and therefore not purlieu-men, yet having land in the pourallee, may, if they find any wild beafts of the forefts in their own grounds within the pourallee, chafe them thereout with little dogs; but not with greyhounds, or other dogs.

Nor is the purlieu-man left at large to hunt at his own difcretion; but he is tied down to feveral rules: as,

1. That he always begins his chafe in his own ground; and, that, though he finds fuch wild beafts in his own pourallee, and in refpect thereof, hath a property in them, *ratione foli,* againft all perfons, but the king; yet fuch his property is only on this condition, that he can ftay them with his dogs in chafe, without foreftalling them, before they can recover the foreft. If they be within the lift of the foreft, before the dogs faften on them, they are the king's, or other owner of the foreft.

2. But if the pourallee-man firft make his chafe in his own freehold, he may purfue the fame through every man's ground within the pourallee, and his dogs faften on a wild beaft, before he can get within the bounds of the foreft, and the beaft draw the dogs into the foreft, and is there flain by them; here the pourallee-man fhall not enter into the foreft, nor take the beaft fo killed, becaufe his courfe was irregular from the beginning, as he could claim no property in the beaft, *ratione foli.*

3. A pourallee-man may hunt in his own pourallee with no more company than his own fervants; neither may he appoint, licenfe, or warrant any other perfon, except his fervants, to hunt by his commandment in his pourallee.

4. Every pourallee-man is forbidden, by the laws of the foreft, to hunt in his own grounds within the pourallee every day, or oftener than three days in any one week, Sunday excepted.

5. Nor is any man to difturb, or make a courfe after any deer found in his pourallee, within forty days after the king hath made a general hunting in the foreft adjoining thereunto; becaufe then the wild beafts of the foreft come not into the pourallees of their own accord, but as they are forced into the fame by the hunters, with clamours, and blowing of horns, fo that they fly thither for refuge.

6. No man fhall hunt within feven miles of the borders of the foreft, or in his own pourallee, within forty days next before the king hath iffued out his proclamation, declaring his royal will and pleafure to make a general hunting in that foreft.

Inafmuch as the pourallees were once, and in fome fenfe ftill are foreft, it was neceffary to have officers to attend, and take on them the charge of the prefervation of the game that may happen to wander out of the foreft into the pourallees; fince otherwife the laws of the pourallees could not be executed, but the foreft itfelf would foon be deftroyed by the pourallee-men.

For this reafon, rangers were firft appointed, who, though not officers in the foreft, yet appertain thereto; for all officers in the foreft have charge of the vert and venifon of the foreft; but a ranger hath no charge of the vert, but only of venifon coming out of the foreft, into the pourallees, his place of charge; from whence his office is to conduct the fame back again into the foreft.

This officer is appointed by the king, or his chief juftice in eyre, and is made by patent, with a fee commonly of twenty, thirty, or forty pounds, or more, by the year, payable out of the exchequer, as alfo certain fee-deer, both red and fallow, to be taken annually, at proper feafons, out of the foreft.

The fubftance of his oath is, to rechafe, and with his hounds drive back, the wild beafts of the foreft, as often as they range out of the fame into his pourallee; to prevent all unlawful hunting and hunters of wild beafts of venery and chafe, as well within the pourallees, as within the foreft; and to prefent thofe and other offences, at the next court of attachments or fwainmote, which fhall firft happen.

Rangers, it is to be obferved, belong only to fuch pourallees as were once the woods and lands of the fubject, and were afterwards difafforefted again, and fo became pourallees. Hence, as there are fome forefts in England, which never had any enlargement by new afforeftations, and therefore have no pourallees at this day, there can be no rangers belonging to them. Manwood's Foreft Laws, part 2. c. 20. 4 Inft. 303, 4. 1 Jones's Rep. 278. Moor. 706. 987.

PURMALL, in *Geography,* a town of Hindooftan; 15 miles W.S.W. of Allahabad.

PURMERENT, a town of North Holland, on a brook of the fame name, governed by a council, bailiff, and burgomafters. The town had a voice in the affembly of the ftates; 10 miles N. of Amfterdam. N. lat. 52° 33′. E. long. 4° 46′.—Alfo, a fmall ifland near the coaft of Java, on which lies an hofpital for the difeafed poor of Batavia.—Alfo, a fmall ifland in a large bay on the N. coaft of New Guinea. S. lat. 2° 16′. E. long. 135° 12′.

PURNA. See PANNAH.

PURNEAH, a circar of Bengal, bounded on the N. by Morung, on the E. by Dinagepour, on the S. by Rajemal, and on the W. by Bahar; about 80 miles long from N.E. to S.W., and 70 from N.W. to S.E. The capital of the fame name is fituated on a river which runs into the Ganges; 200 miles N. of Calcutta. N. lat. 25° 48′. E. long. 87° 40′.

PURNITZ, a town of Moravia, in the circle of Iglau; 7 miles S.E. of Iglau.

PURPARTY (Fr. *pour part,* i. e. *pro parte*) is that part or fhare of an eftate, firft held in common by parceners, which is by partition allotted to any of them. To make purparty is to divide and fever the lands that fall to parceners, which till partition they held jointly, and *pro indivifo.* Old Nat. Br. 11.

PURPLE, PURPURA, πορφυρα, a red colour, bordering on violet; now dyed chiefly with cochineal.

Purple was much efteemed among the ancients; efpecially the Tyrian purple, which underwent more dyes than the reft, and which was almoft peculiar to the emperors and kings. Yet this purple did not exceed that now in ufe. The chief reafons why the ancient purple dye has been difufed are, that the latter is both cheaper and finer.

The ancient purple was tinged or given with the blood or juice of a precious turbinated teftaceous fea-fifh, called by the Greeks πορφυρα, and by the Latins *purpura;* of which we have defcriptions in feveral authors, and fhells in moft of the cabinets of the curious. See PURPLE-*Fifh.*

The

The method of obtaining the colour, Mr. Cole (see PURPLE-*Fish*) describes thus:

The shell, which is very hard, being broken, (with the mouth of the fish downwards, so as not to crush the body,) and the broken pieces being picked off, there appears a white vein lying transversely in a little furrow or cleft next the head of the fish.

In this vein is the purple matter lodged; some of which, being laid on linen, appears at first of a light green colour; and, if exposed to the sun, soon changes into a deep green, and in a few minutes, into a sea-green, and, in a few more, into a blue; thence it soon becomes of a purplish-red, and, in an hour more, of a deep purple red.

And here the sun's action terminates; but by washing in scalding water and soap, and drying it, the colour ripens to a most bright and beautiful crimson, which will bear washing admirably without the addition of any styptic. While the cloth marked with this colour lies in the sun, it will yield a very strong and fœtid smell, as if garlic and assa fœtida were mixed together.

The juice which gives this beautiful purple colour is, says M. du Hamel, while it remains in the body of the animal, and while that is in health, wholly white; but no sooner is it exposed to the sun, than it begins to change colour, and in less than five minutes goes through the several changes of pale green, yellowish, and a beautiful emerald green; after this it becomes of a deeper and duskier green, then blueish, reddish, and finally a deep and very beautiful purple. Sometimes the juice is found naturally green in the animal: this is probably from the creature's being in a diseased state. But when it is naturally thus, it immediately becomes red, and afterwards purple, on being exposed to the sun; its several preceding changes seeming to have been made already in the body of the animal.

If a piece of linen be rubbed over with this juice, and part of it exposed to the sun, part not, that only will turn red which is so exposed, the other remaining green without any alteration; and it is observed, that the stronger the sun shines, the quicker the change appears, and probably the colour is in proportion also the more beautiful and lively. And it is very remarkable, that if a needle, or any other opaque body, be laid upon the linen which is yet green, and is to become red on being exposed to the sun; after such an exposure, the whole shall be changed red or purple, excepting only that small spot which is covered by the needle, which will still remain green.

A plate of glass, though it be three inches thick, will not prevent the colour from changing purple by being laid over it; but the thinnest piece of metal will keep it wholly green. The one being opaque, and the other pellucid, are evidently the only reasons for this difference.

If the coloured linen be successively covered by three pieces of paper, the one blacked with ink, the other in its natural state, and the third rubbed over with oil, it will change colour on being exposed to the sun in different degrees; and that exactly in proportion to the degree of transparence in each of the papers: most of all in that which was covered with the oiled paper; something less in that covered by the paper in its natural state; and least of all in that which was covered with the blacked paper, as that is least transparent.

The common heat of a fire, or that of a red-hot iron, produces no change at all in the colour when green. The vapour of burning sulphur produces a little; but the green, which had not changed to purple by these experiments, immediately changed to it on being exposed to the rays of the sun.

These experiments were all made in the months of January and February, by M. du Hamel, in Provence; and the sun having power to change the colour so speedily there in these cold months, probably in a warmer climate or season the air would have been sufficient for the purpose, without the open sun; since it seems, from experiment, that both the solar rays, and the light alone in a cloudy day, can act upon this colour. The light and heat of the sun both act on this colour: light is always sufficient to produce the effect, but the heat may easily be too great or too little; and to do the whole in perfection, it must be at a certain middle degree.

This beautiful purple, if it can ever be brought into use in dyeing, will have one very great advantage from its viscosity. The pieces of cloth that had been stained by it retained their colour, in spite of several boilings in different liquors, which M. du Hamel made them pass through; and the colour, on examination, was found not to be superficial, but penetrated the whole body of the stuff, which was tinged by it. There are many inconveniences which must naturally attend the use of this substance as a dye, but they may, perhaps, all be got over by care and application. It is very certain, that it is of too viscid a nature easily to penetrate many substances; but it is also certain, that this might be obviated by dissolving it in some proper liquor. It appears very plainly, that the ancients had a method of thus dissolving their purple; but we neither know what was their purple, nor what was its dissolvent; nor, which would be of much more consequence to us at present, what is the proper dissolvent for our own. Mem. Acad. Scien. Par. 1736.

M. Reaumur has also discovered another very different kind of purple. This is produced in oval grains about a quarter of an inch long, full of white liquor bordering on yellow, which cover certain stones or sands, about which the buccina of Poictou usually assemble.

By the experiments M. Reaumur has made, it appears that these grains are neither the eggs of the buccinum, nor the seeds of any sea-plants, nor any rising plants, but the eggs of some other unknown fish.

These grains, being bruised on a white linen, at first only tinge it yellow, and that insensibly; but in three or four minutes they give it a very beautiful purple red, provided the linen be exposed to the open air; for the air of a room, even though the windows be open, will not do. This colour fades, however, a little by repeated washings.

M. Reaumur concludes, from some experiments he made, that the effect of the air on the liquor does not consist in its taking away any particles of it, nor in giving it any new ones, but only in its agitating it, and changing the arrangement of the parts that compose it. He adds, that the liquor of the buccinum, and that of the grains, seem to be nearly of the same nature; except that the latter is more watery, and only saline; whereas the other is hot, and pungent.

P. Labat gives us the description of another purple dye, produced by a tree growing in the Antilles. The juice of this tree, when cut standing, is of a blood-red, and communicates the same colour to cloths; though, like the former, it loses much in often washing.

PURPLE, *Dyeing*. See DYEING.

PURPLE *Gold*. See GOLD *Precipitate*, &c.

PURPLE, in *Medicine*, an epithet applied to every disease, in which eruptions of purple spots, or *petechiæ*, appear, and these being usually the accompaniments of fevers of every kind in their worst and most dangerous forms, so *purple* fever was nearly fynonimous with *putrid*, or *malignant* fever. See PETECHIÆ, and PURPURA.

PURPLE *Apple*, in *Botany*. See ANNONA.

PURPLE *Fifh*, *Purpura*, in *Natural Hiftory*, the name of a genus of fhell-fifh, the characters of which are thefe: it is an univalve fhell, jagged and befet from head to tail with fpines, tubercles, umbos, or ftriæ. The mouth is fmall and roundifh; the tail is fhort, and ufually the bafe runs out into a long beak. See DYEING.

It has been ufual with moft authors to confound together the genera of the murex and purpura, and to ufe the words as fynonimous: but though there is fome external refemblance between many of the fhells of the two genera, yet they are eafily diftinguifhed by this, that the mouth of the purpura is lefs long, and is lefs dentated and alated than that of the murex. The body and the head of the fhells of this genus are not fo elevated as thofe of the murex kind, and are not covered with points or buttons at the mouth. If a fhell is therefore found to have a fmall, fmooth, and round mouth, and a body covered with undulated leaves, as it were, like thofe of favory or endive, and fometimes with long points, and its tail, whether long or fhort, be hollowed and fomewhat bent, this may be called a purpura, and not a murex. Linnæus makes the purpura a fpecies of the murex.

The ancients diftinguifhed three kinds of purpura; one which had a long and crooked tail, made hollow like a tube or pipe; a fecond which had either no tail at all, or at the moft a very fhort one; and a third which had no fpiral head, or, as we fhould exprefs it, no clavicle.

On examining the whole family of the purpuræ, we may diftinguifh four remarkable fpecific differences among them. The firft of thefe comprehends thofe purpuræ which have the body of the fhell garnifhed with a fort of undulated foliage in clouded ridges, and have a fhort and crooked tail. The fecond comprehends thofe which have the body of the fhell covered with acute points, and have a long tail. The third comprehends thofe which have as long a tail as the former, but have a fmooth body, or at the utmoft have only a few flight protuberances and wrinkles on it. And the fourth takes in thofe which are fmall, and have an elevated clavicle, a fhort crooked tail, and the body of which is covered either with flender fpines or hairs.

This fpecies of fifh, as well as the murex, ferved among the ancients to dye the fine purple colour they were fo fond of, and fome of the buccina (*e. g.* the *lapillus* of Linnæus) have been of late found to have the fame juice. The purpura and murex are both fifhed up in great plenty in the gulf of Tarentum; but the fmall quantity of the coloured juice which each fifh contains, and the neceffity of ufing it before the animal dies, makes it impoffible to bring it to any regular article of traffic. The ancients ufed this colour only on cotton and woollen ftuffs; whereas our cochineal, which was unknown to the ancients, ftrikes equally well on filks and ftuffs. Thefe fhells are alfo found in various parts of the Mediterranean.

In the feas of the Spanifh Weft Indies about Nicoya, is found a fhell-fifh, which perfectly refembles the ancient purpura, and, in all probability, is the very fame. This fifh, Gage tells us, ufually lives feven years; it hides itfelf a little before the dog days, and continues to difappear for three hundred days running.

They are gathered plentifully in the fpring, and, by rubbing one againft another, they yield a kind of faliva or thick glair, refembling foft wax: but the purple dye is in the throat of the fifh, and the fineft part is lodged in a little white vein; the reft of the body is of no ufe. He adds, that the chief riches of Nicoya confift in this fifh. Cloth of Segovia, dyed with it, is fold for twenty crowns the ell; and none but the greateft Spanifh lords ufe it.

There are alfo found upon the coafts of the South-fea, near the equator, in the neighbourhood of point St. Helena, in the province of Guayaquil, certain fea-fnails, as Don Antonio de Ulloa calls them, fticking to the ftones, and covered by the fea at high water, about the fize of fmall nuts, which contain a liquor or juice that has the true colour of purple. The colour is very bright, and fo durable, that wafhing rather increafes than diminifhes its luftre, nor does it fade or decay by ufe and wearing. Woven ftuffs are not dyed with it, but only cotton threads. As foon as a fufficient quantity of the liquor is fqueezed from the fifh, the cotton thread is drawn through it, and it takes and retains the tincture without any farther trouble; but the purple colour is not difcovered till the thread is dry, the juice being of a milky colour at firft, but it foon changes into green, and at laft fettles in a purple.

Befides the Indian purple fifhes, we have others much nearer home. In the Philofoph. Tranfact. abr. vol. ii. p. 823, we have an account of purple fifh difcovered in 1684, by Mr. W. Cole, on the coafts of Somerfetfhire, South Wales, &c. where it is found in great abundance. The modern purple fifh, M. Reaumur obferves, is a kind of buccinum, a name given by the ancients to all fifhes whofe fhell bears any refemblance to a hunting-horn; and it appears from Pliny, that part of the ancient purple was taken from this kind of fhell-fifh: fo that this may be efteemed a recovery of what had been fuppofed entirely loft. See DYEING.

The fifh, he obferves, is good; and adds, that there are feveral kinds of it differing in fize and fhell, and alfo in the colour of the tinging liquor. There are fome found on the coafts of Poictou.

The Caribbee iflands have likewife their purple fifh. This is called *burgan*, being of the fize of the end of the finger, and refembling our periwinkles; its fhell is of a brownifh azure, its flefh white, its inteftines of a very bright red, the colour of which appears through the body; and it is this that dyes the froth, which it cafts forth when taken, and which is at firft of a violet hue, bordering on blue.

To oblige them to yield the greater quantity of froth, they lay them on a plate, and fhake and beat them againft one another; upon which the plate is immediately covered with the froth, which is received on a linen cloth, and becomes purple in proportion as it dries.

P. Labat obferves, that if this be the real Tyrian purple, the fecret of preparing and fixing it is loft; this colour being found to dwindle and diffipate, in proportion as the linen dyed with it is wafhed.

The purpura lives on other fifh. It ufually hides itfelf at a fmall depth in the fand, fometimes even in frefh-water rivers, and as it lies hid, it thrufts up a pointed tongue, which wounds and kills any thing that comes over it. We frequently find fea-fhells with round holes bored through them, as regularly as if made with a boring inftrument: thefe are generally allowed to be made by the tongue of the purpura, in order to its feeding on the fifh within.

The purpura has two horns like that of a fnail; and Fabius Columna fays, that they have eyes in thefe, not placed at the ends, as in the fnail, but in the middle of each horn.

The purpura is a fhell-fifh very well known, and has been known alfo in almoft all times to afford a purple liquor; but as there has been no method difcovered of bringing this liquor into ufe in dyeing, the fifh has been neglected, and its juice never attempted to be brought into ufe.

PURPLE-*Wort*, in *Botany*, a name given to feveral fpecies of trefoil.

PURPRESTURE, in our *Ancient Law Books*. See POURPRESTURE.

PURPRISUM, of the French *pourpris*, denotes a clofe, or inclofure: alfo the whole compafs or extent of a manor or place.

"Donavi eis meum purprifum de Kirkeham, & domos meas, & molendinum, & prata, &c." Charta Walteri Efpec. Priorat de Kirkeham.

PURPURA, PERSIAN, the fame with the Perfian fhell, a fpecies of dolium.

PURPURA, in *Medicine*, in the nomenclature of cutaneous difeafes propofed by Dr. Willan, fignifies an eruption of purple fpecks and patches, that is of *petechiæ*, *ecchymomata*, and *vibices*, accompanied with general debility, but not always with fever.

Under this limitation, the purpura is fynonimous with the "petechiæ fine febre" of fome medical writers, (fee Rombergius, Ephem. Natur. Curiof. dec. iii. ann. 9 and 10, obf. 108; and Dr. Graaf, Diff. Inaug. de Petechiis fine Febre, Gött. 1775); with the "hæmorrhæa petechialis" (fee Dr. Adair, Diff. Inaug. Edin. 1789, and Dr. Bateman, Diff. Inaug. ibid. 1801); with the "land-fcurvy," &c. of others. Riverius, Diemerbroeck, Sauvages, Cullen, and one or two others, appropriated the term *purpura* in like manner to *petechial* fpots only, and rightly excluded from this appellation all other eruptions of a character effentially different.

In thus limiting the acceptation of the term, however, it is proper to mention, that in the writings of many phyficians it is applied to various other eruptive difeafes, which have no affinity with petechial blotches, and very little with each other. Thus, under the name of purpura, the red-gum, or ftrophulus, is defcribed by Etmuller,—the fcarlet fever by Schultz and Juncker,—the meafles by Hafenreffer and Morton,—the nettle-rafh, miliary veficles, and lichen, by Hoffmann and others. See Willan on Cutan. Dif. p. 452.

The purpura occurs under various degrees of violence, which induced Dr. Willan to make two fpecies, which he denominated *fimplex* and *hæmorrhagica*, according as the eruption occurred alone, or with difcharges of blood. It is impoffible, however, to draw fo diftinct a line, where nature prefents no clear difference. We can only ftate that, in the milder degrees, there is an eruption of petechiæ only, chiefly appearing on the extremities and breaft, and feldom affecting the face. The complexion is generally pallid or fallow, and there is a confiderable degree of debility and languor, and fometimes pains in the limbs.

In the more fevere cafes of the difeafe, the failure of ftrength is confiderably greater, and often precedes, for fome time, the appearance of the eruption. The fpots commonly appear firft on the legs, where they are ufually the largeft and moft numerous, and are often accompanied with anafarcous fwellings. When they firft appear, they are of a bright red hue, but they gradually become purple or livid, and when about to difappear, they change to a brown or yellowifh hue; fo that in the progrefs of the difeafe, as the fpots appear and fade in fucceffion, the fkin prefents a confiderably variegated appearance. In the more fevere forms, the petechiæ are intermixed with *ecchymofes* and *vibices*, or livid patches and ftripes, refembling the effects of a bruife, or of the ftrokes of a whip. In this ftate, fometimes, when thefe patches do not appear fpontaneoufly, the gentleft preffure on the fkin, fuch as is applied in feeling the pulfe, will produce a purple blotch, like that which follows a fevere blow.

When the difeafe is ftill more fevere, in addition to thefe effufions of blood under the cuticle, confiderable difcharges of blood take place from thofe parts which are defended by a very delicate cuticle; whence thefe hæmorrhages originate particularly from the internal paffages and organs, and are occafionally very profufe, endangering, and occafionally deftroying life. Moft frequently, however, the bleeding is flow, and in fmall quantity, fometimes almoft a conftant oozing, and fometimes returning at intervals. Thefe hæmorrhages take place from the gums, noftrils, throat, the infide of the cheeks, the tongue, and lips; fometimes from the lining membrane of the eye-lids, the urethra, and the external ear; and often from the internal cavities, the lungs, ftomach, bowels, kidnies, uterus, and bladder. There is great variety, however, in the periods of the difeafe at which the hæmorrhages commence and ceafe, and as to the proportion which they bear to the cutaneous efflorefcence.

This fingular difeafe occafionally appears fuddenly, in the midft of good health, attacking during the night. It is always accompanied by great feeblenefs and depreffion of fpirits; and often by pains in the cheft, loins, or abdomen, by irregularity of bowels, or by cough; and the pulfe is fometimes flightly quickened and very feeble, as in a moderate hectic. But in fome cafes thefe functions are not perceptibly difturbed. The duration of the difeafe is equally uncertain: in fome inftances it has terminated in a few days, while in others it has continued not only many months, but years. When it terminates fatally, it is commonly in confequence of a copious hæmorrhage, either fuddenly from fome important organ, or more flowly from feveral parts at the fame time.

The caufes of this difeafe are not clearly afcertained, nor its pathology well underftood. It occurs at every period of life, and in both fexes; but moft frequently in women, and in boys before the age of puberty, particularly in thofe who are of a delicate habit, who live in clofe and crowded fituations, and on poor diet, or are employed in fedentary occupations, and fubject to grief, anxiety, fatigue, and want of fleep. It has likewife attacked thofe who are left in a ftate of debility by previous acute and chronic difeafes, as after meafles or fmall-pox, or during confinement in the puerperal ftate, or after a violent falivation from mercury. On the other hand, however, the difeafe appears occafionally in its moft fevere and fatal form, where none of thefe circumftances had previoufly exifted: for inftance, in young perfons living in the country, and fuffering no privation of any of the comforts of life, and previoufly enjoying good health. This fact tends greatly to obfcure the pathology of the difeafe: for it renders the operation of thefe alleged caufes extremely queftionable, and feems to eftablifh an effential difference between purpura and fcurvy, in the origin and nature of the morbid actions which conftitute the difeafe. In fcurvy (by which we mean the *fcorbutus*, or true fcurvy, formerly prevalent among feamen in long voyages, and among people in befieged towns, and other fituations, when living upon putrid, falted, dried, or otherwife indigeftible food, yielding imperfect nutriment,) the refteration of the proper nourifhment, with the ufe of frefh vegetables and acids, invariably removes the fymptoms, and they never commence where fuch diet can be obtained: while, in many cafes of purpura, this diet has been taken abundantly, without the fmalleft alleviation of the complaint, and the difeafe has come on, where there had been no deficiency. "On the other hand, the rapidity of the

the attack, the acuteneſs of the pains in the internal cavities, the actual inflammatory ſymptoms that ſometimes ſupervene, the occaſional removal of the diſeaſe by ſpontaneous hæmorrhage, the frequent relief derived from artificial diſcharges of blood, (ſee two caſes of purpura by Dr. Parry, Edin. Med. and Surg. Journ. for Jan. 1809), and from purging, all tend to excite a ſuſpicion that ſome local viſceral congeſtion or obſtruction is the cauſe of the ſymptoms in different inſtances." (Bateman's Practical Synopſ. of Cutan. Diſ. p. 110.) Several facts in proof of theſe obſervations are ſtated in the work juſt quoted; but a ſufficient number has not yet been collected to afford any general inference reſpecting the nature of the diſeaſe.

The cure of purpura is, therefore, not eſtabliſhed upon any clear principle, and there has been conſiderable difference of opinion upon the ſubject. Dr. Willan has given a very imperfect view of this point. All that he ſays relative to the cure of the worſt form of purpura, is compriſed in theſe few lines. "In the treatment of this diſeaſe, we ſhould recommend moderate exerciſe in the open air, a generous diet, and the free uſe of wine, Peruvian bark, vitriolic acid, &c. Without air, exerciſe, and an eaſy ſtate of mind, the effect of medicines is very uncertain." (On Cutan. Diſeaſes, p. 461.) Of this, indeed, he has given an ample proof in the next ſentence, where he tells us that a patient "took for *two or three months* Peruvian bark in conſiderable quantities, the vitriolic and marine acid, and wine, without much advantage." In truth, the cure of purpura is, we believe, not to be effected by theſe means. In the ſlighter degrees of the diſeaſe, occurring in children who are ill fed and nurſed, and excluded from the air and from all exerciſe, theſe tonics may ſeem to do good, when combined with air and exerciſe. "But," as Dr. Bateman obſerves, "when it occurs in adults, eſpecially in thoſe already enjoying the benefits of exerciſe in the air of the country, and who have ſuffered no privation in reſpect to diet; or when it appears in perſons previouſly ſtout, or even plethoric; when it is accompanied with a white and loaded tongue, a quick and ſomewhat ſharp, though ſmall, pulſe, occaoſinal chills and heats, and other ſymptoms of feveriſhneſs, however moderate;—ſymptoms which may be preſumed to indicate the exiſtence of ſome local congeſtion; —then the adminiſtration of tonic medicines, particularly of wine, cinchona, and other warmer tonics, will be found inefficacious, if not decidedly injurious. In ſuch caſes, free and repeated evacuations of the bowels, by medicines containing ſome portion of the muriate of mercury, will be found moſt beneficial. The continuance or repetition of theſe evacuants muſt, of courſe, be regulated by their effects on the ſymptoms of the complaint, or on the general conſtitution, and by the appearance of the excretions from the inteſtines. If the pains are ſevere and fixed, and if the marks of febrile irritation are conſiderable, and the ſpontaneous hæmorrhage not profuſe, local or general blood-letting may doubtleſs be employed with great benefit, eſpecially in robuſt adults." Pract. Synopſis, before quoted, p. 114.

The importance of free purgation in purpura has been clearly ſtated in a ſhort but valuable communication from Dr. Harty, of Dublin, publiſhed in the Edinburgh Medical and Surgical Journal, for April, 1813: in more than a dozen caſes treated in this manner by Dr. Harty, the hæmorrhages ceaſed, and the purple ſpots diſappeared, after a few doſes of calomel and jalap had been taken. In the two caſes related in the ſame uſeful journal by Dr. Parry, of Bath, before alluded to, and which were ſpeedily cured by two bleedings from the arm, the blood drawn exhibited a tenacious contracted coagulum, covered with a thick coat of lymph, as in diſeaſes of an inflammatory nature. The patients were a lady and an officer, the latter of whom was accuſtomed to free living: in both caſes ſome degree of feveriſhneſs accompanied the purpura.

There is one variety of the diſeaſe, which Dr. Willan diſtinguiſhed as a third ſpecies, by the title of purpura *urticans*, becauſe the eruption commences in the form of rounded and reddiſh elevations of the cuticle, reſembling the wheals of nettle-raſh; but they are not accompanied by the ſame ſenſations, tingling and itching, which belong to the nettle-raſh. Theſe little tumours gradually dilate; but within one or two days they ſubſide to the level of the ſurrounding cuticle, and at the ſame time their hue becomes darker and at length livid, or purple. As theſe ſpots are not permanent, but appear in ſucceſſion in different places, they are commonly ſeen of different hues; the freſh and elevated ones being of a brighter red, while the level ſpots exhibit different degrees of lividity, and become brown as they diſappear. They are moſt common on the legs, where they are frequently mixed with petechiæ; but they ſometimes appear on other parts of the body.

The duration of the purpura urticans is various, from three to five weeks, in the courſe of which time the hands and ankles are affected with œdematous ſwellings: there is alſo a diſtreſſing degree of languor and debility, and a loſs of appetite, but ſeldom hæmorrhage. It generally appears in ſummer and autumn, affecting thoſe who are expoſed to fatigue, and live on poor diet, and delicate young women of indolent and luxurious habits. The ſame precepts, as to treatment, are applicable to this as to the other varieties of purpura.

When purple ſpots occur as ſymptomatic of bad fevers, they require no peculiar treatment. They are much leſs frequent concomitants of fevers than they were formerly; a circumſtance which is probably to be aſcribed partly to the more liberal uſe of purgatives at preſent in all febrile diſeaſes, and partly to the more free admiſſion of freſh air, to the ſuperior cleanlineſs, &c. now obſerved in theſe maladies. The appearance of theſe ſpots has been occaſionally noticed by various authors in agues, remittent fevers, palſies, dropſy, and atrophy. Dr. Willan obſerves, that in the laſt ſtage of pulmonary conſumption they ſometimes occur as the immediate forerunners of death. (See Petechiæ.) For hiſtories and caſes of purpura, ſee Duncan's Med. Comment. vols. xiv. and xx. and Med. Caſes and Obſerv. p. 90. Annals of Medicine, vol. ii. Memoirs of the Med. Society of London, vol. iii. art. 20; and vol. iv. art. 17. Medical Tracts and Obſ. vol. ii. Willan's Reports on the Diſeaſes of London.

PURPURATI, in our *Ancient Hiſtorians*, denote the ſons of emperors and kings.

PURPURE, Pourpre, or *Purple*, in *Heraldry*, according to ſome, is one of the five colours of armories, mixed or compounded of gules and azure, bordering on violet; and, according to others, of a little black and much red colour. It is, by the heralds, ſuppoſed a ſymbol of temperance, liberality, dignity, authority, faith, and piety. Moſt authors in heraldry, as Favyn, Geliot, Monet, and Meneſtrier, do not allow purple for a colour, in regard it is not ſimple, but compoſed of a mixture of other colours. They rather eſteem it a kind of intermediate tincture, ſometimes metal, and ſometimes colour: hence the Spaniards call it *una miſtion:* ſo that one cannot lay it on metal and colour without falſifying the arms.

Add, that many take the purple, as it is accounted, on many ancient bearings, by which ſome of the moderns would evince the regularity and legitimacy of this colour in armory, to be no other than filver tarnifhed.

Spelman, however, in his Afpilogia, allows purple the preference before all other colours, as having been an enfign of royalty for many ages; yet even he allows it to have been excluded, by the ancient heralds, as only an imperfect colour.

It is reprefented in engraving, by diagonal lines drawn from the finifter chief to the dexter bafe point. In the coats of noblemen it is called *amethyft;* and in thofe of princes, *Mercury.*

PURPURINA, a name ufed by Caneparius, and fome other authors, for the aurum mofaicum, or aurum mufivum of the fhops, the prefent preparation of which differs from that of that author only in the proportions of the ingredients.

PURPURISSUS, in the *Ancient Writers*, both Greek and Roman, the name of a compound colour or fucus of a fine purplifh red, ufed to paint women's cheeks.

It feems by the compofition to have been fomewhat like our rofe pink, as it is called by the colourmen. It was made of the creta argentaria, or fine white kind of chalk, diffolved in a ftrong purple tincture of fome of the roots of wood which dyed red; and when the coarfer part was fubfided to the bottom of the veffel, the liquor, while yet thick, was poured off into another veffel; and what fubfided from this, which was as fine as flour, was of a beautiful pale purple, and was the purpuriffus faved for ufe.

PURREL, anno 35 Eliz. cap. 10. a lift ordained to be made at the ends of kerfeys, to prevent deceit in diminifhing their length.

PURRONGUR, in *Geography*, a town of Hindooftan, in the circar of Bilfa; 20 miles S.E. of Bilfa.

PURROWNAH, a town of Hindooftan, in Oude; 28 miles E. of Gooracpour. N. lat. 26° 57'. E. long. 84° 17'.

PURRUAH, a fmall circar of Bengal, about 16 miles in circumference; N. of Mauldah.—Alfo, a town of Bengal, and chief town of the faid circar; 26 miles E.S.E. of Burdwan. N. lat. 23° 4'. E. long. 88° 25'.

PURSAH, a town of Hindooftan, in Bahar; 18 miles N.W. of Chuprah.

PURSAUMMAH, a town of Hindooftan, in Bahar; 35 miles E. of Durbungah.

PURSE, a manner of accounting; or, as fome call it, a fpecies of money of account, much ufed in the Levant, particularly at Conftantinople, where it is 500 afpers; three afpers being equal to a para, and forty paras equal to a piaftre, called by the Turks grouch, and by the Englifh dollar. By the regulations of 1780, the purfe of 500 piaftres was to weigh $2812\frac{1}{2}$ Turkifh drams. A fingle piaftre weighed $5\frac{5}{8}$ drams, or 277 Englifh grains; and the other pieces in proportion. Their ftandard of finenefs was reduced at the fame time to 50 carats (or hundredth parts) of fine filver, and 50 of alloy: which gave the value of the piaftre at $19\frac{1}{4}d.$ fterling, and the other filver coins in proportion. But fince that period the Turkifh coins have undergone a deterioration, fo that a piaftre of the lateft coinage being weighed and affayed by the king's affay mafter of the Mint, appeared to be in weight 8 dwt. 6 gr.; in finenefs, 5 oz. 6 dwt. worfe than the Englifh ftandard. This gives its finenefs 47 carats 2 grains Turkifh, and its value, in fterling, $13\frac{1}{8}d.$ Kelly's Un. Cambift.

This money of account is called purfe, becaufe all the grand fignior's treafure in the feraglio is kept in leather bags of this value.

In this, however, there is fome difference; for the purfe in Egypt is 25,000 medinis, or 75,000 afpers; and in other parts of Turkey it is only 20,000.

This method of accounting the Turks derive from the Greeks, and they from the Romans; the emperors of which brought it to Conftantinople, as appears from a letter of Conftantine to Cecilian, bifhop of Carthage, quoted by Eufebius and Nicephorus. See Follis.

Purse-*Net*, in *Rural Economy*, a net ufed for taking both hares and rabbits at certain times; and three or four dozen of them are fufficient to lay over their holes: they are to be faftened, by tying ftrings to fticks thruft into the earth, otherwife when the rabbits bolt out, they will run away and get out of the nets; but when the nets are fixed, and all things are in order, there muft be one or two perfons to lie clofe, to fee what game comes home; while, in the mean time, you beat the bufhes, to force them homewards. But another way to take rabbits with thefe nets is, at their coming out of their parraces: and they fhould be fecreted in this manner. Firft hunt them up and down, to force them all in, then put in a ferret, with a bell about her neck, which gives the rabbit notice of her coming, who, in endeavouring to avoid the ferret, runs into the net.

PURSER, an officer aboard a man of war, appointed by the lords of the admiralty, who receives her victuals from the victualler; and is to take care that it be in good condition, and well laid up and ftowed. He is alfo to fee that they are carefully diftributed to the officers and crew, according to the inftructions which he has received from the commiffioners of the navy for that purpofe. To him alfo belongs the diftribution of flops, &c.

He is alfo to keep a lift of the men and boys belonging to the fhip, and to fet down, exactly, the day of each man's admittance into pay; that the paymafter or treafurer of the navy may iffue out his difburfements, and pay off the men according to the mufter-book.

PURSIVENESS, or Pursiness, among *Farriers, thicknefs of wind*, a name common to all thofe difeafes in horfes which arife from obftructions in the paffages of the lungs.

Purfivenefs, fometimes alfo called *broken wind*, may proceed from an ulcer, or fome inward walling of the lungs, in which the fmall veffels are worn or abraded by the fharpnefs or acrimony of the common difcharges.

The like diforder may alfo arife from a ftagnation, hindering the air from penetrating fo as to lift up the lungs in the act of refpiration; or from fome tough and mucilaginous matter feparated in the branches of the wind-pipe.

The ufual occafions are cold, furfeits, and other difeafes not thoroughly carried off. Purfive diforders may alfo arife from unwholefome food, bad air, and hard riding when a horfe is full. The figns are commonly a heaving and beating of the flanks; a wheezing and rattling. Sometimes the kernels about the throat will fwell, and there will be a glandulous running at the nofe, which is the utmoft ftage of the difeafe, and ufually reputed defperate.

PURSLANE, in *Botany*. See Portulaca.

Purslane, *Horfe*. See Trianthema.

Purslane, *Sea*. See Atriplex.

Purslane *Tree*. See Portulacaria.

Purslane, *Water*. See Peplis.

PURSOTTUMPOUR, in *Geography*, a town of Hindooftan, in Bahar; 35 miles W.S.W. of Arrah.

PURSOYAH, a town of Hindooftan, in Bahar; 25 miles W.S.W. of Gayah.

PURSUIVANT. See Poursuivant.

PURSUR, in *Geography*, a town of Hindooftan, in Oude; 13 miles N. of Mahomdy.

PURVER, Anthony, in *Biography*, was born at Up-

 Hurfborn,

Hurſborn, in Hampſhire, about the beginning of the 18th century. His education was extremely limited, but he exhibited a ſtriking proof of his capacity for learning while he was very young; for, being prevented by illneſs from attending ſchool almoſt ſix weeks, he applied, by himſelf, during that time, with ſuch diligence and ſucceſs to the ſtudy of arithmetic, that upon his return to ſchool he was able to explain the proceſſes of evolution to his maſter, whoſe attainments had not carried him ſo far. At this time of life he exhibited great powers of memory, by committing to it twelve of the longeſt chapters in the bible in as many hours. He was put apprentice to a ſhoe-maker, who was alſo a dealer in ſheep, and employed Anthony a good deal in looking after his flock. This was not by any means an irkſome buſineſs, as it afforded him an opportunity for reading the ſcriptures, to which he was particularly attached. As he advanced in years, he found that his favourite book contained doctrines that were very differently interpreted by different perſons, and he was reſolved to ſtudy the Old and New Teſtament in their original languages. Having renounced the occupation for which he was originally intended when he was about twenty years of age, he commenced teacher in a ſchool, but afterwards removed to London, for the ſake of more eaſily acquiring the means of proſecuting his ſtudies. Here he probably reſided in 1727, when he publiſhed his work, entitled "The Youth's Delight." While at London he became a Quaker, and officiated among the friends in the character of a miniſter. He returned to Hurſborn, and reſumed his ſchool in 1727, and probably continued it for ſome time, during which he began to tranſlate the books of the Old Teſtament, from the original Hebrew. While thus employed, he felt it his duty to become a miſſionary, and travelled through ſeveral counties of the kingdom, till he came to Stambrook, near Briſtol, towards the latter part of the year 1738. Here he reſided at the houſe of a maltſter, whoſe ſon he inſtructed in claſſical learning, while he devoted his leiſure to his favourite employment of tranſlating the ſcriptures. In 1746 he made an attempt to publiſh his tranſlation of the Old Teſtament in numbers; but for want of encouragement he did not proceed beyond two or three numbers. When he had completed the tranſlation of the whole bible, he could find no bookſeller who would embark in the publication. Thus was the labour of thirty years likely to be loſt, till Dr. Fothergill made him a preſent of 1000*l.* for the copy, and took upon himſelf the expence of printing the work. Under his auſpices, it made its appearance in the year 1764, with the title of "A new and literal Tranſlation of all the Books of the Old and New Teſtament, with Notes critical and explanatory," in 2 vols. folio. It was the author's intention to have publiſhed a ſecond edition, with various corrections and alterations, but he did not live to accompliſh the deſign. He died in 1777, about the age of 75. Purver was deſcribed by Dr. Fothergill as "a man of great ſimplicity of manners, regular conduct, and a modeſt reſerve: he is ſteadily attentive to truth, hates falſehood, and has an unconquerable averſion to vice; and to crown the portrait, he is not only greatly benevolent to mankind, but has a lively ſenſe of the divine attributes, and a profound reverence of, and ſubmiſſion to, the Supreme Being." Gent. Mag.

PURVEYANCE. See Pourveyance.

PURVEYOR. See Pourveyor.

PURVIEW, from the French, *pourveu*, *a gift*, *grant*, *proviſion*, &c. a term frequently uſed, by ſir Edward Coke, for the body of an act of parliament, or that part which begins with *Be it enacted*, &c. as contradiſtinguiſhed from the *preamble*.

The ſtatute of 3 Hen. VII. ſtands upon a preamble and a purview. 12 Rep.

PURULENT, Purulentus, in *Medicine*, ſomething mixed with, or partaking of, pus or matter.

Phthiſical people frequently ſpit a purulent matter. In a dyſentery, the ſtools are purulent: when there is an ulcer in the reins or bladder, the urine is purulent.

PURUSHA, in *Mythology*. See Parusha.

PURUZ, in *Geography*, a river of La Plata, which riſes about S. lat. 17° 20′, taking the name of "Rio Beni," and afterwards called "Amaru-Mayu," or "The Serpent:" from S. lat. 12° its courſe is not aſcertained till it comes to S. lat. 6°, after which it aſſumes the name of Puruz, and runs into the river of the Amazons, or Maranon, S. lat. 3° 44′. W. long. 45° 6′. Its whole courſe is northerly about 800 miles.

PURWAR, a town of Hindooſtan, in Lahore; 14 miles S. of Sealcot.

PURYSBURG, a handſome town of South Carolina, in Beaufort diſtrict, which diſtrict contains 25,887 inhabitants, on the E. ſide of Savannah river, 37 miles from the ocean, and 20 from Savannah. It derives its name from a Swiſs, John Peter Pury, who ſettled a colony of his countrymen here about the year 1735, with a view to the culture of ſilk. The mulberry-trees are ſtill ſtanding, and ſome attention is paid to the raiſing of ſilk. The town contains between 40 and 50 dwelling-houſes, and an epiſcopal church; 64 miles W.S.W. of Charleſtown. N. lat. 32° 23′. W. long. 81° 12′.

PUS, from πυον, *matter*, the fluid contained in abſceſſes, and diſcharged from ulcerated ſurfaces, and ſometimes from membranous ſurfaces which are merely inflamed, and quite free from ulceration, as is illuſtrated in caſes of gonorrhea, empyema, &c. Pus is formed by a peculiar proceſs, which is termed *ſuppuration*, of which we ſhall have occaſion to ſpeak in a future volume of this work.

In the preſent place, we ſhall content ourſelves with inſerting a few obſervations on the qualities and uſes of pus, chiefly taken from the writings of Mr. Hunter.

True pus has certain properties, which, when taken ſingly, may belong to other ſecretions, but which, conjointly, form the peculiar character of this fluid, *viz.* globules ſwimming in a fluid, which is coagulable by a ſolution of ſal ammoniac, which no other animal ſecretion is, and, at the ſame time, a conſequence of inflammation.

The colour and the conſiſtence of pus are the two qualities which firſt attract the notice of every, the moſt ſuperficial, obſerver. The colour ariſes from the largeſt portion of this fluid being compoſed of very ſmall round bodies, very much like thoſe little globules which, ſwimming in a fluid, make cream. The fluid in which the globules of pus ſwim, we might at firſt ſuppoſe to be the ſerum of the blood, for it coagulates with heat, like the latter fluid. Pus is alſo probably mixed with a ſmall quantity of coagulating lymph; as it partly coagulates after it is ſecreted.

The fluid part of pus, however, is known to have properties which ſerum has not. There being a ſimilarity between pus and milk, experiments have been made to aſcertain whether the fluid of pus could be coagulated with the gaſtric juice of animals; but no coagulation could be effected in this manner: a ſolution of ſal ammoniac made the fluid part of pus coagulate; but not any other ſecretion, or natural fluid; and hence it was concluded, that whenever globules were found swimming in a fluid, coagulable by fal ammoniac, the matter was to be confidered as pus.

The proportion which the white globules bear to the other parts of pus, depends on the health of the parts producing the difcharge. When the globules are very abundant, the matter is thicker and whiter, and is called healthy pus; the meaning of which is, that the folids, which produced it, are in good health; for thefe appearances in the matter are no more than the refult of certain falutary proceffes going on in the folids, the effect of which proceffes is to produce the difpofition, on which both fuppuration and granulation depend.

Pus is fpecifically heavier than water, and is probably about as heavy as blood.

Befides the above properties, pus has a fweetifh mawkifh tafte, very different from that of moft other fecretions, and the fame tafte takes place, whether it is pus from a fore, or an irritated inflamed furface.

Pus has a fmell in fome degree peculiar to itfelf; but this differs in different cafes. Some difeafes, it is faid, may be known by the fmell, as, for inftance, a gonorrhœa.

Pus finks in water; mucus floats. Pus communicates to water an uniformly troubled white colour; mucus gives the appearance of ftringy portions floating in it. Mucus is faid to be more readily diffolved by fulphuric acid than pus is. It has alfo been afferted, that if water be added to fuch folutions, the pus is precipitated to the bottom of the veffel; while the mucus, inftead of being completely precipitated, forms fwimming flakes. A folution of cauftic alkali diffolves both pus and mucus; but when water is added, the pus is faid to become feparated, but not the mucus.

Though folutions in chemical menftrua and precipitations have been thought a teft of the diftinction between thefe two fluids; yet the method has been thought abfurd and unphilofophical. It has been conceived, that all animal fubftances whatever, when in folution, either in acids or alkalies, would be in the fame ftate, and therefore, that the precipitation would be the fame in all. Calcareous earth, when diffolved in muriatic acid, is in that acid in the fame ftate, whether it has been diffolved from chalk, limeftone, marble, or calcareous fpar, and precipitations from all are the fame. Hence experiments were made on organic animal matter, fuch as mufcle, tendon, cartilage, liver, and brain; and on inorganic, fuch as pus and the white of an egg. All thefe fubftances were diffolved in fulphuric acid, and precipitated with the vegetable alkali. Each precipitation was examined with fuch magnifiers as plainly fhewed the forms of the precipitates, all which appeared to be flaky fubftances. The precipitate by the volatile alkali had exactly the fame appearance. The fame appearances were feen when the above kinds of animal matter were diffolved in the vegetable cauftic alkali, and precipitated with the muriatic acid. A flaky fubftance, void of any regular form, compofed each precipitate.

Pus does not irritate the particular furface which fecretes it, though it may be irritating to any other. Hence no fuppurating furface, of any fpecific kind, can be kept up by its own matter. If this had not been the cafe, no fore of a fpecific quality, or producing matter of an irritating kind, could ever have been healed. This is fimilar to every other fecretion of ftimulating fluids, as the bile, tears, &c. which fluids do not ftimulate their own glands or ducts, but are capable of ftimulating any other part of the body.

Whenever a real difeafe attacks either the fuppurating furface or the conftitution, the production of true pus ceafes, and the fluid becomes changed in fome meafure, in proportion to thefe morbid alterations. In general it becomes thinner and more tranfparent, and it partakes more of the nature of the blood, as is the cafe in moft other fecretions under fimilar circumftances. *Sanies* is the term ufually applied by furgeons to pus in this degenerated ftate. This unhealthy fort of matter has more of the ferum, and frequently more of the coagulating lymph in it, and lefs of the combination, which renders it coagulable by a folution of fal ammoniac. It has alfo a greater proportion of the extraneous parts of the blood, which are foluble in water, fuch as falts; and it has a greater tendency than true pus to become putrid. Such unhealthy matter may even be irritating to the furface which produces it.

The difcharge, when of an irritating fort, is more ftimulating to the adjoining parts with which it comes in contact, than to its own fecreting furface. In this manner it frequently produces excoriation of the fkin and ulceration. Thus the tears excoriate the fkin of the cheek, in confequence of the quantity of falts which they contain. From this effect, matter has been called corrofive, a quality which it has not; the only property which it poffeffes being that of irritating the parts which it touches, fo as to caufe their abforption.

When the veffels thus lofe the power of producing good pus, they alfo lofe more or lefs the power of forming granulations. This may depend on fome deviation from the due ftructure and action which fuch veffels fhould poffefs, in order to be qualified for the performance of thefe two operations.

Pus, from feveral circumftances, would appear in general to have a greater tendency to putrefaction than the natural juices have; but, perhaps, this is not the cafe with pure pus, which, when firft difcharged from an abfcefs, is commonly perfectly fweet. There are, however, fome exceptions to this, but thefe depend on circumftances entirely foreign to the nature of pus itfelf. Thus, if the abfcefs had any communication with the air, while the matter was confined in it; or if the collection has been fo near the colon, or rectum, as to have been infected by the feces, then we cannot wonder that the matter fhould become putrid. When blood is blended with pus; when floughs are mixed with it; when the parts forming the feat of the abfcefs are in a gangrenous ftate from an eryfipetalous affection; the matter has a greater tendency to putrify than the pure pus difcharged from found abfceffes, or healing fores. Pure matter, though eafily rendered fufceptible of change by extraneous additions, is in its own nature tolerably uniform and immutable. It appears fo unchangeable, that we find it retained in an abfcefs for weeks, without having undergone any alteration. Thefe qualities, however, only belong to perfect pus.

In the preceding paragraph it is ftated, that matter remains very often unchanged in abfceffes for weeks. This expreffion of Hunter's is not ftrictly correct; for it is well known, that the furfaces of the cavities of abfceffes are always abforbing, as well as fecreting ones; confequently there muft be a continual mutation going on in the contained matter.

When there are difeafed bones, or other extraneous bodies, exciting irritation, fometimes even to fo great a degree as to make the veffels bleed, and often wounding the veffels of the part, the matter is always found to be very offenfive. This ftate of the difcharge is one mark of a difeafed bone.

The

The discharge of an unhealthy sore blackens silver probes, and preparations of lead. This effect is imputed by Dr. Crawford to the sulphurated hydrogen gas generated in the matter. Phil. Transf. vol. lxxx. for the year 1790. p. 391, &c.

Use of Pus.—By some it is supposed to carry off humours from the constitution. Suppuration is sometimes regarded as a constitutional disease, changed into a local one, which constitutional malady is discharged, or thrown out of the body, either in the form of pus, or together with this fluid. Critical abscesses have been thought to be cases of this sort. Suppuration has also been imagined to carry off local complaints from other parts of the body, on the old principle of derivation or revulsion. For this reason, sores or issues are made in sound parts before allowing other sores to be dried up. Suppuration is sometimes excited with a view of making parts, such as indurated swellings, dissolve into pus; but we have endeavoured to shew that no dissolution of the solids is concerned in the production of pus.

A secretion of pus is looked upon as a general prevention of many, or of all, the causes of disease. Hence issues are made to keep off both universal as well as local diseases. However, the use of pus is perhaps unknown; for it is formed most perfectly from healthy sores, and in healthy constitutions; and large discharges from parts not very essential to life, produce very little change in the constitution, and as little upon being healed up, whatever some may suppose to the contrary.

This is certainly the case with many old ulcers, the suppuration from which seems to have little or no effect in impairing the health. Nor is there any real reason to be afraid of healing such ulcers, when possible, lest a worse disease should follow from the stoppage of the discharge, to which the system is supposed to be habituated so much, that the continuance of such discharge is essential to health.

Every one knows, that when there is no interference of art, that is, when the surface of a sore is left uncovered, the thin part of the matter evaporates, and the thick part dries and forms a scab. Nature, therefore, seems to have designed, that one use of pus should be to make a cover or protection for ulcerated surfaces.

Among the secondary uses of suppuration may be mentioned, opening a communication between a disease and the external surface of the body; forming a passage for the exit of extraneous bodies, &c.

PUSA, in *Geography*, a town of Hindoostan, in Bahar; 12 miles E. of Hajypour.

PUSBACH, a town of Germany, in the principality of Culmbach; 12 miles S. of Culmbach.

PUSCHENGA, a river of Russia, which rises in lake ...rus, in the government of Archangel, and runs into the ...nega near Kevrol.

PUSCHIAVO, a town of Switzerland, in the Grisons, from which is derived the name of one of the jurisdictions ...ded by the duke of Milan, in the year 1436. The greater number of the inhabitants consists of Roman Catholics. The town lies three miles N. of a lake of the same name, abounding in fish, and distant 14 miles S.W. of Bormio, and is situated 17 miles W.S.W. of the same town, and 20 miles E. of Chiavenna.

PUSCHIMA, a town of Russia, in the government of Novgorod; 40 miles N.N.E. of Bielozersk.

PUSHAN, in *Mythology*, a name for Surya, a personification of the sun, among the Hindoos, and a name also of their god Siva.

PUSHENG, in *Geography*. See KOOSHINJEE.

PUSHERS, a name given to Canary birds when new flown. See BRANCHER, and CANARY *bird*.

PUSHING, in *Geography*, a considerable town of Persia, in the province of Khorasan, a little to the N. of Herat, built on the banks of the Herirood, and celebrated for the beauty of the cypress trees which grow in its vicinity.

PUSHPADANVA, in *Mythology*, one of the names of the Hindoo deity Kama, the cupid of their mythology. It means with a flowery bow; his bow, which is made of a sugar cane, having its string composed of flowers and bees. See KAMA.

PUSHPAKA, the name of a flowery car, in which the Hindoo Plutus, named Kuvera, is conveyed. See KUVERA.

PUSILLATUM, a word used by some medical writers to express a coarse powder, or any medicinal substance, beat into small pieces for infusion, or the like purposes.

PUSTING, in *Geography*, a town of Hungary, on the Waag; eight miles N.N.W. of Leopoldstadt.

PUSTOMERZ, a town of Moravia, in the circle of Brunn; 16 miles E.N.E. of Brunn.

PUSTOZIRSK, a town of Russia, in the government of Archangel, near the Petchora. N. lat. 67° 15'. E. long. 51° 14'.

PUSTULE, PUSTULA, in *Medicine*, a small elevation of the cuticle, upon an inflamed base, containing *pus*.

Pustules originate from an inflammation of the skin, and the consequent partial effusion of purulent matter under the cuticle, by which the latter is elevated into small circumscribed tumours. Pustules are of various sizes, sometimes very minute, and sometimes extending to half an inch in diameter; and they terminate either in small ulcerations, or more commonly in scabby crusts. Dr. Willan constituted an order of cutaneous diseases under the head of *pustules*, including five genera, impetigo, porrigo, ecthyma, variola, and scabies; but he never completed this part of his work, a brief compendium of which has been drawn up by Dr. Bateman. (See his Practical Synopsis of Cutaneous Diseases, 1813.) See also IMPETIGO, PORRIGO, SMALL-POX, and ITCH.

By many writers the use of the word *pustule* is very general, including not only *purulent* elevations of the skin, but vesicles and even pimples; and it must be admitted that the best ancient authority sanctions even a more extensive acceptation of the word, including even wheals, "quæ ex urticâ vel sudore nascuntur." (Celsus, lib. v. cap. 28.) But not only the etymology (quasi *pus tulit*), but accuracy of language would lead us to limit the term to *purulent* eruptions, as in the above definition, and as some correct writers have done. See Prof. Arnemann, Comment. de Aphthis. Linnæus, Gen. Morbor. class xi. ord. 4, &c.

PUSTVOLA, in *Geography*, a river of Asiatic Turkey, which runs into the sea of Marmora; 16 miles W. of Artaki, in the province of Natolia.

PUSU, in *Botany*, the name of a famous plant growing in China, and greatly esteemed there. This and the ginseng these people a long time kept to themselves; but at length it was discovered, that the one was esteemed a certain prolonger of life, and the other a preservative against all diseases.

They, in their manner of speaking, say, that the pusu gives immortality. We have not been so happy to obtain any of this famous plant for the trial, but the ginseng having been brought over, and found not to possess those great virtues they ascribe to it, and the people in China, who are possessed of the pusu, dying, as well as those who have it not, we find, that the virtues of both are so greatly exaggerated

exaggerated by the eaftern dialect, that there is not much to be expected from them.

PUSULA, in *Geography*, a town of Sweden, in the province of Nyland; 37 miles N.N.W. of Helfingfors.

PUT, in the *Manege*, called in French *mettre*, is ufed for the breaking or managing of a horfe: thus,

To put a horfe to corvets, or caprioles, is to teach him thofe parts of the manege.

To put a horfe upon his haunches, called in French *affeoir*, is to make him bend them handfomely in galloping in the manege, or upon a ftop. See HAUNCHES.

To put a horfe to the walk, trot, or gallop, is to make him walk, trot, or gallop.

To put a horfe under the button, fee BUTTON.

PUTAGE, PUTAGIUM, in our old *Law Books*, denotes whoredom or fornication on the part of a woman.

The word is formed from the French *putte, whore; putagium*, q. d. *putam agere*. "Quod autum generaliter folet dici, putagium hæreditatem non adimit; illud intelligendum eft de putagio matris; quia filius hæres legitimus eft, quem nuptiæ demonftrant." Glanv. lib. vii. cap. 12.

PUTALA, in *Geography*. See PATELI.

PUTALLOM, a town on the coaft of Ceylon, near Calpenteen, remarkable for its falt-pans. This place, before the arrival of Europeans on the ifland, fupplied the natives with falt; and on account of its convenient fituation, was pitched upon by the Dutch for the manufacture of the falt with which they fupplied the king of Candy's dominions, according to the articles of their treaty with him. The falt-pans are formed by an arm of the fea which overflows part of the country between Putallom and Calpenteen. A very large quantity of falt was manufactured here by the Dutch; they looked upon it as of the higheft importance to their interefts in the ifland, and the moft formidable weapon which it was in their power to employ againft the native king, as it was impoffible for him to procure any but through their means. Since the Britifh have obtained poffeffion of the ifland, this manufacture has been almoft entirely neglected. It is capable, however, of being rendered very profitable, as it is the only one of the kind on this fide of the ifland, and the moft conveniently fituated for fupplying the king of Candy's dominions. The Dutch enacted very fevere laws to prevent individuals from manufacturing or trading in this article; the government taking upon itfelf the management of the works, and the care of fupplying both its own fubjects and the Candians. In order to keep a conftant check on the latter, the Dutch were careful not to allow them too great a quantity at once; and whatever remained at Putallom, after fupplying the demands of each year, they deftroyed, that it might not be feized upon by furprife.

PUTANGES, a town of France, in the department of the Orne, and chief place of a canton, in the diftrict of Argentan; nine miles N.W. of Argentan. The place contains 502, and the canton 11,934 inhabitants, on a territory of $212\frac{1}{2}$ kiliometres, in 31 communes.

PUTANISM, PUTANISMO, an Italian term, naturalized by fome Englifh writers, fignifying *whoredom*, or the life or condition of a courtezan.

The word we borrow immediately from the French, *putanifme*; and they from the Italian *puttana, whore*; of *putta, girl*.

PUTAO, in *Geography*, a town on the S. coaft of the ifland of Luçon. S. lat. 13° 6′. E. long. 123° 28′.

PUTATIVE, SUPPOSITIVE, fomething reputed to be what it really is not.

The word is feldom ufed but in the phrafe putative father. Thus we fay, Jofeph was the putative father of Jefus Chrift.

PUTAVERI, in *Biography*, a native of Otaheite, brought into France by the circumnavigator Bougainville: of whom a gentleman, who had refided a confiderable time in Italy, and was an excellent judge of mufic, affured us that the effects of French mufic, when fairly tried upon him immediately on his arrival, were not thofe of rapture, but ridicule. He danced to it, indeed, as we would to a marked meafure beat on a drum or a table; for as foon as he returned from the great opera, whither he was carried, he mimicked what he had heard and feen in the moft natural and ridiculous manner poffible; giving the company a fpecimen of the French opera, which was the moft admirable parody imaginable of French finging, or rather of the fcreams and howlings at the Académie Royale de la Mufique in the time of Louis XV. Our friend wifhed to try the effects of Italian mufic upon this demi-favage native of Otaheite; but there was no opportunity, for how could it be properly executed at Paris? However, according to the late lord marfhal, the experiment had been fairly made on another occafion.

A young Greek lady being brought from her own country to Paris, fome years fince, was, foon after her arrival in that city, carried to the opera by fome French ladies, fuppofing, as fhe had never heard cultivated mufic, that fhe would be in raptures at it; but, contrary to thofe expectations, fhe declared that the finging only reminded her of the hideous howlings of the Calmuc Tartars, and as to the machinery, which it was thought would afford her great amufement, fhe proclaimed her diflike of many parts of it, and was particularly fhocked by what fhe called the impious and wicked imitation of God's thunder. Soon after this experiment fhe went to Venice, where another trial was made on her unprejudiced ears, at an Italian opera, in which the famous Gizziello fung, at whofe performance fhe was quite diffolved in pleafure, and was ever after paffionately fond of Italian mufic.

PUTAWATAMES, or POOTOOTAMIES, in *Geography*, Indians who inhabit between St. Jofeph's and Detroit in North America, and can furnifh about 500 warriors. There are two tribes of this name, the one of the river St. Jofeph, and the other of Huron. At the treaty of Greenville, Auguft 3d, 1795, they ceded lands to the United States, who paid them a fum of money, and engaged to give them goods to the value of 1000 dollars *per annum*, for ever.

PUTBUS, a town and fort of the ifland of Rugen; five miles S. of Bergen.

PUTCABARY, a town of Hindooftan, in Bengal 45 miles S.E. of Moorfhedabad.

PUTEA, in *Ancient Geography*, a town of Africa propria, S. of Adrametum, between Campfa and Caraga, according to Ptolemy.—Alfo, a town of Syria, in the Palmyrene, between Oriza and Abada. Ptol.

PUTEAL, among the Romans, a fmall kind of edific raifed in the place where a thunder-bolt had fallen. Se BIDENTAL.

PUTELKAW, in *Geography*, a town of Pruffia, i the province of Ermeland; fix miles S.W. of Frawer burg.

PUTEMAHRY, a town of Hindooftan, in Bengal 16 miles N. of Kifhenagur.

PUTEOLANUS PULVIS. See POZZOLANA.

PUTHLOSE, or PUTLOS, in *Geography*, a town the duchy of Holftein; four miles N.W. of Oldenburg.

PUTI, or POTI, a town of the principality of Guri at the mouth of the Rione, on the Black fea; 80 miles W.S.W. of Cotatis. N. lat. 42°. E. long. 41° 28′.

PUTICULI, among the Romans, ditches or holes in the earth, a little without the Efquiline gate, in which the poorer fort of people were buried.

PUTIGNANO, in *Geography*, a town of Naples, in the province of Bari; 33 miles S.E. of Bari.

PUTIVLI, a town of Ruffia, in the government of Kurfk, on the Sem; 72 miles W.S.W. of Kurfk. N. lat. 51° 20′. E. long. 34° 14′.

PUTLACH, a town of Bavaria, in the bifhopric of Bamberg; five miles E. of Goffweinftein.

PUTLITZ, or PUDLITZ, a town of Brandenburg, in the Mark of Pregnitz; 10 miles N. of Perleberg. N. lat. 53° 16′. E. long. 12° 3′.

PUTLOGS, or PUTLOCKS, in *Building*, fhort pieces of timber, about feven feet long, ufed in building fcaffolds. They lie at right angles to the wall, with one of their ends bearing upon it, and the other upon the ledges or poles which ftand parallel to the fide of the wall of the building.

PUTNA, in *Geography*, a town of Moldavia; 32 miles W. of Suczava.—Alfo, a river of Moldavia, which runs into the Milcow, at Focfani.

PUTNAM, a county of America, in the fouthern diftrict of Georgia, containing 6809 free perfons, and 3220 flaves. Its chief town is Eatonton.

PUTNEY, a town of America, in Windham county, and ftate of Vermont, containing 1607 inhabitants.

PUTNEY, a village and parifh in the weft half hundred of Brixton, and county of Surrey, England, is fituated on the fouth bank of the river Thames, at the diftance of four miles from Hyde Park corner, London. The parifh contains 1630 acres, of which the greater proportion is an open common or heath. In the time of the civil wars it was the fcene of fome very interefting tranfactions. The parliamentary army lay at Putney, for a confiderable time, in the year 1747; and here the general officers, after long debates in the church, completed their propofitions for the future government of the kingdom, and fent them to the king at Hampton Court. Here alfo were born two celebrated ftatefmen, Nicholas Weft, bifhop of Ely, and Thomas Cromwell, earl of Effex, the protegée of Wolfey, and the fucceffor to his power and misfortunes. In this parifh are many agreeable villas; in one of which the late illuftrious William Pitt breathed his laft. The church was originally built as a chapel of eafe to Wimbledon, not long after the conqueft; but was, in a great meafure, re-erected in the reign of Henry VII. It is a fmall edifice, with a ftone tower at the weft end. A little chapel at the eaftern extremity of the fouth aifle, built by bifhop Weft, is, however, its chief ornament. Monuments and infcriptions are numerous, but few of them deferve notice. Over the Thames, in this parifh, is a wooden bridge, conftructed in the year 1729, at the expence of 23,975*l.* and yielding a revenue, by tolls, to the proprietors, of above 3000*l.* *per annum.* A fifhery here was poffeffed by the lord of the manor, previous to the conqueft; and is now rented for a confiderable fum. All fturgeons and porpufes are claimed by the lord mayor of London, but the fifhermen receive 13*s.* for each of the former, and a guinea for each of the latter, when delivered to the water bailiff. On the common ftands an obelifk, erected, in 1786, in memory of Hartley's invention for fecuring buildings againft fire.

According to the parliamentary returns of 1811, this parifh contains 492 houfes, and 2881 inhabitants. Lyfons's Environs of London, vol. i. 1795. Supplement, 1811.

PUTNOK, a town of Hungary; 36 miles W.N.W. of Tokay.

PUTORIUS, in *Zoology*, the *Pole-cat*, a fpecies of *Muftela*; which fee. See alfo POLE-CAT.

PUTORIUS *Serpens*, a name given by fome to that fpecies of ferpent called by others *dryinus*.

PUTREFACTION, or PUTRIFACTION, in *Chemiftry*, is a fpecies of *fermentation* (which fee); being the laft ftage of the fermentatory procefs, and confifting not merely in the decompofition and tranfpofition of the particles of putrefying fubftances, whether animal or vegetable, by which new combinations are produced, but alfo in the extrication and expulfion of fome of the conftituent parts of thefe fubftances.

This decompofition or derangement of the conftituent parts of vegetable fubftances is ufually called *fermentation*, and that of animal bodies, is denominated *putrefaction*. The agents that produce both kinds of decompofition, and the circumftances that attend them are, in various refpects, very fimilar, and the chief difference of the products that are obtained from both depends upon the diverfity of their conftituent parts. The procefs of putrefaction, and its effect in diffolving the combination of the conftituent parts of bodies, are fufficiently obvious to fenfe; but the rationale of the procefs, and the mode in which gafeous and volatile compounds are feparated from bodies that are diforganized and afterwards form new combinations, are ftill involved in confiderable obfcurity; and different writers have difagreed in their explication of them. Several facts, however, are univerfally acknowledged; and of thefe we fhall give a brief account in the fequel of this article, together with a detail of fome of thofe principles and theories that have been adopted for explaining them. Becher long ago obferved, in his "Phyf. Subt. l. i. §. 5." that air is the principal agent of decompofition, but that water and heat very much facilitate its action. Thus he fays, "Fermentatio ergo definitur quod fit corporis denfioris rarefactio, particularumque aërearum interpofitio; ex quo concluditur debere in aëre fieri nec nimium frigido, ne rarefactio impediatur; nec nimium calido, ne partes raribiles expellantur."

An animal fubftance may be preferved from putrefaction by depriving it of the contact of the air; and this procefs may be accelerated or retarded by varying or modifying the purity of the fame fluid. When we obferve putrefaction occurring without the accefs of atmofpherical air, the effect is produced by the water which impregnates the animal fubftance, becomes decompofed, and affords the element and the agent of putrefaction. Hence it appears, that moifture is an indifpenfible requifite to facilitate putrefaction. A moderate degree of heat is alfo a condition favourable to animal decompofition.

Dr. Hales, it is well known, afcribed the cohefion and folidity of bodies to the air, which exifts in them in a fixed ftate, and forms, as he expreffes it, the cement or bond of union between their feveral conftituent particles. To this purpofe he obferves, that air abounds much more in folid than in liquid bodies; and that folid bodies being generally denfer than water, the attraction of the air of thefe folid bodies in a fixed ftate, and its repulfion when in an elaftic ftate, are greater than the attraction and repulfion of the lighter watery particles in a fixed and in an elaftic ftate; and hence the particles of air are fitter to be the principal bond of union in folid bodies, than the particles of water. This opinion was afterwards adopted by baron de Haller, who maintains, that air is the *vinculum elementorum primarium*, or the true cement which binds together the earthy particles

particles of bodies. Mr. Macbride, as we have elsewhere shewn, has taken occasion, by a variety of experiments, to illustrate and establish this opinion; and in support of it he alleges, that the preservation of firmness and soundness in bodies depends on restraining the escape of that principle, since known by the name of fixed air, and which he supposes to be the immediate cause of cohesion: for the moment it flies off and resumes its elasticity, the other constituent particles, *viz.* the earthy, the saline, the oily or inflammable, and the aqueous, being thereby put in motion, immediately begin to exert their several peculiar attractive and repulsive powers, and run into new combinations, which first change, and at length altogether destroy the texture of the substance they formerly composed; provided that this substance contained in itself a sufficient quantity of water to allow of the intestine motion, by giving the proper degree of fluidity; for without fluidity there can be no intestine motion; and without intestine motion there can be no change of combination: because we see that such animal and vegetable bodies as are suddenly deprived of their water, or naturally contain very little, are almost as durable and unchangeable in their texture as minerals. Hence Acosta observes, that in Peru, and others have observed the same in Egypt, where it very rarely rains, every thing will continue a long time uncorrupted; unless we should rather ascribe this effect to the abundance of nitrous salt in the air of those places, which is known to resist putrefaction. Indeed all putrefactions, both of animal and vegetable bodies, are affirmed by the learned Boerhaave to be performed by means of water alone. Take, says he, a pound of fresh flesh, and keep it in a heat like that of our body, and, in a few days the putrefaction will be completed; but if you first drain out, or exhale, all the watery part from the same in some chemical vessel, though the salt and oil remain, the flesh will harden like a stone, and may be kept for ages without putrefaction. Though when thus hardened, water poured on it, or even the common dew, will soon set it a putrefying. Thus Villaris and Cazalet of Bourdeaux, as Chaptal informs us, dried meat by means of stoves, which was preserved for several years without contracting any bad flavour.

By such means, bread, flesh, or the like foods, may be preserved for many ages; provided regard be had to the place. Hence it is that in dry countries, as Egypt, dead carcases never putrefy, but dry and harden uncorrupted: as we see also in the mummies found buried under the sand.

The sands and light porous earths preserve human bodies by exhausting their juices and drying the solid parts. Hence it is, that entire caravans have been discovered in Arabia, consisting of men and camels, preserved in the sands under which the impetuous winds have buried them. In the library of Trinity college, Cambridge, a human body may be seen in a perfect state, which was found under the sand in the island of Teneriffe. Hence substances putrefy much more slowly when exposed to a drying wind, than in a sheltered place.

Nevertheless, too much humidity impedes putrefaction. To this purpose Becher observes: "Nimia quoque humiditas a putrefactione impedit, prout nimius calor; nam corpora in aqua potius gradatim consumi quam putrescere, si nova semper affluens sit, experientia docet: unde longo tempore integra interdum submersa prorsus a putrefactione immunia vidimus; adeo ut nobis aliquando speculatio occurreret, tractando tali modo cadavera anatomiæ subjicienda, quo diutius a fœtore et putrefactione immunia forent." Accordingly it is necessary, that in order to a body's putrefying by moisture, that the water should impregnate but not inundate it. It is also necessary, that it should remain in the texture of the animal body, without being renewed; for thus the lymph is dissolved, and the most putrescible substance is presented to the air with the greatest extent of surface; and the water itself is decomposed, and by this means affords the putrefactive principle.

Even human blood, which, naturally, is so prone to putrefaction, if you deprive it of its watery part, may be kept for fifty years. Goat's blood, we actually find kept so long in the shops, without corrupting; though, if you dissove it in water, and expose it to a gentle warmth, it will putrefy immediately. Blood is said to be the most putrescent animal substance that is known; and this property is ascribed partly to its fluidity and partly to the large quantity of fibrin and uncondensed albumen, which it contains, and especially to the former. See Blood.

We shall here add, that animal substances seem to be (cæteris paribus) more putrescent in proportion to the number of constituent parts which they contain. The substances either absolutely or nearly imputrescible are bone and condensed albumen, the latter being such as exists in cuticle, nail, hair, &c. which long remain unaltered in the midst of putrefying substances. Animal oil also putrefies with great difficulty, and hence the people that live in the most northern parts of America, the Esquimaux and others, preserve fish and meat to a certain degree from putrefaction by immersion in fish-oil.

In putrefaction there is a great intestine motion, which, when carried to an extreme, and when the putrefying substance is much compressed, is accompanied with heat and smoke, and sometimes flame. However, M. Beaumé affirms, that putrefaction is not attended with any sensible heat: when, indeed, it proceeds slowly, and the quantity of putrefying matter is but small, the heat, if any, is very little. That putrescent substances emit light, is an unquestionable fact; and on this principle philosophers account for the luminousness of the sea, the ignis fatuus, &c. To this purpose M. Ant. Martin (Swed. Abhad. vol. xxiii. p. 225, cited by Dr. Priestley, in his History of Light, &c. p. 576.) observes, that human bodies have sometimes emitted light about the time they begin to putrefy; and that the walls and roof of a place in which dead bodies had often been exposed, had a kind of dew or clamminess upon them, which was sometimes luminous. And he imagines, that the lights which are said to be seen in burying grounds may be owing to this cause. It has been observed, that heat extinguishes the light of putrescent substances; Mr. Canton, attending to this circumstance in some experiments for ascertaining the cause of the luminousness of the sea, remarks, that though the greatest summer-heat is well known to promote putrefaction, yet twenty degrees more than that of the human blood seems to hinder it; for putting a small piece of luminous fish into a thin glass ball, he found that water of the heat of one hundred and eighteen degrees would extinguish its light in less than half a minute; but that on taking it out of the water, it would begin to recover its light in about ten seconds: but it was never afterwards so bright as before. See Light.

It has been observed, that a temperature from about forty degrees to the highest natural heat is favourable to the putrefaction of animal matter, whereas a freezing temperature is known to stop putrefaction, as it is the custom in cold countries to bring victuals frozen to market, and in this state they are kept for any length of time without any other preparation; and besides, bodies of men or of other animals remain unaltered under ice for many weeks. We might

might allege many other circumſtances of a ſimilar nature. On the other hand, a ſcorching heat alſo prevents putrefaction; probably by expelling the moiſture which is eſſential to the proceſs, becauſe by an inferior degree of heat putrefaction is promoted. The influence of temperature on animal putrefaction is thus ſtated by Becher: "Aër calidus et humidus maximè et putrefactionem facit—corpora frigida et ſicca difficulter, imo aliqua prorſus non putreſcunt: quæ ab imperitis proinde pro ſanctis habita fuere; ita aër frigidus et ſiccus, imprimis calidus et ſiccus, a putrefactione quoque preſervat: quod in Hiſpania videmus, et locis aliis calidis, ſicco, calido aëre præditis, ubi corpora non putreſcunt et reſolvantur; nam cadavera in oriente in arena, imo apud nos arte in furnis, ſiccari, et ſic ad finem mundi uſque à putredine præſervari, certum eſt: intenſum quoque frigus à putredine præſervare: unde corpora Stockholmiæ tota hyeme in patibulo ſuſpenſa ſine putredine animadvertimus." From the facts already ſtated, we may deduce the moſt effectual means of preventing, and increaſing putrefaction, and alſo of modifying it at pleaſure. A body may be preſerved from putrefaction by depriving it of the contact of atmoſpherical air: for this purpoſe nothing more is required than to place the body in a vacuum, or to envelope it in a covering, which may defend it from the immediate action of air; or alſo to envelope it in an atmoſphere of ſome gaſeous ſubſtance, which does not contain vital air. Putrefaction may alſo be favoured by keeping bodies at a ſuitable temperature. A degree of heat from between ſixty-five and ninety degrees diminiſhes the adheſion of the parts, and favours the action of the air; but if the heat be greater, ſays Chaptal, it volatilizes the aqueous principle, dries the ſolids, and retards the putrefaction. Hence it is inferred, that for the decompoſition of an animal ſubſtance, it is neceſſary that it ſhould have the contact of atmoſpheric air, and that the purer the air is, the more ſpeedy will be the putrefaction: that it be expoſed to a moderate degree of heat: and that its texture be impregnated with humidity.

The moſt ſudden and remarkable changes produced upon a body by putrefaction, are upon its colour, ſmell, and taſte. Fleſh beginning to putrefy, is well known to exhale very ſoon after a penetrating fœtid ſmell, its colour becomes pale, then inclining to blue, and afterwards livid and black, and its taſte nauſeous. Tranſparent liquor, as urine and broth, during putrefaction, becomes alſo turbid: as the putrefaction advances, the ſmell becomes more and more fœtid, and it alſo acquires great pungency, which is cauſed by a large quantity of volatile alkali, diſengaged from thoſe ſubſtances that are completely putrefied. Solid bodies, whilſt they are putrefying, ſwell, become ſoft, loſe the coheſion of their parts, and are laſtly reduced to a very diſagreeable putrid pulpy maſs: the fluids become turbid, and the effluvia are loathſome and ſickening, and after a time a putrid gas is diſengaged in a ſlow but ſenſible efferveſcence. A foul and brown ſerum then ſweats out from the pulpy maſs, and about this time the effluvium is very ſenſibly ammoniacal, which is indicated by its effects on the eyes and throat, and by forming a white vapour with muriatic acid gas. For ſome time a large part of the putrid ſubſtance is evaporated, and carried off in the putrid gas and diſperſed in the atmoſphere, after which the extreme fœtor ſubſides; and finally the proceſs of putrefaction ceaſes, and leaves a kind of fat fœtid earthy matter. All the gaſes certainly known to be produced by putrefaction, are carbonic acid, carburetted hydrogen, ſulphuretted and phoſphuretted hydrogen, and ammonia; but either theſe, or ſome of theſe, muſt be conſiderably changed by the ſolution of the animal matter; or ſome compound not yet examined, muſt be produced in that ſtate of putrefaction, when the gas evolved occaſions ſuch dreadful effects upon thoſe that have the misfortune to fall in the way of it, even when diluted conſiderably with common air. This is ſaid to be the caſe when the abdomen of a large animal is firſt burſt, after ſome days or perhaps weeks of putrefaction; the gas from which cauſes inſtant fainting, and ſometimes death, and even when the perſon expoſed to it receives the firſt ſhock, it leaves exceſſive debility and other alarming ſymptoms for a conſiderable time. The moſt deleterious gas that is known is, perhaps, carburetted hydrogen, but the effects of this, as obtained by chemical means, are far ſhort of thoſe above-mentioned, when equally diluted. The generation of ammonia has been ſatisfactorily accounted for, ſince the diſcovery of the conſtituent parts of the volatile alkali, by the new combination formed between the azote of the animal matter, and the hydrogen, of which latter there are many ſources, and particularly that of the decompoſition of water. As ammonia is always produced during putrefaction, it ſeems rational to ſuppoſe, that one important purpoſe of the moiſture neceſſary to the proceſs, is to afford, by its decompoſition, the hydrogen of the volatile alkali. The nitrous acid is alſo an undoubted product of putrefaction; but farther experiments and facts are neceſſary for explaining the reaſon, why in ſome caſes the azote tends to unite with oxygen to form this acid, and in others with hydrogen to form ammonia. For an account of the peculiar changes which animal fleſh undergoes, by which it is converted into a ſpermaceti-like ſubſtance, inſtead of paſſing through the uſual proceſs of putrid decompoſition, we refer to the article Adipocire.

Sir John Pringle has obſerved, that, as all the humours of all animal bodies become thinner by putrefaction, ſo the ſolid or fibrous parts are thereby relaxed, and rendered more tender: and hence the extraordinary bulk of the heart, liver, and ſpleen, incident to perſons labouring under putrid diſeaſes, may be accounted for. It is remarkable, that in diſſections of perſons who die of the plague, the heart is almoſt always found of an uncommon magnitude; and as to the ſcurvy, the liver and ſpleen are ſometimes enlarged to ſuch a degree, that the tumour may be ſeen outwardly.

From matters completely putrefied may be obtained by diſtillation volatile alkali, ſome liquid and ſome ſolid; a pungent fœtid oil, which at firſt is thin, and afterwards becomes more thick; and a reſiduum of coal, not eaſily reducible to aſhes. Some writers on this ſubject have apprehended, that putrid ſubſtances are not to be regarded as alkaline. Sir John Pringle, finding from the experiments which he made in the year 1750, that ſyrup of violets was not changed into a green colour by the ſerum of putrid blood; that this ſerum did not make any efferveſcence, when ſpirit of vitriol was poured upon it; that water, in which corrupted fleſh had been for ſome time infuſed, neither efferveſced nor changed the colour of the ſyrup; and that alkaline ſalts, both fixed and volatile, powerfully oppoſe putrefaction; was led to adopt this opinion. But when he became acquainted with the experiments made by M. J. Bapt. Gaber of Turin (Acta Taurinenſ. vol. i. p. 78, &c.) he embraced with the liberality of a true philoſopher, the firſt opportunity of acknowledging his miſtake. M. Gaber, having poured a drop or two of aqua fortis upon bile, taken out of the gall-bladder of a perſon who had died of an inveterate jaundice without a fever, and whoſe body had lain about twenty-four hours in a cold place in winter, found, that the mixture immediately efferveſced, became ſenſibly warm, and that ſeveral air-bubbles roſe to the ſurface. He alſo expoſed the remainder of this bile in three open glaſſes

 to

to the thirty-fifth, twenty-fifth, and tenth degrees of heat, indicated by Reaumur's thermometer, and at the end of twenty-four hours mixed them with acids; and he found, that the bile which had been placed in a degree of heat anſwering to thirty-five, was moſt dilated, and gave very ſlight indications of effervefcence; that which had ſtood in twenty-five was alſo dilated, and the acid produced a more ſenſible effervefcence, but ſtill very ſlight; and the bile which had been expoſed only to the temperament of the air, varying from ſeven to ten, preſerved its tenacity, and fermented as much as that in his firſt experiment. Having mixed ſome blood, taken out of a vein of the dead body at the ſame time, and which appeared to be of the yellowiſh-red, with ſpirit of nitre, the mixture effervefced, but in a much leſs degree than the bile: this mixture, being left to digeſt for ſome hours, a yellow ſerum ſeparated from the blood, and covered its whole ſurface; and the blood, being ſubjected to the ſame heat as the bile, and for the ſame time, appeared more diſpoſed to effervefce than the bile, though this diſpoſition afterwards gradually diminiſhed. From theſe experiments the ingenious writer infers, that in diſeaſed bodies the humours may become ſo alkaleſcent as to effervefce with acids: that a very ſlight degree of putrefaction and fœtor, which is not ſufficient to produce alkaleſcence out of the body, will produce it in the body; that alkali formed in the body, and contained in the bile, is extremely volatile, ſince the heat of twenty-five degrees made a great part of it evaporate; and that the ſame alkali contained in the blood, being a little more entangled with other elements, is conſequently leſs volatile, ſince the ſame degree of heat continued for the ſame time, diſſipated but a very inconſiderable part of it: and, therefore, that the different phenomena taken notice of by thoſe who have proſecuted experiments of this kind, ſome of whom affirm that they have ſeen undoubted proofs of the preſence of an alkali, and others that they have ſcarcely diſcovered any ſuch indications at all, are the effects of different degrees of heat, the ſtaleneſs of the ſubſtance expoſed to the heat, or the different volatility of the alkali ariſing from its coheſion with other principles. Having made ſimilar experiments upon healthy bile, blood, and ſerum, and ſubmitted them to the action of mineral acids, he found the bile moſt diſpoſed to effervefce; that human bile was more diſpoſed to effervefce than the bile of an ox; that corrupt blood ferments with acids ſtill ſlower; and that ſerum ferments ſlower than blood. He alſo obſerved, that putreſcent humours not only effervefce with mineral acids, but with very weak diſtilled vinegar: and that thoſe humours that have been expoſed to artificial heat, become fœtid and effervefce ſooneſt, and ſooneſt arrive at the laſt ſtage of fermentation; in which caſe the fermentation ceaſes, though the heat is continued; and the ſmell, which till then is intolerably fœtid, becomes herbaceous, and is not diſagreeable. The fœtor, he ſays, manifeſts itſelf ſooner and laſts longer than the alkaleſcence.

M. Gaber farther obſerves, in relation to the experiments of ſir John Pringle, that at the degree of heat to which he expoſed putreſcent ſubſtances, and which was equal to the hundredth degree of Fahrenheit, correſponding nearly to the thirtieth degree of Reaumur, animal humours very ſoon become putrid; but that they as ſoon loſe the alkaleſcence which they derive from putrefaction, if this degree of heat is continued: ſo that as the corrupting humours manifeſt their alkaleſcent quality only for a very ſhort time, it might eaſily happen that no ſign of alkaleſcence appeared in his experiment, if it was not made in the critical moment, *i. e.* if he examined the putreſcent humours a little before the alkali was formed, or a little after it had evaporated. And he, therefore, apprehends, that if ſir John Pringle's experiments were made with a degree of heat juſt equal to his own, the reſult, *cæteris paribus*, muſt have been the ſame.

From other experiments this writer infers, that blood received from the arm, agitated and left to putrefy, does not putrefy ſo ſoon, nor ſo ſoon manifeſt ſigns of alkaleſcence, as the red part ſeparated from the ſerum, becauſe the ſerum putrefies more ſlowly than any other animal humour; and that the alkali, which evaporates with a degree of heat from twenty-five to twenty-eight of Reaumur, being collected in a receiver, will effervefce, and that the reſiduum is a maſs extremely fœtid, wholly deſtitute of alkali, and, conſequently, that no effervefcence is to be expected by pouring acids upon it. Having kept ſome blood in a glaſs veſſel cloſe ſtopped, he found that it retained its alkaleſcence a long time, though expoſed to a degree of heat equal to twenty-five; but upon unſtopping the veſſel, it flew off with great violence, in an extremely fœtid vapour. Theſe exploſions he attributes to the expanſion of the air, in conſequence of the putrefaction; and hence he deduces the reaſon, why the humours that are contained in the veſſels of a human body become alkaleſcent while they are yet ſcarcely fœtid, although when drawn from the body, and kept in open veſſels, they become fœtid, before they give ſigns of alkaleſcence. As ſoon as they begin to form alkali in the veſſels, the alkali is retained; but as it exhales from veſſels expoſed to the air, a greater quantity muſt be formed than exhales before it can become ſenſible. Having collected the diſtilled liquor of blood in ſuch a ſtate of putreſcence as to effervefce with acids, and expoſed it to the action of various acids, a violent effervefcence enſued; and when poured upon ſyrup of violets, it produced as fine a green as ſpirits of hartſhorn; and this tincture, having been changed into a red by the effuſion of a few drops of aqua fortis, became again blue, upon pouring into it ſome more of the diſtilled liquor; whence he concludes, that putreſcent humours form a true alkali, which exhales with a very ſlight heat. From other experiments he infers, that the alkali of putreſcent ſubſtances is not the productive cauſe of their fœtor, becauſe the latter remains when the former is departed. But as both appear in the ſame degree of heat, when long continued, it appears, he ſays, that this fœtor is produced by the effluvia of parts extremely volatile, but different from volatile alkali, which, though ſooner produced, are more ſlowly diſſipated. Alkaleſcence, however, may be ſometimes connected with a ſlight fœtor; and, on the contrary, extreme fœtor may ſubſiſt without alkaleſcence. And this fact confirms the obſervation of ſir John Pringle, who found a difference between the fœtid and alkaline particles; ſince the exhalations of freſh urine are not pernicious, though they contain more alkali than any ſubſtance in a ſtate of putrefaction, the odour of which is pernicious in the higheſt degree; and, therefore, putrid effluvia are of a different nature from alkaline ſalts. M. Gaber farther adds, by way of inference from this fact, that a volatile alkali is not a neceſſary product of putrefaction, and that the degree of alkaleſcence is not equal to that of putrefaction. Dr. Crell, profeſſor of chemiſtry at Brunſwick, has objected to this doctrine, as not conformable to the phenomena (Phil. Tranſ. vol. lxi. part i. art. 39.); for he ſuppoſes, that as all ſmell depends on a ſaline matter joined with phlogiſton, and the ſaline matter producing the putrid ſtench was very probably not an acid, it muſt be a volatile alkali, which, involved in phlogiſtic matter, might fly off before the alkali was developed. From ſome experiments made with a view of aſcertaining this fact, he infers that the volatile alkali is preſent as long, at leaſt, as the putrid ſmell continues, and that this volatile alkali is the baſis of it; becauſe, as this was diftilled over in his experiments, the refidue, being ftill in inteftine motion, required only the herbaceous fmell. The reafon why the volatile alkali has been diftinctly obferved at a certain period of putrefaction, and not in the other, he apprehends to be this: the volatile alkali has, it feems, a tendency to difentangle itfelf, by inteftine motion, of all fuch matter as it is involved with; but if it is not combined with fuch fixed matter as retains it till it has gone through all its evolutions, it is, being itfelf volatile, carried off by the ftill more volatile phlogiftic matter with which it is commonly joined. For this reafon, he fuppofes the putrefying matter fhews in its beginning no figns of volatile alkali, becaufe its fmell depends only on thofe particles which have been on the furface, without any ftrong cohefion with the fubftance. In the farther progrefs of putrefaction, the matter involving the alkali, or forming it, is intermixed, and in cohefion with the folid particles of the fubftance, and is by thefe means retained till the alkali is come to its purer ftate. Towards the end of putrefaction, the cohefion of the particles being almoft entirely taken off, the volatile alkali is carried off before it can go through all its ftates.

Dr. Macbride made feveral experiments with putrid blood and putrid bile, which afcertain the fact, that as foon as an animal fubftance begins to putrefy, it begins to difcover an alkaline quality; and this volatile matter, now produced in it, may be feparated by diftillation in a very gentle warmth; but he obferves, that the volatile alkali obtained from putrid fubftances is not exactly fimilar to that obtained by violent heat from animal fubftances not putrid. It differs remarkably in the flavour, which is naufeous and difagreeable, is not fo pungent, and is much weaker than the common volatile alkali; and this latter is capable of difpoffeffing the putrid alkali, and of driving it off from any body to which it has been united. But to return from this digreffion. As to the caufe and procefs of putrefaction, it has been generally believed, that the contact of atmofpherical air is neceffary for this purpofe, and that bodies become putrid, becaufe air communicates fomewhat to them: accordingly it has been alleged, that bodies buried deep under the earth, or in water, out of the reach of any air, have remained entire for ages; which, when expofed to the open air, have foon rotted and mouldered away. It is alfo well known, that bodies are preferved from putrefaction by covering them with wax, fuet, &c.; and Mr. Boyle relates, that he has preferved lemons, oranges, and other fruits, from putrefaction, during feveral years, by including them in an exhaufted receiver. Experiments of the fame kind have been lately made by M. Eller of Berlin, which fhew that fubftances, even of the moft putrefcent nature (fuch as blood) may be kept found *in vacuo* for many years. But Dr. Macbride has urged a variety of facts and confiderations to prove, that putrefaction enfues in confequence of the lofs of fome principle, which cemented the conftituent particles of bodies, and that, when this is difengaged from them, they feparate, and are difunited. This principle he difcovered to be air, which, in putrefaction and fermentation, is extricated and thrown off, from a fixed and non-elaftic ftate, into one that is volatile and elaftic; but which immediately, upon meeting with a proper recipient, returns again to its former nature. Thus he found, that cauftic alkali and quicklime may be rendered mild by abforbing this air, extricated from putrefying and fermenting fubftances; that without the extrication of this air no putrefaction can happen; and that even by abforption of it, putrefied fubftances may be corrected and rendered fweet. To the fame purpofe Dr. Alexander has endeavoured to prove, that putrid matter will preferve other fubftances from putrefaction; which is not improbable, becaufe, being already faturated with the putrid effluvium, they cannot readily take any more. Dr. Macbride, having expofed putrid matters to the vapours arifing from fermenting mixtures, or from alkaline fubftances effervefcing with acids, found that the putrid quality was deftroyed; and hence he confiders the fixed air as powerfully antifeptic. And it appears alfo from the experiments of Dr. Prieftley, that fixed air corrects and renders wholefome air tainted with refpiration or putrefaction. Hence he infers, that lime-kilns, which difcharge great quantities of this air, may be wholefome in the neighbourhood of populous towns, the atmofphere of which muft abound with putrid effluvia. Sir William Lee, in a hot feafon, contrived, by impregnating water with fixed air, in the manner defcribed under PYRMONT *water*, and wafhing meat with it two or three times a-day, not only to preferve it as perfectly fweet and good to the extent of ten days, as at the firft killing, but alfo to recover fome meat that had begun to change. And it is farther well known, that fixed air, or carbonic acid, has been lately introduced into the materia medica, and adminiftered with fuccefs in a variety of putrid cafes. Dr. Macbride has alfo proved, that putrefaction is accelerated by taking off the preffure of the atmofphere; and from fome experiments he was led to conclude, that it will take place fooner in vacuo than in the open air; but making a more complete vacuum by means of two brafs hemifpheres joined together, he found that the obfervation of Mr. Boyle and others was agreeable to fact. It appeared alfo, by inclofing flefh in condenfed air, that increafing the preffure of the furrounded air, retarded putrefaction; and hence he deduces, what he deems to be a demonftrative proof, that bodies do not putrefy, becaufe the air adds fomewhat to them; for if they did, then a piece of flefh which lay in condenfed air ought to have putrefied the fooneft, becaufe it had the greateft quantity of air applied to its furface. But the reafon why, according to his fyftem, condenfed air prevents putrefaction is, that the preffure of every fide muft force the conftituent particles clofer together, thus increafe their cohefion, and prevent the inteftine motion; and without inteftine motion there can be no change of combination. However, it is obferved by fir John Pringle, that the putrefaction of meat and other fubftances, advances quicker in a confined than free air; for as the moft putrid parts are alfo the moft fugitive, they inceffantly iffue from a corruptible fubftance, and difperfe with the wind; but in a ftagnation of air they remain about the body, and in the nature of a ferment excite its corruption.

It has been long obferved, that putrefaction generates air. Hence, though flefh, as well as blood, be fpecifically heavier than water, yet dead bodies are found to float, after lying fome time at the bottom, from air generated in the bowels by putrefaction. And fince it has been found by experiments, that the blood and other animal fubftances begin to emit air before they are fo far corrupted, as they frequently are in putrid difeafes, it is probable that feveral of the fymptoms in deep furfeits may be owing to the action of the confined air. As dead bodies become putrid from the lofs of their fixed air, according to Dr. Macbride's theory, he fuggefts, that the immediate caufe of putrefaction in living bodies may be the detachment of too large a proportion of their fixed air. This fact he endeavours to evince by an enumeration of the fymptoms that occur in the fcurvy, and other highly putrid difeafes, which fhew that the air is actually detached from the blood in fuch cafes; as well as from an examination of the principal and prevailing caufes of fuch diforders. And fince the air tainted with animal or vegetable putrefaction is the fame with air rendered noxious by animal refpiration; fince both equally extinguifh flame, are equally noxious to animals, are equally and in the fame way offenfive to the fmell, equally precipitate lime in lime water, and are reftored by the fame means, Dr. Prieftley fuggefts, that one ufe of the lungs is to carry off the putrid effluvia, without which, perhaps, a living body might putrefy as foon as a dead one. See BLOOD and RESPIRATION.

We fhall here obferve, that putrefying and fermenting fubftances have been found, by the experiments of Mr. Cavendifh, Dr. Prieftley, &c. to yield not only *fixed* but *inflammable* air. From an experiment of Dr. Prieftley, intended to determine the proportion of each of the kinds of air in the different ftages of the putrefactive procefs, it appears that a piece of mutton weighing four penny-weights fix grains, yielded in all $2\frac{11}{14}$ meafures of air, of which $2\frac{15}{56}$ was fixed, and the reft inflammable; and that all the inflammable part was exhaufted a confiderable time before the fixed air. The fame ingenious writer has obferved, that the diminution of common air, by means of putrefaction, amounts to a complete fourth part of the whole, notwithftanding the production of fome permanent air from the putrefying fubftance, and has, in all refpects, the appearance of being produced folely by the precipitation of fixed air. It muft occur to every reader, in any way acquainted with this fubject, if the phlogiftic theory be admitted, (which indeed is now generally difcarded,) that if inflammable air be the fame with phlogifton, as Dr. Prieftley feemed to have difcovered, many of the phenomena of putrefaction, depending on this principle, fuch as the fmell, colour, light, &c. will probably from hence admit of an eafy explication.

We fhall here fubjoin fome obfervations with refpect to the decompofition of animal bodies that are interred in burying-grounds. In this fituation, the decompofition is four times as flow as when the putrefying animal is expofed to the air. It is not perfectly ended, according to Mr. Petit, till three years after the body has been interred, at the depth of four feet; and it is flower in proportion as the body is buried at a greater depth. Thefe facts agree with the principles which we have already eftablifhed for bodies buried in the earth, and fubjected to laws of decompofition very different from thofe which take place in bodies expofed to the open air. In this cafe, the decompofition is favoured by the waters which filter through the earth, and diffolve and carry with them the animal juices. It is alfo favoured by the earth, which abforbs the juices with more or lefs facility. Meffrs. Lemery, Geoffroy, and Hunaud, have proved that argillaceous earths exert a very flow action upon bodies; but when the earths are porous and light, the bodies then dry very fpeedily. The feveral principles of bodies abforbed by the earth, or carried by the vapours, are difperfed through a great fpace, imbibed by the roots of vegetables, and gradually decompofed. This is what paffes in burying-grounds in the open air; but it is very far from being applicable to the fepulchres which are made in churches and covered places. Here is neither water nor vegetation; and confequently no caufe which can carry away, diffolve, or change the nature of the animal fluids: and we cannot but applaud the wifdom of government, which has prohibited the burying in churches; a practice which was once a fubject of horror and infection.

The accidents which have happened at the opening of graves and vaults are but too numerous, to render any apology neceffary for our fpeaking a few words refpecting the method of preventing them.

The decompofition of a body in the bowels of the earth can never be dangerous, provided it be buried at a fufficient depth, and that the grave be not opened before its entire and complete decompofition. The depth of the grave ought to be fuch that the external air cannot penetrate it; that the juices, with which the earth is impregnated, may be conveyed to its furface; and that the exhalations, vapours, or gafes, which are developed or formed by decompofition, fhould not be capable of forcing the earthy covering which detains them. The nature of the earth in which the grave is dug, influences all its effects. If the ftratum which covers the body be argillaceous, the depth of the grave may be lefs, as this earth difficultly affords a paffage to gas and vapour; but in general it is admitted to be neceffary that bodies fhould be buried at the depth of five feet, to prevent all thefe unhappy accidents. It is likewife neceffary to attend to the circumftance, that a grave ought not to be opened before the complete decompofition of the body. This decompofition, according to Mr. Petit, is not perfect until the expiration of three years, in graves of four feet depth; or four years, when they are fix feet deep. This term affords many varieties, according to the nature of the earth, and the conftitution of the fubjects buried in it; but we may confider it as a medium. The pernicious cuftom, which allows a fingle grave to families more or lefs numerous, ought therefore to be fuppreffed; for in this cafe, the fame grave may be opened before the time prefcribed. Thefe are abufes which ought to occupy the attention of government; and it is time that the vanity of individuals fhould be facrificed to the public fafety. It is likewife neceffary to prohibit burying in vaults, and even in coffins. In the firft cafe, the principles of the bodies are fpread into the air, and infect it; in the fecond, their decompofition is flower and lefs perfect.

If thefe precautions be neglected; if the dead bodies be heaped together in too confined a fpace; if the earth be not proper to abforb the juices, and decompofe them; if the grave be opened before the entire decompofition of the body;—unhappy accidents will no doubt be produced; and thefe accidents are but too common in great towns, where every wife precaution is neglected. An inftance of this happened, when the ground of the church of St. Benoit at Paris was dug up a few years ago: a naufeous vapour was emitted, and feveral of the neighbours were affected by it. The earth which was taken out of this grave was unctuous, vifcid, and emitted an infectious fmell. Meffrs. Maret and Navier have left us feveral fimilar obfervations. Chaptal's Elem. of Chem. vol. iii.

Putrefaction is one of the inftruments in nature by which many great changes are brought about. In the procefs of vegetable putrefaction, if we throw together any of the tender, green, and fucculent parts of recent vegetables, whether acid or alkaline, in a large heap, in the warm open air, and prefs them down with an additional weight, if their own be inconfiderable; the middle part of the heap will, in a little time, fpontaneoufly conceive a fmall degree of heat, and pafs fucceffively through the other degrees, till it arrive at a ftate of ebullition, and be perfectly putrefied.

In the fpace of three days, from the firft putting them together, they will yield a heat, perceivable by the hand, equal to that of a human body in a healthy ftate; by the fifth, the heat will be too great for the hand to bear without pain; and, laftly, by the fixth, feventh, or eighth day, the juices will generally appear ready to boil; and fometimes the matter will even flame, and burn away.

By this fpontaneous operation, the vegetable acquires an abominably putrid, ftercoraceous, or cadaverous, tafte and odour; and turns entirely into one foft, fimilar, pulpy mafs, or craffamentum, greatly refembling fœtid human excrements in the fcent, and putrefied flefh in the tafte.

If

If now this fœtid matter, thus obtained, be directly, whilst it remains in its fœtid state, committed to a glass retort, and distilled with proper degrees of fire, there will come over, 1. A water impregnated with an urinous spirit, perfectly like that obtainable from animal subjects, and separable by a fresh distillation slowly made in a tall glass, into elementary water, and a large quantity of pure, white, volatile, dry, alkaline salt, not to be distinguished from animal salts. 2. A volatile, alkaline, oily salt, that shoots into globes. 3. An exceedingly volatile and thick fœtid oil, both which are entirely like those of animals. And, lastly, the remainder, being calcined in an open fire, affords not the least particle of fixed salt; just as if the subject had really been of the animal, and not of the vegetable kingdom.

This process is truly universal, and holds equally in all kinds of vegetables, though ever so different in their nature and virtue.

Experiments have been made in the coldest and most succulent, or watery, plants; such as purslane, sorrel, &c. as well as with the hottest or most acrimonious, such as the spurges, &c. and it was always found to succeed; but that the sooner, as the vegetable employed contained the greater quantity of oil; though with the same phenomena.

It will likewise succeed with dry vegetables, provided they be moistened with water before they are thrown into heaps; and thus we sometimes see, that stacks of hay will spontaneously take fire, and burn away; especially if the hay was not well dried in the making.

The conditions necessary for the putrefaction of vegetables are similar to those required in the putrefaction of animal substances. It is necessary that the organization be impregnated with water; the contact of air is necessary, as is also a certain degree of heat; and for the due effect of this kind of decomposition, the vegetables should be heaped together, and their juices be abundant. In these circumstances, the phenomena of decomposition are as follow: the colour of the vegetable is changed; the green leaves become yellow, the texture becomes lax, and the parts less coherent; the colour of the vegetable itself changes to black or brown; the mass rises, and perceptibly swells up; the heat becomes more intense, and is perceived on approaching the heap; and the fumes which arise have already a smell, which sometimes is not disagreeable; at the same time bubbles arise, and break at the surface of the liquid, when the vegetables are reduced to a magma. This gas is a mixture of nitrogene, hydrogene, and carbonic acid. At this epocha, likewise, an ammoniacal gas is emitted, which is formed in these circumstances: and, in proportion as these appearances diminish, the strong and offensive odour is succeeded by another which is fainter and milder, and the mass becomes dry. The internal part still exhibits the vegetable structure, when the stem is solid, and the fibrous matter has been the predominating principle; and it then constitutes manure or soil. Hence it arises that the herbaceous plants of a loose texture, and abounding in juices, are not capable of forming manure by their decomposition, but are reduced into a brown mass of little consistence, in which neither fibre nor texture are observed; and this is what, for the most part, forms vegetable mould.

Vegetable mould usually constitutes the first covering or stratum of our globe; and in such cases wherein it is discovered at a depth in the earth, there is no doubt but it has been buried by some revolution.

When a vegetable is converted into earth by this tumultuous fermentation, it still retains the remains of the vegetable, mixed and confounded with the other solid earths and metallic products; and by distillation it affords oil, nitrogene gas, and often hydrogene. It may, therefore, be considered as an intermediate substance between crude and organic bodies, which participates of the inertia of the one, and the activity of the other; and which in this state is still subject to an insensible fermentation, that changes its nature still more, and deprives it of all its organic contents. These remains of vegetables, still contained in vegetable earth, serve as food for other plants that may grow in it. The insensible progress of fermentation, and the suction of vegetables, impoverish the vegetable earth, deprive it of all its organic matter, and there remain only the earths and metallic residue which form the stiff poor soils, and ochres when the ferruginous principle is very abundant.

As this muddy earth is a mixture of all the primitive earths, and some of the metals which are the product of vegetation, as well as the oils, the salts, and other products we meet with in it; we may consider it as the residue of vegetable decomposition, as the great agent and means by which nature repairs the continual losses the mineral kingdom undergoes. In this mixture of all the principles the materials of all compounds exist; and these materials are so much the more disposed to enter into combinations, as they are in a more divided and disengaged state. It is in these earths that we find diamonds, quartz-crystals, spars, gypsum, &c. It is in this matrix that the bog ores, or ochreous ores of iron, are formed; and it appears that nature has reserved the impoverished residue of vegetables for the reproduction or reparation of the earthy and metallic substances of the globe, while the organic remains are made to serve as nourishment for the growth of other succeeding vegetables.

Some have taken occasion to apply the process of putrefaction to that of digestion, or the change which the aliment suffers in the human body. (See Digestion.) For the change our vegetable foods undergo in the body, being such as brings them to be of the same nature, and to afford the same principles, with the change induced by putrefaction, is a presumption, that digestion is nothing else. Besides, as we know that neither animal nor vegetable substances can become aliment, without undergoing some degree of putrefaction, many distempers must proceed from a deficiency of this action: the crisis of fevers seems to depend upon it; and even animal heat, according to Dr. Stevenson, does the same.

Now, that the concoction of the humours is nothing else but putrefaction, seems probable from hence, that whenever they are in that state, they are always more fluid, and fitter to pass through the smaller vessels, where they stagnated before. Again, the offensiveness of the sweats, or other excretions consequent on a crisis, is likewise a sure sign of a high degree of corruption. The time of resolution or putrefaction depends on the degree of heat, the habit of the patient, and on the part obstructed. Resolution is the putrefaction of the impacted humour only, but suppuration implies a corruption of the vessels also. This manner of speaking, indeed, has been disused, from the prejudice that nothing was putrid but what was offensively so; whereas, in fact, every fibre becoming more tender, and humour thinner, may be considered as putrid in some degree, whether the change tends to the better health, or to the destruction of the person, or whether it becomes grateful or offensive to the senses.

Mr. Boyle has used the words *fermentation* and *putrefaction* of the blood promiscuously, in his Treatise on the Human Blood. Stahl and other celebrated chemists likewise use the term putrid *ferment*; which see.

It

It is, therefore, juſtly obſerved by lord Bacon (Nat. Hiſt. cent. iv.) that an enquiry into the means of preventing or ſtaying putrefaction is of excellent uſe in phyſic. Sir John Pringle has made many curious experiments with a view of determining the power of certain ſubſtances to promote or to prevent putrefaction, together with remarks on this ſubject, which are publiſhed in the Phil. Tranſ. vol. xlvi. p. 480. 525. 550, and by way of appendix to his Obſervations on the Diſeaſes of the Army. From the experiments of this learned and judicious phyſician, it appears, that ſalts of every kind, whether acid, alkaline, or neutral, fixed or volatile, as well as the aſtringent and gummy-reſinous part of vegetables, all of them reſiſt and moſt of them correct putrefaction; and he purſued this branch of enquiry ſo far as to enable him to form a table ſhewing the comparative antiſeptic power of the ſeveral ſubſtances, that of ſea-ſalt being the ſtandard. See this table under the article ANTISEPTIC.

Of all reſinous ſubſtances, he found that camphor reſiſted putrefaction moſt powerfully; its antiſeptic power being three hundred times greater than that of ſea-ſalt. Decoctions of wheat, barley, and other farinaceous grains, checked putrefaction, by becoming ſour. He alſo made experiments to diſcover the effects of mixing vegetable with animal matters.

Two drams of raw beef, as much bread, and an ounce of water, being beat to the conſiſtence of pap, and expoſed to 90° of heat, according to Fahrenheit's thermometer, began to ferment in a few hours, and continued in a fermentation two days. When it began to ferment and ſwell, the putrefaction had begun; and in a few hours afterwards the ſmell was offenſive. Next day the putrid ſmell ceaſed, and an acid taſte and ſmell ſucceeded. Freſh alimentary vegetables, as ſpinach, aſparagus, ſcurvy-graſs, produced ſimilar effects as bread on fleſh, but in a weaker degree. From ſeveral other experiments, he found that animal ſubſtances excite the fermentation of vegetable ſubſtances; and that the latter ſubſtances correct the putreſcency of the former.

By adding ſaliva to a ſimilar mixture of fleſh, bread, and water, the fermentation was retarded, moderated, but rendered of twice the uſual duration, and the acid produced at laſt was weaker than when no ſaliva was uſed.

By adding an oily ſubſtance to the common mixture of fleſh, bread, and water, a ſtronger fermentation was produced, which could not be moderated by the quantity of ſaliva uſed in the former experiment, till ſome fixed alkaline ſalt was added, which ſalt was found, without ſaliva, to ſtop ſuddenly very high fermentations.

He did not find that ſmall quantities of the following ſalts, ſal ammoniac, nitre, vitriolated tartar, ſal diureticus, ſalt of hartſhorn, ſalt of wormwood, were ſeptic, as ſmall quantities of ſea-ſalt were.

Sugar was found to reſiſt putrefaction at firſt, as other ſalts do, and alſo to check the putrefaction after it had begun by its own fermentative quality, like bread and other fermentative vegetables.

Lime-water made ſome ſmall reſiſtance to putrefaction.

Port-wine, ſmall beer, infuſions of bitter vegetables, of bark, and the juice of antiſcorbutic plants, retarded the fermentation of mixtures of fleſh and bread. But an unſtrained decoction of bark conſiderably increaſed that fermentation.

Lime-water neither retarded nor haſtened the fermentation of ſuch a mixture; but when the fermentation ceaſed, the liquor was neither putrid nor acid, but ſmelt agreeably.

Fleſh pounded in a mortar was found to ferment ſooner than that which had not been bruiſed.

The tough inflammatory cruſt of blood was found to be moſt putreſcent, next to which the craſſamentum, or red coagulated maſs, and laſtly the ſerum.

Charcoal is a powerful antiſeptic: hence all ſorts of glaſs-veſſels and other utenſils may be purified from long retained ſmells of every kind, in the eaſieſt and moſt perfect manner, by rinſing them out well with charcoal powder, after the groſſer impurities have been ſcowered off with ſand and potaſh. Rubbing the teeth and waſhing out the mouth with fine charcoal powder will render the teeth beautifully white, and the breath perfectly ſweet, when an offenſive breath has been owing to a ſcorbutic diſpoſition of the gums. (Crell's Journal, vol. ii.) Meat alſo, which is a little tainted with putridity, may at once be made ſweet by charcoal; and it has been ſaid, that common raw ſpirits agitated with charcoal will be deprived of their bad flavour, but they are apt to reſume their old flavour, if kept in the caſk only a few weeks.

The experiments of the author of the "Eſſai pour ſervir à l'Hiſtoire de la Putrefaction," ſhew that metallic ſalts, reſinous powders, extracts of bark and opium, are very powerfully antiſeptic, and that ſalts with earthy baſes are leſs antiſeptic than any other ſalts.

The ſame ingenious phyſician made ſome attempts towards the ſweetening of corrupted fleſh by means of mild ſubſtances. For this purpoſe he put a piece of putrid fleſh into an infuſion of chamomile flowers, which was renewed twice or thrice in as many days, and its ſweetneſs and firm texture were recovered. Several pieces of putrid fleſh were alſo ſweetened by repeated affuſions of a ſtrong decoction of the bark; and he conſtantly obſerved, that not only the corrupted ſmell was removed, but a firmneſs reſtored to the fibres. The corrupt yolk of an egg, diluted with water, was ſweetened by mixing it with a ſtrong infuſion of chamomile flowers. He found alſo that decoctions of wormwood, of the bark, and infuſions of chamomile flowers, and of ſnake-root, preſerved yolks of eggs for a longer time than water, even with the addition of a conſiderable quantity of ſea-ſalt; and that they were preſerved better by ſalt of hartſhorn than by four times the weight of ſea-ſalt. Ox-gall was kept for ſome time from putrefaction by ſmall quantities of ley of tartar, ſpirit of hartſhorn, crude ſal ammoniac, and the ſaline mixture; and ſtill longer by a decoction of wormwood, infuſion of chamomile flowers and of ſnake-root, and by ſolutions of myrrh, camphor, and ſalt of amber. The ſerum of human blood was preſerved by a decoction of the bark, and an infuſion of ſnake-root, as effectually as fleſh. See ANTISEPTIC.

For an account of ſir John Pringle's experiments and obſervations with reſpect to thoſe ſubjects that haſten or promote putrefaction, ſee SEPTICS.

Dr. Macbride's experiments confirm many of thoſe above related, eſpecially thoſe which ſhew that the fermentation of vegetable ſubſtances is increaſed by a mixture of animal or putreſcent matter, that the putreſcency of the latter is corrected by the fermentative quality of the former; and that the putrefaction and fermentation of mixtures of animal and vegetable ſubſtances were accelerated by additions of abſorbent earths and of Peruvian bark. He alſo found, that although unburnt calcareous earths were ſeptic, quicklime and lime-water prevented putrefaction, but that they deſtroyed or diſſolved the texture of fleſh.

From his experiments we learn alſo, that acids, even when greatly lowered, have a ſtrong degree of power to reſiſt putrefaction, and alſo to correct it; but that they deſtroy the texture of the ſubſtance whoſe ſoundneſs they were ſuppoſed to reſtore; that ſalts in general, by a property which is common to them all as ſalts, have the ſame power,

power, but that they exceed the acids in their efficacy for correcting putrefaction; that fermenting and effervescent mixtures are the most powerful of all known antiseptics; and, in general, that whatsoever hath a power to restrain the escape of the fixed air, or hinder the intestine motion, must of course prevent putrefaction; and that fixed air, when transferred from a sound body to one that is putrid, appears to restore to that body the principle which has been destroyed or lost.

Dr. Macbride objects against the administration of acids in putrid diseases, for the following reasons; because, if they came unchanged to the absorbent vessels, they would not admit of them, and if they did, they would be dangerous, and they are quite changed before they leave the primæ viæ. Dr. Crell (Phil. Trans. vol. lxi. part i. p. 340.) has replied to this reasoning, and proposed experiments to prove, that acids, though changed in the alimentary canal so far as not to effervesce with alkalis, may, notwithstanding, check putrefaction, and, therefore, that their use is of great consequence, and ought not to be omitted in putrid diseases.

With regard to the exhibition of alkalis, Dr. Macbride observes, that the point is not yet satisfactorily settled. There can be no doubt of their power to resist and correct putrefaction in dead bodies; but whether, upon the presumption of this virtue, they can be given with propriety as antiseptics, he adds, is not so clear. Dr. Crell affirms, that they can never be used in living bodies as antiseptics; for, laying aside their stimulating quality, which must prevent their use in most of the putrid diseases, they would, he apprehends, increase the morbific matter, by being intimately mixed by circulation with phlogistic matter, which they find abundantly in such bodies. Astringents, says Dr. Macbride, prevent putrefaction very powerfully, but they have not the least degree of efficacy in correcting it; and as antiseptics, they can be of importance only in those cases where, from extreme relaxation and resolution of the solids, the dissolved fluids are suffered to transude, and either form spots of different hues, or run off by actual hæmorhage; and he apprehends, that acids act in those cases where they have been administered with success, merely as astringents. The antiseptic virtue of the gummy-resinous vegetables, judging of their effect by that of the bark, appears to depend on their fermenting in the body, and parting with fixed air in the course of their fermentation, and throwing a great quantity of it into the blood; and attending to the things that prevent putrefaction in living bodies, we shall find that the dependence is on the quantity of air. Thus, vegetable food prevents the putrefactive diathesis; and to the frequent use of fresh vegetables and sugar, in the diet of the European nations, it is owing that putrid diseases or plagues are now so uncommon. And what proves almost to a demonstration the antiseptic power of the fermentable substances, is the cure of the sea-scurvy.

Dr. Crell disagrees with the opinion of Dr. Macbride, that putrid diseases may be cured with fermentable substances only; nor is he convinced that putrefaction depends only on the loss of fixed air. This, he apprehends, is an effect rather than the cause of putrefaction. We shall here only add, that Dr. Macbride recommends, in the putrid yellow fever of the West Indies, to give the patient repeated doses of the alkaline salts, in fresh lime-juice, or the like, and to let it be swallowed during the effervescence; and to order the patient's drink to be somewhat of the highly fermentable kind; such as the juice of the green sugar-cane, diluted and acidulated with some of the recent sour juices. The natives on the coast of Africa give in fevers of this kind, with good success, a drink prepared by macerating in water a fruit of the plum kind, that grows there in great plenty. He adds, that by throwing in such a quantity of antiseptic vapour as would be furnished from this kind of materials, the putrefactive acrimony, which at first seems chiefly to affect the biliary system, might be corrected and saturated. See on the subject of this article Dr. Macbride's Essays, 1776, passim.

Putrefaction, in *Physiology*, the spontaneous changes which animal substances undergo, when deprived of life. See Death.

Putrefaction, in *Agriculture*. It is by means of putrefaction, as stated under its appropriate article, that various substances and bodies are decomposed, reduced, and brought into the state proper for being applied to lands for the support of crops; but this is more fully explained, in speaking of the nature of the different materials that are capable of being made use of in ameliorating land for the growth of crops. See Manure.

Putrefaction *of Water*. It is said to be the peculiar quality of the Thames water, that it will stink and yet be wholesome; and after this will recover itself again. Many sailors have been obliged to drink it stinking, so that they held their noses while they poured it down their throats, yet no sickness ensued from it. It generates a sort of spirit also in this stinking state, which will take fire at the approach of a lighted candle, as if spirit of wine were touched by the same.

It appears from the article Putrefaction, that though a volatile alkali may be obtained from putrid substances by distillation, such substances must not be suffered to remain too long before they are distilled, unless they are kept in close vessels; because the volatile alkali, which is the offspring of putrefaction, is dissipated as fast as it is generated, insomuch that, at length, nothing is left behind but an insipid water, or a solid matter, being an earth similar to common mould. It is in this way, says Dr. Macbride, that stinking water, after some time, becomes sweet: the volatile alkali, generated by the putrefaction of the animal and vegetable substances at first contained in the water, being, after a while, entirely dissipated, leaves the remainder without any disagreeable smell.

Putrid water is immediately deprived of its offensive smell by charcoal. If putrid water be agitated with a small quantity of magnesia, it will lose its bad taste and smell in a few minutes. See Crell's Journal, and Proust, Journal de Physique.

A method of preserving water free from putrefaction was some years since proposed by Dr. Alston. It consisted in adding a quantity of lime to every cask of water; and as lime is known to have a strong antiseptic property, water, as long as it retains the impregnation of lime, never putrefies.

In order to free the water, at the time of using it, from the lime, Dr. Alston proposes the precipitation of the latter by throwing a quantity of magnesia alba, on this principle, that as lime-stone is rendered soluble in water by the deprivation of its fixed air, and has a greater affinity with that air than magnesia has, the particles of quicklime dissolved in the water would attract the air from the magnesia, and thereby becoming no longer soluble, would fall to the bottom, and leave the water tasteless and fit for economical uses. See Lime-*water* and Magnesia.

The expence, however, attending this process prevented the execution of the proposal. Mr. Henry has not long ago suggested a cheap and easily practicable method of precipitating the lime, and thus of restoring the water to its original taste. The following is a short sketch of the author's process. To preserve

preserve the water from putrefaction, two pounds of good quicklime are directed to be added to each cask of water of a hundred and twenty gallons. To free the water afterwards from the lime with which it has been impregnated, it is to be drawn off into a strong cask, containing about sixty gallons, with an aperture at one end large enough to admit a vessel, which is to be let down into it by means of strings, and which contains a proper quantity of effervescent materials, that is, of marble or chalk, and vitriolic acid. Eight ounces of mild calcareous earth, and six ounces of strong vitriolic acid, will be sufficient for sixty gallons of lime-water. The mouth of this last vessel is to be stopped with a tubulated stopper, through which the fixed air, let loose from the marble, passes up through the body of the water. The lime is thus rendered insoluble, and is soon precipitated in the form of an impalpable powder of chalk; the water being thus restored to the same state of purity as when it was first shipped on board; or, as Mr. Henry believes, to a state of still greater purity; several hard waters having, in consequence of this process, been rendered as soft as rain water, and freed from different impregnation. For farther particulars, and the description and drawing of an apparatus for this operation, see Henry's Account of a Method of preserving Water at Sea, &c. p. 10, &c. 1781.

PUTRESCENT Matters, in *Agriculture*, such substances as are in a state of putridity. Various materials of this kind are capable of being made use of by the farmer. It has been lately suggested by Dr. Hunter, of York, in a paper in the third volume of the Farmer's Magazine, that different materials of this nature may form a substitute for the folding of sheep.

The trouble and expence of keeping a flock of sheep for the purpose of folding, may probably be avoided by forming large ponds, so constructed as to receive and hold water. Into these ponds let drains from the stables, cow-houses, ox-stalls, pigeon and wash-houses be directed; and, in order to enrich the water, let all kinds of vegetable and animal substances be thrown in, particularly the contents of the necessaries and slaughter-house. It is presumed, that this putrid water, when put upon the land by means of water-carts, will prove as beneficial as a flock of sheep kept for the express purpose of folding; and where no sheep are kept for that purpose, such will prove an excellent manure for meadow land. A pond of sixty feet diameter, by six feet deep, which will contain upwards of 700 hogsheads of water and putrescent bodies, may be equal in its effects to a considerable fold of sheep. The putrescency of the water may be greatly increased, by occasionally supplying the ponds with the refuse of fish, and sea-weed, where they can be conveniently procured; and in all places within a reasonable distance of sea-ports, where ships are employed in the Greenland fishery, the farmer will find a seasonable supply of putrescent matter by the purchase of the whale blubber, after the oil has been taken from it. Such is the strength of the last named substance, that it is well worth the farmer's while to be at the expence of carrying it in casks to a considerable distance, for the purpose of giving vigour to his compost dunghills. The ancients were scrupulously nice in the formation of their dunghills; and it is a reproach to the present race of farmers, that so material a branch of their business should, at this day, be so imperfectly known or attended to. And in many large cities, and especially Edinburgh, it would be a great improvement, if a well-constructed reservoir was made to receive the excrementitious matter, the bason being occasionally replenished with earth and small rubbish. In this manner, many thousands of loads of rich manure might be saved from the sea, to which place the excrementitious matters are upon their passage.

PUTRID, Putridus, something rotten, or putrefied. See Putrefaction.

Thus we say, putrid flesh; a putrid humour: putrid limbs, *i. e.* mortified ones, are to be cut off.

Putrid *Diseases*. See Putrid *Fever*, &c.

Putrid *Ferment*. See Ferment.

Putrid *Fever*, *&c.* in *Medicine*, an epithet originating in the chemical school of physic, in which the true operations and phenomena of *life* were mistaken for the fermentations and decompositions of the laboratory. This mistake was probably the result of the offensive smell, and actual putrefactive odour of some of the discharges from the living body, in the last stages of severe fevers; but farther observation has demonstrated that, however the excretions may undergo the process of putrefaction after they are thrown out of the living system, no degree of putrefaction can exist for a moment in the circulating blood, without occasioning instant death.

The symptoms which were formerly ascribed to putrefaction, but which are now believed to originate from a great deficiency of the vital or nervous power derived from the brain and nervous system, are such as occur in typhus gravior, the hospital and gaol fever, and in the worst cases of dysentery, and small-pox; among which are a black tongue and mouth, extreme prostration of strength, fœtid evacuations from the stomach, bowels, and bladder, hæmorrhages, petechiæ, and purple blotches, &c. See Fever, and Typhus.

Putrid *Ulcer*. See Ulcer.

PUTRINE, in *Geography*, a town of Prussia, in Oberland; six miles W. of Passenheim.

PUTT, in *Rural Economy*, a provincial word, applied commonly in some districts to the mole-hill. Also, sometimes to animals which put or thrust with their horns.

Putt, or *Pitne*, in *Geography*, a town of Anterior Pomerania; eight miles S.W. of Stralsund.

PUTTAN-SUMNAUT, a town of Hindoostan, in Guzerat; near which was a famous pagoda, much venerated and frequented by devotees from all parts of the country. In the year 1002 this town and temple were taken by Mahmood, king of Ghizni, and plundered of their great wealth. In the temple was found a statue, in which, on being broken, was found a vast quantity of precious stones. The Hindoos believed that the souls of deceased persons came to this place to be transferred to other bodies; 80 miles S. of Noanagur. N. lat. 21° 1'. E. long. 69° 40'.

PUTTEN, Vander, Henry, in *Biography*, was born at Vandloo in 1574: after studying at the universities of the Low Countries, he visited Italy, and for a considerable time was professor of rhetoric at Milan, where he took the degree of doctor of laws. He was nominated historiographer to his Catholic majesty, and received the honour of citizenship at Rome. In 1606 he was invited to the chair of Lipsius, who had been his tutor. He was also made a counsellor to the archduke Albert, and entrusted with the government of the citadel of Louvain. When a truce was negotiating between the Dutch and the king of Spain, in 1633, he published a work, entitled "Statera Belli et Pacis," in which he shewed how important a peace would be to the Spanish Netherlands. This work gave great offence, and the author had nearly experienced the usual fate of those who counsel pacific measures, at a time when passion, prejudice, and interest, urge the continuance of war. He died at Louvain in 1646, age 72. Besides his "Statera," mentioned above, he published "Historia Insubrica;" "Orchestra

"Orcheftra Burgundica;" "Theatrum Hiftoricum Imperatorum;" "Comus, feu de Luxu;" "De ufu Bibliothecæ," with a catalogue of the Ambrofian library; befides feveral tracts relative to claffical antiquities, printed among the collections of Grævius and Gronovius. Moreri. Bayle.

Putten, in *Geography*, a fmall ifland of Holland, in the Meufe, E. of Voorn.

PUTTERAHEE, a town of Hindooftan, in the circar of Gohud; 27 miles E.N.E. of Gohud.

PUTTOCKS, or Puttock-*Shrouds*, otherwife called *futtock* or *foot-hook fhrouds*, in a *Ship*, are fmall fhrouds which go from the fhrouds of the main-maft, fore-maft, and mizen-maft, to the top-maft fhrouds; and if there be any top-gallant maft, there are puttocks to go from the top-maft fhrouds into thefe. Thefe puttocks are at the bottom feized to a ftaff, or to fome rope which is feized to a plate of iron, or to a dead-man's eye, to which the laniards of the fore-maft fhrouds come. See Shrouds.

PUTTY fometimes denotes a white powder of lead and tin calcined together, in the proportion of two parts of lead to one of tin; ufed in polifhing, and giving the laft glofs to works of iron, fteel, ftone, and glafs. This is alfo the bafis of white enamels, and glazings for earthen-ware.

Putty is alfo ufed to denote fpodium.

Putty, in its popular fenfe, denotes a kind of pafte, compounded of whiting, with or without a little white lead, and linfeed oil, beaten together to the confiftence of a tough dough; ufed by glaziers for faftening the fquares of glafs in fafh-windows, &c. and by painters, to ftop up the crevices and clefts in timber and wainfcot, to prevent the wet from getting in, and ruining the work.

PUTTYRAM, in *Geography*, a town of Hindooftan, in Bengal; 18 miles E.S.E. of Dinagepour.

PUTUAY, a fmall ifland on the coaft of Bengal. N. lat. 22° 41′. E. long. 89° 28′.

PUTUMAYO, a river of South America, which rifes about 80 miles S. of Popayan, purfues an eaftern courfe, inclining to the fouth, about 300 miles, and after being joined by a branch of the Caquet, takes the name of Ica, and running S.E. about 200 miles, joins the river of the Amazons in S. lat. 3° 30′. W. long. 50° 40′.—Alfo, a town of South America, in the government of Popayan, on a river of the fame name; 50 miles E. of Pafto.

PUTURA, a cuftom claimed by the keepers of forefts, and fometimes by bailiffs of hundreds, to take man's meat, horfe's meat, and dog's meat, of the tenants and inhabitants, gratis, within the perambulation of the foreft, hundred, &c.

"Johannes clamat unam puturam in prioratu de Penevoftham, qui eft quædam cella abbatiæ de Evefham, pro fe & miniftris, equis, & garcionibus fuis, per unum diem & duas noctes, de tribus feptimanis, in tres feptimanas, *viz.* de victualibus, ut & efculentis & potulentis, ad collas prioratus prædicti indebite." Placit. apud Præfton. 17 Edw. III.

This cuftom, within the liberty of Knarefburg, was long fince turned into the payment of four-pence, *pro putura*.

The land fubject to this fervice is called *terra puturata*. The learned Somner has erred in his expofition of this word.

PUTYAJURY, in *Geography*, a town of Bengal; 30 miles S.S.W. of Silhet.

PUTZIG. See Pauzk.

PUVIGLIO, a town of the duchy of Parma; nine miles N.E. of Parma.

PUWAKHAGA, in *Botany*, the name by which fome authors call the faufel-tree, of whofe fruit the expreffed juice called terra Japonica, or Japan earth, is made.

PUXUANAIRO, in *Geography*, a town of Mexico, in the province of Mechoacan; 25 miles N.W. of Mechoacan.

PUY, Peter du, in *Biography*, the third fon of Claude du Puy, a magiftrate in the parliament of Paris, was born in that city in 1582, and was educated with great care under his father. While a youth, he made extraordinary proficiency in literature, and ftill further improved himfelf by a journey to Holland, whither he accompanied the French ambaffador. After his return he laboured with great affiduity in afcertaining the rights of the crown of France over fome of the neighbouring diftricts, and for that purpofe was indefatigable in his examination o. ancient charters, and thereby acquired a profound knowledge of French hiftory. The reward of this, and other labours of the fame fort, were the places of king's counfellor, and keeper of the royal library, in both of which he was diftinguifhed by his patriotifm and love of letters. His works were numerous and valuable. In almoft all of them he aims at repreffing the ecclefiaftical authority, and the claims of the fee of Rome; hence they were not well received at the papal court. They are, however, faid to contain a rich treafure of facts relative to all the matters on which he treats. He died at Paris in 1651, at the age of 69, and his life was written by his intimate friend Nicholas Rigault. Some of his writings are as follow: "Preuves des Libertès de l'Eglife Gallicane;" "Hiftoire Veritable de la Condemnation de l'Ordre des Templiers;" "Traité de la Loi Salique;" "Du Concordât de Bologne entre le Pape Léon X., et le Roi Francis I;" "Apologie de l'Hiftoire de M. le Préfident de Thou." He had a brother, James, prior of St. Sauveur, who became keeper of the king's library after the death of Peter, whom he affifted in all his works, of the greater part of which he was the publifher. He died in 1656, leaving behind him a high character for learning and probity. Another brother, Chriftopher du Puy, was prothonotary to the cardinal de Joyeufe, and by his remonftrances he prevented the congregation of the Index from putting the firft of De Thou's hiftory in the lift of heretical books. He was king's almoner, and, while attached to cardinal du Perron, he made a collection entitled "Perroniana." He became a Carthufian, and died at Rome in 1554, proctor-general of his order.

Puy, Louis du, a man of letters, was born at Clarey, in Bugey, in 1709; he ftudied in the college of Lyons, and came to Paris in 1732. He was for a confiderable time principal editor of the Journal des Sçavans, and during thirty years enriched this collection with a great number of critical differtations. He was well verfed in the learned languages, and in the mathematics, and acquired an extenfive knowledge of hiftory and antiquities. The prince of Soubife entrufted him with the management of his library, and by his care it was rendered one of the moft valuable in the metropolis. In 1753 he was nominated fecretary to the Academy of Infcriptions, in which fituation he pronounced the eulogies of twelve of his affociates, and edited from the 36th to the 41ft vols. of its memoirs. He died in 1795. He was author of "Obfervations on infinitely fmall Quantities, and the metaphyfical Principles of Geometry," inferted in the Journal des Sçavans for 1759; "A Tranflation of four Tragedies of Sophocles," 1762; "A Tranflation of the Greek Fragments of Anthemius on mechanical Paradoxes, with Notes;" fome memoirs on the Roman coin, the filver denier of Charlemagne, and other antiquarian and literary fubjects. Du Puy was highly efteemed for ftrict probity,

 fincerity,

ſincerity, and an obliging diſpoſition, which diſplayed itſelf in uſeful advice and information to thoſe who conſulted him on literary topics.

Puy, *Mademoiſelle du*, a celebrated performer on the harp, who had acquired a conſiderable fortune by the exerciſe of her talents in different parts of Europe. She died at Paris in 1777, and made a will that ſeemed dictated by inſanity. Among other articles, ſhe ordered that no blind, lame, or deformed perſon ſhould attend her funeral. She ordered that her houſe ſhould be let to none but nobility. She left a large piece of ground to be formed into a public garden, upon condition that no ſtunted trees ſhould be allowed a place in it. And laſtly, ſhe bequeathed an annuity for the maintenance of cats, of which ſhe was fond, and for a perſon to take care of them. But the annuity depended wholly on the life of the cats. The harp upon which ſhe had acquired her poſſeſſions, was left to a blind harper in the Hoſpital des Quinze Vingts, who played tolerably well on many different inſtruments. Great pains were taken to ſet this will aſide, but without effect. It was declared valid by law, and obliged to be executed. Laborde.

Puy, *Le*, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Upper Loire, and capital of the department, ſituated on a ſmall river near the Loire; before the revolution, the ſee of a biſhop; a place of conſiderable trade, eſpecially in lace; 38 miles S.W. of Lyons. The place contains 15,915 inhabitants, in two cantons, the one containing 13,396, and the other 14,100, on an extent of 185 kiliometres, in 16 communes. N. lat. 45° 2′. E. long. 3° 57′.

Puy-*Laurens*, a town of France, in the department of the Tarn, and chief place of a canton, in the diſtrict of Lavaur; 12 miles S.E. of Lavaur. This place contains 5648, and the canton 9817 inhabitants, on a territory of 125 kiliometres, in 9 communes.

Puy-*l'Evêque*, a town of France, in the department of the Lot, and chief place of a canton, in the diſtrict of Cahors; 14 miles W. of Cahors. The place contains 2082, and the canton 12,127 inhabitants, on a territory of 285 kiliometres, in 11 communes.

Puy-*Mirol*, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the diſtrict of Agen. The place contains 1263, and the canton 8072 inhabitants, on a territory of 125 kiliometres, in 11 communes.

Puy *de Belliard*, a town of France, in the department of La Vendée; 18 miles N.W. of Fontenay le Comte.

Puy *Caſquier*, a town of France, in the department of the Gers; nine miles N.E. of Auch.

Puy *de Dome*, a mountain of France, near Clermont en Ferrand, 810 toiſes in height.

Puy *de Dome* is alſo the name of one of the nine departments of the central region of France, ſo called from the mountain that is ſituated in it; it is bounded on the N. by the department of the Allier, on the E. by that of the Rhône and Loire, on the S. by the departments of the Cantal and Upper Loire, and on the W. by thoſe of the Correze and Creuſe; formerly Lower Auvergne, in N. lat. 45° 40′, containing 8450 kiliometres, or about 35 French leagues in length, and 22 in breadth, or 447 ſquare leagues, and 508,444 inhabitants; divided into five diſtricts, *viz.* Riom, including 126,640; Thiers, 61,530; Ambert, 73,535; Clermont, 158,449; and Iſſoire, 88,290 inhabitants; 50 cantons, and 438 communes. The circles, according to Haſſenfratz, are 8, the cantons 71, and the population 516,593. Its capital is Clermont. The general total of its contributions in the 11th year of the new French era, was eſtimated at 3,656,547 francs; and its expences for adminiſtration, juſticiary, and for public inſtruction, at 374,681 francs, 37 cents. The ſoil of this department, diverſified with hills and plains, is remarkably fertile, producing abundantly grain, wine, fruits, hemp, and paſtures. It has mines of ſilver and lead, mineral ſprings, &c.

Puy *le Garde*, a town of France, in the department of the Lot; 15 miles N.E. of Montauban.

Puy *Guillaume*, a town of France, in the department of the Puy de Dome; eight miles N.E. of Lezoux.

Puy *Laurens*, a town of France, in the department of the Aude; ſeven miles S.E. of Quillan.

Puy *Marin*, a town of France, in the department of the Upper Garonne; 17 miles N. of St. Gaudens.

Puy *Mirlan*, a town of France, in the department of the Lot and Garonne; ſix miles E. of Marmande.

Puy *Moiſſon*, a town of France, in the department of the Lower Alps; 15 miles S. of Digne.

Puy *Notre Dame*, or *Puy en Anjou*, a town of France, in the department of the Mayne and Loire; 10 miles S.W. of Saumur.

Puy *de la Poix*, a town of France, in the department of the Puy de Dome; 18 miles E. of Clermont.

Puy *la Roque*, a town of France, in the department of the Lot; 17 miles N.E. of Montauban.

Puy *St. Martin*, a town of France, in the department of the Drôme; 11 miles N.E. of Montelimart.

Puy *Val d'Or*, a town of France, in the department of the Eaſtern Pyrenées; 10 miles N.W. of Montlouis.

PUYA, in *Botany*, the vulgar name, in Chili, of a plant, which is figured in Feuillée, v. 3. 59. t. 39, and adopted as a genus, after Molina, in Juſſieu's Genera 447, under the above barbarous appellation, with the following character.

"Calyx in ſix deep ſegments; the three innermoſt largeſt, and vaulted. Stamens ſix, inſerted into the lower part of the calyx; their filaments formed like a ſcale at the baſe, and bearing honey. Germen ſuperior, triangular; (ſtyle and ſtigma unknown). Capſule of three cells, with numerous minute ſeeds, (doubtful whether furniſhed with down.")

Feuillée's deſcription is to the following effect. The roots are fibrous, throwing up ſeveral ſtems, about nine feet high, as thick as a man's body at the bottom, where they are clothed with the ſcaly imbricated veſtiges of old leaves, above which ſtand the numerous leaves of the preſent year. Theſe are three or four feet long, and about two inches wide, reſembling the foliage of the Pine-apple, their margins being fringed with very ſharp hooked prickles, five lines long, and about an inch and a half aſunder; the ſurface of the leaves is ſmooth, ſhining, of a fine bright green. The Indians make uſe of theſe prickles as fiſh-hooks. The part of the ſtem above the leaves is round, two inches or more in thickneſs; of a blueiſh-green externally; white and watery within, clothed with very ſhort, alternate, claſping leaves, or ſcales. The ſummit conſiſts of a large pyramid of flowering branches, or ſpikes, the lowermoſt a foot long; all clothed with ſimilar ſcales, or bracteas, each of which is accompanied by a ſeſſile axillary flower. Each flower is compoſed of ſix leaves, three large and three ſmall, in a double row. The latter are three quarters of an inch long, (Feuillée ſays, apparently by miſtake, three inches,) and three lines and a half broad, covered with minute white down: the three larger are of a greeniſh-yellow, two inches and a half long, and nine lines broad, terminating like a Gothic arcade. The flowers roll up ſpirally as they fade. Six ſtamens ſpring from the bottom of each flower, ſurrounding a triangular piſtil, which extends beyond them, and becomes

a fruit

a fruit of three cells, filled with an infinite number of seeds. Feuillée met with several specimens of this plant in the kingdom of Chili. He refers it to his genus of *Renealmia*, the *Tillandsia* of Linnæus. Jussieu justly suspects its being the same genus with l'Heritier's PITCAIRNIA, see that article; of which therefore the plant in question may be presumed to constitute an additional species to the four we have described; agreeing most with *P. bracteata* in habit, size and colour, but differing in having more spinous leaves, as well as a more compound inflorescence.

The reader will observe that Jussieu, according to the principles he had assumed, calls the whole integument of the flower a calyx, while we follow other writers in taking the three inner parts for petals; a measure justified, if we mistake not, by their habit, and mode of withering. The little differences respecting the scales or nectaries may easily be reconciled.

PUYCERDA, in *Geography*, a town of Spain, in Catalonia, and capital of the county of Cerdagne, surrounded with walls and bastions, and defended by a castle; 19 miles E.N.E. of Urgel. N. lat. 42° 30′. E. long. 1° 48′.

PUYO, a town of France, in the department of the Landes; nine miles S.W. of Aire.

PUYS, a term used for the poles with which the keels on the Tyne river are stowed along.

PUYSEGUR, JAMES DE CHASTENET, *Lord of*, in *Biography*, lieutenant-general under Lewis XIII. and XIV., was born in 1600. He entered the army at the age of seventeen, and served, without intermission, during forty-three years. He was present at above thirty battles, and one hundred and twenty sieges, without ever having been sick or received a wound, but he had not the good fortune to rise in his profession, being more zealous for the king's service, than complaisant to the ministers. He drew up "Memoirs," comprising the period from 1617 to 1658, in which are contained various remarkable particulars relative to the campaigns in which he served, with useful military instructions. They were printed at Paris and Amsterdam in 1690, 2 vols. 12mo. under the inspection of Du Chesne, historiographer of France, and they have the character of narrating with freedom and fidelity. He died at his country seat in 1682. Moreri.

PUYSEGUR, JAMES DE CHATELET, *Marquis de*, was son of the preceding, born at Paris in 1655, and entered into the army under his father, and gradually rose to the post of commander-in-chief in the French Netherlands, and finally, to the still more important one of a marshal of France in 1734. He died at Paris in the year 1743, at the age of 88. He was author of a work "On the Art-Military," published by his only son the marquis of Puysegur. Moreri.

PUZZALO, in *Geography*, a town of the island of Sicily, in the valley of Noto, near the S. coast of the island; 12 miles S.W. of Noto.

PUZZLING BAY, a bay in the straits of Magellan, on the coast of Patagonia. N. lat. 53° 35′. W. long. 74° 28′.

PUZZOLANA. See POZZOLANA, and *Calcareous* CEMENT.

PUZZUOLI, in *Geography*. See POZZUOLI.

PWLLHELI, a borough, market, and sea-port town in the parish of Denio, cwmmwd of Cannologion, cantref of Lleyn, now called the hundred of Gyfflogion, county of Caernarvon, South Wales, is situated on the south side of the promontory of Lleyn, in St. George's Channel, at the distance of 27 miles S.S.W. from Caernarvon, and 243½ miles W.N.W. from London. This town consists chiefly of a single street, running parallel to the shore. It was constituted a free borough by Edward the Black Prince, at the request of Nigel de Lohareyn, and had its privileges confirmed by king Edward III. The government is vested in a mayor, recorder, and two bailiffs, who have the powers of justices. The market days here are Wednesday and Saturday, weekly; and there are besides six annual fairs. This port has a considerable trade; and upwards of eighty ships, of different burthens, belong to it. Along the coast to Bardsea island, an extensive and valuable herring fishery has been lately established. The harbour is good, and well sheltered from the winds; and the bay, to which the town gives name, affords excellent anchorage ground. Pwllheli is one of the contributary boroughs with Caernarvon, in returning one member to parliament, and is likewise the seat of the petty sessions for the district of Lleyn, which extends about twenty-two miles in length, and from three to ten in breadth, projecting into the sea in a manner similar to the county of Cornwall. According to the parliamentary returns of 1811, the parish contains 312 houses, and 1383 inhabitants, of which number, above one-half are resident in the town of Pwllheli.

At the distance of five miles from this town is Carn-Madryn, a strong fortress, which formerly belonged to the sons of Owen Gwynedd. The bottom, sides, and top are filled with cells, varying in size and shape, many of which are still nearly entire. Close to the sea-coast is an entrenchment, called Dinas Dinlle, which constitutes an object of great attraction from the road to Caernarvon by Clynnog Fawr, a neat romantic village, boasting one of the largest and handsomest churches in Wales. Near it is the valley called Nant-y-Gwrtheyrn, or the valley of Vortigern, where that prince is said to have concealed himself, to avoid the persecution of his subjects. It is bounded on two sides by stony steps, only productive of heath and stunted gorse, and on a third by a tremendous precipice. The only opening to this secluded spot is towards the sea, "a northern aspect, where chilling winds exert all their fury, and half freeze, during winter, its few inhabitants." Nicholson's Cambrian Traveller's Guide, 1813. Carlisle's Topographical Dictionary of Wales, 1811, 4to.

PYANEPSIA, Πυανεψια, in *Antiquity*, a feast celebrated by the Athenians in the month Pyanepsion; which, according to the generality of the critics, corresponded to our September.

Plutarch refers the institution of this feast to Theseus; who, at his arrival from Crete, made a kind of sacrifice to Apollo of all the provisions remaining in his vessel; putting them all into a kettle, boiling them together, and eating them with his six companions; which custom was afterwards continued. The scholiast of Aristophanes says, this was done to acquit himself of a vow he made to Apollo in a tempest.

M. Baudelot writes the word *Puanepsia*, and takes it to be a feast instituted in memory of Theseus's return after killing the Minotaur.

The Greeks vary as to the origin and signification of the word Pyanepsion, whence the feast is denominated. Harpocration calls it *Pæanoptia*; he adds, that others call it *Panopsia*, because then the fruits all appear to the eye. Hesychius writes *Pyanepsia*; and derives it from πυανον, *bean*, and εψω, *coquo*; because in this feast the Athenians gathered their beans, and made a kind of broth of them.

PYANEPSION, Πυανεψιων, in the Athenian *Chronology*, a month of thirty days, in which the festival Pyanepsia was celebrated, and called by the Bæotians Damatrius.

PYAPOUR, in *Geography*, a town of Hindoostan, in Bahar; 13 miles E. of Bahar.

PYBOLOWO, a town of Lithuania; 25 miles E. of Minfk.

PYCIELT, in *Botany*, a name given by Hernandez, and fome other authors, to a peculiar fpecies of tobacco, diftinguifhed by Mr. Tournefort by the name of nicotiana major lato et rotundo folio, the broad roundifh-leaved great tobacco.

PYCNANTHEMUM, a name contrived by Michaux, from πυκνος, *denfe*, and ανθος, *a flower*, to exprefs the denfe inflorefcence.—Michaux Boreali-Amer. v. 2. 7. Ait. Hort. Kew. v. 3. 376. Purfh v. 2. 409. (Brachyftemum; Michaux Boreali-Amer. v. 2. 5.)—Clafs and order, *Didynamia Gymnofpermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juff.

Gen. Ch. *Cal.* Perianth of one leaf, inferior, tubular, ftriated, erect, permanent, with five awl-fhaped, acute, nearly equal teeth; the mouth naked. *Cor.* of one petal, ringent; tube cylindrical, the length of the calyx; upper lip nearly erect, oblong, flightly convex, rounded, fcarcely notched; lower lip much the largeft, widely fpreading, channelled, three-lobed; the lateral lobes femi-elliptical; the middle one longeft. *Stam.* Filaments four, awl-fhaped, diftant, various in length; two of them fhorter than the reft; anthers with two parallel cells. *Pift.* Germen fuperior, four-cleft; ftyle briftle-fhaped, rather fhorter than the corolla; ftigmas two, fpreading, acute. *Peric.* none, except the permanent calyx. *Seeds* four, roundifh.

Eff. Ch. Calyx five-cleft. Middle fegment of the lower lip of the corolla longer than the reft. Stamens diftant. Anthers with parallel cells.

Obf. This genus feems to differ from *Satureja* principally in the form of its corolla. The fpecies, as far as we know, are all American.

Sect. 1. *Stamens prominent. Pycnanthemum* of Michaux.

1. P. *incanum.* Hoary Tufted Savory. Michaux v. 2. 7. Purfh n. 1. Ait. n. 1. (Clinopodium incanum; Linn. Sp. Pl. 822. Willd. Sp. Pl. v. 3. 132. C. menthæ folio, incanum et odoratum; Dill. Elth. 87. t. 74. C. Serpentaria dictum, &c.; Pluk. Mant. 51. t. 344. f. 1.)—Leaves oblong-ovate, acute, flightly ferrated, downy. Heads compound; the lateral ones ftalked. Bracteas fetaceous.—Found in low fields and copfes, from Virginia to Carolina; flowering from July to October. It was cultivated in Sherard's garden at Eltham before the year 1732, but has fcarcely been attended to by recent amateurs. The *root* is perennial. *Stem* three feet high, erect, fomewhat branched, leafy, bluntly quadrangular. *Leaves* about two inches long, on fhort ftalks; their under fide moft hoary or downy. *Flowers* white, tinged with red, in denfe ftalked hoary whorls, with a terminal head; their inner *bracteas* briftle-fhaped. The whole herb is clothed with fine foft pubefcence; the *leaves* marked with pellucid dots; their fcent aromatic, partaking of the common, as well as fweet, Marjoram.

2. P. *ariftatum.* Briftly Tufted Savory. Michaux v. 2. 8. t. 33. Purfh n. 2. Ait. n. 2. (Nepeta virginica; Linn. Sp. Pl. 799. Willd. Sp. Pl. v. 3. 56. Clinopodium amaraci folio, flore albo; Pluk. Phyt. t. 85. f. 2.)—Leaves ovato-lanceolate, fomewhat hoary, flightly ferrated. Heads feffile. Bracteas and calyx awned.—Native of dry woods, on a limeftone foil, from Maryland to Carolina, flowering in July and Auguft. Miller appears to have cultivated this fpecies in 1752. It is perennial, with altogether the herbage and afpect of an *Origanum.* The *leaves* are not an inch long, nearly feffile, dotted, veiny, thick-edged, very minutely, and fcarcely perceptibly, hoary. *Flowers* white, fmall, in numerous, denfe, terminal, hoary, compound heads. *Bracteas* lanceolate, entire, with long, rigid, awn-like points.

3. P. *montanum.* Mountain Tufted Savory. Michaux v. 2. 8. Purfh n. 3.—"Leaves oval-lanceolate, ferrated. Head feffile. Calyxes crowded, erect, with fhort teeth."—Native of high mountains in Carolina, according to Michaux, the only perfon who appears to have gathered this plant. The *ftem*, and part of the reft of the herb, are ufually tinged with purple. We have feen neither fpecimen nor figure.

4. P. *Monardella.* Monarda Tufted Savory. Michaux v. 2. 8. t. 34. Purfh n. 4. (Origanum incanum; Walter Carolin. 165.)—Somewhat hairy. Leaves ovate, taper-pointed, ferrated. Outer bracteas ovate, coloured, longer than the flowers; inner lanceolate, fringed. Calyx bearded.—Found on the mountains of Virginia and Carolina, but as yet a ftranger to our gardens. It flowers from June to Auguft, and is perennial. The habit of the plant, and its coloured *bracteas*, refemble *Monarda fiftulofa.* The *flowers* are fmall, and pale red, according to Mr. Purfh, on whom we depend for the fynonym of Walter.

5. P. *linifolium.* Flax-leaved Tufted Savory. Purfh n. 5. Ait. n. 3. (Brachyftemum virginicum; Michaux v. 2. 6. B. linifolium; Willd. Enum. 623. Thymus virginicus; Linn. Syft. Veg. ed. 13. 453. Willd. Sp. Pl. v. 3. 145. Satureja virginiana; Linn. Sp. Pl. 793. Herm. Parad. 218. t. 218. Pulegium virginianum anguftifolium, &c.; Pluk. Phyt. t. 54. f. 2.)—Stem erect, much branched, corymbofe, roughifh. Leaves lanceolate, entire. Heads crowded, nearly globular. Bracteas ovate, fringed.—Found in rather dry and mountainous meadows of North America, from New England to Carolina, flowering in July and Auguft. Miller had it in cultivation in the year 1739, and it is ftill preferved in curious gardens, being a tolerably hardy, fomewhat fhrubby, perennial, of a bufhy corymbofe habit, about eighteen inches or two feet high. The whole plant fmells ftrongly of Penny-royal. The *ftem* is fquare, pale, downy chiefly at the angles; its upper branches rifing all nearly to a level, and forming a *corymbus* of numerous, globofe or hemifpherical, downy heads, of fmall white *flowers.* The *bracteas* are numerous, all ovate; the outer ones large, the inner very downy. Such is the plant intended by Linnæus under the above fynonyms, and which is perhaps rather the *P. lanceolatum* of Purfh, than his *linifolium.* In the latter the *ftamens* are longer than the *corolla;* in the former they are fhorter; but this is evidently, as in Mints, a variable circumftance; and therefore the *Pycnanthemum* and *Brachyftemum* of Michaux, are certainly one and the fame genus. We are confident alfo that there is no fpecific difference between Purfh's and Willdenow's *linifolium* and *lanceolatum.*

Sect. 2. *Stamens within the tube. Brachyftemum* of Michaux.

6. P. *muticum.* Pointlefs Tufted Savory. Purfh n. 7. (Brachyftemum muticum; Michaux v. 2. 6. t. 32.)—Leaves ovate, pointed, fmoothifh, fomewhat ferrated. Heads terminal, feffile, folitary. Bracteas lanceolate, acute, awnlefs.—Gathered by Michaux in Upper Carolina. Mr. Purfh never found this fpecies. The former writer is incorrect in his definition of the *leaves*, which are by no means "lanceolate-oval," nor are they "dentate," but truly ferrated, at leaft in his plate. The *heads* bear fome refemblance to thofe of our fifth fpecies, but are lefs globofe.

7. P. *verticillatum.* Whorled Tufted Savory. Purfh n. 8. (Brachyftemum verticillatum; Michaux v. 2. 6. t. 31. Origanum clinopodioides; Walt. Carol. 165.)—Leaves ovate, pointed, entire. Flowers capitate and whorled. Bracteas lanceolate, pointed.—Native of mountains in North America, from Pennfylvania to Carolina, flowering in

in July and August. *Pursh.* This, like the rest, is perennial. It nearly resembles the last, but differs in having entire *leaves*, and one or two dense axillary whorls of *flowers*, besides the solitary terminal heads. The *bracteas* are also said to be more pointed.

PYCNI, πυκνοὶ, in the *Ancient Music*, was used for such sounds or chords of a tetrachord as might enter the spissum, or πυκνον.

These were the hypatæ, the parypatæ, and the lichani, of the several tetrachords. The hypatæ were called *barypycni*, βαρυπυκνοι; the parypatæ, *mesopycni*, μεσοπυκνοι; and the lichani, *oxypycni*; οξυπυκνοι; because the first were the lowest notes; the second, the middle notes; and the third, the highest of the spissum. Such chords as could never enter the spissum were called *apycni*, απυκνοι, υπατοειδεις, παρυπατοειδεις, λιχανοειδεις.

Hence, in the Greek scale or diagram, containing eighteen chords, there were five barypycni, as many mesopycni, and an equal number of oxypycni, together with three apycni. The apycni and barypycni were stabiles or fixed chords; but the mesopycni and oxypycni were moveable, or mobiles.

PYCNITE, in *Mineralogy*, is the mineral called schulite by Klaproth, leucolite by Daubenton, and schorlous beryl by Werner, who first classed it as a subspecies of beryl. It is now arranged with the topaz, to which its constituent parts bear a nearer resemblance. It is remarkable for containing, like the topaz, a portion of fluoric acid. Pycnite is generally found crystallized in long six-sided prisms imbedded in granite rocks. Small four-sided prisms may be obtained by a careful mechanical division from the large crystals; the bases of these are rhombs with angles of 120° and 60°. Bucholz considers this to be the primitive form of pycnite. The colour of this mineral is either various shades of white, passing on one side from greyish and yellowish-white to straw-yellow, or from reddish-white to a peach blossom and crimson red. Some specimens are marked with spots of violet blue. The crystals are translucent. The cross fracture is imperfectly foliated, the longitudinal imperfectly small conchoidal. It is harder than quartz, which it scratches, but is easily broken in a direction perpendicular to the axis of the crystals. Its specific gravity is 3.61. By the analysis of Vauquelin, pycnite contains

Alumine	- -	60
Silex	- -	30
Fluoric acid	-	6
Lime	- -	2
Water	- -	1
Loss 1.	- -	99

Bucholz makes the proportion of fluoric acid 17 *per cent.* There is no less difference in the proportion of fluoric acid in different specimens of the topaz, as given by Klaproth and Vauquelin. See TOPAZ. B.

PYCNON, πυκνον. See SPISSUM.

PYCNOSTYLE, πυκνοστυλο, formed from πυκνος, *close*, and στυλο, *column*, in the *Ancient Architecture*, a building where the columns stand very close to one another; one diameter and a half of the column being allowed for the intercolumnation.

The pycnostyle is the smallest of all the intercolumnations mentioned by Vitruvius. Some make it the same with *systyle*; others distinguish the latter by its allowing half a module more in the Corinthian intercolumnation.

The pycnostyle, Mr. Evelyn observes, chiefly belonged to the Composite order, and was used before the most magnificent buildings; as, at present, in the perystyle of St. Peter's at Rome, consisting of near three hundred columns; and such as yet remain of the ancients among the late discovered ruins of Palmyra.

PYCNOTICS, INCRASSANTS, or medicines of an aqueous nature, which have the faculty of cooling and condensing, or thickening, the humours.

The word, in its original Greek, πυκνωτικον, signifies something that has the power of thickening.

Purslane, the nenuphar or water-lily, solanum, &c. are ranked among pycnotics.

PYDNA, in *Ancient Geography*, a town of Macedonia, in Pieria, on the coast of the Thermæan gulf, some miles N. of the river Aliacmon. It was near this town that the Romans gained over Perseus the battle which terminated the kingdom of Macedon. Steph. Byz. calls it Cydna.—Also, a town of the Rhodians.—Also, a mountain of the island of Crete.—Also, a town of Asia, in Phrygia, in the vicinity of mount Ida.

PYE, in English *Antiquity*. See PICA.

PYE, in *Mechanics*. See CRAB.

PYE, in *Ornithology*. See PICÆ.

PYE, *Sea*. See PICA *Marina*.

PYE's *Islands*, in *Geography*, a cluster of small islands in the North Pacific ocean, near the W. coast of North America. The southernmost forms, in various appearances of it, a very conspicuous peak; its S. extremity is situated in N. lat. 59° 19′. E. long. 210° 21′.

PYGAIA, in the *Materia Medica*, a name by which some authors have called the ipecacuanha, or vomiting Indian root.

PYGARGA, in *Zoology*, a species of *Antelope;* which see.

PYGARGITES, in *Natural History*, a name given by Pliny and some other of the old writers to the eagle-stone, when it was variegated with white, in the manner of the tail of the eagle, called *pygargus*.

PYGARGUS, in *Ornithology*, a species of eagle, called also by some authors *albicilla*, and *hirundinaria*. Linnæus has classed this bird among the vultures, calling it the *vultur albicilla*, because its bill is rather straighter than is usual in the eagle; but Mr. Pennant observes, that it can have no claim to be ranked with that genus, because the pygargus is wholly feathered; whereas the characteristic mark of the vulture is, that the head and neck are either quite bare, or only covered with down.

It is a large and fierce bird, of the size of the common turkey; its beak is yellow, and covered with a yellow membrane at its base; it has large hazel-coloured eyes; its feet are yellow, and its claws extremely strong and sharp; the head is white, and there are no feathers, but some fine hairs between the eyes and nostrils; the upper part of the neck is of a reddish-brown, and the rump black; all the body besides this is of an obscure rust colour, and its wings are partly black, partly grey; its tail is long, and the upper half of it is white, and the rest black. It is from this white part that it has its name *albicilla*. The male is of a darker colour than the female. This bird inhabits Scotland and the Orkneys, and feeds on fish as well as on land animals.

Authors who have written on this subject seem not at all agreed to call the same bird by this name. The pygargus of Aldrovand seems different from this, and the pygargus prior of Bellonius seems no other than the male of that kind of hawk, called in English the *hen-harrier*.

Mr. Willughby imagines his first pygargus, p. 61, to be only a variety of the white-tailed eagle, having the same charac-

characteriftic mark, and differing only in the pale colour of the head.

Pygargus *Accipiter*, a name by which many authors have called the fubbuteo, a bird of the hawk kind; the male of which is called in Englifh the hen-harrier, and the female fuppofed by fome to be the ring-tail. See Falco.

PYGELA, in *Ancient Geography*, a town of Afia Minor, in Ionia, where was a temple of Venus Munychian, according to Strabo and Steph. Byz.

PYGME, πυγμη, the length, or extent, between the elbow, and extremity of the hand, the fift being fhut; called alfo a cubit.

PYGMY, Pygmæus, πυγμαιος, formed of πυγμη, *cubit*, a dwarf, or perfon of exceeding fmall ftature, not exceeding a cubit in height. See Dwarf.

The appellation is given among the ancients to a fabulous nation, faid to have inhabited Thrace; who generated and brought forth young at five years of age, and were old at eight; famous for the bloody war they waged with the cranes.

Pygmy *Ape*, in *Zoology*. See Simia *Sylvanus*.

PYHA, in *Geography*, a large lake of Sweden, in the province of Savolax, N.E. of lake Saima, and communicating with it.—Alfo, a river of Sweden, which runs into the gulf of Bothnia, at Braheftad.

PYHAJARVI, a town of Sweden, in the province of Nyland; 34 miles N.W. of Helfingfors.

PYHAJOCKI, a town of Sweden, in Eaft Bothnia, near the fea coaft; 10 miles S.S.W. of Braheftad.

PYHAMAA, a fmall ifland in the gulf of Bothnia, on a peninfula of the coaft of Finland. N. lat. 69° 59′. E. long. 21° 12′.

PYKEHAUS, a town of Bengal; 52 miles S.E. of Pucculoe.

PYKER, or Pycar, in our *Writers*, a fmall fhip or herring boat.

PYLA, in *Geography*, a town of the duchy of Warfaw; 48 miles N. of Pofen.—Alfo, a river of England, in Monmouthfhire, which runs into the Olwy; 2 miles N.E. of Ufk.

PYLADES, in *Biography*. See Bathyllus, Hylas, Mime, and Pantomime.

PYLÆ Persides, in *Ancient Geography*, a famous ftrait in Afia, between the Perfide and Sufiana, according to Diodorus Siculus. This ftrait is named Portæ Perficæ by Strabo, and Pylæ Sufiades by Arrian.

Pylæ *Sarmaticæ*. Sarmatia is bounded on the S. by mount Caucafus, which feparates it from the neighbouring countries. Ptolemy fpeaks of two ftraits or paffages in this famous mountain; one called Portæ Caucafiæ, which affords entrance into Siberia; the other named Pylæ Albaniæ, and gives entrance into Albania.

PYLÆA, a town of Macedonia, in Trachinia, fituated at the foot of mount Oëta, according to Philoftratus. This gave name to the Pylaic gulf, mentioned by Strabo.

Pylæa, πυλαια, in *Antiquity*, a name given to the affembly of the Amphictyons, as well when they met at Delphi as at Thermopylæ. The concourfe of people at thefe affemblies was fo great, that the term pylæa came to be ufed for any very numerous affembly, or crowd of people. Mem. Acad. Infcr. vol. iv. p. 287. 290.

PYLAGORÆ, Πυλαγορες, a name given to the Amphictyons, becaufe they affembled at Thermopylæ, or Pylæ.

PYLAU, in *Geography*, a town of Pruffia; 18 miles S. of Konigfberg.

PYLE, Thomas, in *Biography*, was born at Stodey, near Holt, in Norfolk, in the year 1674. He received his academical education at Caius college, Cambridge, where he took his degrees, and became an excellent fcholar. When inducted to the church, he difcharged all the duties attaching to his fituation as curate with the moft confcientious integrity. His great aim was to amend and improve his hearers, and his difcourfes and urgent manner gained him the attention for which he was anxious. In early life he took part in the Bangorian controverfy, and acquitted himfelf fo much to the fatisfaction of bifhop Hoadly, that his lordfhip prefented him with a prebend, and procured for him a refidentiaryfhip in the cathedral church of Salifbury, and likewife made his two fons prebendaries of Winchefter. He died in his 84th year. He was greatly admired as a preacher, and no lefs fo as a faithful friend, an agreeable companion, a man of the moft liberal fentiments, and fo free from all pride and conceit of his own abilities, that he was apt to pay a deference to the opinions of many perfons much inferior to himfelf. Archbifhop Herring fpeaks of him as a worthy man, but who had not at all times the proper government of his own temper. He was author of feveral works: as "A Paraphrafe, with Notes, on the Acts of the Apoftles, and Epiftles," being a fupplement to Dr. Clarke's Paraphrafe on the Four Gofpels: "The Scripture Prefervative againft Popery; being a Paraphrafe, with Notes, on the Revelation of St. John." He publifhed alfo, between the years 1715 and 1725, "A Paraphrafe, with fhort and ufeful Notes, on the Books of the Old Teftament." In 1773, his friends publifhed two vols. of pofthumous fermons, to which, in 1783, a third was added. Though thefe fermons want the care and polifh of finifhed compofitions, they are reckoned interefting and highly ufeful family difcourfes.

PYLE-RUDBAR, in *Geography*, a town of Perfia, in the province of Ghilan; 32 miles S. of Refhd.

PYLING *the Ground for Foundations*. See Foundation, and Pallification.

PYLORIC *Artery* and *Vein*, in *Anatomy*, are blood veffels belonging to the ftomach. See Stomach.

PYLORUS, the circular ring by which the ftomach communicates with the fmall inteftine. See Stomach.

PYLSTART, in *Geography*, an ifland in the South Pacific ocean, about fix miles in circumference, difcovered by Tafman in 1643. It prefents to view two lofty hills, which feem feparated from each other by a low valley: it is called by Maurelle "La Sola." S. lat. 22° 22′. W. long. 175° 59′.

PYLUS *Meffeniæ*, now *Navarin*, in *Ancient Geography*, was fituated on the weftern coaft of Meffenia, over-againft the ifland of Afina.

Pylus (*Zonchio*), or *Avarino Veccio*, a town of Meffenia, upon the fea-coaft, S.E. of Platamodes.

Pylus *Ælianus*, a town of Triphylia, N.W. of Onus, upon the Ladon.

PYMATUNING, in *Geography*, a town of America, in Mercer county, Pennfylvania; 23 miles W.S.W. of Fort Franklin. It contains 376 inhabitants.

PYNAKER, Adam, in *Biography*, a landfcape painter, was born at the village of Pynaker, near Delft, in 1621. Whether his real name was that by which he is known or not, is not now to be afcertained. By an earneft ftudy of the art, firft in his native land, and afterwards at Rome, he acquired very confiderable fkill and celebrity. He generally exhibits brilliant effects of funfhine, in fubjects not always happily felected, but executed with great frefhnefs, purity, and tafte. In his pictures we frequently fee ruins of elegant and antique buildings, and figures well adapted to the fcenery.

fcenery. In general his pictures are of a fmall fize, and are rather fcarce. He died in 1673, at the age of 52.

PYNANG, in *Botany*, a name by which fome authors call the faufel, or areca-tree; a kind of palm, from the expreffed juice of which the drug commonly, but improperly, called Japan-earth is made.

PYNY, in *Geography*, a town of Hindooftan, in Coimbetore; 18 miles S. of Daraporum.

PYONY WATER. See WATER.

PYRACANTHA, in *Botany*, a name given by fome authors to the lycium, or box-thorn.

PYRÆIA, or PYRETHEA, among the *Eaftern Nations of Antiquity*, were great inclofures uncovered, and dedicated to the fun, in which a perpetual fire was kept up in honour of this luminary, which was worfhipped by moft of them. See CHAMANIM.

PYRALIS, the *fire-fly*, a name given by authors to a fuppofed infect, which they fay is produced in the violent fires of the glafs and metal furnaces. Plin. lib. ii. c. xxxvi. See LAMPYRIS.

PYRAMID, πυραμις, in *Geometry*, a folid ftanding on a fquare, triangular, or polygonal bafis, and terminating at top in a point; or a body whofe bafe is a regular rectilinear figure, and whofe fides are plain triangles; their feveral vertices meeting together in one point.

Euclid defines it a folid figure, confifting of feveral triangles whofe bafes are all in the fame plane, and have one common vertex.

Wolfius defines it a folid, bounded by as many triangles, A D C, D C B, and A D B, terminating in one point D, as the bafe A B C has fides. *Plate* XI. *Geometry*, *fig.* 18.

The pyramid is faid to be *triangular*, *quadrangular*, *quinquangular*, &c. according as the bafe is triangular, quadrangular, &c. The pyramid may be called a fquare, triangular, &c. cone; or the cone a round pyramid.

PYRAMID, *Properties of the*. 1. All pyramids and cones ftanding on the fame bafe, and having the fame altitude, are demonftrated to be equal.

2. A triangular pyramid is the third part of a prifm, ftanding on the fame bafe, and of the fame altitude.

3. Hence, fince every multangular may be divided into triangulars, every pyramid is the third part of a prifm, ftanding on the fame bafis, and of the fame altitude.

4. If a pyramid be cut by a plane, *a b c*, parallel to its bafe, A B C, the former plane, or bafe, will be fimilar to the latter.

5. All pyramids, prifms, cylinders, &c. are in a ratio compounded of their bafes and altitudes: the bafes, therefore, being equal, they are in proportion to their altitudes; and the altitudes being equal, they are in proportion to their bafes.

6. Similar pyramids, prifms, cylinders, cones, &c. are in a triplicate ratio of their homologous fides.

7. Equal pyramids, &c. reciprocate their bafes and altitudes; *i. e.* the altitude of the one is to that of the other, as the bafe of this to the bafe of that.

8. A fphere is equal to a pyramid, whofe bafe is equal to the furface, and its height to the radius of the fphere.

PYRAMID, *to meafure the furface and folidity of a*. Find the folidity of a prifm that has the fame bafe and height with the given pyramid. And divide this by three; the quotient will be the folidity of the pyramid. Or, multiply the bafe by the perpendicular height; and one-third of the product will be the content.

Suppofe, *v. gr.* the folidity of the prifm be found 67010328, the folidity of the pyramid will be thus found 22336776.

The furface of a pyramid is had, by finding the areas, both of a bafe, A B C, and of the lateral triangles, A C D, C B D, D B A. (See TRIANGLES.) The fum of thefe is the area of the pyramid.

The external furface of a right pyramid, ftanding on a regular polygonal bafe, is equal to the altitude of one of the triangles which compofe it, multiplied by the whole circumference of the bafe of the pyramid.

PYRAMID *on a plane, to defcribe a*. 1. Draw the bafe, *v. gr.* the triangle A B C (if the pyramid required be triangular); fo as that the fide A B, fuppofed to be turned behind, be not expreffed. 2. On A C and C B, conftruct the triangles A D C and C D B, meeting in any affumed or determined point, *v. gr.* D; and draw A D, C D, B D; then will A D B C be a triangular pyramid.

PYRAMID *of pafteboard*, &c. *to conftruct a*. Suppofe, *v. gr.* a triangular pyramid required. 1. With the radius A B defcribe an arc B E (*fig.* 19.); and to this arc apply three equal chords, B C, C D, and D E. 2. On C D conftruct an equilateral triangle, D F C, and draw the right lines A D and A C. This pafteboard, &c. being cut off by the contour of the figure, what remains within will turn up into a pyramid.

PYRAMID, *Truncated*. See TRUNCATED.

PYRAMID, *Fruftum of a*. See FRUSTUM.

PYRAMID, in *Architecture*, denotes a folid, maffive edifice; which, from a fquare, triangular, or other bafe, rifes diminifhing to a point, or vertex.

Some derive the word from πυρος, *wheat*, and αμαω, *colligo*; pretending that the firft pyramids were built by the patriarch Jofeph, for granaries. But Villalpandus, with much better reafon, derives the word from πυρ, *fire*; becaufe of their ending in a point like flame.

Wilkins, converfant with the Coptic tongue, fuggefts (Diff. de Ling. Copt.) another derivation from that language, in which *pouro* fignifies a king, and *mifi*, a race or generation; and he fays, the pyramids were thus called, becaufe they were erected to preferve the memories of the Egyptian kings and their families; and that thofe who defcended from them had recourfe to thefe pillars in order to prove their pedigree.

When they are very narrow at bottom, *i. e.* their bafe very fmall, they are called *obelifks*, and *needles*.

Pyramids are fometimes erected to preferve the memory of fingular events, and, fometimes, to tranfmit to pofterity the glory and magnificence of princes; but, as they are the fymbols of immortality, they are more commonly ufed as funeral monuments

Such is that of Ceftius at Rome, the maufoleum of this diftinguifhed Roman, who was one of the feven officers called *Epulones*, and is faid to have lived under Auguftus, repaired in 1673, by Alexander VII. and thofe other celebrated ones of Egypt, as famous for their fize as their antiquity; and reckoned by the ancients among the wonders of the world.

Thefe laft are all fquare in their bafes; and it is a thing that has been frequently propofed, to eftablifh a fixed meafure from them, to be thereby tranfmitted to pofterity. See their defcriptions, meafures, &c. in Thevenot, Pietro della Valle, Greaves, Pococke, Shaw, Perry, Maillet, Savary, &c. The pyramids of Egypt, comprehending the great and fmall, are very numerous; of thefe there are about twenty of the largeft fize. The moft remarkable are the three pyramids of Memphis, or, as they are now called, of Gheifa, Geeza, or Gizé. The dimenfions of the greateft of thefe have been differently ftated both by ancient and modern

modern writers. Herodotus (lib. ii.) makes the bafe of it to be 800 Grecian feet long; Diodorus (lib. i.) 700; Strabo (lib. xvii.) lefs than 600; and Pliny (lib. xxxvi. c. 12.) 883 feet. Among the moderns, Sandys found it to be 300 paces; Bellonius 324; Greaves 693 Englifh feet; Le Bruyn 704 French feet, or 750 Englifh feet; Profper Alpinus 750 French feet; Thevenot 682; Niebuhr 710; Chazelles 704.80 Englifh feet. In order to reconcile thefe differences, Dr. Shaw obferves, that none of the fides of this pyramid are exactly upon a level; fo that it is difficult to find a true horizontal bafe; befides, it is impoffible to fay how much the drifts of fand, to which it is expofed, may have been accumulated above the foundation of it; and, therefore, all calculations depending upon the time and circumftances of the fituation, when they were made, muft be exceedingly precarious. The perpendicular altitude of it, according to Greaves, is 499 feet; but its oblique height is equal to the breadth of the bafe, or 693 feet. The whole area of the bafe contains 480,249 fquare feet, or $11\frac{1089}{43560}$ Englifh acres. The height, according to Herodotus, is 800 French feet; according to Strabo 625; according to Diodorus Siculus 600 and a fraction; as ftated by Le Bruyn 616; by Profper Alpinus 625; by Thevenot 520; by Niebuhr 440. The afcent to the top of the pyramid is by fteps, the lowermoft being near four feet high and three broad; the fecond of the fame dimenfions, but retiring inward from the firft near three feet; and in the fame manner the third row is placed upon the fecond, and the reft in the fame order to the top, which terminates in a fmall flat or fquare; and they are fo difpofed, that a line ftretched from the bottom to the top would touch the angle of every ftep. Thefe fteps are called by Herodotus little altars, on account of their form; and their number has been varioufly affigned; Greaves ftates them at 207; Maillet at 208; Pococke at 212; Belon at 250; Thevenot at 208, and Chazelles at 498.222 Englifh feet. For a defcription of the infide of this pyramid, we muft refer to Greaves, Savary, &c. *ubi infra.*

This pyramid, being that already defcribed, is fituated on a rocky hill, in the fandy defert of Libya, about a quarter of a mile from the plains of Egypt, above which the rock rifes 100 feet or more, with a gentle and eafy afcent. Upon this advantageous elevation, and folid bafis, the pyramid is erected: the height of the fituation adding to the beauty of the work, and the folidity of the work affording it a ftable fupport.

We may here obferve, that the fides of this pyramid ftand exactly facing the four quarters of the world, and confequently mark the true meridian of the place: which precife pofition could not have been well owing to chance, but was, probably, the effect of defign and art; and this is faid to be confirmed by the pofition of the tomb itfelf, which lies within it. We may hence infer that the Egyptians had made an early progrefs in aftronomy.

The fecond pyramid ftands at about a bow-fhot from the firft, towards the fouth of this. Herodotus fays, after having meafured both, that it falls fhort of the other in magnitude; that it has no fubterraneous chambers, and that the Nile is not conveyed into it by a channel, as into the former, but that it is of an equal altitude. Diodorus informs us, that it refembles the firft in its architecture, but is inferior to it in magnitude; each fide of the bafe containing a ftadium, or 600 Grecian feet in length, fo that by his computation each fide is lefs than that of the former in length by 100 feet. Pliny makes the difference to be greater by 46 feet. Thevenot makes it but 631 feet fquare. Strabo fuppofes thefe pyramids to be equal, and Greaves affures us, that the bafes of both are alike, and that the height is not inferior to that of the firft. This pyramid has no entrance like the other, and is built of white ftones, not near fo large as thofe of the firft: the fides do not rife with gradations, but are fmooth and equal, and the whole fabric, except on the fouth fide, is quite entire. On the N. and W. fides of this fecond pyramid are two very ftately and elaborate pieces of architecture, about 30 feet in depth, and about 1400 in length, cut out of the rock in a perpendicular direction and fquared by a chiffel; fuppofed to be defigned for the lodgings of the Egyptian priefts.

The third pyramid ftands at about the diftance of a furlong from the fecond, on an advantageous rifing of the rock, fo that at a diftance it appears equal to the former, though it be much lefs and lower. Herodotus fays that it is 300 feet on every fide, and to the middle, built of Ethiopic marble. Diodorus gives the fame dimenfions of its bafe, and adds that the walls were raifed fifteen flories with black ftone, like Thebaic marble, and the reft finifhed with fuch materials as the other pyramids are built with; that this piece of work, though it be exceeded by the two former in magnitude, yet far excels them in refpect to the ftructure, art, and magnificence of the marble; and that on the fide towards the north, the name of Mycerinus, the founder, is engraved; but this infcription has been defaced by time. Pliny writes to the fame effect, except that he makes this pyramid 363 feet between the angles.

Dr. Shaw apprehends, that neither of thefe pyramids was ever finifhed, fuppofing that the fteps already mentioned fhould have been filled up with prifmatical ftones, fo that each fide of the pyramid might be fmooth and level, like that of Ceftius at Rome.

But from the defcription of Maillet and Savary, the firft pyramid appears to have been covered with a coating of marble, and thus finifhed on the outfide, but clofed; and that it has been fince forcibly opened, and the ftones which fhut the paffage and were of an enormous fize have been removed. This paffage was compofed of marble, and the ftones which form its four fides are of the fineft white and hardeft marble. For other particulars we refer to Greaves, Maillet, and Savary.

The ancients inform us, that the ftones of the pyramids were brought from the mountains of Arabia, and Herodotus (lib. ii. c. 124.) has defcribed the manner in which they were conveyed; but Dr. Shaw imagines, that they were taken from the fpot where they were employed; and he obferves, that the greateft of them, efpecially, is not an entire heap of hewn ftones, becaufe that portion of it, which lies below the horizontal fection of the entrance, may probably be no more than an incruftation of the natural rock on which it is founded. Dr. Bryant conjectures, that, like the fphynx, which ftands directly in the front of the fecond pyramid, they were immenfe rocks which ftood upon the brow of the mountain; that the Egyptians cafed them over with large ftones, and brought them by thefe means to a degree of fymmetry and proportion. At the fame time they filled up the unneceffary interftices with rubbifh and mortar, and made chambers and apartments, as the intervals in the rock allowed, being obliged to humour the indirect turns and openings in the original mafs to execute what they propofed. This he infers from the narrownefs and unneceffary floping of the paffages, which are often very clofe and fteep, and alfo from the fewnefs of the rooms in a work of fo immenfe a ftructure. That the pyramids were built upon a rock in the place where they now ſtand, was ſuggeſted by Mr. Hooke. See Birch's Hiſt. Royal Society, vol. iv. p. 245.

It is very ſurpriſing that the pyramids, which have been reckon d among the wonders of the world, ſhould not have preſerved a more certain era, and tradition of the names of their founders. Pliny reckons a number of authors who have wrote concerning them; and all, he informs us, diſagree in their accounts of thoſe who built them. Some modern writers maintain, that they were erected by the Iſraelites, under the tyranny of the Pharoahs, and allege to this purpoſe the teſtimony of Joſephus, Antiq. lib. i. cap. 5.

According to the relations of Herodotus (lib. ii.), and Diodorus (lib. i.), the firſt pyramid was erected by Cheops, or Chemmis, a king of Egypt, who is ſaid to have employed three hundred and ſixty thouſand men for twenty years in the ſtructure. Cephren, brother and ſucceſſor to the former king, is ſaid to be the founder of the ſecond pyramid; and the third is ſaid to have been built by Mycerinus, the ſon of Chemmis, according to Diodorus, but according to Herodotus, of Cheops. However, Herodotus ſays, that ſome aſcribed the laſt to Rhodope, a courtezan, and the other two to the ſhepherd Philittion. The learned Greaves places the three kings who erected theſe pyramids in the twentieth dynaſty; Cheops having begun his reign in the year 3448 of the Julian period, 490 years before the firſt olympiad, and 1266 years before the Chriſtian era. He reigned fifty years, ſays Herodotus, and built this pyramid, as Diodorus obſerves, 1000 years before his time, or in the 180th olympiad; whereas, he might have ſaid 1207. Cephren, the builder of the ſecond, reigned fifty-ſix years; and Mycerinus, the builder of the third, ſeven years.

Dr. Bryant gives a different account of the origin of theſe pyramids: he aſcribes the ſtructure of them to the Cuthites (ſee Dispersion *of Mankind*), or Arabian ſhepherds, who built Heliopolis, and who were the giants and Titans of the firſt ages. Theſe ſons of Chus, according to this writer, ſeem to have come into Egypt immediately after their diſperſion from Babel.

Many have conſidered theſe ancient ſtructures with contempt, as being vaſt piles without any great ſymmetry, and have thought the labour idle, and the expence unneceſſary. Thus Pliny (lib. xxxvi. cap. 12.) calls them *regum pecuniæ otioſa ac ſtulta oſtentatio, &c.* built for oſtentation, to keep an idle people employed, and to prevent commotion and rebellion. Ariſtotle (Polit. lib. iii.) calls them the work of tyranny.

The general opinion with regard to their intention and uſe is, that they were ſepulchres and monuments of the dead, particularly of kings. This is expreſsly affirmed by Diodorus (lib. i.), and Strabo (lib. xvii.), and the opinion is confirmed by the writings of the Arabians. And the reaſon, ſays Greaves, of their erecting theſe magnificent ſtructures is founded in the theology of the Egyptians, who, as Servius ſhews in his comment upon Virgil (Æneid, lib. iii.), where he deſcribes the funeral of Polydorus—*Animamque ſepulchro condimus*—believed, that as long as the body endured, ſo long the ſoul continued with it; and this was alſo the opinion of the Stoics. Upon this principle, that the bodies might neither be reduced to duſt by putrefaction, nor converted into aſhes by fire, they embalmed them, and laid them up in theſe ſtately repoſitories, where they might continue free from the injury of time and of men. The reaſon of their building their ſepulchres in the form of pyramids, was either from a notion that this was the moſt permanent form of ſtructure, or becauſe they hereby intended to repreſent ſome of their gods: particularly, as Greaves conjectures, Oſiris, or the ſun with many rays; for, under this form, the ſtatues of the gods were frequently exhibited, and the gods themſelves worſhipped.

Among the Egyptians, the pyramid is ſaid to have been a ſymbol of human life; the beginning of which is repreſented by the baſe, and the end by the apex; on which account it was that they uſed to erect them on ſepulchres. Herodotus.

Some, however, have objected to this deſign of the Egyptian pyramids, and are of opinion that they were originally intended for ſome nobler purpoſe. If Cheops, or any other perſon, ſays Dr. Shaw, who was the founder of the great pyramid, intended it only for his ſepulchre, what occaſion was there for ſuch a narrow crooked entrance into it; for the well, as it is called, at the end of the entrance; for the lower chamber, with a large nitch or hole in the eaſtern wall of it; for the long narrow cavities in the walls of the upper room; or, for the two antichambers and the lofty gallery, with benches on each ſide that introduce us into it.

As the whole of the Egyptian theology was clothed in myſterious emblems and figures, it ſeems reaſonable to ſuppoſe, ſays this writer, that all theſe turnings, apartments, and ſecrets in architecture were deſigned for ſome purpoſe of religion, and that the Deity, which was typified in the outward form of this pile, was to be worſhipped within. The ſquare cheſt of granite marble, which is placed in the upper chamber of the great pyramid, may be ſuppoſed to have been rather intended for ſome religious uſe than for the coffin of Cheops. It might have ſerved for one of their ſacred cheſts, in which either the images of their deities, or their ſacred veſtments or utenſils were kept, or it might have been a *ſaviſſa* or ciſtern, ſuch as contained the holy water uſed in their ceremonies. Its length favours the opinion of its having been deſigned for a coffin, but its height and breadth far exceed the dimenſions that were adhered to on ſuch occaſions; the Egyptian ſtone coffins were made of a different form, and inſcribed with hieroglyphics. Nor is this cheſt placed according to the manner in which the Egyptians depoſit their dead; for their mummies always ſtand upright, whereas this cheſt lieth flat upon the floor. If, therefore, this cheſt was not intended for a coffin, it is inferred that the pyramid itſelf could not have taken the name of a ſepulchre from it. Cheops, indeed, and others might have been buried within the precinct of this or any other of the pyramids, and this was no more than was practiſed in other temples, and therefore could not deſtroy the principal uſe and deſign for which they were erected. Upon the whole, Dr. Shaw concludes, from the outward figure of theſe piles, the ſtructure and contrivance of the ſeveral apartments in the inſide of the greateſt, together with the ample proviſion that was made on each ſide of it for the reception, as may be ſuppoſed, of the prieſts, that the Egyptians intended the latter for one of the places, as all of them were to be the objects, at leaſt, of their worſhip and devotion.

Dr. Bryant has lately maintained, with conſiderable force of argument, this opinion, that the pyramids were deſigned for high altars and temples, and were conſtructed in honour of the Deity. If the chief pyramid were deſigned for a place of burial, what occaſion, ſays he, was there for a well, and for paſſages of communication, which led to other buildings? The apartments near the pyramids he ſuppoſes to be deſigned for the reception of prieſts, and to be appendages not to a tomb, but to a temple of the Deity.

 The

The ftone coffin, he apprehends, was a trough or refervoir for water, which, by means of the well, they drew from the Nile. The priefts of Egypt delighted in obfcurity, and they probably came by the fubterraneous paffages of the building to the dark chambers within; where they performed their luftrations, and other nocturnal rites. Many, he adds, of the ancient temples in this country were caverns in the rock, enlarged by art, and cut out into numberlefs dreary apartments; for no nation upon the earth was fo addicted to gloom and melancholy as the Egyptians. From the top of the pyramids they obferved the heavens, and marked the conftellations; and upon the fame eminence it is probable that they offered up vows and oblations. See on this article Greaves's Works, vol. i. p. 1, &c. Shaw's Travels, fol. p. 413, &c. Pococke's Defcript. of the Eaft, vol. i. p. 41, &c. Perry's View of the Levant, p. 413, &c. Bryant's Anal. of Ancient Myth. vol. iii. p. 523, &c. Farmer's Worfhip of Human Spirits, &c. p. 379, &c. Savary's Letters, vol. i.

The tomb of Porfenna, king of Etruria, at Clufium in Italy, is an ancient monument of fquare ftone, each fide of which is three hundred feet broad, and fifty feet high. Within the fquare bafe there is an inextricable labyrinth; upon this fquare there ftand five pyramids, four in the angles and one in the middle, feventy-five feet broad at the bottom, and a hundred and fifty feet high, and terminating in a point; at top they are covered with a brafs circle, from which are fufpended bells, which are put in motion by the wind, fo as that their found may be heard at a great diftance. Upon this circle there are four other pyramids, each a hundred feet high, above which, upon one plane, there are five other pyramids. Such is the account which Pliny gives from Varro, lib. xxxvi. cap. 13.

Pyramid, *Scenography of a.* See Scenography.

Pyramid, *Optic.* See Optic *Pyramid.*

PYRAMIDAL Fountain. See Fountain.

Pyramidal *Mirrors.* See Mirror.

Pyramidal *Numbers* are the fums of polygonal numbers, collected after the fame manner as the polygonal numbers themfelves are extracted from arithmetical progreffion. See Numbers.

Thefe are particularly called *firft* pyramidals. The fums of firft pyramidals are called *fecond* pyramidals. And the fums of thofe *third* pyramidals; and fo on, *ad infinitum.* Particularly, thofe arifing from triangular numbers are called *prime triangular* pyramidals; thofe arifing from pentagonal numbers are called *prime pentagonal* pyramidals, &c. The numbers 1, 4, 10, 20, 35, &c. formed by the addition of the triangular numbers 1, 3, 6, 10, &c. are ufually called by the fimple name of pyramidals; and the general formula for finding them is $n \times \frac{n-1}{2} \times \frac{n-2}{3}$; *i. e.* the fourth pyramidal may be found by fubftituting 4 for n; the fifth, by fubftituting 5 for n, &c.

PYRAMIDALIA Corpora, in *Anatomy*, two prominences in the medulla oblongata. See Brain, and Nervous *Syftem.*

PYRAMIDALIS Abdominis, one of the abdominal mufcles. See Obliquus.

Pyramidalis *Nafi*, a name given by fome anatomifts to that portion of mufcular fibres which defcends from the fronto-occipitalis along the fide of the nofe. See Epicranius.

PYRAMIDOID, called alfo *parabolic fpindle*, a folid figure, formed by the revolution of a femiparabola round one of its ordinates.

According to the method of indivifibles, this may be conceived to confift of an infinite feries of circles, whofe diameters are all parallel to the axis of the revolving parabola.

The parabolic fpindle is equal to $\frac{8}{15}$ths of its circumfcribing cylinder. See Spindle.

Pyramidoid, *Parabolic.* See Parabolic *Pyramidoid.*

PYRAMIDS, in *Geography*, rocks in the Eaft Indian fea, near the E. coaft of the ifland of Myfol. S. lat. 1° 55′. E. long. 130° 59′.

PYRAMUS, Gihon, in *Ancient Geography*, a river of Afia, rifing in the country of Cataonia, where it begins to be navigable, and traverfing mount Taurus through the rocks, it enters the plain of Cilicia, paffes by the foot of the mountain of Anazarbus, and leaving it to the right, throws itfelf into Mopfuete, and at length lofes itfelf in the Mediterranean, at the point where was formerly fituated the town of Megarfus.

PYRBAUM, in *Geography*, a town of Bavaria, and capital of a lordfhip united to Salzburg; 13 miles S.E. of Nuremberg.

PYRENÆUM Promontorium, *Cape de Creus*, in *Ancient Geography*, a promontory of Hifpania Citerior; which terminates the Pyrenées eaftwards, and projects into the fea.

PYRENÆUS Saltus, a name given by Cornelius Nepos and Livy to that part of the Pyrenæan mountains which Hannibal traverfed in his way to Italy, paffing from Spain to Gaul.

PYRENE, a town of Gallia Celtica, near the place where the Danube rifes, according to Herodotus.

Pyrene, in *Natural Hiftory*, the name of a ftone found always in the fhape of the ftone of an olive. It is of the lapis Judaicus kind, being no other than the petrified fpine of fome fpecies of echinites.

PYRENE'ES, in *Geography*, a chain of mountains, celebrated fince the time of Herodotus, forming the boundaries between France and Spain, and extending from the Mediterranean to the Atlantic, about 200 miles in length, and in its greateft breadth 100 miles. Its various branches are diftinguifhed by different names, and may be confidered as belonging either to France or Spain. The higheft fummits of thefe mountains, which are in the centre of the chain, have prefented to the refearch of the naturalift not only calcareous appearances, but even fhells. The higheft elevation of the Pyrenées is *Mont* Perdu, for an account of which, we refer to that article. The Canigou was formerly reckoned the higheft fummit, though it does not exceed 8544 Englifh feet. Other noted heights are Tuccarroy, Marboré, the pic de Midi, 9300 feet high, the pic de los Reyes, 7620 feet high, the pic d'Offano 11,700 feet in height, the pic d'Arni, the Niege Veille, the Vigne Mali, La Breche de Roland, &c. At a diftance the Pyrenæan chain appears like a fhaggy ridge, prefenting the fegment of a circle fronting France, and defcending at each extremity till it difappears in the ocean and Mediterranean. Thus, at St. Jean de Luz, only high hills appear, and in like manner on the eaft beyond the fummit Canigou, the elevations gradually diminifh. The higheft fummits are covered with perpetual fnow. Blocks of granite are interfperfed with vertical bands, argillaceous and calcareous, the latter primitive or fecondary, and fupplying the marbles of Campan and Antin, of beautiful red fpotted with white, though the general mountain mafs be grey. To the S. and W. the Pyrenées prefent nothing but dreadful fterility, but on the N. and E. the defcent is more gradual, and affords frequent woods and paftures. Befides the dreadful fall of

 rocks,

rocks, undermined by the waters, they are expofed to Lavanges, or the impetuous defcent of vaft maffes of fnow, called Avalanches in Switzerland, and have their glaciers and other terrific features of the Alps.

The opinion of Ramond, that the fummit of mont Perdu (which fee) muft have been covered by the fea, is confirmed by Lapeyroufe, (Journ. des Mines, N° 46.) A fingular feature of the Pyrenées confifts of *houles*, as they are called, or walls difpofed in a circular form. Near the fummit of mont Perdu is a confiderable lake, more than 9000 feet above the level of the fea, which throws its waters to the E. into the Spanifh valley of Beouffa; and which the travellers allege as a proof that mont Perdu really belongs to Spain, and that Tuccarroy forms the boundary. Lapeyroufe fuggefts it as probable that the fole accefs to the fummit of mont Perdu will be found on the fide of Spain; there being three fummits called by the Spaniards "Las Tres Sorrellas," or the Three Sifters; the higheft being to the N., and the loweft on the S., but feparated by large glaciers. Hence he infers the exiftence of chains of mountains, in which bands of granite, porphyry, trap, hornblende, and petrofilex, alternate vertically with primitive limeftone, and are fo intermingled as to prove a common origin. But in the Pyrenées thefe bands are furmounted by fecondary lime-ftone, replete with marine fpoils, and containing even fkeletons of animals, fo that he concludes that the higheft mountains of the chain muft have yielded to the fury of the ocean, and that the fecondary parts only now exift. Mr. Townfend (Spain, i. 89.) obferves, that the lime-ftone and fchiftus feed the vegetation on the N. of the Pyrenées, while the S. is barren, and confifts of granite; while, in fact, mountains are generally barren and precipitous on the S. and W., becaufe the moft violent rains and tempefts come from thofe regions. Pinkerton's Geog. vol. i.

The paffages over thefe mountains from one country to another are five; the three principal of which are from St. Sebaftian to St. Jean de Luz; from Pamplona to St. Jean de Luz; and from Jonqueira to Perpignan. Thefe mountains afford quantities of timber for fhipping, which are conveyed, by means of the Ebro and other ftreams to the fea, with abundance of pitch and tar. The Pyrenées give name to three of the French departments.

PYRENÉES, *Eaftern*, one of the nine departments of the fouthern region of France, in N. lat. 42° 40′, formerly Rouffillon, bounded on the N. by the departments of the Arriere and the Aude, on the E. by the Mediterranean, on the S. and W. by Spain; about 58 miles from E. to W., and from 18 to 25 from N. to S., or 28 Fr. leagues in length, and 15 in breadth, containing 4337½ kiliometres or 212 fquare leagues, and 117,764 inhabitants; it is divided into 3 diftricts, 17 cantons, and 249 communes. The three diftricts are Perpignan, including 51,961 inhabitants, Ceret, 24,750, and Prades, 41,053. According to Haffenfratz, the number of circles is 3, of cantons 25, and of inhabitants 114,158. The contributions in the 11th year of the French era amounted to 1,010,520 fr., and the expences for adminiftration, education, &c. to 181,961 fr. 85 cents. The capital is Perpignan. This department is fertile in corn, wine, oil, flax, hemp, fruits, and paftures. On the hills there is little wood, but variety of medicinal plants and herbs. There are feveral lofty mountains on the S. and W. boundaries, as Maffane, Canigou, &c.

PYRENÉES, *Lower*, a department of France, in the S.W., or Garonne region, compofed of Bearn, Navarre, Bafque-François, with a part of Chaloffa and of Landes, in N. lat. 43° 10′, and bounded on the N. by the departments of the Landes and Gers, on the E. by the department of the Upper Pyrenées, on the S. by Spain, and on the W. by the fea; 70 miles in length, and from 15 to 45 in breadth, or 16 Fr. leagues in length and 10 in breadth. It contains 8072½ kiliometres, or 388 fquare leagues, and 384,030 inhabitants. It is divided into 5 diftricts, 40 cantons, and 660 communes. The diftricts or circles are, Pau, including 99,486 inhabitants, Oleron, 69,484, Mauleon, 65,447, Bayonne, 69,486, and Orthés, 80,127. According to Haffenfratz, its circles are 6, its cantons 44, and the number of its inhabitants 138,339. Its capital is Pau. Its contributions in the 11th year of the French era amounted to 1,523,760 fr. and its expences for adminiftration, &c. to 290,740 fr. 66 cents. This department, bounded on one fide by the Pyrenées, and on the other by the ocean, prefents a great variety of foil and diverfity of profpect. The mountains are crowned with woods; the hills are covered with vines; the vallies are rich and populous; the heaths are wild and uncultivated. The plains yield wheat, rye, barley, oats, millet, flax, fruits, and paftures. It has mines of filver, copper, iron, quarries of marble, granite, flate, and mineral fprings.

PYRENÉES, *Upper*, a department of France, in the Garonne region, formerly Bigore, in N. lat. 43°, bounded on the N. by the department of the Gers, on the E. by that of the Upper Garonne, on the S. by Spain, and on the W. by the department of Lower Pyrenées; 20 Fr. leagues long and 16 broad, or 53 Englifh miles in length, and from 25 to 38 in breadth; a fmall diftrict towards the N. being fcarcely more than feven miles in breadth. It contains 4937½ kiliometres, or about 235 fquare leagues, and 206,680 inhabitants. It is divided into 3 diftricts, 26 cantons, and 501 communes. Its diftricts or circles are Tarbes, including 87,005 inhabitants, Bagnéres, 78,099, and Argelés, 41,376. According to Haffenfratz, its circles are 5, and cantons 30, and the number of its inhabitants 188,690. Its capital is Tarbes. Its contributions in the 11th year of the French era amounted to 893,637 fr. and its expences for adminiftration, &c. to 173,759 fr. 12 cents. The plains in this department yield little wheat, but abundant crops of rye, barley, and millet, excellent wine, flax, and paftures. The hills produce confiderable forefts, with mines of iron and lead, quarries of marble, flate, and mineral fprings.

PYRENOIDES PROCESSUS, in *Anatomy*, a procefs of the fecond vertebra of the neck; called alfo *odontoides*, and *dentiformis*, or the tooth-like procefs.

The word πυρηνοειδής, is formed of πυρην, *nucleus*, *kernel*, or *berry*, and ειδος, *figure*.

PYRETHRUM, in *Botany*, an ancient Greek name, adopted by Haller, Gærtner, and the writer of the prefent article, who are followed by Willdenow and Aiton, for the genus in queftion, on account of its refemblance to the πυρεθρον of Diofcorides. The latter is, however, the *Anthemis Pyrethrum* of modern writers, or Pellitory of Spain; owing its Greek appellation to the fiery or pungent flavour of the root; whence alfo it obtained the Latin name of *Salivaria*, becaufe it caufes fo remarkable a flow of faliva. Our prefent *Pyrethrum* is made up of feveral Linnæan fpecies of *Chryfanthemum* and *Matricaria*, with fome new ones.—Haller Helvet. v. 1. 40. Sm. Fl. Brit. 900. Willd. Sp. Pl. v. 3. 2150. Ait. Hort. Kew. v. 5. 97. Purfh v. 2. 527. Gærtn. t. 169.—Clafs and order, *Syngenefia Polygamia-fuperflua*. Nat. Ord. *Compofitæ difcoideæ*, Linn. *Corymbiferæ*, Juff.

Gen. Ch. *Common Calyx* hemifpherical, imbricated; the fcales clofe-preffed, rather acute, membranous at the edges. *Cor.* compound, radiated. Florets of the difk perfect, numerous,

numerous, tubular, funnel-shaped, with five spreading segments; those of the radius more than 12, female, ligulate, elliptic-oblong, three-toothed. *Stam.* in the perfect florets. Filaments five, capillary, very short; anthers united into a cylinder, hardly so long as the corolla. *Pist.* Germen, in all the florets, obovate; style thread-shaped, longer than the stamens; stigmas two, divaricated, abrupt. *Peric.* none, the calyx remaining unaltered. *Seeds* nearly alike in all the florets, oblong, quadrangular, each crowned with an erect, membranous, more or less lobed border. *Recept.* naked, dotted, convex.

Eff. Ch. Receptacle naked. Seeds crowned with a membranous margin. Calyx hemispherical, imbricated with sharpish scales, bordered with a membrane.

Section 1. *Radius white; rarely reddish.*

1. P. *frutescens.* Shrubby Feverfew. Willd. n. 1. Ait. n. 1. (Chrysanthemum frutescens; Linn. Sp. Pl. 1251. Leucanthemum canariense, sapore pyrethri; Walth. Hort. 31. t. 24. Buphthalmum canariense leucanthemum; Pluk. Almag. 73. Phyt. t. 272. f. 6.)—Stem shrubby. Leaves fleshy, pinnatifid, linear, toothed; three-cleft at the extremities.—Native of the Canary islands, from whence it was brought very early; flowering in the green-house most part of the year. The woody *stem* is much branched. The *leaves* are crowded about the ends of the branches, and in their fleshy texture, as well as linear forked figure, resemble those of a *Crithmum*, or *Artemisia.* The *flowers* are terminal, solitary, on long naked stalks, and resemble a white daisy.

2. P. *simplicifolium.* Simple-leaved West Indian Feverfew. Willd. n. 2. (Matricaria? prostrata; Swartz Ind. Occ. v. 3. 1366.)—Leaves obovate; toothed at the extremity. Stalks axillary, single-flowered. Branches prostrate. Gathered by Von Rohr in Curaçao and the neighbouring islands. It has never been brought alive to Europe. *Stem* herbaceous, branched, decumbent, round, downy, especially the ends of the branches. *Leaves* alternate, nearly sessile, wedge-shaped, obovate, or roundish, half an inch long, downy, ribbed, notched or serrated; mostly accompanied by two minute leaves at the base. *Stalks* opposite to the leaves, thickish, an inch long, erect, downy, each bearing a yellowish-white, nearly globose, *flower*, whose disk is entirely yellow. *Seeds* crowned with a quadrangular minute border. *Swartz.*

3. P. *ptarmicifolium.* Goose-tongue Feverfew. Willd. n. 3. Ait. n. 2.—Leaves linear, finely serrated. Flowers corymbose.—Native of mount Caucasus. Sir Joseph Banks sent it to Kew in 1803. Willdenow describes this as perennial, with the habit of *Achillea Ptarmica*, only the *flowers* are twice as large. The *stem* is branched, either erect or decumbent. *Leaves* an inch long, very finely and sharply serrated. *Corymbs* terminal, simple, the stalks single-flowered. Radiant *florets* ovate. *Crown* half the length of the seed.

4. P. *serotinum.* Creeping-rooted Feverfew. Willd. n. 4. Ait. n. 3. Pursh n. 1. (Chrysanthemum serotinum; Linn. Sp. Pl. 1251. Jacq. Obs. fasc. 4. 8. t. 90. Bellis americana, procerior, serotina, ramosa, flore amplissimo; Pluk. Almag. 65. Phyt. t. 17. f. 2.)—Leaves lanceolate; the lower ones strongly serrated; the upper entire. Branches corymbose.—Supposed to be a native of North America; but Michaux has it not, and Pursh merely saw a specimen in Mr. Lambert's herbarium, probably, like that of Linnæus, from a garden. The plant was cultivated by Miller, and is a hardy perennial, flowering in October or later. Its *stem* is herbaceous, two or three feet high, much branched, leafy, furrowed and angular. *Leaves* alternate, sessile, two or three inches long, and half an inch wide, entire or sparingly serrated in the upper parts of the stem, but mostly furnished, in our specimen, with a sharp tooth on each side at the base, which we do not find mentioned by authors. The *flowers* are terminal, solitary, much like our common *Chrysanthemum Leucanthemum*, but rather smaller.

5. P. *uliginosum.* Bog Feverfew. Willd. n. 5. Waldst. et Kitaib. Hungar.—"Leaves lanceolate, all deeply serrated. Stem erect, branched at the top."—Native of wet ground in Hungary and Spain. Perennial. Very nearly akin to the last, but different in having all the *leaves* deeply serrated throughout, and the *stem* branched at the top only. *Willd.*

6. P. *Halleri.* Hallerian Feverfew. Willd. n. 6. (P. n. 97; Hall. Helvet. v. 1. 41. Leucanthemum alpinum tenuifolium; Barrel. Ic. t. 458. f. 3?)—Stem-leaves lanceolate, deeply toothed; radical ones pinnatifid, on long stalks. Stem single-flowered.—Native of the Swiss alps, in stony places. The *roots* are creeping, black, long and slender, with very long fibres. *Stems* solitary, simple, leafy, ascending, three or four inches high. *Leaves* smooth; the lowermost short, wedge-shaped, deeply pinnatifid, on long stalks; the uppermost sessile, deeply and sharply toothed, an inch or more in length. *Flowers* solitary, stalked, terminal, large; the calyx-scales bordered with black; the radiant florets broad and elliptical. The above figure of Barrelier seems to accord better with our Swiss specimens than fig. 2. cited by Haller and his copyists, except that the upper leaves in fig. 3. are too narrow.

7. P. *alpinum.* Alpine Feverfew. Willd. n. 7. Ait. n. 4. (Chrysanthemum alpinum; Linn. Sp. Pl. 1253. Leucanthemum alpinum; Clus. Hist. v. 1. 335.)—Lower leaves wedge-shaped, pinnatifid; uppermost linear and entire. Stem single-flowered.—Native of the German, Swiss and Italian alps. The creeping *roots* throw out many short tufted leafy *stems*, each bearing one long simple *flower-stalk*, downy in its upper part, and furnished below with one, two, or more, alternate, simple, linear, entire floral leaves. The rest of the *foliage* is stalked, pinnatifid, somewhat pectinate; the segments elliptical, entire, smooth, rather fleshy; each *leaf*, with its flat stalk, an inch or more in length. The *flower* is large, much like the last.

8. P. *Balsamita.* Costmary-leaved Feverfew. Willd. n. 8. Ait. n. 5. (Chrysanthemum Balsamita; Linn. Sp. Pl. 1252. Jacq. Obs. fasc. 4. 8. t. 89. Leucanthemum orientale, costi hortensis folio; Tourn. Cor. 37.)—Leaves ovate-oblong, serrated, auricled. Flowers corymbose.—Native of the Levant; rare in our gardens. Mr. Blackburne is said to have cultivated it in his celebrated collection at Orford about 35 years ago. The habit of this species is so much like Common Costmary, *Tanacetum Balsamita* of Linnæus, that one cannot help suspecting they are mere varieties of each other. The presence of a radius, in the plant before us, is known, by the examples of *Bidens* and *Coreopsis*, to be no infallible distinction. There is indeed the membranous crown of the *seed*, as Willdenow remarks, which makes this a *Pyrethrum*, not a *Chrysanthemum*; but such belongs to *Tanacetum*, and confirms our suspicion, or rather our belief, that the present is but a radiated variety of the Costmary. The *radius* is about twice the length of the *calyx*, white, not yellow, as Linnæus seems to describe it.

9. P. *palustre.* Marsh Feverfew. Willd. n. 9. (Leucanthemum orientale, chrysanthemi folio, tanaceti odore; Tourn. Cor. 37.)—"Leaves smooth, sessile, lyrato-pinnatifid. Stalks single-flowered, corymbose."—Native of marshy places in Armenia. *Tournefort.*—*Stem* erect, furrowed, smooth, two feet high. *Leaves* an inch or inch and

and half long; their fegments lanceolate, toothed at the outer margin, the lower ones deep, the upper gradually confluent into a large cut terminal lobe, and entire. *Stalks* fingle-flowered, leafy, alternate, five or fix at the top of the ftem, compofing a *corymbus*. *Flowers* the fize of *Chryfanthemum Leucanthemum*. *Willd.*

10. P. *pinnatifidum*. Pinnatifid Feverfew. Willd. n. 10. —" Leaves downy, glaucous, nearly feffile, lyrato-pinnatifid, unequally toothed. Flowers corymbofe." — Willdenow defcribed this from living fpecimens, but did not know their native country. The *ftem* is faid to be erect, two feet high, branched, furrowed, flightly downy. *Leaves* downy on both fides; pinnate at the bafe; pinnatifid in the middle; cut at the end; their length two or three inches; their fegments lanceolate, unequally toothed. *Corymbs* fimple, at the tops of the ftem and branches. *Flowers* almoft like the common *P. Parthenium*.

11. P. *macrophyllum*. Large-leaved Feverfew. Willd. n. 11. Ait. n. 6. (Chryfanthemum macrophyllum; Waldft. et Kitaib. Hung. v. 1. 97. t. 94.)—Leaves hairy, nearly feffile, pinnatifid, toothed, obtufe. Corymb terminal, compound.—Native of the woods and mountains of Hungary. Sir J. Banks introduced it, in 1803, to the Kew garden, where it is a hardy perennial, flowering in July and Auguft. This plant refembles *Achillea macrophylla*, for which fome botanifts have miftaken it, but is much larger. We have feen no fpecimen.

12. P. *rofeum*. Rofe-coloured Feverfew. Ait. n. 7. Willd. Enum. 905. (Chryfanthemum coccineum; Willd. Sp. Pl. v. 3. 2144. Sims in Curt. Mag. t. 1080. Buphthalmum orientale, tanaceti folio ampliore, flore magno coccineo; Tourn. Cor. 37. Buxb. Cent. 2. 25. t. 20.)—Leaves fmooth, pinnate; leaflets once or twice pinnatifid, ferrated, acute, fpreading. Stem erect, fingle-flowered. Gathered by Tournefort in Iberia. It is found alfo on mount Caucafus, from whence that diftinguifhed cultivator Mr. Loddiges received feeds of this elegant fpecies in 1803. The plant proves perennial and hardy, flowering in Auguft or September. The *ftem* is 12 or 18 inches high, more or lefs leafy, bearing one large handfome *flower*, whofe difk is yellow, and the radius of a rich rofe colour, or crimfon, on its upper fide; fometimes varying to white. The *leaves* are from two to four inches long, ftalked, rigid, paler beneath, pinnate, varioufly ferrated, cut or pinnatifid, all the points and ferratures very acute. Tournefort gathered plenty of this plant, and his original fpecimens are difperfed through many collections.

13. P. *corymbofum*. Mountain Feverfew. Willd. n. 12. Ait. n. 8. (Chryfanthemum corymbofum; Jacq. Auftr. t. 379. Ch. corymbiferum; Linn. Sp. Pl. 1251. Tanacetum non odorum; Ger. Em. 650.)—Leaves pinnate; leaflets lanceolate, pinnatifid, fharply ferrated; the upper ones confluent. Flower-ftalks corymbofe. — Native of mountainous woods in Siberia, and many parts of Germany. Gerarde appears, by the catalogue of his garden, to have cultivated it in 1596. The *root* is perennial, woody, with long fibres. *Stems* erect, two or three feet high. *Leaves* fomewhat like Tanfy, but without fcent or tafte, except that after a while, according to Jacquin, they caufe a heat or pungency in the mouth. The numerous large white *flowers*, each with a bright yellow difk, form an ample terminal corymb.

14. P. *Parthenium*. Common Feverfew. Sm. Fl. Brit. n. 1. Engl. Bot. t. 1231. Willd. n. 13. Ait. n. 9. (Matricaria Parthenium; Linn. Sp. Pl. 1255. Woodv. Suppl. t. 249. Fl. Dan. t. 674. Matricaria; Ger. Em. 652.)—Leaves pinnate; leaflets oblong, obtufe, pinnatifid and cut. Stem branched. Flowers corymbofe. Radius about twice the length of the calyx. Seed-crown toothed. —Native of cultivated or wafte ground throughout Europe, fpringing up abundantly with us in neglected gardens or court-yards, flowering all fummer long. The *root* appears to be rather biennial than perennial. The whole *herb* is bitter and aromatic, hoary or downy. *Stem* bufhy. *Leaves* ftalked, flat and dilated. *Flowers* numerous, each about the fize of a common daify, but with a large yellowifh difk, and fhort white radius. Sometimes the latter is wanting; and more frequently the flowers are double, the difk becoming white and ligulate, like the radius, but each *floret* of a fmaller proportion. The *receptacle* is flat.

15. P. *parthenifolium*. Narrow Hoary Feverfew. Willd. n. 14.—" Leaves pinnate; leaflets oblong, obtufe, pinnatifid, toothed. Stem wand-like. Flowers corymbofe. Radius thrice the length of the calyx. Seed-crown entire."—Willdenow defcribed this from a garden, without knowing whence it came. He fays it is very like the laft, but has a taller wand-like *ftem*, narrower *leaves*, a *difk* but half fo large, though the *radius* is larger, and an entire, not toothed, margin to the *feed*. A plant, now become a weed in Kew garden, and faid to have been imported from China, anfwers precifely to this defcription in every point, except that its *ftem* is fcarcely lefs bufhy than in *P. Parthenium*. We are perfuaded, neverthelefs, that it is what Willdenow meant. Its *leaves* are confpicuoufly hoary, with narrower divifions than thofe of the laft, and the *flowers*, on account of their long and brilliant-white *radius*, are more ftriking. We have had no opportunity of inveftigating the crown of the *feed*.

16. P. *caucaficum*. Caucafian Feverfew. Willd. n. 15. Ait. n. 10.—" Leaves doubly pinnate; leaflets linear-awl-fhaped. Stem fingle-flowered." — Native of mount Caucafus. Sent to Kew in 1804, by the late Mr. G. Don. " *Root* woody, horizontal. *Stem* a fpan high, fimple, ftriated, fmooth. *Leaves* half an inch long, feffile, doubly pinnate; their leaflets linear-awl-fhaped, entire. *Flower* folitary, the fize of *P. alpinum*, or rather larger. *Seed-crown* membranous, two-lobed." *Willd.*

17. P. *fufcatum*. Dingy Feverfew. Willd. n. 16. Sm. Prodr. Fl. Græc. Sibth. n. 2095. (Chryfanthemum fufcatum; Desfont. Atlant. v. 2. 283. t. 237.) — Leaves downy, pinnate; leaflets with a few deep linear oblong fegments. Stem branched from the bafe, diffufe.—Gathered by Desfontaines in uncultivated fields near Tunis. Sibthorp found it in Greece. The *root* appears to be perennial, bearing many widely-fpreading or procumbent *ftems*, a fpan long, which are leafy, and flightly branched. The *leaves* are rather fucculent. *Flowers* terminal, folitary, large, with a blackifh *calyx*, pale yellowifh difk, becoming brown in decay, and broad white elliptical radiant florets. It bloffoms in winter.

18. P. *inodorum*. Corn Feverfew, or Scentlefs Mayweed. Sm. Fl. Brit. n. 2. Engl. Bot. t. 676. Willd. n. 17. Ait. n. 11. (Chryfanthemum inodorum; Linn. Sp. Pl. 1253. Fl. Dan. t. 696.) — Leaves pinnate, in many capillary fegments. Stem branched, fpreading. Seed-crown entire. — Found in fields and wafte ground throughout moft parts of Europe, efpecially where the foil is gravelly, flowering in autumn. *Root* tapering, annual. *Herb* almoft without any peculiar fcent, by which it is readily known, in every ftate of growth, from *Anthemis Cotula*. The *ftem* is a foot or more in height, widely fpreading, clothed with pale-green fmooth *leaves*, whofe leaflets are deeply and varioufly divided into linear, almoft capillary, pointed fegments. More fimple fegments are numeroufly

numeroufly crowded about the bottom of each *leaf*, rendering it, in a manner, lyrate, and furrounding the ftem or branch. *Branches* fomewhat corymbofe, each terminated by a rather large *flower*, with long white rays, and a prominent yellow difk. The late Mr. Crowe once found in Norfolk a partly double-flowered variety.

19. P. *maritimum*. Sea Feverfew. Sm. Fl. Brit. n. 3. Engl. Bot. t. 979. Willd. n. 18. Ait. n. 12. (Matricaria maritima; Linn. Sp. Pl. 1256. Chamæmelum maritimum perenne humilius, foliis brevibus craffis obfcure virentibus; Dill. in Raii Syn. 186. t. 7. f. 1.)—Leaves doubly pinnate; fegments linear, pointlefs, flefhy; convex above; keeled beneath. Stem diffufe. Seed-crown lobed.—Native of the fea-coaft in the north of Europe. Found in feveral parts of Scotland, as well as on the fouth coaft of England, and in Lancafhire and Durham, flowering in July and Auguft. The *root* is perennial. *Stems* numerous, proftrate, fpreading circularly to the extent of two or three feet. The *leaves* are more flefhy than in the foregoing; the difk of the *flower* broader, in proportion to the length of the rays; and the crown of the *feed* divided into three or four lobes. The whole herb is flightly aromatic, and of a darker more fhining green than *inodorum*.

20. P. *parviflorum*. Small-flowered Feverfew. Willd. n. 19.—"Leaves doubly pinnate; leaflets linear-thread-fhaped, in two or three deep divifions. Stem erect, branched. Seed-crown two-lobed."—Defcribed by Willdenow from living fpecimens, but the native country of this fpecies is unknown. It is faid to be annual, greatly refembling *P. inodorum*, but having a taller and upright *ftem*; a fhorter *radius*; and a green two-lobed crown to the *feed*.

Section 2. *Radius yellow*.

21. P. *multicaule*. Many-ftalked yellow Feverfew. Willd. n. 20. (Chryfanthemum multicaule; Desfont. Atlant. v. 2. 282. t. 236.)—Leaves fimple, fmooth, fpatulate; the lower ones toothed. Stem erect, much branched from the bottom.—Native of fandy hills near Mafcar, in Barbary. *Root* fibrous, apparently annual. *Stem* branched from the bafe principally, bufhy; the branches naked above, each bearing a folitary *flower*, about as big as a French Marygold, whofe radiant *florets* are yellow, and of a very broad elliptical form, about eight or nine or number.

22. P. *trifurcatum*. Three-forked Yellow Feverfew. Willd. n. 21. (Chryfanthemum trifurcatum; Desfont. Atlant. v. 2. 281. t. 235. f. 2.)—Leaves flefhy, fmooth, linear, acute; the lowermoft pinnate; the uppermoft undivided. Stem afcending, fingle-flowered.—Native of fields near Kerwan in Barbary, flowering in winter. The *ftem* is fimple, a foot high; leafy below; naked above; terminated by a very large *flower*, with numerous yellow radiant florets. Some *leaves* are partly bipinnate; others three-cleft; the uppermoft fimple; all linear, wavy, acute, and of equal breadth.

23. P. *Bocconi*. Dwarf Pale-yellow Feverfew. Willd. n. 22. (Chryfanthemum aragonenfe; Affo Synopf. n. 845. t. 9. f. 1. *Willd.* Bellis incana, chryfanthemi cretici folio; Bocc. Muf. 136. t. 98.)—Leaves hoary, ftalked, pinnate; leaflets linear-awl-fhaped: upper ones linear, undivided, and entire. Stems fingle-flowered.—Native of Spain and Sicily. Willdenow defcribes it thus from dried fpecimens. "*Root* many-headed, woody. *Stems* feveral, fimple, a fpan high, fingle-flowered. *Leaves* hoary; the radical ones ftalked, oblong, fading when arrived at maturity, and altogether wanting when the *flowers* open; lower ftem-leaves ftalked, pinnate at the extremity, with three or four pair of very fhort linear-awl-fhaped leaflets, and a membranous linear *footftalk*; the upper ones linear, feffile, and entire. Rays of the *corolla* pale yellow. It refembles *Chryfanthemum pectinatum*, but differs abundantly in the *calyx* not being membranous, and in having a crown to the *feed*."

We know nothing of Affo's plant. Willdenow cites an additional fynonym, Barrelier's t. 1153. f. 1, which feems to have no affinity to the figure of Boccone, and much more refembles *Cineraria minuta*, Cavan. Ic. t. 33. f. 3, under which indeed Willdenow likewife quotes it, Sp. Pl. v. 3. 2086.

24. P. *orientale*. Oriental Yellow Feverfew. Willd. n. 23.—"Leaves doubly pinnate; leaflets linear. Stems afcending, fingle-flowered."—Native of Georgia. *Stems* fix inches high, naked above. Lower *leaves* an inch long; the upper ones half as long, and only fimply pinnate. Scales of the *calyx* withered at the edge. *Flowers* deep yellow, the fize of *Chryfanthemum fegetum*. *Willd.*

25. P. *millefoliatum*. Milfoil-leaved Yellow Feverfew. Willd. n. 24. Ait. n. 13. (P. n. 174; Gmel. Sib. v. 2. 207. t. 86. f. 1, 2. Chryfanthemum millefoliatum; Linn. Syft. Veg. ed. 13. 643. Anthemis millefolia; Linn. Sp. Pl. 1263. Achillea foliis pinnatis, &c.; Mill. Ic. t. 9.)—Leaves doubly pinnatifid, linear, bluntifh. Stem corymbofe. Rays half as long as the diameter of the difk.—Native of Siberia. A hardy perennial, flowering throughout the fummer. The *ftem* is twelve or eighteen inches high, leafy, branched and corymbofe, bearing eight or more long-ftalked yellow *flowers*, whofe difk is about half an inch in diameter, and their radiant florets of a fhort roundifh figure, hardly extending a quarter of an inch from the difk. *Seed-crown* toothed. *Leaves* doubly and interruptedly pinnatifid, with linear, bluntifh fegments, each tipped with a minute point; their furfaces both downy, or fomewhat filky. The *leaves*, as well as *flowers* and *feeds*, are very diftinct from *Chryfanthemum italicum*, to which Linnæus compares this fpecies.

26. P. *bipinnatum*. Wing-leaved Yellow Feverfew. Willd. n. 25. Ait. n. 14. (P. n. 172; Gmel. Sib. v. 2. 205. t. 85. f. 1. Chryfanthemum bipinnatum; Linn. Sp. Pl. 1255.)—Leaves doubly or triply pinnatifid; their fegments dilated upwards, minutely pointed. Stem nearly fimple. Rays wedge-fhaped, not a quarter fo long as the diameter of the difk.—Native of Siberia, flowering in June. Introduced at Kew by Mr. Bufh, in 1796. This differs from the laft in having more compound *leaves*, whofe ultimate fegments are almoft elliptical, and all their points diftinctly awned. But the *flowers* efpecially differ in being fewer, from one to three on each *ftem*, and furnifhed with a difk near an inch wide, while their radiant marginal florets are fhort, broad, and wedge-fhaped, with broad fpreading teeth. The *calyx*, as well as all the herbage, is fhaggy with foft hairs.

27. P. *indicum*. Eaft Indian Yellow Feverfew. Sims in Curt. Mag. t. 1521. Ait. n. 15.—Leaves pinnatifid; their fegments dilated upwards, lobed. Stem branched. Flowers on long ftalks, nearly globular. Radiant florets few, very fhort.—Sent by Dr. Roxburgh, from the Eaft Indies, to A. B. Lambert, efq. It proves a hardy annual in our gardens, flowering moft part of the fummer. The *ftem* is much branched, but the pinnatifid, though more fimple and broader, *leaves*, betray an affinity to the two laft fpecies, which is confirmed by the fhort yellow radiant *florets*. Thefe however are, according to Dr. Sims, moft generally wanting. The *flowers* are folitary, on long fwelling furrowed *ftalks*, terminating each branch; their difk nearly an inch wide, and finally convex. The *herbage* appears to be fmooth.

28. P.

28. P. *Myconi.* Tongue-leaved Yellow Feverfew. (Chryfanthemum Myconi; Dalech. Hift. 873. Linn. Sp. Pl. 1254. Willd. Sp. Pl. v. 3. 2148. Ait. Hort. Kew. v. 5. 96. Jacq. Obf. fafc. 4. 10. t. 94.)—Leaves tongue-fhaped, obtufe, toothed, clafping the much-branched ftem. Radiant florets numerous, roundifh.—Native of fields in the fouth of Europe; a hardy annual with us, but preferved for the fake of variety, rather than ornament, the flowers being inferior in fize and fplendour to our wild *Chryfanthemum fegetum*, while the leaves refemble thofe of *C. Leucanthemum.* The plant however is very different from both thofe, and a true *Pyrethrum*, akin to the laft defcribed, the *feed* having a very evident membranous crown, as Willdenow, copying Linnæus, mentions; yet he ftill left this fpecies where he found it. Our predeceffor, the excellent Mr. Wood, has corrected this error. (See CHRYSANTHEMUM, at the end.) We venture likewife to correct the fpecific name, which authors have copied incorrectly from Dalechamp. He calls the plant *Myconi*, after its difcoverer Myconus. The *ftem* is very much branched. *Leaves* fimple, an inch and a half or two inches long, fmooth. *Flowers* on long folitary ftalks, at the ends of the branches, bright yellow, an inch wide; their radiant florets numerous, crowded, fhort, of a roundifh or oblong fhape. *Seed-crown* large, jagged, and fringed.

PYRETICS, formed from πυρετος, *fever*, of πυρ, *fire*, medicines good againft fevers.

PYREXIA, in *Medicine*, from πυρετος, *fever*, a term ufed by Dr. Cullen to fignify feverifh action generally, whether idiopathic or fympathic. The fame writer alfo ufed the term as the denomination of his firft clafs of difeafes, including fevers and inflammations. See his Nofol. Method. clafs 1, *Pyrexiæ.*

PYRGI, or PYRGOS, in *Ancient Geography*, a town of Italy, upon the coaft of Etruria; placed by Ptolemy between Caftrum Novum and Alfium, and faid by Livy to have been a Roman colony.—Alfo, a town of the Peloponnefus, in Meffenia.

PYRGO, in *Geography*, a fea-port town on the S.E. coaft of the ifland of Santoria. N. lat. 36° 26′. E. long. 25° 38′.

PYRGUS, among the Romans, a dice-box of the fhape of a modius, open above, and having a great many fhelves or partitions within it; fo that when the dice were thrown into it out of the fritillum, they were thereby overturned many times before they could reach the bottom, in which there was an opening for them to fall through upon the table.

PYRGUS, in *Botany*, a genus of Loureiro's, Fl. Cochinch. 120, which Mr. Brown, Prodr. Nov. Holl. v. 1. 533, reduces to ARDISIA, fee that article. The name is taken from πυργος, *a turret*, alluding to the conical fhape affumed by the converging ftamens.

PYRHOPOECILOS, in the *Natural Hiftory of the Ancients*, a ftone fo called from its having a great many fpots of the colour of fire.

PYRIATERION, a word ufed by the ancients to exprefs a fweating room.

PYRIATOS, a word ufed by fome authors to exprefs a brick when heated, in order to be applied to the body wrapped up in a cloth by way of a dry fomentation.

PYRICAUSTUM, a word ufed by medical writers to exprefs a burn or fcald.

PYRICUBIUM, in *Natural Hiftory*, the name of a genus of foffile bodies, ufually comprehended, with many others of very different figure and ftructure, under the general name *pyrites.*

The diftinguifhing characters of the pyricubia are thefe; they are compound, inflammable metallic bodies, of a cubic figure, or refembling a die, being compofed of fix fides. Of this genus there are only two known fpecies. Hill.

PYRIFORMIS, in *Anatomy*, a mufcle of the thigh, flattened and triangular in its figure, fituated at the back of the pelvis, and extending from the facrum to the great trochanter. The pofterior furface is covered by the gluteus magnus, and partly by the medius. The anterior is partly in the pelvis, partly on the outfide of the cavity. Within the pelvis it correfponds to the rectum, the fciatic plexus, and the hypogaftric veffels: externally to the cavity it covers the gluteus minimus, the os innominatum, and the capfule of the hip. The upper edge correfponds to the fciatic notch, and the gluteal artery; it then lies clofe to the gluteus medius. The inferior edge correfponds to the leffer facro-fciatic ligament, and then is parallel to the geminus fuperior: it is at firft feparated from the latter mufcle by the great fciatic nerve, and afterwards approaches to, and is united with it.

The bafis of the pyriformis is attached to the fide of the anterior furface of the facrum, in the intervals of the facral foramina, to thefe foramina at their outer parts, to the anterior furface of the great facro-fciatic ligament, and to the pofterior and upper part of the os innominatum. The mufcle proceeds from within outwards, and rather downwards, paffes out of the pelvis at the great facro-fciatic foramen, gradually diminifhes, and terminates in a fmall tendon, fixed to the upper part of the internal furface of the great trochanter.

The attachment of this mufcle to the great trochanter is by means of a tendon, the lower edge of which is connected to that of the fuperior geminus. This tendon expands into an aponeurofis, which, after extending on the front of the mufcle, enters into its fubftance. The flefhy fibres arife from the parts mentioned above; and are fixed in all directions to the tendon. Sometimes a portion of the fciatic nerve paffes through a flit in the mufcle.

When the thigh is extended, the pyriformis will rotate it outwards; but when it is bent, it will act as an abductor. If the thigh is fixed, it will move the pelvis in an oppofite direction.

PYRIPHLEGES, a word ufed by the old writers in medicine to exprefs a perfon labouring under an extreme degree of a febrile heat.

PYRIPLACIS, in *Natural Hiftory*, the name of a genus of pyritæ, the characters of which are thefe: they are compound, inflammable, metallic bodies, found in loofe detached maffes of a fimple and uniform, not ftriated internal ftructure, and are covered with an inveftient coat or cruft.

Of this genus of foffils there are three known fpecies. Hill.

PYRIPOLYGONIUM, the name of a genus of foffils, the characters of which are, that they are compound metallic bodies, of a regular figure, confifting of twelve planes.

There is only one known fpecies of this genus, though fubject to great varieties in its appearance; and this has been by authors hitherto confounded with many other bodies of a very different nature and figure, under the general name *pyrites.*

It is not unfrequent in Cornwall and Devonfhire; but is much more common in Germany. Hill.

PYRITES, *Sulfure metallique*, in *Mineralogy* and *Chemiftry*, a name given to certain ores which contain a large quantity of fulphur, and have a metallic luftre. The Greek word

word πυρίτης, formed of πυρ, *fire*, denotes fire-ftone; a denomination given to this fubftance on account of its inflammability. For the mineralogical characters of copper pyrites, and iron pyrites, fee COPPER *Ore*, and IRON *Ore*.

Befides thefe there are arfenical pyrites, auriferous pyrites, and tin pyrites. Combinations of fulphur with the metals are called by chemifts fulphurets; and the different kinds of pyrites are properly metallic fulphurets. Sulphur has a great affinity for iron, and in combination with this metal, under the form of pyrites, exifts in extenfive beds in primary mountains, or is diffeminated through the fecondary rocks and ftrata, in veins and maffes, or varioufly cryftallized: it occurs alfo in beds of coal and bituminous clay. Iron pyrites may be confidered, after the earths, as one of the moft abundant fubftances in the mineral kingdom, forming a conftituent part of the globe, and by its decompofition giving rife to many important fubterranean phenomena.

The proportions of iron and fulphur in the different fubfpecies of iron pyrites enumerated by mineralogifts are,

52 to 54 Sulphur
48 to 56 Iron.

Magnetic pyrites differs from common pyrites: its conftituent parts, according to Mr. Hatchett, are,

36.50 Sulphur
63.50 Iron.

By the application of heat common pyrites becomes fufceptible of attraction by the magnet; the excefs of fulphur being expelled. Iron pyrites is not worked as an ore of iron, but is principally valued for the green vitriol or fulphate of iron, which it affords when expofed to air and moifture. Sulphur may alfo be obtained from pyrites when heated with charcoal.

The decompofition of pyrites is effected fpontaneoufly by the abforption of oxygen from water and the atmofphere, which converts the fulphur into fulphuric acid, and the iron into an oxyd. Thefe fubftances unite during the procefs, and form the fulphate of iron, or green vitriol.

Some kinds of pyrites are rapidly decompofed, others require to have part of the fulphur expelled by heat. The pyrites, or pyritous fubftance intended to form vitriol, is collected in extenfive heaps, fpreading the furface as much as can be conveniently done. The ground on which thefe heaps are fpread fhould be impervious to water, and inclined, in order that the faline matter which efflorefces may be wafhed off, and conveyed into refervoirs to cryftallize. As the decompofition proceeds the mafs becomes heated, and is occafionally moiftened, particularly when the air is dry and warm. Thefe beds continue productive for many years, and if the pyrites be pure, but little refiduum is left. An excefs of fulphuric acid is formed during the procefs, on which account a quantity of old iron is added to the folution, to faturate it, and obtain the falt in a cryftallized ftate. During the decompofition of pyrites much heat is evolved, and a confiderable abforption of oxygen from the atmofphere takes place. The fact was firft obferved by Henckel, who affirmed, in his "Pyritologia," that air was neceffary to the procefs of vitriolization, and that it enters into combination with pyrites and remains fixed in it: "non ut inftrumentum tranfiens fed immanens." This may be confidered as a happy anticipation of one of the moft important doctrines of modern chemiftry. Some geologifts have fuppofed that fubterranean fires, and the temperature of hot fprings, are occafioned by the fpontaneous decompofition of immenfe beds of pyrites in the interior of the earth, and an experiment made by Lemery gives fome plaufibility to this opinion. He found that a mixture of iron filings and fulphur, moiftened with a fmall quantity of water, becomes hot in a few hours, the mafs fwells, and the parts adhere together: it then breaks with a perceptible noife and crackling, and emits aqueous vapour, and a fetid odour like that of fulpurated hydrogen gas. If the mixture be made in a large quantity, it takes fire in twenty-four or thirty hours. As foon as the emiffion of aqueous vapour has ceafed, the heat becomes greater and greater, is fucceeded by inflammation, the fmell is then much ftronger, and appears to arife from the hydrogen produced by the decompofition of water. Beaumé, who obferved this phenomenon from a mixture of one hundred pounds of iron filings, with an equal quantity of fulphur in powder, ftates that the flames rofe to a foot in height, but did not continue longer than two or three minutes; the mafs, however, remained red-hot for forty hours. Lemery the elder gave to this experiment the name of the artificial volcano.

Dr. Watfon, in his Chemical Effays, vol. i. p. 187, fays that he has repeated this experiment more than once. When made in the open air the flame is of fhort duration, and the whole mafs, after the extinction of the flame, continues at intervals to throw out fparks. A ladle full of the ignited mafs being dropped down from a confiderable height, defcended like a fhower of red-hot afhes. The fuccefs of this experiment depends on a due proportion of water. Half a pound of flower of fulphur, with half a pound of clean iron filings, mixed with fourteen ounces of water, and worked into a pafte, will acquire heat enough to make the mafs take fire.

Some dark-coloured carbonaceous and bituminous earths contain pyrites in minute grains, and decompofe with great rapidity when expofed to moifture. In the month of Auguft 1751, the cliffs near Charmouth, in Dorfetfhire, containing a fimilar kind of pyritous earth, took fire in confequence of a heavy fall of rain after a hot dry feafon, and continued at intervals to emit flame for feveral years. Almoft all kinds of pit-coal in England contain more or lefs pyrites: in fome the quantity is very inconfiderable, in other kinds it abounds fo much as to render them unfit for domeftic purpofes, and totally inapplicable for forges or iron works, on account of the fulphur which they emit when burned. This pyritous coal may be diftinguifhed by its greater fpecific gravity, and the brafs-like metallic appearance of the pyrites with which it is intermixed. Pyritous coal and coal fhale, or bituminous clay, containing pyrites, frequently take fire fpontaneoufly in coal mines, or when expofed in heaps out of the pits, and continue burning many years. Inftances of this kind now exift in the north of England; and fo intenfe is the heat produced by the ignition of thefe maffes, that the coal fhale is fometimes fufed. We have feen fpecimens from thefe heaps which have all the characters of cellular volcanic lava. In the vicinity of Leeds there is a large heap of coal fhale which has been on fire near half a century; it is covered in parts with vegetation, and prefents no appearance of ignition during the day; but if a dry ftick be thruft into it the furface is changed in a few minutes. In fome of the coal mines in Leicefterfhire, near Afhby de la Zouch, the ftratum of indurated clay over the main bed of coal contains fo much pyritous matter, and is fo fubject to fpontaneous inflammation when it falls down and is intermixed with fmall coal and moifture, that the miners are obliged to clofe up the fpace with brick-clay where the coal has been worked, to prevent the accefs of air to the combuftible matter. In this ftate, excluded from the air, the pyritous earth fometimes becomes ignited, as is evident by the heat communicated to the neighbouring parts of the mine; but the fire is prevented from fpreading among the coal,

coal, by the precautionary meaſure of cloſing the cavities with clay.

The great heat evolved during the decompoſition of pyrites, may proceed in part from the combination of oxygen with the ſulphur and iron, and may be increaſed by the different capacity of the new compound for heat. Whenever chemical changes take place rapidly, they produce a change in the temperature of ſubſtances, as in the well-known inſtances of lime and water, nitric acid and vegetable oils, &c.

The phenomena accompanying the mud volcanoes in various parts of the world, preſent many appearances which give probability to the opinion, that they proceed from the decompoſition of pyritic ſtrata. See Volcano.

The formation of alum is alſo effected naturally, in many ſituations, by the decompoſition of pyrites, the ſulphuric acid combining with the alumine of pyritous clay. This is not unfrequently the caſe in excavations of coal mines that have been long worked out.

At Hartlet, near Glaſgow, in the excavations of an old coal mine that has been worked ſome centuries, there is a very extenſive formation of alum, from the decompoſition of the roof of the pit. It is a pyritous clay ten inches thick. In the old workings of the mine which are dry the air circulates ſlowly, and the roof gradually decompoſes and exfoliates, and falls upon the floor, in which ſituation the decompoſition proceeds, and the ſubſtance aſſumes the appearance of a ſpicular effloreſcence. In time the whole ſpace to the roof is filled; it is then removed. The maſs conſiſts of earth richly impregnated with ſulphate of alumine, ſulphate of iron, and in ſome inſtances with ſulphate of magneſia. The coal in this mine, contrary to the uſual practice, is worked to the dip, ſo that the old workings are always dry. To this circumſtance may principally be attributed the great accumulation of alum in this mine. In many of the mines in England a ſimilar formation of alum would take place, but they contain too much water to permit the ſaline ſubſtances to remain. In general, alum rock or alum ſhale require to be expoſed in heaps, and burned in the open air, to expel the ſulphur, and combine it with the oxygen from the atmoſphere. The ſulphuric acid thus formed unites with a requiſite portion of the clay during the proceſs.

The gypſum, or the ſulphate of lime which occurs in beds, among ſecondary ſtrata of red ſand-ſtone and beds of marle, probably may owe its preſent ſtate to maſſes of pyrites, which have exiſted over common lime-ſtone, and been decompoſed naturally. The ſulphuric acid thus produced would unite with the lime, and form gypſum. The great quantity of the red oxyd of iron which is in the ſtone and marle that accompany this kind of gypſum, gives much probability to this opinion. The cryſtals of gypſum or ſelenite found detached in beds of clay had probably a ſimilar origin.

Sulphuret of iron may be formed by heating together iron filings and ſulphur. From the experiments of Vauquelin it is proved that there are four ſulphurets of iron, according to the degree of heat and other circumſtances under which the combination may be formed. The firſt ſulphuret conſiſts of

$$\left.\begin{array}{l}78 \text{ Iron} \\ 22 \text{ Sulphur}\end{array}\right\} \text{Artificial.}$$

The ſecond ſulphuret, of

$$\left.\begin{array}{l}64 \text{ Iron} \\ 36 \text{ Sulphur}\end{array}\right\} \text{Natural magnetic pyrites.}$$

The third ſulphuret, of

$$\left.\begin{array}{l}54.16 \text{ Iron} \\ 45.84 \text{ Sulphur}\end{array}\right\} \text{Artificial.}$$

The fourth ſulphuret, of

$$\left.\begin{array}{l}47 \text{ Iron} \\ 33 \text{ Sulphur}\end{array}\right\} \text{Natural common pyrites.}$$

When the quantity of ſulphur does not exceed 40 *per cent.* pyrites is ſoluble in muriatic acid, and may be rendered permanently magnetic. The ſpecific gravity of common pyrites is from 4.60 to 4.83. Of magnetic pyrites 4.51.

Arſenical pyrites, called marcaſite, is diſtinguiſhed from iron pyrites by its colour, which is a ſilver white, and by yielding a ſmell like garlic when rubbed or expoſed to heat. See Arsenic *Ores*.

Auriferous pyrites, or iron pyrites, with a ſmall alloy of gold: the richeſt ſpecimens of this ore in Europe are found in Tranſylvania, containing from 0.02 to 0.03 of gld. Theſe ores are diſtinguiſhed from iron and copper pyrites by their colour, malleability, and ſpecific gravity.

Tin pyrites. See Tin *Ore*.

The pyritæ, in ſubſtance, are never uſed medicinally; nevertheleſs, in their products they are very important. From theſe common ſulphur is extracted, in Sweden and Saxony; the native vitriols are produced in caverns of the earth, or on its ſurface; the greateſt quantities of artificial vitriol are prepared; and the mineral waters, vitriolic, aluminous, ſulphureous, hot or cold, are ſuppoſed to receive their impregnation.

When the matter of the pyrites is mixed with the lead ores, the method of ſeparating the metal by aſſaying is this: roaſt two centners of the ore, as in the uſual method, and keep a ſtronger fire than when the ore is pure. The pyrites, eſpecially when it is merely iron, hinders ore from eaſily growing clammy or turning into large lumps, or entirely melting. When the ore is ſufficiently waſhed, let it cool, beat it to powder, and repeat the roaſting to a third fire, till when it is red-hot in the fire, there is no ſmell of ſulphur; then mix the ore with ſix centners of the black flux, and two of ſandiver, and finiſh the work in the common way, only making the fire greater, and continuing it longer, toward the end of the operation. Cramer's Art of Aſſaying, p. 292. See Lead *Ore*.

Pyrites is applied by ſome authors to the marcaſite ores of all metals; the names of which are varied according to the metals they partake of.

Thus *chryſitis* is that of gold; *argyritis* that of ſilver; *ſideritis* that of iron; *chalcitis* that of copper; and *molybditis* that of lead, &c.

PYRITICUM Liquamen. See Liquamen *Pyriticum*.

PYRITRICHIPHYLLUM, in *Natural Hiſtory*, the name of a genus of foſſils of the claſs of the pyrites, the characters of which are theſe: they are compound, inflammable, metallic bodies, found in looſe maſſes not of any regularly angular figure, and of a ſtriated texture, with foliaceous ends to the ſtriæ, appearing on the ſurface, or within the maſs.

Of this genus there are only two known ſpecies: one having the foliaceous ends of the ſtriæ on the outer ſurface of the maſs; and the other having a ſmooth external ſurface, and the foliaceous ends of the ſtriæ covering the ſides of internal hollows.

The firſt of theſe is found in many of the Engliſh and German mines; the other has been yet only found in the mines on Mendip hills in Somerſetſhire, but there in conſiderable plenty. Hill.

PYRITRICHUM, the name of a genus of pyrites, the characters of which are theſe: they are compound, inflammable, metallic foſſils, always found in detached maſſes of no regularly angular figure, and of a fimply ftriated internal ftructure.

Of this genus of pyritæ there are three known fpecies. All the three fpecies are found plentifully in different parts of the kingdom: the firft in all forts of ftrata, and often loofe on the ground; the fecond principally in the chalk-pits of Kent and Suffex; and the laft in Effex and Hampfhire, and very frequently in the German mines. Hill.

PYRITZ, in *Geography*. See PIRITZ.

PYRMONT, a town of Germany, and capital of the country fo named; its citadel is fortified with a broad ditch, high ramparts, and fubterraneous paffages and vaults; 12 miles S.W. of Hamala. N. lat. 51° 57'. E. long. 9° 17'.— Alfo, a county and principality of Germany, bounded on the N. by the principality of Calenberg, on the E. by Wolfenbuttle and Calenberg, on the S. by Wolfenbuttle, and on the W. by the county of Lippe; about nine miles long, and three broad. The revenues are eftimated at 30,000 rix-dollars, principally arifing from the fprings and falt-works.

PYRMONT *Water*, in *Phyfiology* and *Medicine*, a very brifk, fpirituous chalybeate, abounding in fixed air, and which, when taken up from the fountain at Pyrmont, in Germany, whence its name, fparkles like the brifkeft Champaign wine. It has a pleafant, vinous tafte, and fomewhat fulphureous fmell. It is perfectly clear, and bears carriage better than the Spa water.

The hiftory of thefe waters is accurately given by Hoffmann in his obfervations on them, both in their natural ftate, and in mixture with other bodies.

He firft obferves, that they contain a volatile and fubtile principle, much more penetrating and ftrong, as well as in larger quantity, than any other mineral water; but that this is not to be expected in them any where but upon the fpot, for thofe who tranfport them to other places are conftrained to let a part of this fly off, to preferve the reft. If either glafs or earthen veffels be filled at the fpring, and immediately corked and faftened down, the confequence is, that they will burft on the firft motion, or heat of the weather. They are, therefore, forced to fill them only in part at firft, and let them ftand awhile for this fubtile fpirit to exhale; and then awhile after the filling them up, to cork and fit them for carriage.

2. If they are drank upon the fpot in a morning, on an empty ftomach, they affect the nofe with a pungent tingling, and difturb the head for many hours afterwards.

3. If they are taken at the fpring, they purge but very little; but if taken in another place, after tranfportation, they purge confiderably more, and render the ftools black. It is obfervable alfo, that if they are left in an open veffel a few days, their virtue wholly exhales, and they no longer purge nor render the ftools black.

4. If tea-leaves, baulaftine-flowers, or galls, are put into this water, they firft change it to a blue, from that to a purple, and finally to a black. This is a ready proof that black is only a deep purple, and purple only a deep blue: a little fpirit of vitriol added to this liquor deftroys all the colour, and renders it limpid as before.

5. If any acid be mixed with Pyrmont water, there is raifed an effervefcence, and bubbles of air are carried up in great quantity; and this whether the ftronger acids, fuch as fpirit of vitriol, or aqua fortis, be ufed; or the weaker, as vinegar, lemon juice, or Rhenifh wine.

6. If an alkaline liquor be added, whether it be volatile, as the fpirit of fal ammoniac, or fixed, as the oil of tartar, there is no ebullition raifed, but the liquor becomes turbid and milky. If fpirit of vitriol be afterwards added to this, to faturate the additional alkali, the liquor becomes limpid again.

7. Cow's milk mixed in equal quantity with Pyrmont water does not coagulate, but, on the contrary, becomes thinner than before, and is preferved from turning four fo foon as it otherwife would in hot weather. This is a proof that there is no predominating acid in thefe waters.

8. If fyrup of violets be added to Pyrmont water, it turns it to a beautiful green. This is a proof of the alkaline nature of thefe waters; and it is further proved, by adding fpirit of vitriol, or any other acid, to this green liquor, which on that becomes limpid again.

9. Four pints of this water evaporated over a gentle fire, yield no more than two fcruples of a dry refiduum. Oil of vitriol being poured on this, an acid effervefcence arifes, and with it an acrid and pungent vapour, like that produced by mixing oil of vitriol and common falt. If fpirit of vitriol be ufed inftead of the oil, the effervefcence is in a lefs degree, and the falt is in part changed to a bitter faline mafs, the remainder feparated from which proves to be a calcareous earth, no longer fermenting with the fpirit of vitriol.

10. If a quantity of Pyrmont water be expofed twenty-four hours to the open air in a bafon, it will at the end be found to have loft all its virtues, tafting wholly infipid, and being turbid, inftead of the fine clearnefs it had before, and a yellow ochreous earth is precipitated to the bottom: after this the liquor will no longer fhew any of thofe qualities, which were before its diftinguifhing characters; it will no longer ferment with acids, nor turn black with galls, nor green with fyrup of violets.

It appears from the whole, that the Pyrmont waters poffefs a pure, extremely penetrating, and elaftic mineral fpirit, and that in a very large proportion; and to this their virtues are principally to be attributed. This mineral fpirit, while it remains engaged in a calcareous earth, imitates the properties of an alkaline fubftance; and when joined with a fubtile martial earth, it emulates the properties of vitriol, giving the ftools a black colour, and turning a tincture of galls into ink: and while this remains in the water in thefe forms of an alkaline or vitriolic principle of fo great fubtilty, it cannot but give them very great virtues in ftrengthening the tone of the vifcera, opening obftructions, and ftimulating in a proper manner the excretory ducts, fo as to make them duly perform their office; but as foon as by the ftanding of the water open, or by any other accident, this fubtile element is evaporated, all the virtues of the water muft be gone with it.

The great quantity of this powerful fpirit contained in the waters, makes them more fit for the robuft and ftrong conftitutions, when depraved by illnefs, than for the weak and tender ones; but even the tendereft people may take them, only obferving to take but a fmall dofe, or to dilute them with an equal quantity of common water immediately before the taking them.

Hoffmann alfo recommends the Pyrmont water mixed with equal quantities of milk, on his own experience, in fcorbutic and gouty cafes. Hoffm. Oper. tom. v. p. 143, feq.

We have already obferved, under the articles ACIDULÆ and CARBONIC *Acid*, that Pyrmont water, and other mineral waters of a fimilar nature, owe their acidulous tafte and peculiar virtues to the fixed AIR (carbonic acid) which they contain; and to thofe articles the reader is referred for a brief hiftory of of this important difcovery. We fhall here add fome farther remarks on the effects and medical ufes of this water.

Perfons who drink it at the well are affected with a kind of giddinefs or intoxication, which is probably owing to the great quantity of carbonic acid with which the water abounds. The common operation of this water is by urine; but it is alfo a gentle fudorific; and if taken in large quantity, proves laxative. However, in order to this effect, it is ufual to mix fome falts with the firft glaffes. It is drank by glafsfuls in the morning, to the quantity of from one to five or fix pints, according to circumftances; thofe who drink it walking about between each glafs. This water is recommended in cafes where the conftitution is relaxed; in want of appetite and digeftion; weaknefs of the ftomach, and heartburn; the green ficknefs; female obftructions and barrennefs; the fcurvy, and cutaneous difeafes; and in the gout, efpecially, as Hoffmann obferves, when mixed with milk; in colics; bloody fluxes; diforders of the breaft and lungs; in which cafe it is beft taken lukewarm: in nervous, hyfteric, and hypochondriacal diforders; in apoplexies and palfies; in the gravel and urinary obftructions; in foulnefs of the blood; and in obftructions of the finer veffels. It amends the lax tenure of the blood; exhilarates the fpirits without inflaming, as vinous liquors are apt to do; and is reckoned among the beft reftoratives in decayed and broken conftitutions. It is faid to poffefs the general virtues of the Spa water, and at the fountain it is more fpirituous, as well as a ftronger chalybeate. Elliot's Medicinal Virtues, &c. of Mineral Waters, 1781, p. 181.

Near the famous well at Pyrmont is a ftone quarry under ground, from fome parts in which a fulphureous fteam comes out, which commonly rifes to a fmall height. Animals held in this fteam are foon fuffocated, but recover, if quickly taken out. When a man ftands in this fteam, but with his head over it, it proves an excellent fudorific. Dr. Seip propofes to perform cures in feveral difeafes with it. See Phil. Tranf. N° 448, fect. 4, and Mifc. Berolin. tom. v. part 2. fect. 4. See Grotta *del Serpi.*

Pyrmont *Water, Imitation of.* This medicinal water may be imitated very nicely by art in the following manner: take a quart of the pureft and lighteft water, add to it thirty drops of a ftrong folution of iron made in fpirit of falt, a drachm of oil of tartar per deliquium, and thirty drops of fpirit of vitriol, or a little more or lefs, as is found neceffary, not to let the alkali of the oil of tartar prevail too ftrongly, though it muft prevail a little. Shake all brifkly together, and on tafting it will be found extremely to refemble the true Pyrmont water.

The bafis on which this is founded is the analyfis and trial of the true Pyrmont water, by which it is found to contain a fubtile aqueous fluid, a volatile iron, and a predominant alkali, all joined together into one brifk pungent fpirituous water. The artificial Pyrmont thus made, if the proportions are carefully minded, will extremely refemble the natural, and will have the fame effect as a medicine. Shaw's Lectures, p. 90.

But the beft method of forming artificial Pyrmont water is by impregnating it with fixed air, or carbonic acid, for which we are indebted to Dr. Prieftley. The firft perfon, we believe, who actually compounded an artificial acidulous or fpirituous water, like that of Seltzer or Pyrmont, was M. Venel; though he was ignorant of the real nature of the ingredient to which it owed thefe qualities, and which he erroneoufly fuppofed to be common air. For this purpofe he diffolved in a pint of water two drachms of foffile alkali, to which he added an equal quantity of marine acid: in the procefs he made ufe of a veffel with a narrow neck, and to prevent the efcape of the air, he difpofed the ingredients in fuch a manner, that they could not communicate with each other till after the bottle was corked. In this cafe the fixed air diflodged from the alkaline falt, in a phial nearly full and clofely corked, being confined, fuffers a degree of compreffion that greatly promotes its combination with the water. See Memoires prefentés par les Sçavans Etrangers, tom. ii. containing two Memoirs of M. Venel, read before the Royal Academy of Sciences in 1750; and Laviofier's Effays, &c. by Henry, p. 34, &c. However, Dr. Prieftley was undoubtedly the firft who fo far improved upon the difcoveries made by himfelf and others in relation to the principle then denominated fixed air, as to contrive an eafy method of impregnating water with it. The firft idea of this kind occurred to him in 1767, when, having placed fhallow veffels of water within the region of fixed air on the furface of the fermenting veffels of a brewery, and left them all night in that fituation, he found that the water had acquired a very fenfible and pleafant impregnation. He proceeded to accelerate the impregnation by pouring the water from one veffel into another, while they were both held within the fphere of the fixed air. The method of effecting this by air diflodged from chalk and other calcareous fubftances, did not occur to him till the year 1772, when he publifhed his directions for this purpofe, together with a drawing of the neceffary apparatus, which he had before communicated to the Board of Admiralty. This apparatus, reprefented in *Plate* XV. *Pneumatics*, *fig.* 1, confifts of a glafs veffel, *a*, with a narrow neck, and fo formed, that it will ftand upright, with its mouth downwards: this veffel, when filled with water, and covered with a flip of paper or thin pafteboard, preffed clofe to it, to prevent the admiffion of common air, is inverted in another veffel, *b*, with a little water in it, fo that the flip of paper or pafteboard may be withdrawn, and the end of the pipe, *c*, introduced into it. This pipe is flexible and air-tight, and beft made of leather, fewed with a fhoemaker's waxed thread. It is kept open at both ends by a piece of a quill, while one of them is introduced into the veffel of water, and the other into the bladder *d*; the oppofite end of which is tied round a perforated cork, kept open by a quill, and the cork is made to fit a phial, *e*, two-thirds of which fhould be filled with chalk juft covered with water. Dr. Prieftley has fince found it moft convenient to ufe a glafs tube; and to preferve the advantage which he had of agitating the veffel *e*, he makes ufe of two bladders, communicating by a perforated cork, to which they are both tied. He alfo obferves, that the flexible pipe is not neceffary; but inftead of this a bent tube of glafs muft be ready to be inferted into the hole made in the cork, when the bladder containing the fixed air is feparated from the phial in which it was generated. The extremity of this tube being put under the veffel of water, and the bladder being compreffed, the air will be conveyed into it, as in the other cafe. Inftead of the bladder, a fmall phial may be interpofed between the phial containing the chalk, &c. and the veffel of water: for thus the chalk and water that may be thrown up the tube communicating with this phial will lodge at the bottom of the other, while nothing but the air will get into the pipe communicating with the water. The apparatus being thus prepared, let the phial containing the chalk and water be detached from the bladder, and the pipe alfo from the veffel of water; pour a little oil of vitriol upon the chalk and water; and having carefully preffed all the common air out of the bladder, put the cork into the bottle prefently after the effervefcence has begun. Alfo prefs the bladder once more after a little of the newly-generated air has got into it, in order the more effectually to clear it of all the remains of the common air; and then introduce

troduce the end of the pipe into the mouth of the veſſel of water, as in the drawing, and begin to agitate the chalk and water briſkly. This will preſently produce a conſiderable quantity of fixed air, which will diſtend the bladder; and this being preſſed, the air will force its way through the pipe, and aſcend into the veſſel of water, the water at the ſame time deſcending, and coming into the baſon.

When about one-half of the water is forced out, let the operator lay his hand upon the uppermoſt part of the veſſel, and ſhake it as briſkly as he can, not to throw the water out of the baſon; and in a few minutes the water will abſorb the air, and taking its place, will nearly fill the veſſel as at the firſt. Then ſhake the phial containing the chalk and water again, and force more air into the veſſel, till, upon the whole, about an equal bulk of air has been thrown into it. Alſo ſhake the water as before, till no more of the air can be imbibed. As ſoon as this is perceived to be the caſe, the water is ready for uſe; and if it be not uſed immediately, ſhould be put into a bottle as ſoon as poſſible, well corked, and cemented. It will keep, however, very well, if the bottle be only well corked, and kept with the mouth downwards.

It may be proper to obſerve on this proceſs, that the phial, *c*, ſhould always be placed conſiderably lower than the veſſel *a*; that the water to which the chalk is put ſhould be changed after every operation; that with a veſſel of water holding three pints, and a phial containing the chalk and water of ten ounces, a little more than a tea-ſpoonful of oil of vitriol will produce air enough to impregnate ſuch a quantity of water, that the whole proceſs does not take up more than a quarter of an hour, and the agitation not five minutes; and that in this method the water is eaſily made to imbibe an equal bulk of air; whereas Dr. Brownrigg found that Pyrmont water at the ſpring-head did not contain ſo much as one-half. This apparatus has received conſiderable improvements, which we ſhall briefly recite; but in juſtice to the merit of the original inventor, his method deſerves to be recorded; and beſides, it requires leſs time, and is much leſs expenſive than thoſe that are now generally uſed.

The apparatus contrived by Dr. Nooth, and improved by Mr. Parker, is repreſented in *fig.* 2. It is made of glaſs, and ſtands on a wooden veſſel, *d d*, reſembling a tea-board; the middle veſſel B has a neck, which is inſerted into the mouth of the veſſel A, to which it is ground air-tight. This lower neck of the veſſel B has a glaſs ſtopple S, compoſed of two parts, both having holes ſufficient to let a good quantity of air paſs through them. Between theſe two parts is left a ſmall ſpace, containing a plano-convex lens, which acts like a valve, in letting the air paſs from below upwards, and hindering its return into the veſſel A. The upper veſſel C terminates below in a tube *r t*, which, being crooked, hinders the immediate aſcent to the bubbles of fixed air into that veſſel, before they reach the ſurface of the water in the veſſel B. The veſſel C is alſo ground air-tight to the upper neck of the middle veſſel B, and has a ſtopple, *p*, fitted to its upper mouth, which has a hole through its middle. The upper veſſel B holds juſt half as much as the middle one B; and the end, *t*, of the crooked tube goes no lower than the middle of the veſſel B.

For the uſe of this apparatus, fill the middle veſſel B with ſpring or any other wholeſome water, and join to it the veſſel C. Pour water into the veſſel A (by the opening *m*, or otherwiſe) ſo as to cover the riſing part of its bottom: about three-fourths of a pint will be ſufficient. Fill an ounce phial with oil of vitriol, and add it to the water, ſhaking the veſſel ſo as to mix them well together. As heat is generated, it will be beſt to add the oil by a little at a time, otherwiſe the veſſel may be broke. Put to this, through a wide glaſs or paper funnel, about an ounce of powdered raw chalk, or marble. White marble being firſt granulated, or pounded like coarſe ſand, is better for the purpoſe than pounded chalk, becauſe it is harder; and, therefore, the action of the diluted acid upon it is ſlower, and laſts a conſiderable time. On this account the ſupply of fixed air from it is more regular than with the chalk: and beſides, when no more air is produced, the water may be decanted from the veſſel A, and the white ſediment waſhed off, and the remaining granulated marble may be employed again, by adding to it freſh water and a new quantity of oil of vitriol. The funnel in this proceſs is made uſe of in order to prevent the powder from touching the inſide of the veſſel's mouth: for if that happens, it will ſtick ſo ſtrongly to the neck of the veſſel B, as not to admit of their being ſeparated without breaking. Place immediately the two veſſels B and C (faſtened to each other) into the mouth of the veſſel A, as in the figure, and all the fixed air which is diſengaged from the chalk or marble by the oil of vitriol, will paſs up through the valve in S into this veſſel B. When this fixed air comes to the top of the veſſel B, it will diſlodge from thence as much water as is equal to its bulk: which water will be forced up through the crooked tube into the upper veſſel C.

Care muſt be taken not to ſhake the veſſel A when the powdered chalk is put in; otherwiſe a great and ſudden efferveſcence will enſue, which will perhaps expel part of the contents. In ſuch caſe it may be neceſſary to open a little the ſtopple *p*, in order to give vent, otherwiſe the veſſel A may burſt. It will be proper alſo to throw away the contents, and waſh the veſſel; for the matter will ſtick between the necks of the veſſels, and cement them together. The operation muſt then be begun afreſh. But if the chalk be thrown in without ſhaking the machine, or if marble be uſed, the efferveſcence will not be violent. If the chalk be put into the veſſel looſely wrapt up in paper, this accident will be ſtill better guarded againſt. When the efferveſcence goes on well, the veſſel C will ſoon be filled with water, and the veſſel B half filled with air; which will eaſily be known to be the caſe, by the air going up in large bubbles through the crooked tube *r t*.

When this is obſerved, take off the two veſſels B and C together as they are, and ſhake them ſo that the water and air within them may be much agitated. A great part of the fixed air will be abſorbed into the water; as will appear by the end of the crooked tube being conſiderably under the ſurface of the water in the veſſel. The ſhaking them for two or three minutes will be ſufficient for this purpoſe. Theſe veſſels muſt not be ſhook while joined to the under one A, otherwiſe too great an efferveſcence will be occaſioned in the latter; together with the ill conſequences above-mentioned. After the water and air have been ſufficiently agitated, looſen the upper veſſel C, ſo that the remaining water may fall down into B, and the unabſorbed air paſs out. Put theſe veſſels together, and replace them into the mouth of A, in order that B may be again half filled with fixed air. Shake the veſſels B and C, and let out the unabſorbed air as before. By repeating the operation three or four times, the water will be ſufficiently impregnated.

Whenever the efferveſcence nearly ceaſes in the veſſel A, it may be renewed by giving it a gentle ſhake, ſo that the powdered chalk or marble at the bottom may be mixed with the oil of vitriol and water above it; for then a greater quantity of fixed air will be diſengaged.

When the efferveſcence can be no longer renewed by ſhaking the veſſel A, either more chalk muſt be put in, or more

more oil of vitriol; or more water, if neither of these produce the desired effects.

The ingenious Mr. Magellan has still farther improved the contrivance of Dr. Nooth and Mr. Parker; he has two sets of the vessels B and C. While he is shaking the air and water contained in one of these sets, the other may be receiving fixed air from the vessel A. By this means twice the quantity of water may be impregnated in the same time. He has a wooden stand K (*fig.* 3.) to fix the vessels B, C on, when taken off from A, which is very convenient. He has a small tin trough for measuring the quantity of chalk or marble requisite for one operation, and a wide glass funnel for putting it through into the vessel A, to prevent its sticking to the sides, as mentioned before.

He has also contrived a stopple without a hole, to be used occasionally, instead of the perforated one *p*. It has a kind of bason at the top, to hold an additional weight when necessary. (See *fig.* 4.) The stopple must be of a conical figure, and very loose; but so exactly and smoothly ground as to be air-tight merely by its pressure, which may be increased by additional weights put into its bason. Its use is to compress the fixed air on the water, and thereby increase the impregnation: for by keeping the air on the water in this compressed state, the latter may be made to sparkle like Champaign. And if the vessels are strong, there will be no danger of their bursting in the operation.

If the vessels be suffered to stand six or eight hours, the water will be sufficiently impregnated even without agitation. But by employing the means above described, it may be done in as many minutes.

The water thus impregnated may be drawn out at the opening *k*. But if it is not wanted immediately, it will be better to let it remain in the machine, where it has no communication with the external air. Otherwise the fixed air flies off by degrees, and the water becomes vapid and flat; as also happens to other acidulous waters. But it may be kept a long time in bottles well stopped, especially if they are placed with their mouths downwards.

Mr. Blades of Ludgate-Hill has still farther improved this apparatus, by changing the stopple at *k* for a glass cock, which is more convenient. He has likewise altered the middle vessel B into a form more advantageous for the impregnation. See *fig.* 5.

For Dr. Hulme's method of impregnating water with fixed air, we refer to his "Safe and easy Remedy for the Stone," &c. 1778: observing, that he merely mixes the solution of fixed alkaline salt and water, containing as much vitriolic acid as he finds necessary, *á priori*, for neutralizing the alkali, and expelling from it all its fixed air.

Dr. Withering, of Birmingham, has lately contrived a new apparatus for impregnating water with fixed air, which, he says, is preferable to that in common use, because it can be made at less expence, and is more easily prepared; because the whole quantity of fixable air produced is converted to use, without any waste of the vitriolic acid; because it impregnates three times the quantity of water at one time, more completely and with less trouble; and the impregnated water will always retain its virtue, if the joints and cocks of the machine are made perfectly air-tight; for which purpose they should once a year be supplied with a small quantity of unsalted lard. This apparatus is exhibited in *fig.* 6, and consists of a glass vessel A, about ten inches high in the cylindrical part, and six inches and a half in diameter; another glass vessel B, about twelve inches high in the conical part, one inch and a half in the neck, and five inches in diameter at the bottom; a copper pipe C passing through the stopper of the vessel B, and tied fast in the flexible tube D, made of strong leather, air-tight, and kept hollow by means of a spiral wire passing through its whole length; a conical brass pipe E, with a stop-cock fastened to the tube D; another conical pipe F, with a stop-cock G, into which the end of the tube E is accurately ground, so as to be air-tight, and cutting off all communication with the atmosphere when the pipe E is removed; two large hog's bladders H, H, each of which ought to hold two quarts; a stop-cock I, to prevent the water rising into the bladders, when the vessel A is agitated; a bladder K, tied to the crooked tube with the stop-cock L, which occasionally opens or shuts the communication with the vessel B; a glass funnel M, accurately fitted with the glass stopper N; an aperture O, fitted with a glass stopper or a silver cock, from which the impregnated water is to be drawn for use; and, lastly, the tube P opening into the vessel A. When this apparatus is used, let the vessel A be filled with pure water, and any other ingredients that are required, in a proper proportion; into the vessel B put as much marble or whiting, in small lumps, as will cover its bottom to the height of about two inches, and pour in water to the height represented by the dotted line; let the mouth of the vessel A be well fitted with a cork, and through a hole in the cork pass the tube P, putting upon the cork melted sealing-wax of the softest kind, or modelling-wax, so as to make the whole air-tight. The modelling-wax may be procured at the engravers, or it may be prepared by adding to half a pound of melted bees-wax, two ounces of tallow, and one ounce of Venice turpentine: to this mass add a sufficient quantity of red lead, or Spanish brown, to give it a colour, and let the mixture be stirred till it is cold: let the mouth of the vessel B be stopped with a piece of mahogany, turned into a conical figure in a lathe, and of a size somewhat larger than the mouth of the glass will admit; put this piece of wood into melted bees-wax, and heat the wax till the wood begins to grow black: when cool, turn it again till it fits the mouth of the vessel: the tubes C, L, and M, are fitted into holes bored through the wooden stopper, previous to its being immersed in the wax: push these tubes through the holes, and press the stopper into the orifice of the vessel B, and cement the whole with sealing or modelling-wax: shut the stop-cocks I and L, having previously pressed the air out of the bladder K; open the stop-cocks G and E; then squeeze the air out of the bladders H, H, and afterwards press the conical pipe E into the pipe F: pour about a large spoonful of oil of vitriol through the funnel M, and stop it with its stopper N. The fixable air let loose by the effervescence in the vessel B, rising through the tube C, passes into the bladders H, H, and distends them. In this case open the stop-cock I, and from the aperture O draw out about a quart of water; and the space before occupied by the water will be filled with fixable air, which soon begins to be absorbed by the remaining water, and is still supplied from the bladders H, H, and from the effervescing mixture in the vessel B. When the bladders are considerably collapsed, more vitriolic acid must be added through the funnel M, so that they may be always kept pretty fully distended. When an impregnation is speedily required, turn the stop-cocks at G and E, and open that at L; then separate the pipe E from the tube F, and agitate the vessel A; the fixable air will pass into the bladder K, and may be pressed into the two other bladders, when the parts of the apparatus are united. During the agitation, the stop-cock at I should be closed, and open only occasionally to supply out of the bladders H, H, the fixable air absorbed by the water. If a strong impregnation be required, this process should be carried on in a room, the heat of which does not exceed forty-eight degrees of Fahrenheit's thermometer. Dr. Withering observes, obferves, that the impregnated water receives no tafte from the bladders: and that if the veffel A with its impregnated water be feparated from the veffel B, at the conical parting E F, it may be inclofed in a pyramidal mahogany cafe, out of the lower part of which the filver cock at O projects; and thus ferve for an ornamental as well as a luxurious and falubrious addition to the fide-board, particularly in the fummer and autumnal feafons.

Mr. Henry has defcribed a method of impregnating water in large quantities with fixed air, fo as to give it the properties of mineral water, for the ufe of the fick on board of fhips, and in hofpitals. He has given the following account of his apparatus and procefs for this purpofe. Cut off the two extremities of a calf's or pig's bladder *f*, (*fig.* 7.) and having previoufly moiftened them, into one end infert the top of the tubular ftopper *e*, round the neck of which it is to be clofely faftened with ftrong thread. Into the upper end introduce the part *g* of the long bent tube *h*, and tie them round in the fame manner. The pipe *h* muft be paffed through a hole formed by a hot iron borer, in a large cork adapted to the orifice *i* in the cafk B B, holding about ten or twelve gallons, to which it muft be cemented: and the length of the pipe from this point muft be fuch as to reach within a few inches of the bottom of the cafk B B, which is to be completely filled with frefh water, or fuch as has been recovered from lime. See PUTREFACTION *of Water*.

To a quantity of mild calcareous earth and water, placed in the air-veffel C, add a fmall portion of ftrong vitriolic acid, and by the time moft of the common air may be fuppofed to be expelled by the fixed air arifing from the mild calcareous earth, add a larger quantity of acid, and putting the tubulated ftopper *e* in its place, the bladder *f* will become inflated. Prefs it gently till its fides collapfe; and then introducing the pipe *h h*, with its cork, into the orifice *i* of the cafk B B, again prefs the air forward, as it diftends the bladder into the water cafk, where, bubbling up through the water, it will rife to the furface, and by its preffure, force the water to afcend into the funnel *k*, which is to be cemented into the head of the cafk at *l*. In proportion as the water in the cafk becomes impregnated with fixed air, that in the funnel will return into its place; but if, at any time, the latter fhould rife fo high as to be in danger of overflowing, a quantity of air may be let out of the water cafk, by means of the fmall plug at *m*. And this is neceffary to be done, occafionally, to difcharge the refiduum of the fixed air, which is not foluble in water.

If the operation be required to be performed more expeditioufly, it may be quickened by agitating the water cafk. To do this, the tubular ftopper *e* muft be withdrawn from the air-veffel, and fupported, together with the bladder, by an affiftant, while the cafk B B is fhaken. During this time another tubular ftopper muft be put into the air-veffel, and it may be immerfed into a quantity of lime-water to prevent wafte. When the agitation has been continued for fome minutes, in proportion to the falling of the water in the funnel, replace the ftopper attached to the bladder *f* in the air-veffel when taken out of the lime-water, and proceed as before, repeating the agitation occafionally.

During the procefs, additional quantities of vitriolic acid may be introduced into the air-veffel through the opening at *d*, which is to be, at all other times, carefully fecured with its ftopper.

By this procefs, fixed air may be imparted to wine, beer, and almoft any liquor whatever. And when beer is become flat or dead, it will be revived by this means; but the delicate agreeable flavour, or acidulous tafte communicated by the fixed air, and which is manifeft in water, will hardly be perceived in wine, or other liquors, which have much tafte of their own.

The artificial mineral waters thus made, are more pleafant to the tafte than the natural Pyrmont or Seltzer waters; which, befides their fixed air, contain faline particles of a difagreeable tafte, which are known to contribute little or nothing to their medicinal virtues, and may, in fome cafes, be hurtful. They are likewife confiderably ftronger. According to fir John Pringle, thefe waters may be made more nearly to refemble genuine Pyrmont water, by adding to each pint of them from eight to ten drops of tinctura martis cum fpiritu falis. Or this may be done, by adding to the water in the middle veffel B (*fig.* 2.) in the proportion of about thirty grains of Epfom falt, ten grains of common falt, a fcruple of magnefia alba, and a drachm of iron filings, or iron wire, clean and free from ruft, to one gallon of fpring water, and impregnating the whole with fixed air in the manner already defcribed. Let them remain till the other ingredients, and as much of the iron as is neceffary, are diffolved, which will be in two or three days; or the magnefia may be omitted, and then the operation will be finifhed in lefs than half that time. Thefe waters may be rendered ferruginous or chalybeate very eafily, by putting in the middle veffel two or more flender phials, filled with cuttings of fine iron-binding wire, or with fmall iron nails; becaufe the impregnated water will diffolve the iron fo faft, as to become well faturated with it in a few hours, according to the experiments of Mr. Lane. But the method of rendering thefe artificial waters chalybeate, ufed by Dr. Hulme, is to add one grain of falt of fteel to each pint (fixteen ounces) of water already impregnated with fixed air.

The difcovery of an eafy method of impregnating water with fixed air is of great importance; as it is now well known that fuch water is a very powerful antifeptic, or that it both refifts and corrects putrefaction. It is, therefore, given with great fuccefs in putrid fevers, in the fea-fcurvy, in dyfenteries, in mortifications, and in other diforders arifing from a putrid caufe, or attended with putrefaction, a draught of it being taken now and then, or even by way of common drink. But the ingenious Mr. Bewly has invented a ftill better method of exhibiting fixed air as a medicine. He directs a fcruple of alkaline falt to be diffolved in a fufficient quantity (a quarter of a pint, or lefs) of water, which is to be impregnated with as much fixed air as it can imbibe; this is to be drank for one dofe. Mr. Bewly directs it to be prepared in larger quantities at a time, and calls it his mephitic julep. If immediately after it a fpoonful of lemon juice, mixed with two or three fpoonfuls of water, and fweetened with fugar, be drank, the fixed air will be extricated in the ftomach; and thus a much greater quantity of it may be given than the fame quantity of water alone can be made to imbibe. Fixed air acts as a corroborant; and, therefore, may be given with fuccefs in weaknefs of the ftomach, and in vomitings arifing from that caufe. It has alfo been given with fuccefs in the ftone, and in nephritic complaints. When the lungs are purulent, fixed air, mixed with the air drawn into the lungs, has repeatedly been found to perform a cure. The bark alfo may be given with advantage in water impregnated with fixed air, as they both coincide in the fame intention. Fixed air may be applied by means of a fyringe, funnel, or otherwife, to inflamed breafts, putrid ulcers, mortified parts, ulcerated fore throats, and has been found in fuch and fimilar cafes to have very remarkable efficacy. It may alfo be given internally at the fame time. In putrid dyfenteries, and in putrid ftools, fixed air may be given by way of clyfter.

Ferment-

Fermenting cataplaſms are of ſervice chiefly as they ſupply fixed air to the part. In caſes of putridity, fixed air has been ſucceſsfully applied to the ſurface of the body, expoſed to ſtreams of it. It is alſo found an excellent cooling as well as ſtrengthening beverage in hot relaxing weather, and has the advantage of being pleaſant to the taſte. See on the ſubject of this article Prieſtley's Exp. and Obſ. on Air, vol. ii. p. 263, &c. 298, &c. Phil. Tranſ. vol. lxv. part i. p. 59, &c. Elliot's Account of the Nature and medicinal Virtues of the principal Mineral Waters, &c. 1781. Henry's Account of a Method of preſerving Water at Sea, &c. 1781. p. 19, &c.

PYROBOLOGY, or the art of miſſile fires, is derived from the Greek πυρ, *fire*, and βαλλειν, *to throw*. See PYROTECHNY.

PYROBOLUS, in *Natural Hiſtory*, a name given by many authors to the ſtone more generally called *pyrites*; others have called it *ſiderites*, *pyrobalanus*, *pyropus*, and *othonna*, and the Greeks *mylias*.

PYROCHROA, in *Entomology*. See LAMPYRIS.

PYROCTOGONIUM, in *Natural Hiſtory*, the name given by Dr. Hill to a genus of foſſils uſually comprehended by authors, with many other bodies of a different figure and ſtructure, under the general name *pyrites*.

The characters of the pyroctogonium are theſe: it is a compound, inflammable, metallic body, of a regular octohedral figure, or compoſed of eight planes.

There is only one known ſpecies of this genus, which is a very ſingular and elegant foſſil, being compoſed of eight triangular planes; theſe being the ſides of two quadrilateral pyramids, with broad baſes, which being joined baſe to baſe, conſtitute the pyroctogonium.

It is found very frequently in Cornwall, Devonſhire, and moſt other of our counties where there are mines. It is ſometimes met with looſe in the earth, ſometimes lodged in the bodies of marcaſites, or in the ſolid foſſils, and varies ſometimes from its iron colour to a duſky yellow. It is ſometimes alſo found with many ſpecimens connected into a maſs; theſe are ſeldom uniform in ſize, and cohere in various directions, often greatly injuring one another's figure. Sometimes alſo, as in the caſe of the cryſtals, they form a large maſs, of which the outer ſurface only is concreted into or covered with regular figures, the whole inner part being a confuſed ſubſtance.

Maſſes of this kind are not unfrequently found of a regular orbicular figure, and beſet all over with regularly figured pyroctogonia of various ſizes. Hill.

PYRODMALITE, in *Mineralogy*, a mineral diſcovered ſome years ago in the mine of Bjelke, in Vermeland, a province of Sweden, ſituated on the N. ſide of the lake Venner, which was obſerved to have the property of giving out the odour of muriatic acid when heated, and hence diſtinguiſhed by the name of pyrodmalite. J. G. Gahn of Fáhlun has given the following deſcription of it. Its colour is commonly yellowiſh-brown, paſſing into greeniſh: internally, it is light greeniſh-yellow. It occurs cryſtallized in regular ſix-ſided priſms, without any terminating pyramids. It is compoſed of plates lying on each other in a direction perpendicular to the axis of the priſm; principal fracture, reſplendent; croſs fracture, uneven and without luſtre; opaque; ſemi-hard; ſcratched by ſteel; the cryſtals are often ſeveral inches long; ſpecific gravity 3.081. Before the blowpipe it becomes dark reddiſh-brown, and emits the odour of muriatic acid. It then melts into a black ſlag, and at laſt a ſmall bead is obtained, more or leſs attracted by the magnet. It diſſolves readily, and in conſiderable quantity in glaſs of borax, and gives a colour indicating the preſence of mangancſe and iron:—in phoſphate of ammonia and ſoda it diſſolves with great difficulty. Its conſtituents are ſilica, lime, iron, manganeſe, and muriatic acid. In the mine of Bjelke it occurs mixed with iron ore, calcareous ſpar, and black cryſtallized malacolite. Pyrodmalite was lately analyſed by Mr. Hiſinger, who found its conſtituents to be as follow:

Silica - - -	35.4
Oxyd of iron -	32.6
Oxyd of manganeſe	23.1
Alumina - -	0.6
Muriatic acid -	6.5
Loſs - - -	1.8
	100.0

The eſcape of the acid by heat ſeems to indicate the preſence of a portion of water amounting to about two-thirds of the loſs ſtated as ſuſtained in the analyſis. Annals of Philoſophy, N° 12.

PYROENUS, formed of πυρ, *fire*, and οινος, *wine*, is a term ſometimes uſed for rectified ſpirit of wine; thus called becauſe made by fire, or rather becauſe rendered of a fiery nature.

PYROET, PYROUET, or rather *Pirouette*, in the *Manege*. See PIROUETTE.

PYROLA, in *Botany*, a name adopted by Linnæus from the old authors, but not one of their beſt. It is a diminutive of *Pyrus*, and alludes to the reſemblance of the leaves, in this pretty genus, to thoſe of a pear-tree.—Linn. Gen. 221. Schreb. 297. Willd. Sp. Pl. v. 2. 621. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 3. 58. Purſh 299. Sm. Fl. Brit. 443. Prodr. Fl. Græc. Sibth. v. 1. 274. Juſſ. 161. Tourn. t. 132. Lamarck Illuſtr. t. 367. Gærtn. t. 63. (Chimaphila; Purſh 300.)—Claſs and order, *Decandria Monogynia*. Nat. Ord. *Bicornes*, Linn. *Ericæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, ſmall, in five deep ſegments, permanent. *Cor.* Petals five, roundiſh, concave, ſpreading. *Stam.* Filaments ten, awl-ſhaped, ſhorter than the corolla; anthers drooping, large, with two horns at the baſe, each diſcharging the pollen by a terminal orifice. *Piſt.* Germen ſuperior, roundiſh, angular; ſtyle cylindrical, permanent, various in length and direction, ſometimes ſcarcely any; ſtigma thickiſh, variouſly ſhaped. *Peric.* Capſule roundiſh, depreſſed, five-ſided, of five cells, burſting at the angles. *Seeds* numerous, chaffy.

Eſſ. Ch. Calyx in five deep ſegments. Petals five. Capſule ſuperior, with five cells, burſting at the angles, and many ſeeds. Anthers with two pores.

Obſ. In ſome ſpecies the ſtamens and ſtyle are erect; in others inclined to one ſide or the other; in ſome the former ſpread every way. The form of the ſtigma is different in different ſpecies. In two American ones the ſtigma is nearly, or quite, ſeſſile; on which mark Mr. Purſh's genus *Chimaphila* is founded, its name being nearly ſynonimous with Winter-green, the Engliſh appellation of *Pyrola*.

Section 1. *Style elongated.* *Pyrola* of Purſh.

1. P. *rotundifolia.* Round-leaved Winter-green. Linn. Sp. Pl. 567. Willd. n. 1. Ait. n. 1. Purſh n. 1. Engl. Bot. 213. (Pyrola; Ger. Em. 408. Camer. Epit. 723. Rivin. Pentap. Irr. t. 136. f. 2. P. vulgatior; Cluſ. Hiſt. v. 2. 116. Limonium; Fuchſ. Hiſt. 467. L. ſylveſtre; Trag. Hiſt. 707.)—Stamens aſcending. Style twice as long, deflexed and recurved. Cluſter many-flowered. Calyx as long as the ſtamens.—Native of thickets, for the moſt

part in mountainous ſituations, in the more northern parts of Europe, alſo in North America, flowering in July. We have gathered it on the plain of mount Cenis, and in moiſt parts of the ſandy downs of Holland; oppoſite to which, on the Norfolk coaſt, this plant has likewiſe been found by the accurate Mr. Lily Wigg, growing among buſhes, on Bradwell common, not far from Yarmouth; where we likewiſe have ſeen it. There is more difficulty in aſcertaining an indubitable ſtation of this ſpecies in the northern or mountainous parts of Britain, becauſe of the *media* having been ſo much confounded with it, nor have we any ſpecimen from thoſe countries. The *roots* are perennial, long, creeping, thread-ſhaped, ſcaly. *Stems* very ſhort and ſimple, leafy, ſolitary at the end of each ſhoot of the root. *Leaves* four or five; on bordered ſmooth *footſtalks* of various lengths, (from one to two inches); roundiſh or elliptical, obtuſe, an inch or inch and a half long, very obſcurely crenate, ſmooth, ſhining, reticulated with numerous veins; paler beneath. *Flower-ſtalk* terminal, ſolitary, about a ſpan long, angular, ſlightly twiſted, ſmooth, bearing a few ſcattered lanceolate membranous *bracteas*, and terminating in a long, rather looſe, *cluſter*, of from four to eight or ten large, handſome, white, drooping, but not quite pendulous, fragrant *flowers*, each having a ſimilar *bractea* to the reſt, at the baſe of the partial ſtalk, and fully equal to it in length. Segments of the *calyx* lanceolate, acute, full half the length of the *petals*, which, though uſually rounded and blunt, have ſometimes a pointed appearance. *Stamens* about the length of the calyx, all turned upward, and crowded together; their anthers deflexed, yellow, with orange horns. *Germen* ſhort, five-lobed. *Style* twice as long as the ſtamens, ſlender and quite pendulous in its lower part, gradually ſwelling towards the extremity, which is recurved. *Stigma* dilated, annular, with five ſmall central points. *Capſule* the ſize of a pea, depreſſed, five-lobed, crowned with the permanent ſtyle and ſtigma.

2. P. *chlorantha*. Greeniſh-flowered Winter-green.—Swartz in Stockh. Tranſ. for 1810. 190. t. 5. (P. folio obtuſo, flore viridiuſculo; Rivin. Pentap. Irr. t. 138. f. 1.)—Stamens ſlightly aſcending. Style twice as long, club-ſhaped, deflexed and recurved. Cluſter many-flowered. Calyx ſhorter than the ſtamens.—Native of Sweden, and probably, by the ſynonym of Rivinus, of Germany, flowering about the middle of July. Profeſſor Swartz diſtinguiſhes it from the foregoing, by the ſmaller, often abrupt, *leaves; ſtalk* almoſt deſtitute of *bracteas* below; *petals* of a whitiſh, or yellowiſh, green hue; and *ſtamens* leſs curved upwards. We gather alſo, from his figure and deſcription, that the *bracteas* which accompany each *flower* are much ſhorter than the partial ſtalks, and that the *calyx* alſo is ſhorter, and more cloſe-preſſed, than in *P. rotundifolia*. In the poſture and form of the *ſtyle* we find no difference. The common *flower-ſtalk* is remarkably ſpiral. Poſſibly the P. folio rotundo of Rivinus, t. 137, may repreſent this ſpecies in fruit; as the poſture of the permanent *ſtyles* agrees better with it than with the following.

3. P. *media*. Intermediate Winter-green. Swartz in Stockh. Tranſ. for 1804 (not 1784), 257. t. 7. f. 1. Engl. Bot. t. 1945. Winch Guide, v. 2. 19. (P. rotundifolia; Fl. Dan. t. 110.)—Stamens regularly inflexed. Style twice as long, deflexed perpendicularly. Cluſter of many pendulous flowers. Calyx ſhorter than the ſtamens.—Native of buſhy ſhady places in Sweden, and various parts of the north of England, flowering towards the end of June. We ſuſpect alſo that this is the Oxfordſhire ſpecies, commonly miſtaken for *minor*, and that it has often in Scotland, from whence we have ſpecimens, been taken for *rotundifolia*. The *leaves* moſt agree with the laſt-named, but the *flowers* differ eſſentially in being ſmaller, more pendulous, and of a leſs pure white. The *ſtamens* are nearly twice the length of the calyx, all regularly and equally inflexed, not at all turned upward. *Style* bent in a curve downward, its extremity furrowed, ſlightly thickened, vertical, not recurved. The *ſtalk* is ſpiral, as in the laſt, with about two diſtant *bracteas* in its lower part, the *bracteas* which accompany each flower being nearly as long as the partial ſtalks. Even Linnæus may perhaps have confounded this with his true *minor*.

4. P. *minor*. Leſſer Winter-green. Linn. Sp. Pl. 567. Willd. n. 2. Ait. n. 2. Engl. Bot. t. 158. Fl. Dan. t. 55. Rivin. Pentap. Irr. t. 136. f. 1. (P. roſea; Engl. Bot. t. 2543.)—Stamens regularly inflexed. Style the ſame length, ſtraight, ſtigma lobed, pointleſs. Cluſter of many drooping flowers. Stalk ſtraight.—Native of woods and thickets on the mountains of Europe; occurring in ſeveral parts of Scotland and the county of Durham, and flowering in July. This is ſmaller in general than any of the foregoing; the *leaves* more elliptical; *ſtalk* ſtraight, not ſpiral, with three principal angles and a ſmaller one, bearing a few broad *bracteas* near the baſe, but ſcarcely any other, except the ſmall awl-ſhaped ones at each partial ſtalk. The *flowers* are very numerous, but ſmall, drooping or even pendulous, white with more or leſs of a pink tinge. *Stamens* regularly incurved. Pores of the *anthers* dilated, not tubular. *Style* ſtraight, of a much ſhorter proportion than any of thoſe we have hitherto mentioned; the *ſtigma* large, five-lobed; depreſſed, and deſtitute of points, in the centre. We can no longer doubt that t. 158 and t. 2543 of Engliſh Botany repreſent one and the ſame ſpecies, which we poſſeſs alſo from mount Cenis, Savoy, and Switzerland, as well as in the Linnæan herbarium. *P. media*, having been confounded by botaniſts in general with this, has cauſed all our perplexity expreſſed in Engl. Bot. 2543. The plant which Mr. Lightfoot introduced at Bulſtrode, we judge from memory to have been *media;* ſee Engl. Bot. 158.

5. P. *aſarifolia*. Aſarabacca-leaved Winter-green. Michaux Boreal-Amer. v. 1. 251. Purſh n. 2.—"Leaves kidney-ſhaped. Stalk with a few ſheathing, convoluted, diſtant ſcales. Flowers turned every way. Style declining." *Michaux*.—Found by Michaux in Canada; by Purſh in beech woods on the mountains of Pennſylvania, flowering in July. The *flowers* are yellowiſh-green. If it were not for the "ſheathing ſcales," we ſhould ſuſpect this might be the ſame as our *chlorantha*, n. 2, whoſe *leaves* are often, it ſeems, ſhort and abrupt; but we have ſeen no ſpecimens anſwerable to either.

6. P. *dentata*. Toothed Winter-green.—Leaves elliptic-obovate, obtuſe, toothed. Stalk ſtraight, obſcurely angular, nearly naked. Stamens aſcending. Style deflexed, ſtrongly recurved. Stigma with a cylindrical point. Gathered by Mr. Menzies, on the weſt coaſt of North America. This ſpecies is readily diſtinguiſhed from all others, hitherto diſcovered, by its *leaves*, which are obovate, or ſomewhat elliptical, one and a half or two inches long, half or three quarters of an inch broad; their margin beſet with very remarkable diſtinct, ſmall, blunt teeth, uſually near a quarter of an inch aſunder; their ſurface not reticulated, but furniſhed with one ſeries of connected arching veins, on each ſide the midrib. *Footſtalks* triangular, about as long as the leaves. *Flower-ſtalk* ſix inches long, nearly naked, round, very ſlightly angular, bearing a long looſe *cluſter* of *flowers*, much reſembling thoſe of the firſt ſpecies in ſize and ſtructure, as well as in the poſition of their *ſtamens;* but their *ſtyle* is ſtill more remarkably recurved, ſo as to form a ſemicircle; and the point of the *ſtigma* much more prominent, of a cylindrical ſhape, five-cleft at the ſummit.

7. P. *aphylla*. Leafleſs Winter-green.—Stem and ſtalk ſcaly,

fcaly, without leaves. Anthers beaked. Style deflexed and recurved. Stigma with a cylindrical point.—Gathered on the weft coaft of North America, by Mr. Menzies, who affures us the plant is always quite deftitute of *leaves*, inftead of which the angular *ftem* bears numerous lanceolate, membranous, pointed *fcales*, about half an inch in length, a few fimilar but more remote ones being fcattered along the *ftalk*, which is angular. The *flowers* are nearly as large as the laft, but our dried fpecimen will not allow us to determine the pofture of the *ftamens*. The *anthers* are long and narrow, with a fmall acute point at the contrary end to the pores. *Style* deflexed, its end fomewhat recurved. *Stigma* with a long cylindrical point, like the laft.

8. P. *picta*. Variegated Winter-green.—Leaves ovate, fomewhat ferrated. Flowers drooping all one way. Pores of the anthers contracted, tubular. Style curved. Stigma abrupt, with five fmall points.—This alfo was found by Mr. Menzies on the weft coaft of North America. In fome points it agrees with the two laft, as well as with the *rotundifolia* and its allies; in others it refembles the following, but is a totally diftinct fpecies. The *leaves* are near an inch and half long, and almoft an inch wide, ovate, bluntifh, with fhallow, more or lefs diftant, ferratures, rather flefhy, marked with large branching veins, and variegated with white or yellowifh blotches. *Footftalks* nearly as long as the leaves. *Flower-ftalk* fix inches long, obliquely afcending, quadrangular, twifted, bearing two or three fhort, ovate, pointed fcales. *Flowers* numerous, as big as thofe of the *rotundifolia*, all, as far as we can judge from the dried fpecimen, drooping toward one fide. *Calyx* fhort, broad, and fpreading. *Stamens* all, as far as can be difcerned, alike difpofed round the germen; their *anthers* fhort, ovate, minutely pointed, the pores prominent in the form of two fhort narrow tubes, contracted at the orifice. *Style* curved, but we cannot tell in what direction. *Stigma* fcarcely at all thicker than the ftyle, abrupt, with an acute edge, and apparently five minute fharp central points.

9. P. *fecunda*. Serrated Winter-green. Linn. Sp. Pl. 567. Willd. n. 3. Ait. n. 3. Purfh n. 4. Fl. Dan. t. 402. Engl. Bot. t. 517. (P. fecunda tenerior; Cluf. Hift. v. 2. 117. Ger. Em. 408. P. folio mucronato; Rivin. Pentap. Irr. t. 138. f. 2.)—Leaves ovate, acute, ferrated. Flowers drooping all one way. Pores of the anthers dilated. Style ftraight. Stigma dilated, five-lobed.—Native of moffy alpine woods in various parts of Europe, from Lapland to Greece, as well as of fandy barren woods in North America, from Canada to New Jerfey, flowering in July. It occurs in fir or birch woods, in feveral parts of the highlands of Scotland; as alfo near Moffat in the lowlands; and according to Ray in Yorkfhire. The *ftems* are long and trailing. *Leaves* fcattered or crowded, an inch or more in length, with numerous fine fhallow ferratures, and abundance of reticulated veins. *Footftalks* half the length of the leaves. *Flower-ftalk* from three to fix inches long, erect, ftraight; round below; angular above; with two or three green ovate fcales. *Clufter* of many crowded greenifh-white *flowers*, not half the fize of the foregoing, nor fo much expanded. *Stamens* regularly placed round the germen, at firft curved, then ftraight. *Anthers* whitifh, fhort, pointlefs; their pores fomewhat oblique, but not tubular, foon becoming dilated and jagged. *Style* ftraight, twice the length of the flower. *Stigma* much dilated, annular, but thin-edged, terminating in a large five-lobed umbilicated fummit.

10. P. *uniflora*. Single-flowered Winter-green. Linn. Sp. Pl. 568. Willd. n. 6. Ait. n. 6. Purfh n. 5. Fl. Dan. t. 8. Engl. Bot. t. 146. (P. quarta minima; Cluf. Hift. v. 2. 118. Ger. Em. 408. P. flore fingulari; Rivin. Pentap. Irr. t. 139. f. 1.)—Stalk bearing a folitary flower. Pores of the anthers contracted, tubular. Stigma with five rays.—Native of alpine forefts, among moffy rills, in various parts of Europe and North America. It was firft difcovered, in the Britifh dominions, by Mr. James Hoggan, who gathered wild fpecimens, now before us, in the weftern iflands of Harris and Bernera, in 1783. Mr. James Hoy, and Mr. Brodie of Brodie, have alfo gathered this moft elegant and curious plant in fir woods of the county of Moray. It is, like the reft, perennial and evergreen, bloffoming in July. The *leaves* vary greatly in fhape and acutenefs, but are generally roundifh, about an inch long, more or lefs ftrongly ferrated, and reticulated with many veins. *Footftalks* half as long. *Flower-ftalk* folitary, fimple, erect, three inches high, with one concave *bractea*, and a large, terminal, white, or flightly reddifh, *flower*, an inch in diameter, and fmelling like lily of the valley. *Stamens* fpreading equally, half the length of the corolla, three of them lying on one of the petals, one only on another, and two on each of the three remaining. *Anthers* fhort, ovate, pointlefs; their pores tubular, confiderably elongated. *Style* erect, ftraight, the length of the germen. *Stigma* large, of five thick, fpreading, acute, ray-like lobes. The wild fpecimen delineated in Englifh Botany, having travelled from fo great a diftance, was in too imperfect a condition to allow of that figure being fo good as ufual.

Section 2. *Stigma nearly feffile*. *Chimaphila* of Purfh.

11. P. *umbellata*. Umbelled Winter-green. Linn. Sp. Pl. 567. Willd. n. 4. Ait. n. 4. Curt. Mag. t. 778. (P. tertia fruticans; Cluf. Hift. v. 2. 117. Ger. Em. 408. P. folio arbuti; Rivin. Pentap. Irr. t. 139. f. 2. Chimaphila corymbofa; Purfh n. 2.)—Leaves obovate, ferrated. Flowers fomewhat umbellate. Stigma nearly feffile. Stamens fmooth.—Native of woods in the northern parts of Europe, Afia and America, but not found wild in Britain. Mr. Menzies gathered it on the weft coaft of North America, and Mr. Purfh found it frequent in dry woods, from Canada to Virginia. Linnæus, Gmelin, Pollich, Roth, &c. give it in their Floras. Dr. Sims, who received this fpecies in flower in June, from Mr. Loddiges, juftly afferts it to be the moft beautiful of all the genus. The *ftem* is woody, a fpan high, fomewhat branched, angular, and roughifh. *Leaves* crowded together into fomething like whorls, ftalked, narrow-obovate, bluntifh, ftrongly ferrated; dark green and veiny above; paler beneath; about an inch and a half long. *Flower-ftalks* terminal, folitary, three inches long, reddifh, bearing about five, imperfectly umbellate, fimple, partial ftalks, each an inch long, fpreading, rough with glandular pubefcence, and fometimes furnifhed with a little lanceolate *bractea*. *Flowers* fmaller than that of *P. uniflora*, but larger than any other of the foregoing, drooping. *Petals* orbicular, concave, cream-coloured; crimfon at the bafe. *Stamens* fhort, red, all regularly inflexed. *Anthers* fhort, purple, with white tubular pores, dilated and lobed at the orifice. *Germen* globofe, green. *Style* thick and very fhort, but certainly prefent. *Stigma* orbicular, convex, with five flight notches. The American fpecimens are ufually lefs umbellate, and more racemofe, than the European.

12. P. *maculata*. Holly-leaved Winter-green. Linn. Sp. Pl. 567. Willd. n. 5. Ait. n. 5. Curt. Mag. t. 897. (P. mariana, arbuti foliis anguftioribus, &c.; Pluk. Mant. 157. Phyt. t. 349. f. 4. Chimaphila maculata; Purfh n. 1.)—Leaves ovato-lanceolate, with tooth-like ferratures. Stalks two or three-flowered. Stigma nearly feffile. Stamens woolly.—This is exclufively an American fpecies. Mr. Purfh obferved it in fhady gravelly or fandy woods, from Canada to Carolina, and Mr. Menzies brought fpeci-

mens from the north-weſt coaſt. It is now and then met with in our more curious gardens, requiring bog earth, with ſhade and moiſture, and flowering in June and July. Its ſhrubby habit is like the laſt, but of more humble growth. *Leaves* more pointed, with ſharper tooth-like ſerratures; their upper ſurface marked, along the rib and veins, with a pale ſtripe. Partial *flower-ſtalks* uſually two, rarely three, drooping. *Flowers* the ſize of the laſt, but white. *Stamens* denſely fringed in their lower part. *Anthers* with tubular jagged-mouthed pores. *Style* very ſhort and thick. *Stigma* hemiſpherical, nearly entire, green. Mr. Purſh ſays this plant is in high eſteem among the natives of North America for its medicinal qualities, and is called *Sip-ſiſewa*. He witneſſed a ſucceſsful cure of ſevere hyſterics by a decoction of this *Pyrola*.—We can by no means aſſent to the eſtabliſhment of that able writer's genus *Chimaphila*, hinted at by Michaux; there being ſurely no diverſity of habit to ſupport it; nor any character, but a difference of length in the ſtyle; which the other ſpecies of *Pyrola* ſhew to afford admirable ſpecific, but no generic, diſtinctions.

PYROLAMPIS, in *Zoology*. See GLOW-*worm*, and LAMPYRIS.

PYROLIGNEOUS ACID, or *Empyreumatic acid of wood*, in *Chemiſtry*, a ſpecies of empyreumatic ACETOUS *Acid* (which ſee), procured by diſtilling in a glaſs or earthen retort a quantity of ſhavings of any kind of wood, ſuch as box, guaiacum wood, or beech; in which caſe an extremely ſtrong-ſmelling dark-coloured empyreumatic acid liquor is obtained, nearly one-third of the weight of the wood. This acid is ſourer, and alſo much blacker and more empyreumatic, than either the *pyromucous* or *pyrotartareous* acid, probably as requiring a ſtronger heat for its production. The acid of wood is obtained in a large quantity near London, from the preparation of charcoal for gunpowder, by diſtilling wood in caſt-iron cylinders. It ſtains the hands deeply, and wood indelibly. This acid is procured in ſuch a quantity as to be an object of manufacture. At the beſt it is only an inferior acetous acid, and the difficulty of purifying it will prevent the profitable uſe of it in many of the arts to which vinegar is applied. However, as the proceſs for procuring radical vinegar at the ſame time purifies this empyreumatic acid, it may probably be uſed for this purpoſe. It may be added, that much of the acid from the diſtilled charcoal for gunpowder, near London, is employed by calico-printers in forming the acetated iron, uſed as a mordant, as in this caſe the colour and ſmell of the acid are not at all detrimental. Some time ago Vauquelin announced, as a *new* diſcovery, that pyroligneous acid is identically the ſame as the acetous; but this was known to Glauber near 200 years ago. In the folio edition of his works, p. 188, may be ſeen directions for its diſtillation, with a copper-plate of the apparatus which he employed. He there calls it the vinegar of wood. Parker's Chem. Catech. p. 195, note.

PYROMACHUS, a name given by ſome to antimony, when reduced to a ſtony hardneſs; and by others to copper, when fuſed with ſulphur, and thus rendered leſs ductile.

PYROMANCY, πυρομαντεια, a kind of divination, performed by means of fire.

The ancients imagined they could fortell futurity by inſpecting fire and flame: to this end they conſidered its direction, or which way it turned. Sometimes they added other matter to the fire, *e. gr.* a veſſel full of urine, with its neck bound about with wool, watching narrowly on which ſide it would burſt, and thence taking their augury.

Sometimes they threw pitch on it, and if it took fire immediately, they eſteemed it a good augury.

PYROMETER, formed of πυρ, *fire*, and μετρεω, *I meaſure*, in *Phyſics*, the name of a machine contrived to meaſure the alteration of the dimenſions of metals, and other ſolid bodies, ariſing from heat.

Theſe inſtruments have been conſtructed of various forms; but as their object is to render the ſmall expanſions of ſolids apparent to the obſerver, they have conſiſted of a machine adapted to this purpoſe, and of an apparatus fit for heating the bodies under examination to a determined degree.

The moſt uſual, and, indeed, the moſt eligible mode of heating the bodies, is to place them in water, in which a thermometer is placed, and to heat the water by means of lamps. The ſmall expanſions of the heated ſolids have been rendered viſible, *firſt*, by multiplying-wheels, or by levers, or by fine ſcrews, which render a ſmall motion communicated to one end of the mechaniſm productive of a great movement at the other end; and, *ſecondly*, by magnifying the ſmall expanſion through microſcopes; which ſeems, upon the whole, to be the method that is both moſt certain and moſt manageable; for with wheels and pinions, and even with levers or ſcrews, there is always ſome equivocal motion, ariſing from the looſe connection of teeth and pinions, or from the ſtreſs and bending of other parts.

Muſchenbroek, who was the original inventor of this machine, has given a table of the expanſion of the different metals, in the ſame degree of heat. Having prepared cylindric rods of iron, ſteel, copper, braſs, tin, and lead, he expoſed them firſt to a pyrometer with one flame in the middle; then with two flames; and ſucceſſively to one with three, four, and five flames. But previous to this trial, he took care to cool them equally, by expoſing them ſome time upon the ſame ſtone, when it began to freeze, and Fahrenheit's thermometer was at thirty-two degrees. The effects of which experiment are digeſted in the following table, where the degrees of expanſion are marked in parts equal to the $\frac{1}{12500}$dth part of an inch.

Number of Flames.	Expanſion of					
	Iron.	Steel.	Copper.	Braſs.	Tin.	Lead.
By one flame - -	80	85	89	110	153	155
By two flames placed cloſe together	117	123	115	220		274
By two flames $2\frac{1}{2}$ inches diſtant	109	94	92	141	219	263
By three flames placed cloſe together	142	168	193	275		
By four flames placed cloſe together	211	270	270	361		
By five flames - -	230	310	310	377		

It

It is to be obferved of tin, that it will eafily melt when heated by two flames placed together. Lead commonly melts with three flames placed together, efpecially if they burn long.

From thefe experiments it appears, at firft view, that iron is the leaft rarefied of any of thefe metals, whether it be heated by one or more flames; and therefore is moft proper for making machines, or inftruments, which we would have free from any alterations by heat or cold, as the rods of pendulums for clocks, &c. So likewife the meafures of yards or feet fhould be made of iron, that their length may be as nearly as poffible the fame, fummer and winter.

The expanfion of lead and tin, by only one flame, is nearly the fame; that is, almoft double of the expanfion of iron. It is likewife obfervable, that the flames, placed together, caufe a greater rarefaction than when they have a fenfible interval between them; iron, in the former cafe, being expanded 117 degrees, and only 109 in the latter; the reafon of which difference is obvious. By comparing the expanfion of the fame metal, produced by one, two, three, or more flames, it appears, that two flames do not caufe double the expanfion of one; nor three flames three times that expanfion, but always lefs; and thefe expanfions differ fo much the more from the ratio of the number of flames, as there are more flames acting at the fame time.

It is alfo obfervable, that metals are not expanded equally at the time of their melting, but fome more, fome lefs. Thus, tin began to run, when rarefied 219 degrees; whereas brafs was expanded 377 degrees, and yet was far from melting.

As to the conftruction of M. Mufchenbroeck's pyrometer, together with Defaguliers's alterations and improvements, the curious may confult Defagul. Experim. Philof. vol. i. p. 421, &c. See alfo Mufchenbroeck's tranflation of the experiments of the Academy del Cimento, printed at Leyden in 1731. And for a pyrometer of a new conftruction, by which the dilatations of metals in boiling fluids may be examined and compared with Fahrenheit's thermometer, fee Mufchenb. Introd. ad Philofophiam Nat. 4to. 1762, vol. ii. p. 610.

But it has been obferved, that M. Mufchenbroeck's pyrometer was liable to fome objections; and a contrivance was made, with a view of removing thefe, by Mr. Ellicott, who has given a defcription of his improved pyrometer in the Philofophical Tranfactions, N° 443. This may alfo be feen in Dr. Martyn's Abridgment, vol. viii. p. 464.

This inftrument is formed with a flat piece of brafs A A, (*Plate* XXIII. *Mifcellany*, *fig.* 4.) which is fcrewed down to a thick piece of mahogany. Upon this plate are fcrewed three pieces of brafs, two of which, B, B, ferve to fupport the flat iron bar C, called the ftandard bar. The upper part of the third piece of brafs is a circle D, about three inches in diameter, divided into three hundred and fixty equal parts, or degrees: within this circle is a moveable plate *d*, divided likewife into three hundred and fixty parts, and a fmall fteel index. The bar of metal E, upon which the experiment is to be made, is laid on the ftandard bar. F is a lever two inches and a half long, faftened to an axis, which turns in two pieces of brafs, fcrewed to one of the fupports B. To the end of this lever is faftened a chain, or filk-line, which, after being wound round a fmall cylinder, to which the index in the brafs circle, D, is faftened, paffes over a pulley, with a weight hung to the end of it. Upon the axis, to which the lever is fixed, is a pulley, a quarter of an inch in diameter, to which a piece of watch-chain is faftened, the other end of which is hooked to a ftrong fpring G, which bears againft one end of the metal E. H is a lever, exactly of the fame form and dimenfions with the other; but the chain faftened to the pulley on its axis is hooked to the ftandard bar. The line faftened to the end of this lever, after being wound round a cylinder, to which the moveable plate is fixed, paffes over a fmall pulley, and has a weight hung to the end of it; or rather the fame line, paffing under a pulley to which the weight is hung, has its other end faftened to the lever F; fo that one weight ferves for both levers. From this defcription it is plain, that whenever the bar E is lengthened, it gives liberty to the weight to draw the lever F upwards by its action to the fpring G; and the index will, at the fame time, by means of the filk line, be carried forward in the circle; and as the bar fhortens, it will return back again: the fame motion will be communicated to the ftandard bar. When the bar is lengthened the 20th part of an inch, the index will be carried once round the brafs circle, which is divided into three hundred and fixty degrees; and, therefore, if the metal lengthens the 7200dth part of an inch, the index will move one degree. In order to make an experiment with this inftrument, lay a bar of any kind of metal, as E, on the ftandard bar; then heat this bar to any degree of heat with a lamp, and mark the degree of its expanfion, as indicated by the moveable plate; obferve alfo the degree of expanfion of the metal E, by the heat communicated to it from the ftandard bar, as marked on the brafs circle by the index: let the inftrument ftand, till the whole is thoroughly cold; then removing the bar E, lay any others fucceffively in its place, and proceed exactly as before; and thus the degrees of expanfion of different metals, by the fame degree of heat, may be eftimated.

By the help of this inftrument Mr. Ellicott found, upon a medium, that the expanfion of bars of different metals, as nearly of the fame dimenfions as poffible, by the fame degree of heat, were as follow:

Gold,	Silver,	Brafs,	Copper,	Iron,	Steel,	Lead,
73	103	95	89	60	56	149

The great difference between the expanfions of iron and brafs, has been applied with good fuccefs to remedy the irregularities in pendulums arifing from heat. Phil. Tranf. vol. xlvii. p. 485. See PENDULUM.

Mr. Graham ufed to meafure the minute alterations, in length, of metal bars, by advancing the point of a micrometer-fcrew, till it fenfibly ftopped againft the end of the bar to be meafured. This fcrew, being fmall and very lightly hung, was capable of agreement within the three or four thoufandth part of an inch. On this general principle Mr. Smeaton contrived his pyrometer, in which the meafures are determined by the contact of a piece of metal with the point of a micrometer-fcrew. A B C D (*fig.* 5.) reprefents the main bar or bafis of this inftrument; E F is the bar to be meafured, lying in two notches, one fixed to the upright ftandard A B, the other to the principal lever H I; the end E of the bar E F bears againft the point of G, a fcrew which is of ufe in examining the micrometer-fcrew; the other end of the bar F bears againft a fmall fpherically protuberant bit of hard metal, fixed at the fame height as G, in the principal lever H I; K is an arbor fixed in the bafis, which receives at each end the points of the fcrews, H, L, upon which the lever H I turns and ferves as a fulcrum to it; O is a flender fpring, to keep the lever in a bearing ftate againft the bar; and P is a check, to prevent the lever from falling forward, when the bar is taken out; N is the feeler, fomewhat in the fhape of a T, fufpended, and moveable up and down upon the points of the fcrews,

I, M,

I, M, which, as well as L, H, are fo adjufted as to leave the motion free, but without fhake; Q R is the handle of the feeler, moveable upon a loofe joint at R, fo that laying hold of it at Q, the feeler is moved up and down, without being affected by the irregular preffure of the hand; the extremity, S, of the feeler is alfo furnifhed with a bit of protuberant hard metal, to render its contact with the point of the micrometer-fcrew more perfect; T is the micrometer-fcrew; V the divided index-plate; and W a knob for the handle; the micrometer-fcrew paffes through two folid fcrewed holes at D and Y; the piece Y Z is made a little fpringy, and endeavours to pull the fcrew backwards from the hole at D, and confequently keeps the micrometer-fcrew conftantly bearing againft its threads the fame way, and thereby renders the motion thereof perfectly fteady and gentle; X is the index, having divifions upon it, anfwering to the turns of the fcrew. This piece points out the divifions of the plate, as the face of the plate points out the divifors upon the index. When the inftrument is ufed, lay hold of the knob at Q with one hand, and, moving the feeler up and down, with the other move forward the fcrew T, till its point comes in contact with the feeler; then will the plate and index, V and X, fhew the turns and parts. The bafis of this inftrument, as well as the other parts of it, is brafs: one end of which is continued of the fame piece at right angles, to the height of three inches and a half; and the other end acts upon the middle of a lever of the fecond kind, whofe fulcrum is in the bafis; and, therefore, the motion of the extremity of the lever is double the difference between the expanfion of the bar and the bafis. Hence, having the length of the lever from its fulcrum to the point of fufpenfion of the feeler, the diftance between the fulcrum and the point of contact with the bar, the inches and parts that correfpond to a certain number of threads of the micrometer, and the number of divifions in the circumference of the index-plate; the fraction of an inch expreffed by one divifion of the plate may be deduced. Thofe meafures are as follow: from the fulcrum of the lever to the feeler, 5.875 inches; from the fulcrum to the point of contact, 2.895 inches; length of feventy threads of the fcrew, 2.455 inches; and the divifions in the circumference of the index-plate, 100. Hence the value of one divifion will be the $\frac{10}{57863}$d part of an inch: but if the fcrew be altered one-fourth of one of thefe divifions, when the contact between the fcrew and feeler is well adjufted, the difference of contact will be very perceivable to the flighteft obferver; and, confequently, $\frac{1}{23145}$th part of an inch is perceivable in this inftrument. When the inftrument is made ufe of, it is immerged, together with the bar to be meafured, in a ciftern of water; which water, by means of lamps underneath, is made to receive any intended degree of heat not greater than that of boiling, and thereby communicates the fame degree of heat to the inftrument, the bar, and to a mercurial thermometer immerged therein, for the purpofe of afcertaining that degree. See *fig*. 6, in which A B is the ciftern, C the cover, which, when the inftrument (*fig*. 5.) is raifed upon blocks, goes on between the bar E F and the bafis B C; D a handle to take off the cover, when hot; E the mercurial thermometer; F the cock, to let out the water; and G H a hollow piece of tin, which fupports feven fpirit lamps, which are raifed higher or lower by the fcrews I and K, in order to give the water in the ciftern a proper degree of heat. With this pyrometer Mr. Smeaton performed feveral experiments, which are arranged in a table; and their refult agrees very well, he obferves, with the proportions of expanfions of feveral metals given by Mr. Ellicott. The following table fhews how much a foot in length of each metal grows longer, by an increafe of heat correfponding to 180° of Fahrenheit's thermometer, or to the difference between freezing and boiling water, expreffed in fuch parts of which the unit is equal to the 10,000dth part of an inch.

For a farther account of this inftrument, with its ufe, fee Phil. Tranf. vol. xlviii. art. 79. p. 598, &c.

Mr. Fergufon has conftructed and defcribed a pyrometer, which makes the expanfion of metals by heat vifible to the 45,000dth part of an inch. The upper furface of this machine is reprefented by *fig*. 7. Its frame, A B C D, is made of mahogany, on which is a circle divided into three hundred and fixty equal parts; and within that circle is another, divided into eight equal parts. If the fhort bar E be pufhed one inch forward (or toward the centre of the circle,) the index *e* will be turned 125 times round the circle of 360 parts or degrees. As 125 times 360 is 45,000, it is evident, that if the bar E be moved only the 45,000dth part of an inch, the index will move one degree of the circle. But, as in this pyrometer the circle is nine inches in diameter, the motion of the index is vifible to half a degree, which anfwers to the 90,000dth part of an inch in the motion or pufhing of the fhort bar E.

One end of a long bar of metal F is laid into a hollow place in a piece of iron G, which is fixed to the frame of the machine; and the other end of this bar is laid againft the end of the fhort bar E, over the fupporting crofs-bar H I: and, as the end, *f*, of the long bar is placed clofe againft the end of the fhort bar, it is plain that if F expands, it will pufh E forward, and turn the index *e*.

The machine ftands upon four fhort pillars, high enough from a table, to let a fpirit lamp be put on the table under the bar F; and, when that is done, the heat of the flame of the lamp expands the bar, and turns the index.

There are bars of different metals, as filver, brafs, and iron; all of the fame length as the bar F, for trying experiments on the different expanfion of different metals, by equal degrees of heat applied to them for equal lengths of time; which may be meafured by a pendulum that fwings feconds. Thus,

Put on the brafs bar F, and fet the index to the 360th degree: then put the lighted lamp under the bar, and count the number of feconds in which the index goes round the plate, from 360 to 360 again; and then blow out the lamp, and take away the bar.

This done, put on an iron bar F where the brafs one was

was before, and then set the index to the 360th degree again. Light the lamp, and put it under the iron bar, and let it remain just as many seconds as it did under the brass one; and then blow it out, and you will see how many degrees the index has moved in the circle: and by that means you will know in what proportion the expansion of iron is to the expansion of brass; which will be found to be as 210 is to 360, or as 7 to 12. By this method, the relative expansion of different metals may be found.

The bars ought to be exactly of equal size, and to have them so, they should be drawn, like wire, through a hole.

When the lamp is blown out, you will see the index turn backward; which shews that the metal contracts as it cools.

The inside of this pyrometer is constructed as follows.

In *fig.* 8. A *a* is the short bar, which moves between rollers; and, on the side *a*, it has fifteen teeth in an inch, which take into the leaves of a pinion B (twelve in number), on whose axis is the wheel C of one hundred teeth, which take into the ten leaves of the pinion D, on whose axis is the wheel E of one hundred teeth, which take into the ten leaves of the pinion F, on the top of whose axis is the index above-mentioned.

Now, as the wheels C and E have one hundred teeth each, and the pinions D and F have ten leaves each, it is plain, that if the wheel C turns once round, the pinion F, and the index on its axis, will turn one hundred times round. But, as the first pinion B has only twelve leaves, and the bar A *a* that turns it has fifteen teeth in an inch, which is twelve and a fourth part more; one inch motion of the bar will cause the last pinion F to turn one hundred times round, and a fourth part of one hundred over and above, which is twenty-five. So that if A *a* be pushed one inch, F will be turned one hundred and twenty-five times round.

A silk thread *b* is tied to the axis of the pinion D, and wound several times round it; and the other end of the thread is tied to a piece of slender watch spring G, which is fixed in the stud H. So that as the bar *f* expands, and pushes the bar A *a* forward, the thread winds round the axle, and draws out the spring; and as the bar contracts, the spring pulls back the thread, and turns the work the contrary way, which pushes back the short bar A *a* against the long bar *f*. This spring always keeps the teeth of the wheels in contact with the leaves of the pinions, and so prevents any shake in the teeth.

In *fig.* 7. the eight divisions of the inner circle are so many thousandth parts of an inch in the expansion or contraction of the bars; which is just one thousandth part of an inch for each division moved over by the index. Ferguson's Lectures on Mechanics, Supplem. p. 7, &c. 4to.

Another pyrometer was invented by M. De Luc, in consequence of a hint suggested to him by Mr. Ramsden. The basis of this instrument is a rectangular piece of deal board two feet and a half long, fifteen inches broad, and one inch and a half thick, and to this all the other parts are fixed. This is mounted in the manner of a table, with four deal legs, each a foot long, and an inch and a half square, well fitted near its four angles, and kept together at the other ends by four firm cross-pieces. This small table is suspended by a hook to a stand; the board being in a vertical situation in the direction of its grain, and bearing its legs forward in such a manner as that the cross-pieces which join them may form a frame, placed vertically facing the observer. This frame sustains a microscope, which is firmly fixed in another frame that moves in the former by means of grooves, but with a very considerable degree of tightness; the friction of which may be increased by the pressure of four screws. The inner sliding frame, which is likewise of deal, keeps the tube of the microscope in a horizontal position, and in great part without the frame, insomuch that the end which carries the lens is but little within the space between the frame and the board. This microscope is constructed in such a manner as that the object observed may be an inch distant from the lens; and it has a wire which is situated in the focus of the glasses, in which the objects appear reversed. At the top of the apparatus there is a piece of deal, an inch and a half thick, and two inches broad, laid in a horizontal direction from the board to the top of the frame. To this piece the rods of different substances, whose expansion by heat is to be measured, are suspended: one end of it slides into a socket, which is cut in the thickness of the board, and the other end, which rests upon the frame, meets there with a screw, which makes the piece move backwards and forwards, to bring the objects to the focus of the microscope. There is a cork very strongly driven through a hole bored vertically through this piece; and in another vertical hole, made through the cork, the rods are fixed at the top; so that they hang only, and their dilatation is not counteracted by any pressure. In order to heat the rods, a cylindrical bottle of thin glass, about twenty-one inches high, and four inches in diameter, is placed in the inside of the machine, upon a stand independent of the rest of the apparatus. In this bottle the rods are suspended at a little less than an inch distance from one of the sides, in order to have them near the microscope. Into this bottle is poured water of different degrees of heat, which must be stirred about by moving upwards and downwards, at one of the sides of the bottle, a little piece of wood fastened horizontally at the end of a stick: in this water is hung a thermometer, the ball of which reaches to the middle of the height of the rods. During these operations the water rises to the cork, which thus determines the length of the heated part; the bottle is covered to prevent the water from cooling too rapidly at the surface; and a thin case of brass prevents the vapour from fixing upon the piece of deal to which the rods are fixed. This pyrometer is represented in *fig.* 9, in which *a a* is the stand to which it is suspended; *b* the hook from which it hangs; *c c c* the deal-board, which is the basis of the whole apparatus; *d, d, d, d,* four arms, to which is fixed the frame *e e e e*: the other frame which carries the microscope is *s s s s*: *g, g,* are two cross-pieces, through which passes the tube of the microscope, and which support it near both ends; *h h* is the microscope; *i* its micrometer; *k* the cork, through which passes the glass rod *l l*, and by which it is kept suspended; *m* a rod of metal, or any other substance less dilatable than glass; *n* the point of union, obtained by means of two connected rings, in which both rods are fastened by screws: above these is another pair of rings, in one of which the metal rod is free, and which rod it supports; *o p* the piece to which the glass rod is suspended; *q* a square piece fixed to the frame by four screws, behind which is a box, in which, as well as in a groove cut in the basis in *p*, the piece *o p* slides; *r* a screw, which passes through the square piece *q*, whose use is to move backwards or forwards the piece *q*, in order to bring the surface of the metal rod to the focus of the microscope: *s, s, s, s,* four screws, with round metal plates behind their heads, which serve to press the frame of the microscope against the frame *e e e e*; the longitudinal openings, through which the screws pass, permit the free motion of the first frame, when one strikes gently with a hammer to the bottom or the top of one of the sides. If the microscope is wanted higher or lower than the grooves permit, the screws may be removed

moved to other holes made on purpose in the side pieces or the frame *eeee*: *tttt* is the cylindrical bottle, in which hang the rods in order to be heated at different degrees by water of various temperatures; *u, u*, are the supporters of the bottle; *x* the thermometer suspended in the water; *yy* a rod, to the lower end of which is fixed a small plate, to stir the water, by moving it up and down; *zz* a syphon, one branch of which is within, and the other without, the bottle, the latter being furnished with a cock, which serves to draw off the quantity of water that is necessary for changing the temperature in the bottle. For a farther account of this instrument, together with the principle of its construction and use, both in the comparative measure of the expansions of bodies by heat, and the measure of their absolute expansion, and the experiments made with it, we must refer to an elaborate essay of M. De Luc on Pyrometry, &c. in the Phil. Transf. vol. lxviii. part i. art. 20. p. 419—546.

All the contrivances above described must be considered as inferior to that constructed by Mr. Ramsden, of which general Roy has given an accurate and minute account in the Phil. Transf. vol. lxxv. p. 462. We shall here give such an account as our limits will allow of this instrument, the construction of which is so accurate, says major-general Roy, that it seems not easy to improve it; and refer for a fuller account illustrated by appropriate drawings. This pyrometer, named the *microscopic*, because by means of two microscopes attached to it, the expansion is measured, consists of a strong deal frame, 5 feet long, nearly 28 inches broad, and about 42 inches in height. The metallic bar, whose expansion is to be measured, and which may be even five feet long, is placed in a copper trough little longer than five feet; and this is placed over 12 spirit lamps, the flames of which heat the water of that trough fully to the boiling point, and of course heat the bar which is plunged into it. Two other wooden troughs, also full of water, are placed parallel to, and at a little distance from, the copper one. Each of these contains a cast-iron prismatic bar. To the ends of one of these bars two microscopes are fastened in an horizontal situation, perpendicularly to the bars. One of these microscopes is furnished with a micrometer, or mechanism, to measure the magnified image of an object; the other microscope has a simple mark. The parts of the microscopes, as well as the proper marks for measurement, are so separated and disposed, partly upon the ends of the cast-iron rods, and partly upon the ends of the rod under examination, that if any of them be lengthened or shortened, that alteration is clearly perceived through the microscopes, and may be measured by means of the micrometer. It follows, that if the temperature of the cast-iron prismatic bars be kept unaltered, whilst that of the bar under examination is increased, then the increase of length, which is measured by the micrometer, must be attributed to that bar only, and by these means the expansions of seven substances were ascertained. For further particulars relating to the construction and use of this instrument, we refer to the Transactions (ubi supra), and to the article Expansion in this Cyclopædia. For an account of Wedgwood's pyrometer, see Thermometer. Also, for a description of Mr. Troughton's pyrometer, we are under the necessity of referring to the same article.

PYROMUCOUS Acid, or *Empyreumatic acid of sugar*, or *Syrupous acid*, is different from the acid of sugar, or Oxalic *Acid*, (which see,) and denotes that pungent acid vapour of sugar, or any saccharine matter strongly heated, which is familiar to every person who has ever entered a sugar baking-house. It is prepared by chemists in the following manner: Put into a very large glass retort any quantity of pulverized sugar of any kind, so as to fill only ⅛th of it, as the matter very much swells in the process: adapt to it a large receiver, not closely luted, and heat it gradually on a sand-bath. A great quantity of gas arises when the sugar begins to be scorched, which is mostly carbonic acid mixed with an inflammable gas, probably the gaseous oxyd of carbon. In the receiver is condensed a weak acidulous liquor, coloured by an oily matter, and also apparently fouled by a portion of fuliginous matter volatilized during the distillation. The quantity of acid, obtainable in this process, varies according to the regulation of the fire, which should at least be pushed so as to make the retort red-hot, and to reduce the sugar to a perfect charcoal; but in general about ⅘ths of the weight of sugar may be obtained of the distilled acid. Gum mucilage, manna, honey, starch, and other mucous or mucoso-saccharine substances, yield, by distillation, the same acid as sugar. Aikin, Dict. Min.

PYRONOMIA, a term used by the chemical writers to express the art of regulating fire, so as to make it subservient to all their processes in a determinate degree.

PYROPE, in *Mineralogy*, a precious stone, formerly called the Bohemian garnet. (See Garnet.) The colour is a dark blood red: when held between the eye and the light, the red colour inclines to a yellow. The pyrope is never found crystallized, but occurs in small round or angular fragments imbedded in serpentine rock, or scattered in the sands on the sea-shore, and in alluvial ground. It scratches quartz. The specific gravity is stated by Klaproth 3.718. On account of its lustre, transparency, colour, and hardness, it is much prized by jewellers. The small grains, when powdered, are applied to cut softer stones. According to Klaproth, the constituent parts of pyrope are

Silex	40.0
Alumine	28.50
Magnesia	10.00
Lime	3.50
Oxyd of iron	16.50
Oxyd of manganese	0.25
Loss	1.25

B.

PYROPHAGI. See Fire-*Eaters*.

PYROPHANES, in *Mineralogy*, a variety of the semi-opal; so called because, being heated in a spoon, it becomes transparent, but returns to its opaque state when cold, as Mr. Landriani has discovered. M. Saussure, junior, renders common hydrophanes transparent, and of a topaz colour, when heated by digesting them in melted wax. It is said that some pyrophanes are found in Armenia, which are transparent while exposed to the sun, and opaque at night. See Gem.

PYROPHORUS, formed of πυρ, *fire*, and φερω, *I bear*, in *Chemistry*, the name usually given to that substance called by some *black phosphorus*; a chemical preparation possessing the singular property of kindling spontaneously when exposed to the air.

This substance was accidentally discovered by M. Homberg, who prepared it of alum and human fæces. (See Phosphorus *Fæcalis*.) See also M. Le Fevre's preparation, described under Phosphorus *of Sulphur*.

It was apprehended for a considerable time after the discovery, that human fæces were essential to the operation, till the youngest son of the great Lemery found, that honey, sugar, flour, and, indeed, any animal or vegetable matter, might be substituted instead of the human fæces; and since that time, M. de Suvigny has shewn that moist vitriolic salts may be substituted for the alum; having added to the alu-

 minous

minous pyrophorus of Homberg two other claſſes of ſubſtances of this kind, *viz.* the metallic, or thoſe made with the three vitriols of iron, copper, and zinc; and the neutral, or thoſe compoſed of vitriolated tartar and Glauber's ſalt.

The aluminous pyrophorus may be made in the following manner. Take four or five parts of alum, and one part of wheat flour, or any animal or vegetable ſubſtance; calcine theſe together to a brown or blackiſh maſs: powder the maſs, and put it into a phial; ſtop it looſely with paper, and ſet it in a ſand heat, ſo as to make it continue glowing-hot for ſome time; after this remove the whole from the fire, ſet it to cool gradually, and finally ſtop the bottle very cloſe down.

The following proceſs is recommended by Macquer for this preparation. Let three parts of alum and one part of coarſe brown ſugar be mixed together. This mixture muſt be dried in an iron ladle or ſhovel over a moderate fire, till it be almoſt reduced to a blackiſh powder or coal; during which operation it muſt be ſtirred with an iron ſpatula. Any large maſſes muſt be bruiſed into powder, and then it muſt be put into a glaſs matraſs, the mouth of which is rather ſtraight than wide, and its length ſeven or eight inches. This matraſs is to be placed in a crucible, or rather earthen veſſel, large enough to contain the belly of the matraſs, with about a ſpace equal to the thickneſs of a finger all round it. The ſpace is to be filled with ſand, ſo that the matraſs ſhall not touch the earthen veſſel: the apparatus is then to be put in a furnace, and the whole to be made red-hot; the fire muſt be gradually applied, that any oily or fuliginous matter may be expelled. After which, when the matraſs is made red-hot, ſulphureous vapours exhale: this degree of heat is be continued till a truly ſulphureous flame, which appears at the end of the operation, has continued nearly a quarter of an hour: the fire is then to be extinguiſhed, and the matraſs to cool without taking it out of the crucible; and when it ceaſes to be red-hot, it muſt be ſtopped with a cork. Before the matraſs is perfectly cold, it muſt be taken out of the crucible; and the powder it contains muſt be poured into a very dry glaſs phial, which muſt be well cloſed with a glaſs ſtopper. If we would preſerve this pyrophorus a long time, the bottle containing it muſt be opened as ſeldom as poſſible. Sometimes it kindles while it is poured into the glaſs phial, but it may be then extinguiſhed by cloſing the phial expeditiouſly.

Another excellent method of preparing pyrophorus, cited by Aikin from Higgins's Minutes, is the following. Mix together three parts of Roman alum, and one of flour, and heat the mixture to dryneſs in an iron pot, as already deſcribed: the black calcined maſs thus produced is to be put into ounce phials of green glaſs, coated without and within with clay. The phials thus charged are to be lightly ſtopped with balls of tempered clay, and then ſet up to their necks in ſand in an iron pot; charcoal powder is then to be ſtrewed on to the depth of half an inch, over which is to be placed an earthen cover, luted to the pot. The whole apparatus is now to be placed in a furnace, and kept at a red heat for an hour and a half; at the expiration of which period, being taken out of the furnace and cooled quickly, it is to be unpacked, and the phials containing the pyrophorus are to be placed with their mouths inverted in mercury, in which ſituation the pyrophorus may be kept for many years without injury.

When half a drachm of this pyrophorus is put on a piece of paper and expoſed to air, it quickly kindles, becomes red like burning coals, emits a ſtrongly ſulphureous vapour, and burns the paper or other combuſtible body which ſupports it: and nothing is left but the white earthy baſe of the alum. When no ſenſible change takes place in the pyrophorus, either from a defect in the preparation, or from ſome air remaining in the phial that contains it, the combuſtion may be effected by breathing on the powder, and thus ſupplying it with the moiſture which ſeems to be the primary agent in this phenomenon. The pyrophorus that is made in the laſt method we have recited is ſo highly inflammable as to take fire while it is falling from the mouth of the phial. If it be poured into a jar of pure oxygen gas, it forms a brilliant fiery ſhower: the oxygen is for the moſt part conſumed, and there remain in the jar ſulphureous acid and carbonic acid gaſes: the pyrophorus alſo being conſumed with the exception of its aluminous baſe.

The ſpontaneous accenſion of the aluminous pyrophorus, on its being expoſed to the air, has been a ſubject of conſiderable diſcuſſion among chemiſts and philoſophers; ſeveral of whom have adopted the hypotheſis propoſed by M. de Suvigny, in the Memoires de Mathematique et de Phyſique, tom. iii. To explain this curious appearance, M. de Suvigny obſerves, that the vitriolic acid in the alum, during the calcination in the phial, leaves its earthy baſis, and unites with the phlogiſton in the coal. By its union with this inflammable matter, a part of it is undoubtedly rendered volatile, and exhales partly under the form of volatile vitriolic acid, and partly in that of a blue ſulphureous flame; while another part of it combines likewiſe with the phlogiſton forming a real ſulphur, or an earthy hepar ſulphuris; in which the ſulphur is protected from the fire by the earth with which it is combined, and the particles of which remain every where intermixed with thoſe of the powder. Thus far (ſays Mr. Bewly, an excellent chemiſt and philoſopher) M. de Suvigny is ſupported by the appearances, and by a juſt chemical analyſis of the powder: but he proceeds farther, and ſuppoſes that, at the end of the proceſs, a part of the vitriolic acid is left in a diſengaged, or uncombined ſtate, and highly concentrated. In this ſtate it is well known that this acid attracts moiſture, and at the ſame time generates a conſiderable degree of heat. When the pyrophorus, therefore, is expoſed to the air, he again ſuppoſes that this diſengaged and concentrated acid ſuddenly attracts the watery particles floating in the atmoſphere, and by the heat thus generated, ſets fire to the ſulphur and other inflammable matter contained in the powder. This hypotheſis he has endeavoured to eſtabliſh by the following obſervations; that the pyrophorus, as he apprehends, can be made only with ſubſtances fit for producing ſulphur, or with ſulphur itſelf:—that no pyrophorus will be produced, if the mixture be calcined by too long or too violent a fire; becauſe then the whole vitriolic acid can be combined into perfect ſulphur, and conſequently is engaged, and not in a proper ſtate to attract the moiſture of the air; or elſe if it does not combine into ſulphur, being half diſengaged from its baſis, it is driven off by the violence or long continuance of the fire; and, conſequently, after this complete calcination, no acid remains partly diſengaged, as it ought to be, that it might unite with the water with ſufficient activity:—that when the pyrophorus is very ſlowly moiſtened, as when it is kept in a bottle not well cloſed, it does not kindle, becauſe ſufficient heat is not produced by this ſlow and gradual attraction of water; it is alſo ſpoiled and rendered incapable of kindling, when expoſed to the open air; becauſe its acid becomes then ſaturated, or nearly ſaturated with moiſture, and cannot, therefore, unite with that of the air with ſufficient activity:—that a pyrophorus, thus ſpoiled by expoſure to moiſture, may be reſtored to its peculiar properties by making it again red-hot in a matraſs; ſince by this calcination its partly-difengaged acid is again concentrated, and refumes all its force of combining with water ;—and, laftly, that the inflammation of the pyrophorus is accelerated by placing it upon a paper a little wetted, or by breathing upon it ; becaufe the acid then attracts the moifture more haftily, and confequently with more heat.

M. de Suvigny extends the fame reafoning to the feveral other pyrophori which he difcovered, fimilar to that of alum ; particularly to thofe which are made by fubftituting vitriolated tartar, Glauber's falt, and other vitriolic falts with metallic, earthy, or alkaline bafes, in the room of alum. Mr. Bewly has examined this hypothefis with his ufual acutenefs and accuracy ; and from numerous well-conducted experiments he is led to conclude, that pyrophori of all the above-mentioned claffes may be prepared, differing from them in no other particular, except that they contain no vitriolic acid, and which neverthelefs kindle as readily, on being expofed to the air, as thofe which have been impregnated with that principle. In order to fhew that the prefence of vitriolic acid is not neceffary to conftitute the pyrophorus made with vitriolated tartar, he added to a quantity of this tartar more than an equal weight of powdered charcoal, and calcined the mixture a long time, in a red heat, in an open crucible ; frequently ftirring the powder, in order to expel from it as much of the vitriolic acid as poffible ; the calcination was alfo fometimes repeated with frefh charcoal : and yet on heating the falt, thus deprived of a confiderable part of its acid, with charcoal, in a crucible or tobacco-pipe, in the manner which we fhall here fubjoin, he obferved no diminution in its quality of producing a pyrophorus.

Mr. Bewly, in feveral of his experiments, made ufe of the bowl of a tobacco-pipe, in which he combined the materials, which he wifhed to examine in fmall quantities, and in an expeditious manner ; preffing them down flightly, fo as to fill half or three-fourths of the bowl, and filling the remainder of it with fine fand. This is kept in a red heat twenty minutes, or half an hour ; or it may continue there two hours longer, if the operator pleafes, without any injury to the pyrophorus. The pipe being taken out of the fire, the matter is knocked out of it as foon as it becomes cool, and generally, pretty foon afterwards, takes fire fpontaneoufly. Thus he formed his pyrophorus with a mixture confifting of two parts of alum, previoufly calcined in a red heat ; and of powdered charcoal and falt of tartar each one part.

In another experiment, having added fucceffively various and increafing quantities of fixed alkali to the falt heated as above, till the vitriolic acid contained in the mixture might be confidered nearly as an evanefcent quantity, a pyrophorus was ftill produced on calcining it with charcoal as before. He alfo mixed equal parts of falt of tartar, and vegetable or animal coal, or fometimes three parts of the former with two of the latter, and calcined them in the ufual manner ; and this compofition, on being expofed to the air, generally kindled in half a minute or a minute ; though, as it contained no fulphur, it did not burn with fo much vivacity as the vitriolic pyrophori. This, which Mr. Bewly calls the alkaline pyrophorus, differs in no circumftance from M. de Suvigny's neutral pyrophori, except in its not containing that principle to which he afcribes their accenfion. However, left it might be fufpected that the falt of tartar which he employed might accidentally contain vitriolated tartar, or vitriolic acid, he repeated the experiment with tartar calcined by himfelf, as well as with nitre fixed or alkalifed by deflagration with charcoal, and with iron filings ; and in all thefe cafes with the fame refult. By diverfifying in a like manner M. de Suvigny's experiments on the metallic pyrophori, Mr. Bewly found that none of the three vitriols, heated with charcoal alone, in his ufual method, could produce a pyrophorus. And thus he found that the addition of an alkaline falt to the compofition, which was a part of M. de Suvigny's procefs, was effential to its fuccefs.

Treating in the ufual manner equal parts of calcined green vitriol and charcoal, the powder which contained no fulphur nor hepar fulphuris, did not acquire any of the properties of a pyrophorus. The vitriolic acid feemed to have been entirely diffipated ; having no bafe to detain it, when diflodged from the metallic earth. The charcoal and calx of iron, left in this procefs, were calcined again, together with fome falt of tartar ; and a pyrophorus was produced, which exhibited indications of its containing a fcarcely perceptible portion of hepar fulphuris. Thirty grains of crocus martis aftringens were calcined with fifteen grains of charcoal, and the fame quantity of falt of tartar ; and the mixture burnt fpontaneoufly, though it contained no hepar fulphuris, or vitriolic acid. Having by thefe experiments evinced that metallic pyrophori may be prepared without vitriolic acid, Mr. Bewly proceeded to form an aluminous pyrophorus of the fame kind. For this purpofe, he procured the earth of alum by a long and violent calcination ; and examining a part of it, he found, by the ufual tefts, that it neither contained any fulphur, hepar fulphuris, nor alum undecompounded. This he confidered as perfectly pure, though he afterwards found that it contained a fmall quantity of vitriolated tartar : and yet it repeatedly furnifhed a pyrophorus as active as when alum itfelf is employed. From thefe and fimilar experiments he infers, that the feveral kinds of pyrophori are not kindled by moifture attracted by the vitriolic acid, as M. de Suvigny has maintained : and his conclufion is farther confirmed by fome experiments of Dr. Prieftley, from which it appears, that they are kindled in dry, nitrous, and dephlogifticated air.

M. Prouft, cited by Mr. Bewly, defcribes a variety of new pyrophori, which neither contain vitriolic acid, nor feem likely to owe their accenfion to the attraction of humidity from the air. Thefe principally confift of a coaly matter fimply divided by metallic or other earths ; fuch are the fediment left on the filter in preparing Goulard's extract, various combinations of tartar, or its acid, or the acetous acid, with metals, calcareous earth, &c.

Mr. Bewly, having evinced the infufficiency of M. de Suvigny's theory, and difcovered that the pyrophori are not kindled by moifture, attracted (merely) by the vitriolic acid, directed his attention to the nitrous acid, which Dr. Prieftley has fhewn to be a conftituent part of atmofpherical air, as the probable agent in the production of this phenomenon. The ftrong affinity which this acid has with phlogifton, and the heat, and even flame, which it is known to produce with certain inflammable matters, manifefted that it was equal to the effect ; and having excluded the vitriolic acid from having any effential concern in this operation, he fuggefts, either that the pyrophorus is kindled by moifture attracted by fome of the other ingredients which compofe it ; or that it has the power of decompounding atmofpherical air, by fuddenly attracting its nitrous acid, and thereby generating a heat fufficient to kindle the phlogiftic matter contained in it. This idea appeared plaufible, when he farther confidered that Dr. Prieftley produced the pureft refpirable air with this fame acid combined with other principles ; and that this as well as common air is diminifhed, and probably in part decompounded, in a variety of phlogiftic proceffes. This ingenious writer concludes, upon the whole, from the experiments he hath made, that the pyrophorus feems to owe its fingular

lar property to its being a combination of earth or alkali with phlogiston; the vitriolic acid, when present, only occasionally increasing or diminishing the effect, according to circumstances. In the process of calcination, the earth or alkaline principle is not merely mixed, but actually, though loosely, combined with the phlogistic principle of the coal; so that the pyrophorus, considering it in its most simple state, is only a perfectly dry phlogisticated alkali or earth. On these data, the phenomena may be explained in the two following methods; with respect particularly to the influence of moisture and heat upon the pyrophorus. Supposing either the alkaline or earthy principles to have a greater affinity to water than to the phlogiston with which either of them is united, they may, on being exposed to a moist atmosphere, attract the humidity, and therefore set the phlogistic principle at liberty; which may, in its turn, attract and be ignited by, the supposed aerial acid, its strong affinity to which is well known:—or, if this hypothesis be rejected, the inflammable matter may be kindled, merely in consequence of the heat produced by the combination of the alkali, &c. with moisture. This reasoning, however, supposes the existence of phlogiston, which modern chemists have generally exploded.

The chemical changes that take place during the formation and decomposition of pyrophorus, as they are stated by Aikin, appear to be the following: 1. By being heated below redness in the open air, the ingredients enter into fusion, and thus mix accurately with each other; then the water of crystallization is driven off from the alum, and of the sugar or flour, little else than the charcoal escapes volatilization. 2. The red heat to which it is exposed in the phial causes the sulphuric acid of the alum and charcoal of the sugar to re-act on each other, by which part of the charcoal is driven off in the form of carbonic acid, and part of the sulphuric acid escapes as sulphureous acid. The blue flame that characterizes the latter part of this process is probably caused by the volatilization and combustion of a portion of sulphur, more than is requisite to saturate the potash of the alum. Thus the pyrophorus, when prepared, consists of alumine, charcoal, and sulphuret of potash in intimate mixture. 3. When this powder is exposed to the air, a rapid decomposition of the air itself, and of the moisture which it contains, takes place, the oxygen of each being absorbed by the sulphuret, while a sufficient quantity of heat is disengaged, to bring the charcoal and remainder of the sulphur to a state of actual inflammation. See on the subject of this article, Macquer's Chemical Dict. art. Pyrophorus; and Priestley's Obs. on Air, vol. iii. Appendix, p. 386, &c. vol. iv. Appendix, p. 479, &c. Aikin's Dictionary.

PYROPHYLACIA, a term used by Kircher and some others, to express those magazines of fire which are placed in the cavities of mountains and other hollows of the earth, and serve to supply the several volcanoes in the different parts of the world. See VOLCANO.

PYROPHYSALITE, in *Mineralogy*, is so called from πυρ, *fire*, and φυσαλις, *a bubble*, because this mineral emits bubbles when exposed to the flame of the blowpipe. It is found at Finbo, near Fahlun, in Sweden, imbedded in a granitic rock. The colour of pyrophysalite is white, inclining to green, and occasionally small spots of blue fluor spar are seen on its surface. It commonly occurs in oblong pieces, some of which approach to an irregular rhomboid. It differs from felspar, to which it has the most resemblance, in having but one determinate direction in which it can be split; its specific gravity is also greater, and it fuses more easily. The fragments scratch glass, but are less hard than quartz. The powder of the finest fragments emit a phosphorescent light when heated. Its specific gravity is 3.45, and the constituent parts, according to Hesinger and Berzelius, are

Alumine	-	53.5
Silex	-	32.88
Lime	-	.88
Oxyd of iron		.88
Volatile matter		.75
Loss	-	11.26

The substance lost during the process is suspected to be fluoric acid. Haüy classes this mineral with the topaz. See TOPAZ. B.

PYROPŒCILOS, in the *Natural History of the Ancients*, the name by which they call the granite of Arabia, commonly known to this day under the name of the Oriental granite.

The name is derived from the Greek, πυρ, *fire*, or *fire-coloured*, and ποικιλος, *spotted*; and the ancients having used the epithet fiery to yellow, as well as red, some have imagined the granite must be a yellow stone; but it is evident that red is the colour meant by it here.

PYROSCOPE, an instrument invented by professor Leslie for measuring the intensity of fire. This is merely the *differential* THERMOMETER (which see), with one of its balls covered with silver leaf, while the other is naked. The fire heats the naked ball, but not the silvered ball. Hence the liquid in the tube rises or falls, according to the intensity of the fire, and of course marks that intensity.

PYROSCOPIA, formed of πυρ, *fire*, and σκοπεω, *I consider*, among the Greeks, a kind of divination, being the same with pyromancy and ignispicium.

PYROSIS, in *Medicine*, called in Scotland the *water-brash*, is a disorder of the stomach, which is characterized by a sudden and violent attack of pain in that organ, followed by a copious discharge of a colourless, insipid, and generally cold fluid, resembling saliva, from the œsophagus, mouth, and throat.

The first description of this disease was given by Linnæus, as a common affection of the Laplanders, under the appropriate appellation of *Cardialgia sputatoria*; whence Sauvages gave it the denomination of pyrosis *Suecica*. (Nosol. Meth. class vii. gen. 18.) Dr. Cullen adopted the generic term pyrosis, and deems it an idiopathic disease. It seems to occur, however, in conjunction with other forms of indigestion, and might have been arranged as one of the symptoms of dyspepsia.

The fits of pyrosis usually come on in the morning and forenoon, when the stomach is empty. The first symptom is a pain at the pit of the stomach, with a sense of constriction, as if the stomach were drawn towards the back: the pain is increased by raising the body into an erect posture, and therefore the patient bends himself forward. This pain is often extremely severe, with a sense of burning; and after continuing for some time, it brings on an eructation of a thin watery fluid in considerable quantity. This fluid has sometimes an acid taste; but most commonly it is described as being absolutely insipid. It continues to be brought up for some time, and does not immediately give relief to the pain which preceded it; but at length it terminates the pain, and the fit ceases.

These paroxysms come on without any evident cause, nor is the origin of the disease always to be imputed to any particular sort of diet. It seldom, if ever, attacks those people who use fresh animal food daily; but appears to be most common among those who live almost entirely upon tea, milk, potatoes, and farinaceous substances. It is much more common in women than in men; sometimes it attacks pregnant women, and often those who labour under leucorrhœa. It seldom occurs in any one before the age of puberty, or in those who are considerably advanced in life: when it has once taken place, it is very prone to recur occasionally for a long time afterwards. It is more common in Scotland than in this country, and chiefly affects the lower classes of the people.

While the same diet is continued, it is not always easy to cure the disease. The paroxysm is most effectually relieved by anodynes, especially opium; hyoscyamus, conium, &c. answer a similar purpose; and with less certainty; other stimulants and antispasmodics, as sulphuric æther, ammonia, the tincture of guaiacum, &c. alleviate the fit. These remedies, however, do not materially contribute to prevent the recurrence of the paroxysms; and bitters, aromatics, and the whole of remedies against indigestion, have been often employed in vain. A combination of aromatic laxatives, with strong alkalies and narcotics, have appeared to the writer of this article to be on the whole the most effectual remedies. See Cullen, First Lines, vol. iv. p. 1.

Pyrosis is also a word used to express an intense heat and redness in the face, such as that of persons who travel in extremely hot weather, and the like.

PYROSTRIA, in *Botany*, so called by Commerson, from the pear-shaped striated fruit.—Juss. 206. Willd. Sp. Pl. v. 1. 614. Lamarck Illustr. t. 68.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Rubiaceæ*, Juss.

Gen. Ch. *Cal.* Perianth superior, short, in four deep, acute, broad segments, deciduous. *Cor.* of one petal, somewhat bell-shaped; tube thrice as long as the calyx, swelling gradually upwards; limb of the same length, in four acute, equal, spreading segments; throat downy. *Stam.* Filaments four, short, inserted into the tube of the corolla, alternate with the segments of the limb; anthers oblong, erect, pointed, shorter than the limb. *Pist.* Germen turbinate, inferior; style short, cylindrical; stigma capitate. *Peric.* Berry small, dry, pear-shaped, with eight furrows, and eight cells, destitute of any crown. *Seeds* solitary in each cell.

Ess. Ch. Calyx four-toothed. Corolla bell-shaped, four-cleft, downy in the throat. Berry inferior, obovate, with eight furrows and eight seeds.

Obs. Jussieu, by an error which seems typographical, attributes five segments to the corolla, which Willdenow copies. There are, however, but four, as the analogy of the other parts, in this case, necessarily requires.

1. P. *salicifolia*. Willow-leaved Streak-berry. Willd. n. 1. (Pyrostria olæoides; Lamarck Illustr. v. 1. 289. t. 68. f. 2, (not f. 4.)—Gathered by Commerson, in the isle of Bourbon; not, as Willdenow has it, the Mauritius. A *shrub*, with round, smooth, greyish, leafy *branches*. *Leaves* opposite, on short stalks, rather crowded, two or three inches long, elliptic-lanceolate, sharpish, entire, coriaceous, smooth, with one rib, and several lateral incurved veins, occasionally accompanied by an axillary gland-like tubercle, that seems accidental; paler beneath. *Stipulas* between the footstalks, and of the same length, awl-shaped, erect, dilated at the base, deciduous. *Flower-stalks* axillary, solitary, somewhat umbellate, bearing one or more simple, single-flowered, partial stalks, with a pair of oblong tapering *bracteas* at the base of the latter. *Flowers* hardly a quarter of an inch long, erect, apparently white. *Fruit*, according to Lamarck, near an inch in length, pear-shaped, umbilicated, with eight deep longitudinal furrows. When cut transversely, it shews the eight seeds, compressed, and radiating from the centre.

PYROTARTAREOUS Acid, or *Empyreumatic acid of tartar*, a species of empyreumatic acetous acid, very different from Tartareous *acid*; which see. To procure this acid, distil any quantity of cream of tartar in a glass or earthen retort, as in the process for Pyromucous *Acid:* the retort being half full of the tartar, on raising the fire very slowly, the first produce is a limpid, acidulous, somewhat bitterish water, after which, as the heat increases, a most prodigious volume of the inflammable gas is given out, together with a stronger acid, and more empyreumatic liquid, and at last a black oil, and some volatile alkali.

The whole quantity of liquid acid procured from tartar in this method, is generally not more than about a quarter of the weight of the tartar, and is not quite so brown, nor so highly empyreumatic as the *pyromucous*. This acid, and also the pyroligneous and pyromucous acids, are capable of very considerable purification by easy methods, so that they lose their empyreuma, their peculiar taste and smell, in which consist their characteristic differences, till at last, when brought into the most concentrated state by some of the modes in which vinegar is dephlegmated, they exhibit the characters of acetous acid so unequivocally, that no doubt can be entertained of their identity. Simple rectification, or redistillation in a very gentle heat, and stopping the process when the liquor at last comes over much coloured, will purify, to a very great degree, the pyromucous and pyroligneous acids: the latter, by this process, from being of a dark coffee colour, assumes the hue of very pale clear brandy. But on long exposure to light, it again becomes brown, for it retains its empyreumatic character more than any other. Charcoal, newly burnt and powdered, contributes very much to the purification of all these acids; they may be either gently distilled off it, or even merely filtered through a stratum of it. But the most effectual method of purification is by uniting these acids with lime, or a fixed alkali, evaporating to dryness, and then expelling the acid by means of the sulphuric acid, in the same manner as the concentrated vinegar is prepared. The acid vapour that rises in this process has now lost its empyreuma almost entirely; has both the strength and the powerful odour of radical vinegar; when again united to potash, forms acetated potash, which may be obtained white by repeated crystallization, or by charcoal powder, and in short is perfect acetous acid. Aikin.

PYROTECHNY, derived from the Greek words πυρ, *fire*, and τεχνη, *art*, is a term applied to the art or science which teaches the management and application of fire in certain operations. Although this term has been used in a very extensive sense by some writers, and applied to the use and structure of fire-arms and artillery employed in the art of warfare, yet it is commonly confined, as it will be in this work, to those articles and instruments made use of for amusement, and for grand public occasions, as the celebration of victories, the demonstrations of public joy on account of peace, after long continued war, &c.

Of the origin of artificial fire-works there is nothing certain recorded. In Europe the invention of them is of recent date, and is given to the Italians. The use of fire-works in China was very general long before they were known in European countries: and from an account given of some recent exhibitions at Pekin, it should seem that they have attained to a degree of perfection not surpassed even by the artists of England, France, or Italy. "The fire-works, in some particulars," says Mr. Barrow in his Travels in China, "exceeded any thing of the kind I had ever seen. In grandeur, magnificence, and variety, they were, I own, inferior to the Chinese fire-works we had seen at Batavia, but infinitely superior in point of novelty, neatness, neatnefs, and ingenuity of contrivance. One piece of machinery I greatly admired; a cheft five feet fquare was hoifted up by a pulley to the height of fifty or fixty feet from the ground: the bottom was fo conftructed as then fuddenly to fall out, and make way for twenty or thirty ftrings of lanterns enclofed in a box to defcend from it, unfolding themfelves from one another by degrees, fo as at laft to form a collection of full 500, each having a light of a beautifully coloured flame burning brightly within it. This devolution and developement of lanterns were feveral times repeated, and, at every time, exhibited a difference of colour and figure. On each fide was a correfpondence of fmaller boxes, which opened in like manner as the others, and let down an immenfe net-work of fire, with divifions and compartments of various forms and dimenfions, round and fquare, hexagons, octagons, &c. which fhone like the brighteft burnifhed copper, and flafhed like prifmatic lightning with every impulfe of the wind. The diverfity of colours with which the Chinefe have the fecret of clothing fire feems one of the chief merits of their pyrotechny. The whole concluded with a volcano, or general explofion and difcharge of funs and ftars, fquibs, crackers, rockets, and granadoes, which involved the gardens for above an hour in a cloud of intolerable fmoke."

The apparatus ufed in making fire-works confifts of folid wooden cylinders, called formers, for rolling the cafes on; fimilar cylinders, either of wood or metal, for ramming down the compofition; moulds for holding the cafes while filling; a machine for contracting the cavity of the cafes; another for grinding the materials; and a particular apparatus for boring fome cafes after they are filled.

Conftruction of the Cartridges for Rockets.--A rocket is a cartridge, or cafe made of ftiff paper, which, being filled in part with gunpowder, faltpetre, and charcoal, rifes of itfelf into the air when fire is applied to it. There are feveral kinds and fizes of rockets, but the three following are the principal: *viz.* 1. Small ones, the calibre of which is not larger than that of a bullet of a pound weight. 2. Rockets, the calibre of which is equal to the fize of a ball of from one to three pounds weight. 3. Large rockets, equal to a ball of from three pounds to a hundred weight.

To give the cartridges the fame length and thicknefs, they are put into a hollow cylinder of metal, or ftrong wood. This mould is not to be confounded with another piece of wood, called the former or roller, around which is rolled the thick paper employed to make the cartridge. The rule for the fize of the mould and roller is this: if the calibre of the mould be divided into eight equal parts, the diameter of the roller muft be equal to five of thefe parts; of courfe the vacuity between the roller and the interior furface of the mould is equal to $\frac{3}{8}$ths of the calibre of the mould, which will be exactly filled by the cartridge.

The fize of the mould is meafured by its calibre; but the length of the moulds for different rockets does not always bear the fame proportion to the calibre, the length being diminifhed as the calibre is increafed. In fmall rockets, the length of the mould ought to be fix times the diameter of the calibre; but in the larger fized rockets, it need not be more than between four and five times the calibre of the mould.

Large ftiff paper of a peculiar kind is employed in making cartridges, and hence it has obtained the name of *cartridge-paper*. This paper is wrapped round the roller, and then cemented by means of common pafte. When the cartridge is formed, the roller is drawn almoft out, by turning it round, until it is diftant from the edge of the cartridge the length of its diameter. A piece of cord is then made to pafs twice round the cartridge at the extremity of the roller; and into the vacuity left in the cartridge another roller is introduced, fo as to leave a fpace between the two. By means of the cord, the cartridge muft be pinched till there remains only an aperture capable of admitting an inftrument called a piercer: then the cord is removed, and its place is fupplied by a piece of packthread.

Befides the roller, a rod is employed to load the cartridge, which muft be fomewhat fmaller than the roller, that it may be eafily introduced into the cartridge. This rod is pierced lengthwife to a fufficient depth to receive the piercer, which muft enter into the mould, and unite with it exactly at the lower part. The piercer, which decreafes in fize, is introduced into the cartridge through the part where it has been choaked, and ferves to preferve a cavity within it.

After the cartridge is placed in the mould, the prepared compofition is to be poured gradually in, and rammed down with great accuracy. When the cartridge is about half filled, feparate, with a bodkin, half of the folds of the paper which remains, and having turned them back on the compofition, prefs them down, and pierce three or four holes in the folded paper, by means of a piercer, which muft be made to penetrate to the compofition of the rocket. Thefe holes ferve to form a communication between the body of the rocket and the vacuity at the extremity of the carriage, as it is called, or that part which has been left empty. In fmall rockets this vacuity is filled with granulated powder, and covered over, which ferves to let them off: in thofe that are larger, the pot, containing ftars, ferpents, and running rockets, is adapted to it.

It now remains to affix the rocket to its rod, which is thus done. When it has been conftructed, in the way juft defcribed, it is to be faftened to a rod of light fmooth wood. Its length and weight muft be proportioned to the fize of the rocket; that is, it ought to be as long as to remain in equilibrium with it, when fufpended on the finger, or other fulcrum, within an inch, or an inch and a half of the neck. Before it is fired, place it with the neck downwards, and let it reft on two nails, in a direction perpendicular to the horizon: and to make it afcend to a greater height, adapt to its fummit a pointed cap made of ftiff paper, which will ferve to facilitate its paffage through the air. To thefe rockets may be added feveral other things, as a petard, which is a box of tin plate filled with fine gunpowder, placed on the fummit. The petard is placed on the compofition, at the end where it has been filled, and the remaining paper of the cartridge is folded down over it, to keep it firm. The petard produces its effect when the rocket is in the air, and the compofition is confumed. A reprefentation of a rocket completely fitted up is given in *Plate Pyrotechny, fig.* 2.

Stars, ferpents, &c. may be added to them, which is done by adjufting to the head of the rocket an empty pot or cartridge, larger than the rocket, in order that it may contain the things intended to render the exhibition the more beautiful. The following tables are neceffary to thofe who would manufacture rockets for themfelves. The firft fhews the fize of the calibre of the mould for rockets of a pound weight and below; and the fecond points out the fize required for the calibre of moulds of from 1lb. to 50lbs. It muft be obferved, that a pound rocket is that which is juft capable of admitting a leaden bullet of a pound weight, and fo of the reft.

2	$9\frac{1}{8}$
1	$6\frac{1}{2}$

Here it is evident, that the mould of a rocket of twelve ounces in weight ought to be feventeen lines in diameter ; one of five ounces will require a mould of thirteen lines in diameter. Hence we derive an eafy method of finding the fize when the weights are given : and if the diameter of the rocket be given, it will be equally eafy to find the weight of the ball correfponding to that calibre. Thus, if the diameter be fifteen lines, it will, by the table, be feen that it correfponds to a ball of eight ounces.

Table II.—Size of the Calibre of Moulds, of from 1 to a 50lb. Ball.

Pounds.	Calibre.	Pounds.	Calibre.	Pounds.	Calibre.	Pounds.	Calibre.
1	100	14	241	27	300	40	341
2	126	15	247	28	304	41	344
3	144	16	252	29	307	42	347
4	158	17	257	30	310	43	350
5	171	18	262	31	314	44	353
6	181	19	267	32	317	45	355
7	191	20	271	33	320	46	358
8	200	21	275	34	323	47	361
9	208	22	286	35	326	48	363
10	215	23	284	36	338	49	366
11	222	24	288	37	333	50	368
12	228	25	292	38	336		
13	235	26	296	39	339		

By this fecond table, if the weight of the ball be given the fize of the mould may be found : fuppofe it be 18 pounds, oppofite to it is the number 262. Then we fay by the rule of proportion (as $19\frac{1}{2}$, fee table I. is fuppofed to be divided into 100 parts), 100 : $19\frac{1}{2}$ :: 262 to the fourth term fought, *viz.* 51.09 ; therefore the required calibre is 52 lines nearly, or four inches and four lines, or $4\frac{1}{3}$ inches. But if the calibre be given in lines, the weight of the ball may be found : fuppofe the given calibre be 36 lines, then as $19\frac{1}{2}$: 100 :: 36 : 184. The neareft number in the table to this is 181, which fhews that the weight of the ball will be rather more than 6lbs., or, in other words, that a rocket, the diameter or calibre of which is 36 lines, is a rocket of a 6lb. ball.

The compofition of the powder for rockets muft be different, according to the different fizes, it being completely afcertained that what is proper for fmall rockets would be too ftrong for the larger ones.

For rockets of one or two ounces, the compofition fhould be one pound of gunpowder, and two ounces of finely ground foft charcoal.

For rockets of fomewhat larger fize, the compofition may be ten ounces of gunpowder, three and a half of faltpetre, and three ounces of charcoal.

If the rockets be of five or fix ounces weight, then to two pounds five ounces of gunpowder, add eight ounces of faltpetre, two ounces of fulphur, fix ounces of charcoal, and two ounces of iron filings.

If the rockets be from ten to twelve ounces, you may add to feventeen ounces of gunpowder, four ounces of faltpetre, three and a half of fulphur, and one of charcoal.

For rockets of a pound weight : to one pound of gunpowder add an ounce of fulphur, and three ounces of charcoal.

For rockets of from four to feven pounds : to thirty-one pounds of faltpetre, add four pounds and a half of fulphur, and ten of charcoal : and for thofe that are ftill larger, we may add to eight pounds of faltpetre, one pound four ounces of fulphur, and two pounds twelve ounces of charcoal. In all cafes the ingredients are to be pounded feparately, and finely fifted before they are ufed. Gunpowder, thus reduced from the corns in which it is manufactured, is called meal-powder.

Matches.—The matches to let off rockets are thus made. Take linen, hemp, or cotton thread, and double it eight or ten times, if intended for large rockets, or only four or five times, if to be employed for ftars. When the match is thus made, dip it in pure water, and being foaked, it is to be fqueezed as dry as poffible. Mix fome gunpowder with a little water, fo as to reduce it to a kind of pafte, and immerfe the match in it, turning and twifting it till it has imbibed a fufficient quantity of gunpowder ; then fprinkle it over with dry powder, and when it is dry, it is fit for ufe.

In anfwer to the inquiry what caufes rockets to afcend in the air, we may obferve, that it is nearly the fame as that which produces a recoil in fire-arms. Thus, when powder is inflamed in the chamber of a mufket or cannon, it exerts its power againft the breech of the piece, and againft the bullet or wadding. But the refiftance oppofed by the bullet being much lefs than that oppofed by the mafs of the barrel or cannon, the bullet is forced out with great velocity. The caufe of the afcent of a rocket is nearly the fame. At the moment when the powder begins to inflame, its expanfion produces a torrent of elaftic fluid, which acts in every direction, that is, againft the air which oppofes its efcape from the cartridge, and againft the upper part of the rocket ; but the refiftance of the air is more confiderable than the weight of the rocket ; therefore the rocket afcends by the excefs of the one of thefe forces over the other. This, however, would not be the cafe unlefs the rockets were pierced to a certain depth.

Brilliant Fire and Chinefe Fire.—As iron-filings, when thrown into the fire, enflame and emit a ftrong light, this gave rife to the idea of rendering the fire of rockets much more brilliant, than when gunpowder, or the fubftances of which it is compofed, are alone employed. But the Chinefe have long been in poffeffion of a method of rendering this fire much more brilliant and variegated in its colours. It confifts in the ufe of a very fimple ingredient, namely, caft iron reduced to a powder more or lefs fine : the Chinefe give it a name that anfwers to *iron-fand* in our language. It is prepared from old iron pots pulverized, till the grains are not larger than radifh feed. Thefe, however, are paffed through fieves of different degrees of finenefs; thofe that pafs through the clofeft fieve, are called fand of the firft order ;

order; thoſe which paſs through the next ſieve in ſize, ſand of the ſecond order, and ſo on. This ſand, when it inflames, emits an exceedingly vivid light, forming almoſt inſtantaneouſly luminous flowers and ſtars of various apparent magnitudes. It ſhould be obſerved that rockets, into the compoſition of which iron-filings and iron-ſand enter, cannot be long preſerved, owing to their readineſs in attracting the moiſture which the ſaltpetre gives out. The following tables exhibit the proportions of the different ingredients for rockets of this kind of from 12 to 33 lbs.

For Red Chineſe Fire.

Calibres.	Saltpetre.	Sulphur.	Charcoal.	Sand of the 1ſt Order.
Pounds.	Pounds.	Ounces.	Ounces.	oz. dr.
12 to 15	1	3	4	7 0
81 — 21	1	3	5	7 8
24 — 36	1	4	6	8 0

For White Chineſe Fire.

Calibres.	Saltpetre.	Mealed Gunpowder.	Charcoal.	Sand of the 2d Order.
Pounds.	Pounds.	Ounces.	oz. dr.	oz. dr.
12 to 15	1	12	7 8	11 0
18 — 21	1	11	8 0	11 8
24 — 36	1	11	8 8	12 0

When theſe materials have been accurately weighed, the ſaltpetre and charcoal muſt be three times ſifted through a hair ſieve, in order to their being well mixed: the iron-ſand is then to be moiſtened with brandy to make the ſulphur adhere, and then they are to be thoroughly incorporated.

The upper part of rockets is generally furniſhed with ſome compoſition, which takes fire when it has reached to its greateſt height, emits a conſiderable blaze, or produces a loud report and whizzing noiſe. Of this kind are sauciſſons, maroons, ſtars, ſhowers of fire, &c. To make room for an artifice of this kind, the rocket is crowned with what is called a pot, which is larger than the rocket. (See *fig.* 3.) The following is the method of making this pot, and connecting it with the body of the rocket.

The mould for forming the pot, though of one piece, muſt conſiſt of two cylindric parts of different diameters. That on which the pot is rolled up muſt be three diameters of the rocket in length, and its diameter muſt be three fourths that of the rocket; the length of the other ought to be equal to two of theſe diameters, and its diameter to $\frac{7}{8}$ths that of the rocket. Having rolled the thick paper, intended for making the pot, twice round the cylinder, a portion of it muſt be pinched in that part of the cylinder which has the leaſt diameter: this part muſt be pared in ſuch a manner, as to leave only what is neceſſary for making the pot faſt to the top of the rocket, and the ligature muſt be covered with paper.

To charge ſuch a pot, attached to a rocket. Having pierced three or four holes in the double paper which covers the vacuity of the rocket, pour over it a ſmall quantity of the compoſition with which the rocket is filled, and by ſhaking it, make a part enter theſe holes; then arrange, in the pot, the compoſition with which it is to be charged, taking care not to introduce into it a quantity heavier than the body of the rocket. The whole muſt be ſecured by means of a few ſmall balls of paper, to keep every thing in its place, and the pot muſt be covered with paper cemented to its edges: if a pointed ſummit be added to it, the rocket is fit for uſe.

Serpents.—Theſe are ſmall flying rockets, without rods, which, inſtead of riſing in a perpendicular direction, mount obliquely, and deſcend in a zigzag form, without aſcending to a great height. The compoſition of theſe is nearly the ſame as that of rockets, and the conſtruction is as follows. The length, A C, (*fig.* 4.) of the cartridge is about four inches; it muſt be rolled on a ſtick ſomewhat larger than a gooſe-quill, and after being choaked at one of its ends, it is filled beyond the middle, as to B, with the compoſition; then it is to be pinched ſo as to leave a ſmall aperture. The remainder, B C, muſt be filled with grained powder, which will occaſion a report when it burſts. Laſtly, choak the cartridge entirely towards the extremity C; and at the other extremity, A, place a train of moiſt powder, to which, if fire be applied, it will be communicated to the compoſition in the part A B, and cauſe the whole to riſe in the air. The ſerpent, as it falls, will make ſeveral turns in a zigzag direction, till the fire is communicated to the grained powder in the part B C; on which the ſerpent will burſt with a loud report before it falls to the ground. The ſerpent cartridges are generally made of playing cards. Theſe are rolled round a rod of iron or hard wood, and to confine the card a piece of ſtrong paper is cemented over it. Larger ſerpents may be made by cementing two playing cards together, firſt moiſtened with water.

Maroons are ſmall cubical boxes, filled with a compoſition proper for making them burſt. To conſtruct theſe, cut a piece of paſteboard according to the method taught in geometry to form the cube (ſee *fig.* 5.); join theſe ſquares at the edges, leaving one only to be cemented, and fill the cavity of the cube with grained powder; then cement ſtrong paper in various directions over the body, and wrap round it two rows of packthread, dipped in ſtrong glue: then make a hole in one of the corners, and introduce into it a match. If the maroons are to be luminous, that is, which are to give out a brilliant light before they burſt, they muſt be covered with a paſte, the compoſition of which will be noticed below under *Stars*, and then rolled in meal powder to ſerve as a match or communication.

Sauciſſons differ from maroons only in form. The cartridges of the latter are round, and muſt be only four times their exterior diameter in length. They are choaked at one end in the ſame manner as a rocket, and a pellet of paper is driven into the aperture which has been left, in order to fill it up. They are then charged with corn powder, above which is placed a ball of paper, gently preſſed down to prevent the powder from being bruiſed; the ſecond end of the sauciſſon being now choaked, the edges are to be pared on both ſides, and the whole is covered with ſeveral turns of packthread, dipped in ſtrong glue, and then left to dry.

Stars are ſmall globes which emit a moſt brilliant light, ſo that, momentarily, they may be compared to the light of the ſtars in the heavens. Theſe balls are not larger than a muſket-ball, and when put into rockets they muſt be wrapped up in tow, prepared for the purpoſe. The compoſition of theſe ſtars is as follows: To a pound of fine mealed gunpowder, add four pounds of ſaltpetre, and two pounds of ſulphur. When theſe ingredients are thoroughly mixed, take a piece as large as a ſmall nutmeg, and having

wrapped

wrapped it in a linen rag, or paper, form it into a ball; then tie it clofely round with packthread, and pierce a hole through the middle of it, large enough to receive a piece of prepared tow, which is to ferve as a match. This, when lighted, will exhibit a moft beautiful appearance; becaufe the fire as it iffues from the two ends of the hole in the middle will extend to a great diftance, and will make it feem very much larger than it actually is.

There are other compofitions for ftars; *viz.* with three ounces of faltpetre, mix one ounce of fulphur, and two drachms of mealed gunpowder; or with eight ounces of mealed powder, mix four ounces of fulphur, and the fame quantity of faltpetre. When thefe materials have been well fifted, and fprinkled over with brandy, in which a fmall quantity of gum has been diffolved, the ftar is made in the following manner. Take a rocket mould eight or nine lines in diameter, and introduce into it a nipple, the piercer of which is of an uniform fize throughout, and equal in length to the height of the mould. Put into this mould a cartridge, and by means of a pierced rod load it with one of the preceding compofitions; when loaded, take it from the mould, without removing the nipple, the piercer of which paffes through the compofition, and then cut the cartridge quite round into pieces of the thicknefs of three or four lines. The cartridge being thus cut, draw out the piercer gently, and the pieces which refemble the men employed for playing at drafts, pierced through the middle, will be ftars, which muft be filed on a match thread, that may be covered with tow. To give more brilliancy to ftars of this kind, a cartridge thicker than that already defcribed, and thinner than that of a flying rocket of the fame fize, may be employed; but before it is cut in pieces, five or fix holes muft be pierced in the circumference of each piece to be cut. When the cartridge is cut, and the pieces have been filed, cement over the compofition fmall bits of a card, each having a hole in the middle, fo that thefe holes may correfpond to the place where the compofition is pierced.

Etoiles à Pet are made in the fame way nearly as fauciffons already defcribed, only that it will not be neceffary to cover them with packthread: it will be fufficient if they are pierced at one end, in order that ftars may be faftened to them, conftructed according to the firft method, the compofition of which is dry; for if the compofition be in the form of pafte, there will be no need to tie it. In this cafe, a little more of the paper muft be left hollow at the end of the fauciffon which has been pierced for the purpofe of introducing the compofition, and to place in the vacuity, towards the neck of the fauciffon, fome grained powder, which will communicate fire to the fauciffon when the compofition is confumed.

Shower of Fire.—To form this fort of fire-work, mould fmall paper cartridges on an iron-rod two lines and a half in diameter, and make them two inches and a half in length. They muft not be choaked, it being fufficient to twift the end of the cartridge, and having put the rod into it to beat it, in order to make it affume its proper form. When the cartridges are filled, which is done by immerfing them in the compofition, fold down the other end, and then apply a match. This will fill the furrounding air with an undulating fire. The following compofitions are given as proper for ftars of this kind.

Chinefe Fire.—Mealed gunpowder one pound, fulphur two ounces, iron-fand of the firft order five ounces.

Ancient Fire.—Mealed gunpowder one pound, charcoal two ounces.

Brilliant Fire.—Mealed gunpowder one pound, iron-filings four ounces. The firft of thefe compofitions is thought to be the moft beautiful.

Sparks differ from ftars only in their fize and duration, for they are made fmaller than ftars, and are confumed fooner. They are thus prepared. Having put into an earthen veffel an ounce of mealed gunpowder, two ounces of pulverized faltpetre, one ounce of liquid faltpetre, and four ounces of camphor reduced to powder, pour over this mixture fome gum-water, or brandy in which gum has been diffolved, till the compofition becomes of the confiftence of thick foup. Then take fome lint which has been foaked in brandy, or in vinegar, or even in a folution of faltpetre, and being dried and unravelled, throw into the mixture fuch a quantity of it as is fufficient to abforb it entirely, taking care to ftir it well. This compofition may be formed into fmall balls about the fize of a pea, and being dried in the fhade, and fprinked with mealed powder, they will readily catch fire.

Sparks may be made by the following method: Take faw-duft of fir, poplar, &c. and boil it in water in which faltpetre has been diffolved. When the water has boiled fome time, it is to be poured off, that the faw-duft may remain in the veffel. When nearly dry, it is to be fpread out on a table, and fprinkled with fulphur fifted through a very fine fieve, to which may be added a little mealed powder.

Golden Rain.—Some flying rockets, which, as they fall, make fmall undulations in the air like frizzled hair, are called by the French writers *fusées chevelues*, and by us bearded rockets; they finifh with a kind of fhower of fire, which is called golden rain, and they are conftructed in the following manner. Fill the barrels of fome goofe-quills with the compofition of flying rockets, and place upon the mouth of each a little moift gunpowder, both to keep in the compofition, and to ferve as a match. If a flying rocket be then loaded with thefe quills, they will produce at the end a beautiful fhower of fire, which is denominated golden rain.

Conrantins, or Rockets that fly along a Rope.—A rocket may be made to run along an extended rope, by affixing to the rocket an empty cartridge, and introducing into it the rope which is to carry it along. Place the head of the rocket towards that fide to which you intend it to move; if it be then fet fire to, it will run along the rope without ftopping till the matter it contains is entirely exhaufted. If the rocket is to move in a retrograde direction, firft fill one half of it with the compofition, and cover it with a fmall round piece of wood, to ferve as a partition between it, and that put into the other half; then make a hole below this partition, fo as to correfpond with a fmall canal filled with bruifed powder, and terminating at the other end of the rocket. By thefe means the fire, when it ceafes in the firft half of the rocket, will be communicated through the hole into the fmall canal, which will convey it to the other end; and this end being then kindled, the rocket will move backwards, and return to the place from whence it fet out.

Two rockets of equal fize, bound together by ftrong packthread, and fo arranged that the head of the one fhall be oppofite to the neck of the other, in order that when the fire has confumed the compofition in the one, it may be communicated to that in the other, and oblige both of them to move in a retrograde direction, may likewife be adjufted to the rope by means of a piece of hollow reed. Rockets of this kind are generally employed for fetting fire to various other pieces when large fire-works are exhibited; and to render

render them more ſtriking, they are made in the form of different animals, ſuch as ſerpents, dragons, &c.

To give a rocket a kind of rotatory motion around the rope along which it advances, it will be ſufficient to tie to it another rocket, placed in a tranſverſal direction. But the aperture of the latter, inſtead of being at the bottom, ought to be in the ſide, near one of the ends. If both rockets be fired at the ſame time, the latter will make the other revolve around the rope, while it advances along it.

Rockets which burn in the Water.—In theſe there muſt be a conſiderable variation in the conſtruction of the mould, and alſo in the materials of which they are compoſed. The mould may be eight or nine inches in length, and an inch in diameter: the former, on which the cartridge is rolled up, may be nine lines in thickneſs. The compoſition ſhould conſiſt of three materials mixed together, *viz.* three ounces of mealed powder, one pound of ſaltpetre, and eight ounces of ſulphur. If the rocket is to appear on the water with a beautiful tail, the compoſition muſt conſiſt of eight ounces of gunpowder, one pound of ſaltpetre, eight ounces of pounded and finely ſifted ſulphur, and two ounces of charcoal. When the compoſition has been prepared according to theſe proportions, and the rocket has been filled in the manner above deſcribed, apply a ſauciſſon to the end of it, and having covered the rocket with wax, pitch, &c. attach to it a ſmall rod of white willow, about two feet in length, that the rocket may conveniently float. If it be required that theſe rockets ſhould plunge down, and again riſe up, a certain quantity of mealed gunpowder, without any mixture, muſt be introduced into them, at certain diſtances.

A rocket which is fired in the water, and, after burning there half the time of its duration, mounts into the air with great velocity, may be thus conſtructed. Take a *flying* rocket, furniſhed with a rod, and by means of a little glue attach it to a water-rocket, but only at the middle, A, (*fig.* 6.) in ſuch a manner that the latter ſhall have its neck uppermoſt, and the other its neck downward. Adjuſt to their extremity, B, a ſmall tube, to communicate the fire from the one to the other, and cover both with a coating of pitch, wax, &c. that they may not be damaged by the water. Then attach to the flying rocket, after it has been thus cemented to the aquatic one, a rod, as D, and from F ſuſpend a piece of packthread, to ſupport a muſket bullet E, made faſt to the rod by means of a needle or piece of iron wire. When theſe arrangements have been made, ſet fire to the part C after the rocket is in the water; and when the compoſition is conſumed to B, the fire will be communicated through the ſmall tube to the other rocket; the latter will then riſe and leave the other, which will not be able to follow it, on account of the weight adhering to it.

Globes and Fire-Balls are made in different forms, *viz.* ſpherical, ſpheroidal, or cylindrical. The ſpherical are made in the following manner. Conſtruct a hollow wooden globe of any ſize at pleaſure, and very round both within and without, ſo that its thickneſs, A C or B D, (*fig.* 7.) may be about the ninth part of its diameter A B, and having an aperture, L M or O N, equal to the thickneſs A C or B D, that is, to the ninth part of the diameter A B. It is through this aperture that fire is communicated to the globe, when it has been filled with the proper compoſition, through the lower aperture I K. A petard of metal, loaded with good grained powder, is to be introduced alſo through the lower aperture, and to be placed horizontally. The aperture I K, which is nearly equal to the thickneſs, E F or G H, of the cylinder E F G H, is to be cloſed by means of a wooden tompion dipped in warm pitch; and melt over it ſuch a quantity of lead that its weight may cauſe the globe to ſink in water, till nothing remain above it but the part G H; which will be the caſe if the weight of the lead, with that of the globe and the compoſition, be equal to the weight of an equal volume of water. If the globe be then placed in the water, the lead, by its gravity, will keep the aperture, I K, directly downwards, and the cylinder, E F G H, in a perpendicular direction, to which fire muſt have been previouſly applied. The compoſition with which the globe muſt be filled, is as follows: to a pound of corned powder, add thirty-two pounds of ſaltpetre, eight pounds of ſulphur, one ounce of ſcraped ivory, and eight pounds of ſawduſt previouſly boiled in a ſolution of ſaltpetre, and dried in the open air.

Globes which leap or roll on the Ground.—Having conſtructed a wooden globe A, (*fig.* 8.) with a cylinder C, ſimilar to the one juſt deſcribed, and having loaded it with the ſame compoſition, introduce into it four or even more petards, loaded with good corned powder to their orifices, as is ſhewn at A B, which muſt be well ſtopped with paper or tow. If a globe, prepared in this manner, be fired by means of a match at C, it will leap about as it burns, on a ſmooth horizontal plane, according as the petards are ſet on fire. The petards may be affixed to the exterior ſurface of the globe, as is ſeen in the figure, which they will cauſe to roll and leap as they catch fire.

Aerial Globes, called Bombs.—Theſe globes are called ærials, becauſe they are thrown into the air from a mortar. Though they are of wood, and have a ſuitable thickneſs, yet they are liable to burſt unleſs the charge be nicely proportioned to their ſtrength. The uſual quantity is an ounce of powder for a globe of four pounds weight; two ounces for one of eight, and ſo on. As the chamber of the mortar may be too large to contain the exact quantity of powder ſufficient for the fire-ball, which ought to be placed immediately above the powder, in order that it may be expelled and ſet on fire at the ſame time, another mortar may be conſtructed of wood, or of paſte-board with a wooden bottom, which may be put into the large iron mortar, to be loaded with a quantity of powder proportioned to the weight of the globe. This ſmall mortar muſt be of light wood, or of paper paſted together, and rolled up in the form of a cylinder, but the bottom muſt be of wood. The chamber for the powder muſt be pierced obliquely, ſo that the aperture may correſpond to the aperture of the metal mortar, then the fire applied to the latter may be communicated to the powder which is at the bottom of the chamber, immediately below the globe.

The globe muſt be filled with ſeveral pieces of reed or cane, or common reed equal in length to the interior height of the globe, and charged with a ſlow compoſition, made of three ounces of mealed gunpowder, an ounce of ſulphur moiſtened with a ſmall quantity of petroleum oil, and two ounces of charcoal; and in order that theſe reeds or canes may catch fire the ſooner, and with more facility, they muſt be charged at the lower ends, which reſt on the bottom of the globe, with pulverized gunpowder moiſtened with petroleum oil or brandy, and then dried. The bottom of the globe ought to be covered with gunpowder, partly mealed and partly corned, which, when ſet on fire, will communicate the fire to the lower part of the reed. Inſtead of reeds, the globe may be charged with running rockets, or paper petards, and a quantity of fiery ſtars or ſparks mixed with mealed powder placed above theſe petards, which muſt be choaked at unequal heights, that they may produce their effects at different times.

Jets of Fire are a ſort of fixed rockets, the effect of which is to throw up into the air jets of fire ſimilar to jets of water. They

They ferve alfo to reprefent cafcades, for if a feries of fuch rockets be placed horizontally on the fame line, it may be eafily feen that the fire which they emit will refemble a fheet of water. When arranged in a circular form, like the radii of a circle, they form what is called a fixed fun. To form jets of this kind, the cartridge for brilliant fires muft, in thicknefs, be equal to a fourth part of the diameter, and for Chinefe fire only a fixth part. The cartridge is loaded on a nipple, having a point equal in length to the fame diameter, and in thicknefs to a fourth part of it; but as it generally happens that the mouth of the jet becomes larger than is neceffary for the effect of the fire, the cartridge muft be filled equal to a fourth part of the diameter with clay, which muft be rammed down. This will make the jet afcend much higher. When the charge is completed with the proper compofition, the cartridge muft be clofed with a tompion of wood, above which it muft be choaked. Jets intended for reprefenting fheets of fire ought not to be choaked. They muft be placed in a horizontal pofition, or inclined a little downwards. The following are the principal compofitions for jets of fire.

1. *For Jets of half an Inch or lefs in Diameter.—Chinefe fire:* Saltpetre and mealed powder 1lb. each; fulphur 8 ounces; charcoal 2 ounces.—*White fire:* Saltpetre 1lb.; mealed powder 8 ounces; fulphur 3 ounces; charcoal 2 ounces; iron-fand of the firft order 8 ounces.

2. *For Jets of an Inch or lefs in Diameter.—Brilliant fire:* Mealed powder 1lb., iron-filings 5 ounces.—*White fire:* Saltpetre and mealed powder 1lb. each; fulphur 8 ounces; charcoal 2 ounces.—*Chinefe fire:* Saltpetre 16 ounces; fulphur 5 ounces; charcoal 5 ounces; iron-fand of the third order 12 ounces.

3. *For Jets of* 15 *or* 18 *Lines in Diameter.—Chinefe fire:* Saltpetre 16 ounces; fulphur 7 ounces; charcoal 5 ounces; of the feveral different kinds of iron-fand mixed 12 ounces.

Fires of different Colours.—For *white fire* the gunpowder muft be mixed with iron or rather fteel-filings: for *red fire*, iron-fand of the firft order muft be employed in the fame way. Camphor mixed with the ufual compofition is faid to make the flame appear of a *pale white* colour. Rafpings of ivory give a clear flame of a filver colour.

Pafte for reprefenting Animals, &c. in Fire.—Take fulphur reduced to a very fine powder, and having formed it into a pafte with ftarch, cover it with the figure of the thing to be reprefented, having firft coated it with clay to prevent it from being burnt. After the figure is covered with the pafte, it muft be fprinkled, while moift, with gunpowder; and when the whole is perfectly dry, arrange about it feveral fmall matches, that the fire may be fpeedily communicated to it on all fides. In this way all forts of garlands, feftoons, and other ornaments, may be imitated by fire of different colours.

Suns, fixed and moveable.—For fixed funs, let a round piece of wood be cut, into the circumference of which are to be fcrewed twelve or fifteen pieces in the form of radii, to which are to be attached jets of fire, of the compofition defcribed above; fo that they may appear as radii tending to the fame centre, the mouth of the jet being towards the circumference. Apply a match in fuch a manner that the fire communicated at the centre, may be conveyed at the fame time to the mouth of each of the jets, by which means, each throwing out its fire, there will be produced the appearance of a radiating fun, that is, fuppofing the wheel is placed in a pofition perpendicular to the horizon. The rockets or jets may be fo arranged as to crofs each other in an angular manner, in which cafe, inftead of a fun, you will have a ftar, or a crofs. Some of thefe funs are made alfo with feveral rows of jets, which are called glories. For revolving funs, provide a wooden wheel, and attach to the circumference fire-jets placed in the direction of the circumference: they muft not be choaked at the bottom, and ought to be arranged in fuch a manner, that the mouth of the one fhall be near the bottom of the other, fo that when the fire of the one is ended, it may immediately proceed to another. When the fire is applied to one of thefe jets, the recoil of the rocket will make the wheel turn round, unlefs it be too large and ponderous. For this reafon, when thefe funs are of a confiderable fize, that is, when they confift of perhaps twenty rockets, fire muft be communicated at the fame time to the firft, the fixth, eleventh, and fixteenth, from which it will proceed to the fecond, the feventh, the twelfth, the feventeenth, and fo on. Thefe four rockets will make the wheel turn round with great rapidity. If two fimilar funs be placed one behind the other, and are made to turn in a contrary direction, they will produce a fine effect of crofs-fire.

Making, loading, and firing Pots des Brins.—Thefe are made of pafte-board, and muft be rolled pretty thick; ufually made three or four inches in diameter, and four diameters long, and pinched with a neck at one end, like common cafes. A number of thefe are placed on a plank thus: having fixed on a plank two rows of wooden pegs, cut in the bottom of the plank a groove the whole length under each row of pegs; then, through the centre of each peg, bore a hole down to the groove at bottom, and on every peg fix and glue a pot, whofe mouth muft fit tight on the peg: through all the holes run a quick-match, one end of which muft go into the pot, and the other into the groove, which muft have a match laid in it from end to end, and covered with paper, fo that, when lighted at one end, it may difcharge the whole almoft inftantaneoufly: in all the pots put about one ounce of meal and corn powder; then in fome put ftars, and others rains, fnakes, ferpents, crackers, &c.: when they are all loaded, pafte paper over their mouths. Two or three hundred of thefe pots being fired together, make a very pretty fhow, by affording fo great a variety of fires. *Fig.* 9. is a range of pots des brins, with the leader A, by which they are fired.

Caduceus Rockets, in rifing, form two fpiral lines, or double worm, by reafon of their being placed obliquely, one oppofite the other; and their counterpoife is in their centre, which caufes them to rife in a vertical direction. Rockets for this purpofe muft have their ends choaked clofe, without either head or bounce, for a weight at top would be a great obftruction to their mounting; though they have been known fometimes to be bounced, but then they did not rife fo high as thofe that were not; nor do any caduceus rockets afcend fo high as fingle, becaufe of their ferpentine motion, and likewife the refiftance of air, which is much greater than two rockets of the fame fize would meet with, if fired fingly.

By *fig.* 10. we fee the method of fixing thefe rockets: the fticks for this purpofe muft have all their fides equal, which fides fhould be equal to the breadth of a ftick proper for a fky-rocket of the fame weight as thofe we intend to ufe, and to taper downwards as ufual, long enough to balance them, one length of a rocket, from the crofs ftick, which muft be placed from the large ftick, fix diameters of one of the rockets, and its length feven diameters; fo that each rocket, when tied on, may form with the large ftick an angle of fixty degrees. In tying on the rockets, place their heads on the oppofite fides of the crofs ftick, and their ends on the oppofite fides of the long ftick; then carry a leader from the mouth of one into that of the other. When thefe rockets are to be fired, fufpend them between two hooks or nails,

nails, then burn the leader through the middle, and both will take fire at the fame time. Rockets of one pound are a good fize for this ufe.

Illuminated ſpiral Wheel.—Firſt have a circular horizontal wheel, made two feet in diameter, with a hole quite through the nave; then take three thin pieces of deal, three feet long each, and three quarters of an inch broad each: one end of each of theſe pieces nail to the fell of the wheel, at an equal diſtance from one another, and the other end nail to a block with a hole in its bottom, which muſt be perpendicular with that in the block of the wheel, but not ſo large. The wheel being thus made, take a hoop planed down very thin and flat; then nail one end of it to the fell of the wheel, and wind it round the three ſticks in a ſpiral line, from the wheel to the block at top: on the top of this block fix a caſe of Chineſe fire; on the wheel you may place any number of caſes, which muſt incline downwards, and burn two at a time. If the wheel ſhould conſiſt of ten caſes, you may let the illuminations and Chineſe fire begin with the ſecond caſes. The ſpindle for this wheel muſt be a little longer than the cone, and made very ſmooth at top, on which the upper block is to turn, and the whole weight of the wheel to reſt. See *fig.* 11.

Fruiloni Wheels.—Firſt take a nave, made nine inches long, and three in diameter: near the bottom of this nave fix eight ſpokes, with a hole in the end of each, large enough to receive a two or four-ounce caſe: each of theſe ſpokes may be fourteen inches long from the block. Near the top of this block fix eight more of the ſame ſpokes, exactly over the others, but not ſo long by two inches. As this wheel is to run horizontally, all the caſes in the ſpokes at top muſt play obliquely upwards, and all of them in the ſpokes at bottom obliquely downwards. This being done, take a ſmall horizontal wheel, made with eight ſpokes, each five inches long from the block; on the top of this wheel place a caſe of brilliant fire: all the caſes on this wheel muſt play in an oblique direction downwards, and burn two at a time, and thoſe on the large wheel four at a time; that is, two of thoſe in the top ſet of ſpokes, and two of them in the bottom ſet of ſpokes. The four firſt caſes on the large wheel, and the two firſt on the ſmall, muſt be fired at the ſame time, and the brilliant fire at top, at the beginning of the laſt caſes. The caſes of the wheels may be filled with a grey charge. When theſe wheels are completed, you muſt have a ſtrong iron ſpindle, made four feet ſix inches long, and fixed perpendicular on the top of a ſtand: on this put the large wheel, whoſe nave muſt have a hole quite through, from the bottom to the top. This hole muſt be large enough to turn eaſy round the bottom of the ſpindle, at which place there muſt be a ſhoulder, to keep the wheel from touching the ſtand: at the top of the ſpindle put the ſmall wheel, and join it to a large one with a leader, in order to fire them both together.

Illuminated Globes, with horizontal Wheels.—The hoops for theſe globes may be made of wood, tin, or iron wire, about two feet in diameter. For a ſingle globe take two hoops, and tie them together, one within the other, at right angles; then have a horizontal wheel made, whoſe diameter muſt be a little wider than the globe, and its nave ſix inches long, on the top of which the globe is fixed, ſo as to ſtand three or four inches from the wheel: on this wheel you may put any number of caſes, filled with what charge you like; but let two of them burn at a time: they may be placed horizontally, or to incline downwards, juſt as you chooſe. Now, when the wheel is clothed, fix on the hoops as many illuminations as will ſtand within two inches and a half of each other: theſe you faſten on the hoops with ſmall iron binding wire; and when they are all on, put on your pipes of communication, which muſt be ſo managed as to light them all with the ſecond or third caſe on the wheel. The ſpindle on which the globe is to run muſt go through the block of the wheel, up to the inſide of the top of the globe, where muſt be fixed a bit of braſs or iron, with a hole in it to receive the point of the ſpindle, on which the whole weight of the wheel is to bear, as in *fig.* 12, which repreſents a globe on its ſpindle. By this method may be made a crown, which is done by having the hoops bent in the form of a crown. Sometimes globes and crowns are ordered ſo as to ſtand ſtill, and the wheel only to turn round; but when you would have the globe or crown to ſtand ſtill, and the wheel to run by itſelf, the block of the wheel muſt not be ſo long, nor the ſpindle any longer, than to juſt raiſe the globe a little above the wheel, and the wheel-caſes and illumination muſt begin together.

Dodecahedron, ſo called becauſe it nearly repreſents a twelve-ſided figure, and is made thus. Firſt take a ball, turned out of ſome hard wood, fourteen inches in diameter: when done, divide its ſurface into fourteen equal parts, from which bore holes an inch and a half in diameter perpendicular to the centre, ſo that they may all meet in the middle: then let there be turned in the inſide of each hole a female ſcrew; and to all the holes, but one, muſt be made a round ſpoke, five feet long, with four inches of the ſcrew at one end, to fit the holes; then in the ſcrew end of all the ſpokes bore a hole, five inches up, which muſt be bored ſlanting, ſo as to come out at one ſide, a little above the ſcrew; from which cut a ſmall groove along the ſpoke, within ſix inches of the other end, where you make another hole through to the other ſide of the ſpoke: in this end fix a ſpindle, on which put a ſmall wheel, of three or four ſides, each ſide ſix or ſeven inches long: theſe ſides muſt have grooves cut in them, large enough to receive a two or four-ounce caſe: when theſe wheels are clothed, put them on the ſpindles, and at the end of each ſpindle put a nut, to keep the wheel from falling off: the wheels being thus fixed, carry a pipe from the mouth of the firſt caſe on each wheel, through the hole in the ſide of the ſpoke, and from thence along the groove, and through the other hole, ſo as to hang out at the ſcrew end about an inch. The ſpokes being all prepared in this manner, you muſt have a poſt, on which you intend to fire the work, with an iron ſcrew in the top of it, to fit one of the holes in the ball: on this ſcrew fix the ball; then in the top hole of the ball put a little meal powder, and ſome looſe quick-match; then ſcrew in all the ſpokes, and in one ſide of the ball bore a hole, in which put a leader, and ſecure it at the end; and your work will be ready to be fired. By this leader the powder and match in the centre are fired, which will light the match at the ends of the ſpokes all at once, whereby all the wheels will be lighted at once. There may be an addition to this piece, by fixing a ſmall globe on each wheel, or one on the top wheel only. A grey charge will be proper for the wheel-caſes.

Yew-tree of brilliant Fire, is repreſented by *fig.* 13, as it appears when burning. Firſt, let A be an upright piece of wood, four feet long, two inches broad, and one thick: at top of this piece, on the flat ſide, fix a hoop, fourteen inches in diameter; and round its edge and front place illuminations, and in the centre a five-pointed ſtar; then at E, which is one foot and a half from the edge of the hoop, place two caſes of brilliant fire, one on each ſide: theſe caſes ſhould be one foot long each: below theſe fix two more caſes of the ſame ſize, and at ſuch a diſtance, that their mouths may almoſt meet them at top: then, cloſe to the ends of theſe caſes, fix two more of the ſame caſes; they muſt ſtand parallel to them at E. The caſes being thus fixed, clothe them with leaders, ſo that they, with the illuminations and ſtar at top, may all take fire together.

Illuminated Yew-tree.—Firſt have a tree made of wood, ſuch as is ſhewn by *fig.* 14. The middle piece, or ſtem, on which the branches are fixed, muſt be eight feet ſix inches high: at the bottom of this piece draw a line, at right angles, two feet ſix inches long at each ſide; then from L, which is one foot ſix inches from the bottom, draw a line on each ſide to C and D; theſe lines will give the length of the two firſt branches. Then put on the two top branches parallel to them at bottom: let the length of each of theſe branches be one foot from the ſtem: from the ends of theſe two branches draw a line to C and D; then fix on five more branches at an equal diſtance from each other, and their length will be determined by the lines A C and E D. When the branches are fixed, place illuminating port-fires on the top of each, as many as you chooſe: behind the top of the ſtem faſten a gerbe, or white fountain, which muſt be fired at the beginning of the illuminations on the tree.

Moon and Seven Stars.—Let *fig.* 15. be a ſmooth circular board, ſix feet diameter; out of the middle of it cut a circular piece twelve or fourteen inches diameter, and over the vacancy put white Perſian ſilk, on which paint a moon's face; then let I, I, I, &c. be ſtars each four or five inches in diameter, cut out with five points, and covered with oiled ſilk: on the front of the large circular board draw a ſeven-pointed ſtar, as large as the circle will allow; then on the lines which form this ſtar bore holes, wherein fix pointed ſtars. When this piece is to be fired, it muſt be fixed upon the front of a poſt, on a ſpindle, with a wheel of brilliant fire behind the face of the moon; ſo that while the wheel burns, the moon and ſtars will appear tranſparent, and when the wheel has burnt out, they will diſappear, and the large ſtar in front, which is formed of ſtars, will begin, being lighted by a pipe of communication from the laſt caſe of the vertical wheel, behind the moon: this pipe muſt be managed in the ſame manner as thoſe in regulated pieces.

Pin Wheels.—Firſt roll ſome paper pipes, about fourteen inches long each; theſe pipes muſt not be made thick of paper, two or three rounds of elephant paper being ſufficient. When your pipes are thoroughly dried, you muſt have made a tin tube, twelve inches long, to fit eaſy into the pipes: at one end of this tube fix a ſmall conical cup, which done is called a funnel; then bend one end of one of the pipes, and put the funnel in at the other, as far as it will reach, and fill the cup with compoſition; then draw out the funnel by a little at a time, ſhaking it up and down, and it will fill the pipe as it comes out. Having filled ſome pipes, and made ſome ſmall blocks, about an inch in diameter, and half an inch thick; round one of theſe blocks wind and paſte a pipe, and to the end of this pipe join another; which muſt be done by twiſting the end of one pipe to a point, and putting it into the end of the other, with a little paſte; in this manner join four or five pipes, winding them one upon the other, ſo as to form a ſpiral line. Having wound on your pipes, paſte two ſlips of paper acroſs them, to hold them together: beſides theſe ſlips of paper the pipes muſt be paſted together.

There is another method of making theſe wheels, called the French, which is, by winding on the pipe without paſte, and ſticking them together with ſealing wax, at every half-turn; ſo that, when they are fired, the end will fall looſe every time the fire paſſes the wax; by which means the circle of fire will be conſiderably increaſed. The formers for theſe pipes are made from one-half to four-ſixteenths of an inch diameter, and the compoſition for them as follows; meal powder eight ounces, ſaltpetre two ounces, and ſulphur one: among theſe ingredients may be mixed a little ſteel-filings, or the duſt of caſt-iron: this compoſition ſhould be very dry, and not made too fine, or it will ſtick in the funnel. Theſe wheels may be fired on a large pin, and held in the hand with ſafety.

Placing Fire-works to be exhibited, with the *Order of Firing.* Nothing adds more to the appearance of fire-works, than the placing them properly; though the manner of placing them chiefly depends on the judgment of the maker. We ſhall give ſuch rules here, as have been generally obſerved; for example, whether your works are to be fired on a building, or on ſtands. If they are a double ſet, place one wheel of a ſort on each ſide of the building; and next to each of them, towards the centre, place a fixed piece, then wheels, and ſo on, leaving a ſufficient diſtance between them, for the fire to play from one without burning the other. Having fixed ſome of your works thus in front, place the reſt behind them, in the centre of their intervals: the largeſt piece, which is generally a regulated or tranſparant piece, muſt be placed in the centre of the building, and behind it a ſun, which muſt always ſtand above all the other works: a little before the building, or ſtands, place your large gerbes; and at the back of the works, fix your maroon batteries, pots des aigrettes, pots des brins, pots des ſauciſſons, air-balloons, and flights of rockets: the rocket-ſtands may be fixed behind, or any where elſe, ſo as not to be in the way of the works.

Single collections are fired on ſtands, which ſtands are made in the ſame manner as theodolite ſtands, only the top part muſt be long or ſhort occaſionally: theſe ſtands may be fixed up very ſoon without much trouble. Having given ſufficient inſtructions for placing of fire-works, we ſhall proceed with the manner of firing them.

Order of Firing.

1. Two ſignal } rockets.
2. Six ſky } rockets.
3. Two honorary } rockets.
4. Four caduceus } rockets.
5. } Two { vertical } wheels illuminated.
6. } Two { ſpiral } wheels illuminated.
7. } Two { tranſparent ſtars.
8. A line rocket of five changes.
9. Four tourbillons.
10. } Two { horizontal wheels.
11. } Two { air-balloons illuminated.
12. } Two { Chineſe fountains.
13. } Two { regulating pieces of four mutations each.
14. } Two { pots des aigrettes.
15. Three large gerbes.
16. A flight of rockets.
17. } Two { balloon wheels.
18. } Two { caſcades of brilliant fire.
19. Twelve ſky-rockets.
20. } Two { illuminated yew-trees.
21. } Two { air-balloons of ſerpents, and two compound.
22. Four tourbillons.
23. } Two { Fruiloni wheels.
24. } Two { illuminated globes with horizontal wheels.
25. One pot des ſauciſſons.
26. Two plural wheels.
27. Marron battery.
28. Two chandeliers illuminated.
29. Range of pots des brins.
30. Twelve ſky-rockets.
31. Two yew-trees of fire.

32. Neſt

32. Neſt of ſerpents.
33. Two double cones illuminated.
34. Regulating piece of ſeven mutations, *viz.*
   1. Vertical wheel illuminated.
   2. Golden glory.
   3. Octagon vertical wheel.
   4. Porcupine's quills.
   5. Croſs fires.
   6. Star piece with brilliant rays.
   7. Six vertical wheels.
35. Brilliant ſun.
36. Large flight of rockets.

When water-works are to be exhibited, divide them into ſeveral ſets, and fire one ſet after every fifth or ſixth change of land and air-works. Obſerve this rule in firing a double ſet of works; always to begin with ſky-rockets, then two moveable pieces, then two fixed pieces, and ſo on; ending with a large flight of rockets, or a maroon battery: if a ſingle collection, fire a fixed piece after every wheel or two, and now and then ſome air and water-works. Jones's Fire-works, 8vo. 1776.

PYROTECHNICAL Spunge. See Spunge.

PYROTICS, Πυρωτικα, formed from πυρ, *fire*, in *Medicine*, cauſtics, or remedies, either actually or potentially hot; and which, accordingly, will burn the fleſh, and raiſe an eſchar.

PYROUET. See Pirouette.

PYROXENE, in *Mineralogy*. See Augite and Lava. According to Haüy, the mineral called augite by Werner is the black or greeniſh-black variety of pyroxene found in volcanic countries and in baſalt. The primitive form of the cryſtals of pyroxene is an oblique rhomboidal priſm.

The greyiſh-green tranſparent pyroxene, with the forms of the cryſtals diſtinctly marked, from the department of the Po, is the alalite of Bouvoiſin. Journal des Mines, N° 115.

The greyiſh-green, or whitiſh-grey variety, the primitive cryſtals of which are indiſtinct, from the ſame deparment, were called by Bouvoiſin maſſite. Both theſe varieties have been called by ſome mineralogiſts diopſide.

The greyiſh-green and obſcure green perioctahedral variety of pyroxene, is the ſahlite of Werner, called alſo malocolithe by Haüy. The mineral called coccolite, diſcovered by Dandrada at the iron mines of Sudermannland and Nerika, in Sweden, and Arendahl in Norway, is alſo brought under the ſpecies pyroxene by Haüy. Tableau Comparatif.

By reducing many varieties of minerals under one ſpecies, Haüy may be conſidered as having rendered an additional ſervice to mineralogy, already too much loaded with pedantic or unmeaning terms; but the term pyroxene itſelf may be juſtly objected to, as being founded not on any diſtinct character, but on the hypothetical aſſumption that theſe cryſtals are foreign to the igneous products in which they are imbedded, an aſſumption for which there does not appear ſufficient proof. The conſtituent parts of pyroxene, its ſpecific gravity and hardneſs, ſo nearly agree with thoſe of baſaltic hornblende, that theſe ſubſtances ought perhaps to be claſſed as varieties of the ſame ſpecies, without regarding the ſmall difference of their cryſtalline forms. See Hornblende.

Pyroxene *en Roche*, or *Rock Pyroxene*. In the Journal des Mines, Nov. 1812, a deſcription is given of entire rocks compoſed of pyroxene, diſcovered by J. Charpentier in the Pyrenées. The ſubſtance is homogeneous, of a texture commonly granularly lamellar, which in ſome pieces becomes ſlaty. Its moſt common colour is green of various ſhades, from an olive green to an emerald green, ſometimes cloudy but often clear. From a greeniſh-grey it paſſes to a reddiſh-brown and ochre yellow. It is amorphous. The luſtre is ſplendent. Its fracture is lamellar, and has a two-fold cleavage equally perfect, croſſing at an angle of about 92°. In other directions the fracture is either imperfectly lamellar or conchoidal. It ſcratches glaſs, and gives ſome ſparks with ſteel. It melts with great difficulty by the blowpipe, but with borax it eaſily forms a green glaſs. M. Vogel has analyſed this mineral, and diſcovered chrome in the green ſpecimen. From the detailed deſcription of this rock, it appears nearly allied to ſchiſtoſe, ſpar, and ſerpentine. It is frequently intimately combined with talc, in which ſtate it is not eaſy to diſtinguiſh it from ſerpentine. Rock pyroxene is found in beds in the primitive limeſtone, that forms vaſt mountains ſuperincumbent on granite, extending from the valley of Viedeſſos, in the department of Arriege, to St. Beat, in the valley of Garonne. The maſſes of rock pyroxene are of extraordinary ſize, extending in length 5000 toiſes. Its thickneſs is difficult to determine, but is ſuppoſed to exceed 300 toiſes. Charpentier is diſpoſed to claſs rock pyroxene as an intermediate rock between hornblende and ſerpentine, and ſubordinate to primitive limeſtone. It neither contains foreign beds nor mineral veins, and is leſs liable to decompoſition when pure, than almoſt any other rock. When intermixed with talc it decompoſes rapidly.

PYRRHA, in *Ancient Geography*, a town of the iſle of Leſbos, between the promontory Sigrium and the town of Ereſſus, according to Ptolemy. The town took its name from a ſtrait between Aſia Minor and the iſle of Leſbos, and gave it to a foreſt in the ſame iſle.—Alſo, a town of Macedonia, in Magneſia. Pliny.—Alſo, a town of Aſia Minor, in Lycia. Pliny.—Alſo, a town of Aſia Minor, in Ionia, ſituated at the entrance of the northern part of the Latmic gulf, E.N.E. of the town of Miletus, and S.S.E. of that of Myus. Strabo places it at 100 ſtadia from Heraclea—Alſo, a promontory of Theſſaly, upon the coaſt of the Phthiothide. Strabo ſays, that before this promontory were two iſles; one called Pyrrha, and the other Deucalion.—Alſo, a town of Greece, in the Phocide. Pliny.—Alſo, a town ſituated in the vicinity of the Palus-Mæotis; ſubmerged according to the relation of Pliny.—Alſo, a town of Aſia Minor, in Caria.

PYRRHICHA, Πυῤῥιχη, in *Antiquity*, a kind of exerciſe on horſeback; or a feigned combat, for the exerciſe of the cavalry.

It was thus called from its inventor Pyrrhicus, or Pyrrhus, in Cydonia, who firſt taught the Cretans to march in meaſure and cadence to battle, and to obſerve the pace of the Pyrrhic foot. Others derive the name from Pyrrhus, ſon of Achilles, who inſtituted this exerciſe at the obſequies of his father. Ariſtotle ſays, that it was Achilles himſelf who invented it.

The Romans alſo called it *ludus Trojanus*, the Trojan game; and Aulus Gellius *decurſus*. It is doubtleſs this exerciſe, that we ſee repreſented on medals, by two cavaliers in front, running with lances, and the word *decurſio* in the exergum.

PYRRHICHIUS, Πυῤῥιχιος, in the Greek and Latin *Poetry*, a foot conſiſting of two ſyllables, both ſhort; as *deus*.

Among the ancients this foot is alſo called *periambus*; by others *hegemona*.

PYRRHICUS, in *Ancient Geography*, a town of Laconia, upon the ſtream of Scyrax, S. of Hypſus. Here were two temples, one of Diana Aſtratæa, and another of the Amazonian Apollo. The ſtatues of theſe deities were of wood, and it is ſuppoſed they were placed here by the Amazons themſelves.

PYRRHO. See Pyrrhonians.

PYRRHO-

PYRRHOCORAX, in *Ornithology*, a ſpecies of *Corvus* (which ſee), the Alpine crow of Latham, and the Choucas des Alpes of Buffon.—Alſo, the Monedula, Coracias of Aldrovand, &c., Corniſh chough, red-legged crow of Pennant and Latham, and CORVUS *Graculus*, which ſee.

PYRRHONIANS, PYRRHONEANS, or *Pyrrhoniſts*, a ſect of ancient philoſophers, ſo called from their founder Pyrrho, a Greek philoſopher, born at Elea, in Peloponneſus, who in early life ſtudied painting, but aſpiring to philoſophical purſuits he became a diſciple of Anaxarchus, and accompanied him as far as India. In this journey he followed Alexander the Great; and hence we may know in what time he flouriſhed. In India he converſed with the Brachmans and Gymnoſophiſts, imbibing from their doctrine whatever might ſeem favourable to his natural diſpoſition towards doubting; a diſpoſition which was cheriſhed by his maſter, who had formerly been a diſciple of a ſceptical philoſopher, Metrodorus of Chios. As he was involved in freſh uncertainty by every advance he made in the ſtudy of philoſophy, he left the ſchool of the Dogmatiſts, who profeſſed to be poſſeſſed of certain knowledge, and eſtabliſhed a new ſchool, in which he taught, that every object of human inquiry is involved in uncertainty, ſo that it is impoſſible ever to arrive at the knowledge of truth.

The diſtinguiſhing character of this philoſopher was, that he profeſſed to doubt of every thing, maintaining that men only judge of truth and falſehood from appearances, which deceive. On this principle he kept himſelf in continual ſuſpenſion of mind, never determining on any thing; to avoid the inconveniencies of error and falſe judgments.

He found in all things (ſays Bayle) reaſons to affirm and to deny; and therefore he ſuſpended his aſſent after he had well examined the arguments *pro* and *con*, and reduced all his concluſions to a *non liquet*, let the matter be farther enquired into. Hence it is (ſays he) that he ſought truth as long as he lived, but he ſo contrived the matter, as never to grant that he had found it. Though he is not the inventor of that method of philoſophizing, yet it goes by his name. The art of diſputing about every thing, without doing any thing elſe but ſuſpending one's judgment, is called Pyrrhoniſm, or Scepticiſm.

Some have ſaid, that this philoſopher acted upon his own principles, and carried his ſcepticiſm to an extreme ſo ridiculous, that his friends were obliged to accompany him wherever he went, that he might not be run over by carriages, or fall down precipices. Theſe reports, however, are inconſiſtent with the reſpect that is paid to him by ancient writers, and with the general hiſtory of his life, and are charged, as calumnies, upon the Dogmatiſts, whom he oppoſed. A great part of his life was ſpent in ſolitude; and he always preſerved a ſettled compoſure of countenance, undiſturbed by fear, or joy, or grief. He endured bodily pain with great fortitude; and in the midſt of dangers he manifeſted no ſigns of apprehenſion. As a diſputant, he was celebrated for the ſubtlety of his arguments, and the perſpicuity of his language. So highly was Pyrrho eſteemed by his countrymen, that they honoured him with the office of chief prieſt, and from reſpect to him, paſſed a decree by which all philoſophers were indulged with an exemption from public taxes. Of the poets, and particularly of Homer, he was a great admirer; and frequently repeated paſſages from his poems. He flouriſhed about the 110th olympiad, and died about the 90th year of his age, probably in the 123d olympiad, B.C. 288. After his death, the Athenians honoured his memory with a ſtatue; and a monument, as Laertius informs us, was erected to him in his own country. His ſcepticiſm may in a great meaſure be aſcribed to his early acquaintance with the ſyſtem of Democritus. Having learned from this philoſopher to deny the real exiſtence of all qualities in bodies, except thoſe that are eſſential to primary atoms, and to refer every thing elſe to the perceptions of the mind produced by external objects, that is, to appearance and opinion, he concluded, that all knowledge depended upon the fallacious report of the ſenſes, and conſequently, that there can be no ſuch thing as certainty. In this notion he was encouraged by the general ſpirit of the Eleatic ſchool, in which he was educated, which was unfavourable to ſcience. But his ſcepticiſm was more confirmed by the ſubtleties of the Dialectic ſchool, in which he was inſtructed by Bryſon, the ſon of Stilpo. Regarding mental tranquillity as the great end of all philoſophy, and obſerving that nothing contributed ſo much to diſturb it, as the diſſenſions which agitated the ſchools of the Dogmatiſts, and alſo inferring from their endleſs diſputes the uncertainty of the queſtions which they debated, he had recourſe to the doctrine of univerſal uncertainty; and thus it happened in his caſe, as in that of many others, that controverſy became the parent of ſcepticiſm.

Pyrrho had ſeveral diſciples, but none who merit particular notice except Timon, the Phliaſian, who lived to the age of 90 years, and flouriſhed in the time of Ptolemy Philadelphus. The public ſucceſſion of profeſſors in the Pyrrhonic ſchool terminated with Timon, and in Cicero's time this ſchool was extinct. The diſciples of Timon choſe to ſcreen their ſcepticiſm under the authority of the Academy; and after ſome interval, the ſchool itſelf was revived by Ptolemæus, a Cyrenian, and continued at Alexandria by Œneſidemus, a contemporary with Cicero: the latter wrote a treatiſe "On the Principles of the Pyrrhonian Philoſophy," the heads of which are preſerved by Photius. From his time it was tranſmitted, through a ſeries of preceptors little known, to Sextus Empiricus, who has given a ſummary of the ſceptical doctrine; for an account of which, ſee SCEPTICS. As for Pyrrho and his followers, they rather endeavoured to demoliſh every other philoſophical ſtructure, than to erect one of their own. They aſſerted nothing; but propoſed poſitions merely in the way of enunciation, without attempting to determine on which ſide, in any diſputed queſtion, the truth lay, or even preſuming to aſſert, that one propoſition was more probable than another.

Thoſe now diſtinguiſhed by the name of Pyrrhonians, or Sceptics, are perſons who, from the great number of things that are dark and obſcure, and from the averſion they bear to popular credulity, maintain, that there is nothing certain in the world.

The truth is, Pyrrhoniſm has ſome foundation in nature: we do not judge of things from their real eſſences, but from their relations to ourſelves. Moſt of our ideas we receive by means of our ſenſes; but our ſenſes are not given us to judge of the eſſences, but of the relations of things to themſelves; *i. e.* how they may affect us ſo as to do us good or harm.

Thus, *e. gr.* our eyes do not give us the real magnitudes of objects, but their relative ones only.

The Academics differed from the Pyrrhonians, in that they owned there were ſome things more like or more near akin to truth than others, which the Pyrrhonians peremptorily denied. On account of the ſimilarity of the opinions of this ſect and thoſe of the Platonic ſchool in the Middle and New Academy, it happened, that many of the real followers of Pyrrho choſe to ſcreen themſelves from the reproach of univerſal ſcepticiſm, by calling themſelves *Academics* (which ſee); and hence the appellation of Pyrrhoniſts rhonifts fell into difufe, whilft the doctrine of Pyrrho had many advocates. For the difference between them, fee SCEPTICS.

Le Clerc obferves, that the Pyrrhonians, in affirming that there is nothing certain, were the moft affuming and decifive of all philofophers; fince they muft firft have examined all things, to be able to determine precifely that all things are uncertain.

It may be added, that the very principle of the Pyrrhonians deftroys itfelf; for if there be nothing certain, then muft that dogma itfelf be precarious; and if no one thing be more probable, or liker to truth than another, why fhall the principle of the Pyrrhonians be believed preferably to the oppofite one? fince itfelf is come at in the fame way as our other knowledge. Brucker's Hift. of Philof. by Enfield, vol. i.

PYRRHUM, in *Ancient Geography*, a town of Pannonia, on the route from Pætovio to Sifcia, between Aquaviva and Dautona, according to the Itin. of Antonine.

PYRRHUS, in *Biography*, king of Epirus, one of the moft diftinguifhed warriors of the period in which he flourifhed, fuppofed to be defcended from Pyrrhus, the fon of Achilles, was the fon of Æacides, who was expelled the kingdom by a revolt of his fubjects. When Pyrrhus was only twelve years of age, he was placed on the throne of his anceftors by Glaucias, king of Illyria, who had protected him in his infancy. He reigned in peace till he was about feventeen years of age, when, being abfent from his kingdom, his fubjects feized his treafures, and conferred the crown upon his great uncle, Neoptolemus. Pyrrhus being poffeffed of no force to enable him to recover his authority, repaired to Demetrius Poliorcetes, the fon of Antigonus, who had married his fifter, and under that eminent commander he learned the art of war, in company with many officers and foldiers of Alexander the Great. At the battle of Ipfus, in the year B.C. 301, he greatly diftinguifhed himfelf, and after its lofs by Demetrius, he fecured for him the Greek cities, with the care of which he had been entrufted. When a treaty of peace was concluded between Demetrius and Ptolemy Lagus, king of Egypt, Pyrrhus confented to be one of the hoftages fent into that country for the performance of the conditions. In the Egyptian court he excited general admiration by his amiable and correct behaviour, and his dexterity in martial exercifes; and he obtained from the king his daughter Antigone in marriage. The next ftep was to reftore him to his throne, which was effected by an armament fupplied by Ptolemy, with the aid of which he defeated Neoptolemus. That prince, however, being fupported by his allies, Pyrrhus confented to allot him a fhare of his dominions; but fuch a partnerfhip was not likely to be durable, and Neoptolemus, it was faid, attempted to poifon Pyrrhus, which gave the latter a pretence to order his death. He being fettled on the throne of Epirus, began to execute thofe fchemes of ambition, in which the remainder of his life was fpent. A civil war raging between the two fons of Caffander, in Macedonia, one of them, Alexander, applied to Pyrrhus for affiftance. He gladly took occafion of interfering in the affairs of that kingdom, and being put in poffeffion of all its maritime towns, proceeded to conquer the reft for Alexander. A peace was made, by which Macedonia was divided between the two brothers, and Pyrrhus feems to have withdrawn his troops to his own country. Shortly after, Demetrius made himfelf mafter of the kingdom, and notwithftanding their former friendfhip, hoftilities enfued between him and Pyrrhus, who haraffed him by incurfions into Theffaly. They mutually invaded each other's kingdoms; and in one inftance, Pyrrhus gained fo complete a victory over the principal general of his antagonift, and difplayed fo much courage, that he ftruck with admiration the Macedonians whom he had defeated, who deferted their own king, and chofe Pyrrhus for their fovereign. This occurred in the year B.C. 287. He held this crown, however, a fhort time; for Lyfimachus, in the following year, entering the country with a powerful army, and remonftrating againft the injuftice of conferring the kingdom on a foreigner, in prejudice to him, a native and commander under Alexander the Great, the allegiance of the Macedonians feemed to Pyrrhus fo little to be relied on, that he withdrew from the conteft, and returned to Epirus. The Romans, engaged in a war with the Tarentines, looked for affiftance to Pyrrhus. This prince eagerly liftened to the propofal, and communicated his determination to his prime-minifter Cyneas, who, being more prudent than his mafter, endeavoured to diffuade him from it. The enterprize was, however, refolved on, and Cyneas was fent with a body of troops to Tarentum, where he fubverted the Roman influence, which was beginning to prevail, and obtained the command of the citadel for an Epirot officer. Pyrrhus followed, and having left his fon Ptolemy regent of Epirus, landed in Italy, in the year 280 B.C., bringing with him an army of about 25,000 men, of whom 7000 were Macedonians, the veteran foldiers of Alexander the Great. He alfo brought a number of war-elephants, which was the firft time that thefe animals were feen, in that character, in Italy. He was greatly endangered in his paffage by a ftorm, which difperfed his fleet, and deftroyed fome of the fhips that kept company with him. On his arrival at Tarentum, he began to correct the licentious manners of the inhabitants, and enure them to military difcipline. At length he marched out to meet the Roman conful Valerius Lævinus, who was waiting for him on the bank of the Siris, in Lucania. The engagement was extremely obftinate, and Pyrrhus, who exerted himfelf in a manner worthy of his high reputation, was in great perfonal danger. Victory, however, decided in his favour, and he took poffeffion of the enemy's camp. In interring the dead he made no diftinction between his own men and the foldiers of his antagonift, but beftowed due encomia upon the bravery of his fallen foes. He followed up his victory, and had proceeded fo far as to obtain a diftant view of Rome. The advance of the other conful obliged him to retire, and he finifhed his campaign by returning to Tarentum. Senfible that he had engaged in no eafy tafk, he was delighted to receive an embaffy from the Romans, which he imagined was to folicit peace, but it was only to negociate an exchange of prifoners. In this embaffy was included the virtuous Fabricius, whom he in vain attempted to gain to his intereft by large offers. He then attempted to make a treaty, and fent his minifter, Cyneas, to Rome for that purpofe, but was unfuccefsful.

In the next campaign, two confuls with their armies marched againft the king of Epirus; the battle was extremely bloody, and the victory fo indecifive, that both parties claimed it: one of the confuls was killed, and Pyrrhus was feverely wounded; and fuch was the lofs of men, that to one who congratulated him as having been the conqueror, he frankly replied, "fuch another victory will ruin me." Both the confuls of the next year, one of whom was Fabricius, were employed to oppofe Pyrrhus, who had received frefh reinforcements from Epirus. They advanced to the Tarentine territory, where, while they were feeking an opportunity to engage, an offer was made them by the phyfician of Pyrrhus, to take him off by poifon. Detefting

ing the treachery, they informed the king of his danger, which so affected him, that he immediately liberated all his Roman prisoners without a ransom. He now sent Cyneas to Rome to renew the attempt at negociation, but was again unsuccessful. During the state of perplexity which a refusal had thrown him into, he was invited by the Syracusans and others to lend his aid against the Carthaginians, who had established themselves in Sicily. He accordingly seized the pretext for changing the field of action, and embarked the whole army for that island, leaving only a strong garrison in Tarentum. On his arrival he was received with general acclamations, and all the public force of Syracuse was put into his hands. He was soon so completely successful, that the Carthaginians sent deputies to Pyrrhus to treat for peace, but he refused to listen to any other condition, than that of their entirely evacuating the island. In confidence of success, he caused a son to be proclaimed king of Sicily, and then made preparations to cross over into Africa, and carry the war into the Carthaginian territories. These projects were not agreeable to the Sicilians, who became alienated from him, and whom he treated not as friends, but as a conquered people. After this he quitted Sicily, and embarked for Italy; in his voyage he was encountered at sea by a Carthaginian fleet, which sunk a number of his vessels and dispersed the rest, so that he reached a port in Italy with no more than twelve sail. Six years did he consume in Italy and Sicily, inflicting and suffering all the evils of war, and finally exhausted in force, and with diminished reputation. His restless spirit was not subdued; and for the purpose of employing and paying his soldiers, in conjunction with a body of Gauls, he made an irruption into Macedonia, where Antigonus Gonatus then reigned. His success was beyond his expectations, for he not only obtained the pillage of many cities, but defeated Antigonus in battle, and wrested from him almost the whole kingdom. He now marched with a powerful army into the Peloponnesus, at the request of Cleonymus, and appearing before Sparta, required the inhabitants to receive his friend as their king. Upon their determination to resist this mandate, he attacked the city, but was repulsed with the loss of many men: he now retired to Argos, where, through the treachery of Aristeas, a bloody conflict ensued, during which, a woman, who saw Pyrrhus just going to kill her son, hurled a tile from the top of the house, which brought the king to the ground. In this state a Macedonian dragged him to a porch, and was going to cut off his head, when Pyrrhus opened his eyes, and gave him so fierce a look, that his trembling hand failed in its office, and it was not till after repeated strokes, that he could execute his purpose. Thus in the year 272 B.C. terminated the life and exploits of this great warrior, whose career of restless enterprize death alone could stop. His military skill was held in the highest estimation by the Romans, who were so well able to judge of it by experience. Hannibal considered Pyrrhus as second only to Alexander, as a great general. He is said to have been the first who understood the art of encampments, and of properly drawing up an army, and some treatises which he wrote on these subjects are mentioned by the ancients. He was brave to the borders of rashness, and sometimes lost the commander in the soldier. He had unbounded ambition, and a disposition perpetually to engage in new enterprizes, for which, as we have seen, he readily abandoned such as proved more difficult than he had expected. He was fond of glory, but was possessed of generosity, which disposed him to acts of kindness, and to a grateful acknowledgment of obligations. All his sons were warlike, and he encouraged the disposition by the declaration, that he would leave the kingdom of Epirus to him who had the sharpest sword.

PYRRHUS *Campus*, or *Pyrrhon Pedium*, in *Ancient Geography*, a canton of Africa, in Mauritania Tingitana, in the country of the Nectiberes, according to Ptolemy.

PYRRHUS *Campus*, a canton of Africa, in Interior Libya, between the country of the Leucæthiopes and that of the Perorsi, according to Ptolemy.

PYRRHUS *Mons*, a mountain of India, on the sea-coast, on this side of the Ganges, according to the Periplus of Arrian.

PYRRSTEIN, in *Geography*, a town of Austria; 10 miles N.W. of Lintz.

PYRSEPHORUS, Πυρσηφορος, in the Athenian festival, Hephæstia, the same with Lampadephorus.

PYRULARIA, in *Botany*, so called, as it seems, because the fruit resembles a little pear, Michaux Boreali-Amer. v. 2. 231; has received a new appellation from Willdenow in his v. 4. 1114, *Hamiltonia*, which Mr. Pursh adopts, in his Flora, 178.—This genus, referred by Michaux and Willdenow to *Dioecia Pentandria*, is placed by Pursh in *Pentandria Monogynia*, though he allows it to be dioecious. It is said to be allied to NYSSA. See that article.

Eff. Ch. Calyx superior, five-cleft. Corolla none. Nectary a five-toothed disk. Drupa. Flowers dioecious.

1. *Hamiltonia oleifera* of Pursh, *Pyrularia pubera* of Michaux, is the only known species, a native of shady woods, on the mountains of Pennsylvania, in Virginia, near the sweet springs, and in Carolina, flowering in May and June. This is a *shrub*, from four to six feet high, very downy, with alternate, oblong, pointed, entire *leaves*. *Stipulas* none. *Flowers* very small, greenish-yellow, in terminal *clusters*. *Fruit* known in North America by the name of Oil-nut. The *root* is said by Michaux to have an unpleasant smell.

PYRUS, an ancient Latin name, which botanists have adopted, but of which the most correct orthography perhaps would be *Pirus*. This will appear as we trace its etymology, but more trouble than good would now arise from such a correction. The generality of critics have given rather a forced derivation of this word, from its Greek synonym, απιος, the *a* being supposed cut off, and an *r* introduced; but De Theis has proposed a much more probable one, from the Celtic *peren*, whence the Anglo-Saxons have taken *pere*, the English *pear*, and the French *poire*. According to the same writer, *api*, the Celtic name of a fruit of the same kind, is the origin of the Greek απιος, the German *apfel*, and our *apple*. *Api* is even the particular name of one sort of apple, in the French language.—Linn. Gen. 251. Schreb. 339. Willd. Sp. Pl. v. 2. 1012. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 531. Prodr. Fl. Græc. Sibth. v. 1. Ait. Hort. Kew. v. 3. 207. Pursh 339. Juss. 335. Tourn. t. 404. Lamarck Illustr. t. 435. Gærtn. t. 87. (Malus; Juss. 334. Tourn. t. 406. Cydonia; Juss. 335. Tourn. t. 405. Sorbus; Linn. Gen. 250. Schreb. 338. Juss. 335. Lamarck Illustr. t. 434. Cratægus; Linn. Gen. 250. Schreb. 338. Juss. 335. Lamarck Illustr. t. 433.)—Class and order, *Icosandria Pentagynia*. Nat. Ord. *Pomaceæ*, Linn. *Rosaceæ*, Juss.

Gen. Ch. *Cal.* Perianth superior, of one leaf, concave, with five spreading segments, permanent. *Cor.* Petals five, roundish, concave, inserted by their claws into the calyx. *Stam.* Filaments twenty, awl-shaped, shorter than the corolla, inserted into the calyx; anthers simple, roundish. *Pist.* Germen inferior, roundish; styles from two to five, thread-shaped, the length of the stamens; stigmas bluntish.

Peric.

Peric. Apple roundifh, umbilicated, flefhy, with from two to five membranous, more or lefs rigid, cells. *Seeds* two, rarely more, in each cell, oblong, obtufe, pointed at the bafe, convex on one fide, flat on the other.

Eff. Ch. Calyx five-cleft. Petals five. Apple inferior, of from two to five cells. Seeds two in each cell.

Our remarks under the article Mespilus apply equally to the prefent genus, as to the propriety of referring to it the whole Linnæan genus of *Sorbus*, and fome fpecies of *Cratægus* and *Mefpilus;* difregarding the difference in the number of their ftyles, which is evidently uncertain and variable, and diftinguifhing *Mefpilus* by its berry, *Pyrus* by its apple. Even this diftinction proves, in fome inftances, obfcure enough. We fhall, for convenience, follow Willdenow in the order of the fpecies, introducing our additional ones according to their affinities.

1. P. *arbutifolia.* Arbutus-leaved Dwarf Apple. Linn. Suppl. 256. Willd. n. 1. Ait. n. 1. Purfh n. 1. Wangenh. Amer. 89. t. 28. f. 64. (Mefpilus arbutifolia; Linn. Sp. Pl. 685. Cratægus virginiana, foliis arbuti; Mill. Ic. t. 109.)—Leaves obovate, pointed, ferrated; downy beneath; their mid-rib glandular above. Flowers corymbofe. Calyx downy.—Common in low copfes and fwamps, from Canada to Carolina, flowering in May and June. *Purfh.* Frequent in gardens. A bufhy *fhrub,* without thorns, three or four feet high. *Leaves* two inches long, neatly ferrated, more or lefs downy. *Flowers* white, terminal. *Fruit* red, the fize of a currant, mealy, and not eatable.

2. P. *melanocarpa.* Black Bilberry Apple. Willd. Enum. 525. Purfh n. 2. (P. arbutifolia β; Willd. Sp. Pl. n. 1. and Ait. n. 1. Mefpilus arbutifolia; Schmidt Arb. 86. *Purfh.*)—Leaves obovate-oblong, pointed, ferrated; fmooth beneath; their mid-rib glandular above. Flowers corymbofe. Calyx fmooth.—Found in the bogs of Canada, and on the high mountains of Pennfylvania, Virginia, and Carolina, flowering in May and June. The *fruit* is large and black, refembling in tafte the berries of *Vaccinium penfylvanicum. Purfh.*

3. P. *Botryapium.* Snowy Berry Apple. Linn. Suppl. 255. Willd. n. 2. Ait. n. 2. Purfh n. 3. Wangenh. Amer. 90. t. 28. f. 65. (Mefpilus canadenfis; Linn. Sp. Pl. 685. Schmidt Arb. t. 84.)—Leaves oblong-elliptical, ferrated, minutely pointed, finally fmooth. Flowers racemofe. Petals linear-lanceolate. Germen downy. Segments of the calyx fmooth.—Native of woods and hedges from Canada to Carolina, bloffoming in April and May. *Purfh.* Frequent in our fhrubberies. A fmall tree. The young *leaves* are covered with denfe woolly deciduous down. *Flowers* pure white, in lax terminal *clufters.* *Fruit* black, faid by Mr. Purfh to have a very agreeable tafte. It is feldom perfected with us.

4. P. *ovalis.* Oval Berry Apple. Willd. n. 3. Purfh n. 4. (Mefpilus Amelanchier? Walt. Carol. 148. Cratægus fpicata; Lamarck Dict. v. 1. 84.)—Leaves roundifh-elliptical, acute, ferrated, fmooth. Flowers racemofe. Petals obovate. Germen and fegments of the calyx downy.—Native of fwamps, from New Jerfey to Carolina, flowering in April and May. A fmall *fhrub;* the *fruit* black, eatable. *Purfh.* Lamarck, who firft diftinguifhed this fpecies, fays it is twice or thrice as tall as the following, at leaft in the French gardens, with rounder *leaves* and fmaller *flowers,* while the *fruit* is larger, being as big as a floe. The narrow coloured deciduous *bracteas* moreover, which occur in both fpecies, are in the prefent longer than each partial *flower-ftalk,* which is not the cafe with *P. Amelanchier.*

5. P. *Amelanchier.* Alpine Berry Apple. Linn. Suppl. 256. Willd. n. 4. Ait. n. 3. (Mefpilus Amelanchier; Linn. Sp. Pl. 685. Jacq. Auftr. t. 300. Mill. Ic. t. 178. f. 1. Vaccinia alba; Ger. Em. 1416.)—Leaves roundifh-elliptical, acute, ferrated; downy beneath. Flowers racemofe. Petals lanceolate. Germen fomewhat downy. Segments of the calyx fmooth.—Native of rocky mountainous fituations in Germany, Switzerland, France, and the ifle of Crete; common in fhrubberies, ever fince Gerarde's time, bloffoming in May. From three to fix feet high, or more when cultivated, making an elegant appearance with its copious drooping clufters of fnowy *flowers,* whofe *ftalks* are very woolly. *Fruit* blueifh-black, fweet, the fize of a currant.

6. P. *cretica.* Cretan Berry Apple. Willd. n. 5. Prodr. Fl. Græc. n. 1157. (Chamæcerafus Idæa; Alpin. Exot. 4.)—Leaves roundifh, emarginate, with a fmall point, ferrated; woolly beneath. Flowers racemofe. Petals lanceolate. Germen and fegments of the calyx woolly.—Found on the mountains of Crete. This differs from the laft, of which it is juftly fufpected of being a mere variety, in having rounder *leaves,* whofe pubefcence underneath is more permanent; as well as in having more woollinefs about the *flowers.*

7. P. *fanguinea.* Red Berry Apple. Purfh n. 5. (Mefpilus canadenfis γ, rotundifolia; Michaux Boreali-Amer. v. 1. 291.)—"Leaves oval, obtufe at each end, pointed, finely ferrated; fomewhat heart-fhaped at the bafe. Clufters of few flowers. Calyx fmooth. Petals linear, obtufe."—Found in Canada, and on the banks of the Columbia, flowering in April and May. A fmall *tree,* with blood-red *branches.* *Fruit* red, eatable. *Purfh.*

8. P. *communis.* Common Pear-tree. Linn. Sp. Pl. 686. Willd. n. 6. Ait. n. 4. Sm. Fl. Brit. n. 1. Engl. Bot. t. 1784.—Leaves ovate, ferrated, finally fmooth. Flower-ftalks corymbofe. Fruit elongated at the bafe.—Native of various parts of Europe, but even more general as a cultivated plant, the varieties of whofe fruit are many of them highly valuable for the table. The truly wild, or iron, pear is not eatable. It bloffoms in April or May. The *tree* is tall and handfome; the wood light, fine-grained, and tolerably hard, making neat furniture. The *branches,* at firft erect, fubfequently become curved downwards, and pendulous. The ferratures of the *leaves* commonly difappear by culture, as do the ftrong *thorns* found on the wild tree. When young, the *leaves* are downy beneath, and fringed with white. *Flowers* white, with pale red *anthers;* their inflorefcence corymbofe, not umbellate as in the apple. *Fruit* obovate, more or lefs elongated at the bafe.

9. P. *pollveria.* Woolly-leaved Pear-tree. Linn. Mant. 2. 244. Willd. n. 7. Ait. n. 5. (P. pollwilleriana; Bauh. Hift. v. 1. 59. Munch. Haufv. v. 3. part 2. 333.)—Leaves ovate, ftrongly ferrated; moft downy beneath. Flower-ftalks corymbofe, fubdivided.—Native of Germany, according to baron Munchhaufen. John Bauhin firft met with it in the garden of baron Pollwill, in Alfatia. It was fent to Kew, in 1786, by the late Mr. Græffer. This differs from the common Pear-tree in having the *leaves* downy on both fides, but efpecially beneath; the *flowers* cream-coloured, much fmaller and more numerous, even forty in each *corymb,* their partial ftalks being branched and forked. The *fruit* is fmall, fometimes but an inch long, and falls eafily when ripe.

10. P. *nivalis.* Snow Pear-tree. Jacq. Auftr. v. 2. 4. t. 107. Linn. Suppl. 253. Willd. n. 8.—Leaves obovate, obtufe, pointed, entire; hoary beneath. Flower-ftalks corymbofe. Fruit nearly globofe.—Native of mountains in Auftria, about the borders of woods and vineyards, flowering

flowering early in May. The *leaves* are whitifh and filky beneath; nearly fmooth above. *Flowers* large, white, ftrongly fcented, in a fimple downy *corymb*. *Fruit* about two inches in diameter, globofe, rather depreffed, purplifh-green. When gathered in October, as auftere as an unripe medlar; but after lying a few weeks, it firft acquires a fweet fcent, which is but temporary, and at length towards December, thefe pears become foft, like medlars, and very good eating.

11. P. *Malus*. Common Apple, or Crab. tree. Linn. Sp. Pl. 686. Willd. n. 9. Ait. n. 6. Sm. Fl. Brit. n. 2. Engl. Bot. t. 179. Fl. Dan. t. 1101. Mill. Illuftr. t. 44. (Malus fylveftris; Ger. Em. 1461.)—Leaves elliptic-oblong, pointed, ferrated, fmooth. Umbels fimple, feffile. Styles fmooth. — Native of woods and hedges throughout Europe, and ftill more valuable, for its innumerable and ufeful varieties, as a cultivated plant, than even the Pear, n. 8. The Crab itfelf, or Wild Apple, though always too auftere to be eaten raw, is fubject to fome varieties that are worthy of notice for kitchen ufe. This fpecies produces its elegant blufh-coloured bloffoms in May. The *branches* are more horizontal than thofe of *P. communis*, as well as more twifted and diforderly. The younger *leaves* are downy beneath. *Fruit* roundifh, concave, or umbilicated, at the bafe.

12. P. *dioica*. Dioecious Pear-tree. Willd. n. 10. Phytogr. fafc. 1. 8. Moench. Weiffenft. 87. t. 8. *Willd.* (Malus non florens, fructificans tamen; Bauh. Pin. 433.)—Leaves oval, pointed, ferrated. Flowers axillary, dioecious. Petals linear, the length of the calyx.—The native country of this fingular plant is unknown. Profeffor Willdenow, from whom we have dried fpecimens, fufpects it to be poffibly a variety of the preceding fpecies. The *flowers* are fmall, forming in appearance fhort downy *umbels*, at the ends of the branches, but each feparate ftalk is accompanied by a leaf. *Petals* yellowifh-green, not exceeding the *calyx*. *Styles* five, fmooth. We have feen the female plant only.

13. P. *fpectabilis*. Chinefe Apple-tree. Ait. n. 7. Willd. n. 11. Curt. Mag. t. 267. Schneev. Ic. t. 15.—Leaves oval-oblong, ferrated, fmooth. Umbels fimple, feffile, nearly fmooth, without bracteas. Styles woolly at the bafe.—Native of China, from whence Dr. Fothergill is faid to have imported it in 1780. The tree proves tolerably hardy in our gardens, flowering early in May. The *leaves* are furnifhed with copious fhallow ferratures, and have downy *footftalks* and *ribs*. The *umbels* are nearly, if not quite, fmooth, and confift of eight or ten large and handfome rofe-coloured *flowers*, for which alone this plant is cultivated, the *fruit*, which is yellow, an inch in length, and ufually elongated a little at the bafe, being fparingly produced, and of no value. We can difcover no *bracteas*, and if we are not miftaken, the want of them affords the fureft mark of diftinction between this fpecies and the two following.

14. P. *prunifolia*. Siberian Crab-tree. Willd. n. 12. Ait. n. 8. (P. Malus β; Ait. ed. 1. v. 2. 175. Cratægus cerafi folio, floribus magnis; Mill. Ic. t. 269.)—Leaves ovate, pointed, with fhallow ferratures. Umbels fimple, feffile, downy. Bracteas linear, toothed, deciduous. Styles woolly at the bafe.—Native of Siberia, according to Miller, who fays the feeds were fent from Dauria to Peterfburgh, and who had it, bearing flowers and fruit, at Chelfea, before the year 1758. This tree is now common in gardens, the fruit, which refembles a white-heart cherry in fize and colour, but which is liable, in both refpects, to vary, being efteemed for preferving, as well as for tarts; nor is it, when mellowed by froft, unpleafant to eat raw. The *leaves* are rather more downy than the laft, but their ribs are fmooth. *Flowers* copious, with a light fweet fcent, their colour much paler and their fize fmaller than *P. fpectabilis*. *Flower-ftalks* very downy. *Bracteas* fmooth, membranous, very narrow, above half an inch long.

15. P. *baccata*. Small-fruited Crab-tree. Linn. Mant. 75, excluding the reference to Miller. Willd. n. 13. Ait. n. 9. Pall. Roff. v. 1. p. 1. 23. t. 10. Gifeke Ic. fafc. 1. t. 12. (Cratægus cerafi foliis, floribus magnis; Amm. Ruth. 195. t. 31.) Leaves ovato-lanceolate, pointed, fharply ferrated, fmooth. Umbels fmooth, fimple, feffile. Bracteas linear, flightly toothed, deciduous. Styles naked. Fruit fmaller than the petals.—Found in low fituations, about the banks of rivers, in Siberia, flowering the end of May. We received fpecimens from the garden of the late Right Hon. Charles Greville, at Paddington, in flower April 21, 1803. This differs from the laft, with which fome botanifts have confounded it, in having broader, more acutely ferrated, fmoother *leaves*; fmooth *flower-ftalks* and *ftyles*; and a fmall red *fruit*, not bigger than a common haw. The *calyx* in both is deciduous, leaving a fcarred hollow on the top of the *fruit*.

16. P. *coronaria*. Sweet-fcented Crab-tree. Linn. Sp. Pl. 687. Willd. n. 14. Ait. n. 10. Purfh n. 7. Kalm's Travels, Englifh edition, v. 2. 166.—Leaves broad-ovate, fomewhat lobed or angular, ferrated, fmooth. Flower-ftalks corymbofe. Styles woolly in the lower part.—Native of woods in North America, from Pennfylvania to Carolina, flowering in May. It has long been cultivated in England, for the fake of the beauty and violet-like fragrance of its blufh-coloured *bloffoms*, as well as for its *fruit*, which is as big as a fmall golden-pippin, extremely acid, but excellent for preferving with fugar. The *leaves* are diftinguifhed by their breadth, and by being flightly lobed, like fome of the lefs deeply cut leaves of the Hawthorn, but thrice as large.

17. P. *anguftifolia*. Narrow-leaved Crab-tree. Ait. Hort. Kew. ed. 1. v. 2. 176. ed. 2. n. 11. Willd. n. 15. Purfh n. 8. (P. coronaria; Wangenh. Amer. 61. t. 21. f. 47.)—Leaves lanceolate-oblong, fhining, with tooth-like notches; contracted and entire at the bafe. Flower-ftalks corymbofe. Found in the low woods of Carolina, flowering in May. It refembles the foregoing fpecies, but the *fruit* is very fmall. *Purfh.* This is faid in Hort. Kew. to have been cultivated in 1750, by Mr. Chriftopher Gray. We have never examined it, nor have we any account of the *ftyles* being downy or otherwife.

18. P. *japonica*. Japan Apple-tree. Thunb. Japon. 207. Willd. n. 16. Ait. n. 12. Curt. Mag. t. 692. (Malus Japonica; Andr. Repof. t. 462. Buke; Kæmpf. Amoen. 844.)—Leaves elliptic-oblong, fharply ferrated, very fmooth. Stipulas lunate, deeply toothed. Flower-ftalks fomewhat aggregate. Calyx abrupt. Seeds numerous in each cell.—Gathered by Thunberg, on mount Fakona in Japan, where it flowers from February to April. It proves quite hardy in our gardens, into which fir Jofeph Banks introduced it in 1796, flowering at the fame feafon, and alfo frequently again in autumn. When the fpring is fevere, the beautiful deep fcarlet *bloffoms* require the fhelter of a glafs frame. The *ftem* is fomewhat thorny. *Leaves* deep green; the firft that come out are fhort and abrupt. *Stipulas* on the young branches, half an inch or an inch broad. *Fruit* globular, we have not feen it ripe. *Seeds* very numerous in each cell, one above another, fo that we cannot but feel fome fcruples as to the genus of this fpecies.

19. P. *Cydonia*. Common Quince-tree. Linn. Sp. Pl. 687. Willd. n. 17. Ait. n. 13. Jacq. Auftr. t. 342.

Woodv. Med. Bot. t. 79. (Malus cotonea; Ger. Em. 1452. Matth. Valgr. v. 1. 217.)—Leaves roundifh-elliptical, entire; downy beneath. Flowers folitary, ftalked. Calyx ferrated, reflexed.—Native of the rocky banks of the Danube. Naturalized in the hedges of Germany. Dr. Sibthorp found it wild in the northern parts of Greece, in which country it retains the ancient name κυδωνιά. This was among the firft exotic fruits cultivated in England, where it bloffoms in May or June, and ripens fruit in autumn. The *tree* is rather fpreading than tall. *Leaves* roundifh, various in fize; fmooth and light green above; white with foft denfe down beneath. *Flower-ftalks* and *calyx* more or lefs woolly. *Petals* large, flefh-coloured. *Fruit* large, yellow, very auftere and aftringent, but with a peculiar and very powerful fragrance. Cookery renders it mild, and to moft perfons highly grateful. There are three or four angular *feeds* in each cell, ranged horizontally, not, as in the laft, vertically. The Quince is fuppofed to be the golden apple of the Hefperides, fo famous in ancient fable.

20. P. *falicifolia*. Willow-leaved Crab-tree. Linn. Suppl. 255. Willd. n. 18. Ait. n. 14. Pallas Roff. v. 1. p. 1. 20. t. 9.—Leaves linear-lanceolate, hoary, nearly entire; downy beneath. Flowers folitary, almoft feffile.—Native of Siberia, America, and mount Hæmus. Sent to Kew, by Pallas, in 1780. It is a hardy tree, flowering early in fpring, and known by its hoary, narrow, willow-like *leaves*. The *flowers* are terminal, folitary, and nearly feffile; not axillary. *Fruit* pear-fhaped, an inch long, brown, not at all eatable till mellowed by froft, like medlars; and even then not very good.

21. P. *Chamæmefpilus*. Baftard Quince. Ehrh. Beitr. fafc. 4. 19. Sm. Prodr. Fl. Græc. Sibth. n. 1158. (Mefpilus Chamæmefpilus; Linn. Sp. Pl. 685. Willd. Sp. Pl. v. 2. 1011. Ait. Hort. Kew. v. 3. 206. Cratægus Chamæmefpilus; Jacq. Auftr. t. 231. Cotanafter Gefneri; Ger. Em. 1606.)—Leaves elliptical, fharply ferrated, fmooth. Flowers in corymbofe heads. Calyx very woolly within. Styles two, fmooth.—Native of the alps of Auftria, Savoy, and Switzerland, as well as of mount Athos, and the Pyrenées, flowering in June. A bufhy *fhrub*; the *leaves* two or three inches long and one wide; entire at the bafe; of a deep fhining green; their under fide paler, marked with many tranfverfe parallel veins. *Flowers* fmall, deep rofe-coloured. *Calyx* very denfely lined with long white wool. *Styles* and *feeds* but two. *Fruit* corymbofe, oval, of an orange fcarlet, the fize of a haw.

22. P. *Aria*. White Beam-tree, or White Wild Pear-tree. Ehrh. Beitr. fafc. 4. 20. Arb. 84. Sm. Fl. Brit. n. 7. Engl. Bot. t. 1858. Willd. n. 19. Ait. n. 15. (Cratægus Aria; Linn. Sp. Pl. 681. Fl. Dan. n. 301. t. 302. Aria Theophrafti; Ger. Em. 1327.)—Leaves elliptical, cut, and ferrated; white and downy beneath, with crowded parallel veins. Corymbs compound, woolly. Styles two or more.—Native of limeftone rocks, or chalky hills, in moft parts of Europe; not rare in the mountainous countries of England, flowering in May, ripening fruit in September. A handfome fmall *tree*, much cultivated in home plantations. The young *branches*, like the *ftalks*, *calyx*, and backs of the *leaves*, are very white, with mealy or cottony down. The *leaves* vary from an ovate or obovate figure, to a more correct oval, and are pretty regularly cut, as well as ferrated, but not finuated or lobed; their veins, or fide-ribs, numerous, ftraight and parallel; their upper fide fmooth. *Corymbs* fubdivided, many-flowered, cottony. *Petals* white, the fize of thofe of the Hawthorn. *Styles* two, often three, rarely four. *Fruit* nearly globular, fcarlet, dotted, meally and acid; its cells coriaceous rather than horny, equal in number to the ftyles, with two *feeds* in each.

23. P. *intermedia*. Swedifh White Beam-tree. Ehrh. Beitr. fafc. 4. 20. Arb. 94. Willd. n. 20. Arb. 268. Ait. n. 16. (Sorbus alpina, foliis finuofis; Fl. Dan. n. 302. t. 301. fig. in flower only. S. hybrida; Hudf. 216.)—Leaves elliptical, lobed, cut and ferrated; white and downy beneath, with rather diftant veins. Corymbs compound, woolly. Styles two or more.—Native of Sweden. Found by Mr. Waring, on the walls of caftle *Dinas y Brān*, North Wales. *Hudfon*. Specimens from the original plant prove the fame as thofe of Ehrhart, and differ from the common *P. Aria*, only in having the *leaves* fo far cut, as to be, in fome degree, pinnatifid, owing to which the tranfverfe veins are rather more diftant from each other. We can fcarcely admit it to be more than a variety, as Linnæus made it in Sp. Pl. 681. It is his Lapland plant, Fl. Lapp. n. 199.

24. P. *pinnatifida*. Baftard Mountain Afh. Ehrh. Beitr. fafc. 6. 93. Exficc. 145. Sm. Engl. Bot. t. 2331. (P. hybrida; Sm. Fl. Brit. n. 6, excluding the fynonyms of Hudfon and Withering. Sorbus hybrida; Linn. Sp. Pl. 684. Linn. Fil. fafc. 1. t. 6. Willd. Sp. Pl. v. 2. 1008. Ait. Hort. Kew. v. 3. 204. Fl. Dan. n. 302. t. 301. fig. in fruit.) Leaves oblong, deeply pinnatifid, or half pinnate; downy beneath. Corymbs compound, woolly. Styles about three.—Native of Sweden. Gathered wild, by the late Mr. J. Mackay, in rocky places on Cairn na Callich, and other mountains, at the north end of the ifle of Arran. It is frequent in plantations, flowering in May, and propagated by feed. This was thought by Linnæus to be a mule, between *Aria*, and *aucuparia* hereafter mentioned. It nearly accords with the former, but the *leaves* are more oblong and acute; very deeply pinnatifid, or even pinnate, in their lower part. The *flowers* and *fruit* almoft agree with thofe of *aucuparia*. The *ftyles* are ufually three or four.

25. P. *aucuparia*. Mountain Afh; Quicken, or Roan Tree. Ehrh. Beitr. fafc. 6. 94. Gærtn. v. 2. 45. t. 87. Sm. Fl. Brit. n. 5. (Sorbus aucuparia; Linn. Sp. Pl. 683. Willd. Sp. Pl. v. 2. 1008. Ait. Hort. Kew. v. 3. 204. Fl. Dan. t. 1034. Mill. Illuftr. t. 43. Engl. Bot. t. 337. S. fylveftris; Ger. Em. 1473. Matth. Valgr. v. 1. 238.) Leaves pinnate; leaflets equal, ferrated, fmoothifh. Corymbs compound, fomewhat panicled. Styles about three.—Native of mountainous places, in the colder parts of Europe; abundant in Scotland, Derbyfhire, &c. flowering in May, and very common in domeftic plantations. An elegant and very hardy *tree*, of flow growth, the wood being hard and tough. *Leaves* all diftinctly pinnate, of many pair of oppofite, oblong, fmooth, ferrated *leaflets*, more or lefs entire towards the bafe, with an odd one; the young ones downy beneath. *Flowers* very numerous, white, the fize of the three laft, but rather more panicled. *Fruit* fcarlet, acid and bitter, yet eatable when prepared with fugar. According to Lightfoot, this tree is found generally about the Druidical circles in North Britain, and is ftill believed, by the fuperftitious Highlanders, to be powerfully efficacious againft witchcraft.

26. P. *domeftica*. True Service Tree. Ehrh. Beitr. fafc. 6. 95. Exficc. 155. Sm. Fl. Brit. n. 4. Engl. Bot. t. 350. (Sorbus domeftica; Linn. Sp. Pl. 684. Willd. Sp. Pl. v. 2. 1009. Ait. Hort. Kew. v. 3. 204. Jacq. Auftr. t. 447. Matth. Valgr. v. 1. 237. Sorbus; Ger. Em. 1471.)—Leaves pinnate; leaflets equal, ftrongly ferrated, downy beneath. Flowers panicled. Styles five.—Native of the warmer parts of Europe. Dr. Sibthorp found

found it in Greece, as well as on mounts Hæmus and Athos, and in woods near Conftantinople. Ray fpeaks of it as wild in the mountainous parts of Cornwall and Staffordfhire. It is now rarely cultivated, being, though a handfome tree, yet of flow growth, and inferior in the value of its fruit to the Medlar. A folitary individual of this fpecies now and then occurs, about ancient manfions and very old orchards. It bloffoms in May. The *leaves* are larger, and the *flowers* twice the dimenfions of the laft, being the fize of hawthorn-bloffoms, rather panicled than corymbofe. *Fruit* like a fmall pear, reddifh, above an inch long, with five cells, anfwerable to the five *ftyles*; its cells with two valves, like thofe of a Common Pear; and though only one *feed* is perfected in each cell, Gærtner obferved two in an early ftate. This *fruit*, if tafted before it is mellow, occafions a moft intolerable forenefs at the back of the palate, lafting many hours. When ripe it is foft, brown, and agreeably acid. The name *Service* is evidently a corruption of *Sorbus*.

27. P. *torminalis*. Wild Service Pear-tree. Ehrh. Beitr. fafc. 6. 92. Sm. Fl. Brit. n. 3. Willd. Sp. Pl. n. 21. Ait. n. 17. (Cratægus torminalis; Linn. Sp. Pl. 681. Engl. Bot. t. 298. Fl. Dan. t. 798. Jacq. Auftr. t. 443. Mill. Illuftr. t. 42. Sorbus torminalis; Ger. Em. 1471. Matth. Valgr. v. 1. 239.)—Leaves fimple, fomewhat heart-fhaped, ferrated, acute, fmooth, feven-lobed; the lower lobes fpreading.—Native of Germany, Switzerland, England, and the Levant, in woods, flowering in April or May. A moderate-fized *tree*, with a hard wood, and fmooth bark. *Leaves* on long ftalks, without *ftipulas*, unequally lobed, pointed; their ribs fometimes downy beneath. *Corymbs* downy, much branched. *Flowers* fmaller than the laft. *Styles* three, four, or five. *Fruit* brown, dotted, twice the fize of a haw, very pleafantly acid and pulpy, when touched by froft, and often fold in the London fruit-fhops. By the fpecific name, it fhould feem to be of a griping quality. Tragus, in his p. 1010, reprefents it as powerfully expelling worms.

28. P. *hybrida*. Mule Service Pear-tree. Willd. n. 22. Moench. Weiffenft. 90. t. 6. *Willd.* — Leaves elliptical, ferrated, downy beneath; fimple or pinnate, the terminal one largeft. Flowers corymbofe. Calyx hairy.—This is afferted by Profeffor Willdenow, from whom we have fpecimens, to be a mule production, from the firft fpecies, *P. arbutifolia*, impregnated by the 25th, *aucuparia*. It retains indeed as great a refemblance to both parents as it poffibly could to what are fo diffimilar to each other. The fimple *leaves* are two inches or more in length, obtufe, ftrongly ferrated; the lateral *leaflets*, of the compound ones, half, or one-third, as large, unequal at the bafe. *Stipulas* ovate, toothed, recurved. *Flowers* not much unlike the laft, but their *cymes* fomewhat fmaller, with hairy, rather than downy, ftalks. It is curious that the rib of each *leaf*, on its upper fide, retains fome portion of the brown glands characteriftic of *P. arbutifolia*.

29. P. *anthyllidifolia*. Kidney-vetch-leaved Service-tree. —Leaves pinnate, entire; filky beneath. Corymbs axillary and terminal, of few flowers.—Gathered in the Sandwich iflands, by Mr. Menzies, to whom we are obliged for fpecimens, under the name of *Sorbus*, to which, now abolifhed, Linnæan genus there can be no doubt that this tree belongs, though we have not feen the fruit. The *leaves* are all uniformly pinnate, two or three inches long, of eight or nine pair, befides an odd one, of equal, oblong or obovate, obtufe, minutely pointed, entire leaflets, half an inch at leaft in length; fmooth and fhining above; paler and filky beneath. *Stipulas* lanceolate, a little hairy, deciduous. *Flower-ftalks* axillary and terminal, nearly the length of the leaves, downy, corymbofe, though each bears but three or four *flowers*, which are about the fize of *P. aucuparia*. *Bracteas* awl-fhaped. *Calyx* woolly. *Styles*, as far as we can fee, three, hairy at the bafe. The *leaves* of this very pretty and remarkable fpecies ftrikingly convey the idea, at firft fight, of fome kind of *Anthyllis*, efpecially *A. Barba Jovis*.

Pyrus, in *Gardening*, contains plants of the fruit-tree kind, of which the fpecies cultivated are the common pear-tree (P. communis); the common apple-tree (P. malus); the Chinefe apple-tree (P. fpectabilis); the Siberian crab-tree (P. prunifolia); the fweet-fcented crab-tree (P. coronaria); and the quince-tree (P. cydonia.)

With refpect to the firft, it is obferved that "the wild pear, the mother of all the orchard and garden varieties, is thorny. The ftipules are fetaceous, white (or reddifh), deciduous; the peduncles alternate; and the calyx clothed with a ferruginous wool."

There are numerous varieties; but thofe of moft importance for cultivation are,

The little mufk, which is often termed the fupreme. The fruit, when ripe, is of a yellow colour; the juice fomewhat mufky; and, when gathered before it be too ripe, it is a good fruit. It becomes ripe about the latter end of July, but continues good only a very fhort time.

The chio, or little baftard mufk, which is pretty much like the other, but fmaller. The fkin, when ripe, has a few ftreaks of red on the fun fide.

The green chiffel, or Haftings, which is a middle-fized fruit, that always remains green, and is full of juice when ripe. It becomes ripe in the beginning of Auguft.

The red mufcadelle, which is a large early pear, of great beauty; the fkin is of a beautiful yellow, ftriped with red, and the flefh has a rich flavour. It fometimes produces two crops in a year; the firft about the end of July, and the fecond in September, or thereabouts.

The little mufcat, which is a fmall pear, having the fkin very thin, and of a yellowifh colour, when ripe. This fruit has a rich mufky flavour, but does not keep long. It becomes ripe about the beginning of Auguft.

The lady's thigh, which is here commonly called jargonelle, is of a ruffet-green colour from the fun, but towards it inclining to an iron colour; the flefh is breaking, and has a rich mufky flavour. It becomes ripe about the middle of Auguft.

The Windfor, which has a fmooth fkin, and when ripe is of a yellowifh-green colour; the flefh is very foft, and, if permitted to hang but two or three days after it is ripe, grows mealy, and is good for nothing. It becomes ripe about the latter end of Auguft.

The jargonelle, which is commonly called cuiffe madame. According to Mr. Forfyth, it is certainly the true French jargonelle, and the pear that commonly goes by that name here is the real cuiffe madame, or lady's thigh; it being very probable that the names have been changed, in coming to this country. This pear is fomewhat like the Windfor; the fkin is fmooth, and of a pale green colour. It is a plentiful bearer; but the flefh is apt to be mealy, if it ftands to be ripe, which is about the middle of Auguft. It bears beft on ftandards.

The orange mufk, which is of a yellow colour, fpotted with black; the flefh is mufky, but very apt to be dry. It ripens about the latter end of Auguft.

The great blanquet, or bagpipe of Anjou, which has a fmooth fkin of a pale green colour; the flefh is foft, and full

full of juice of a rich flavour. It ripens about the middle of Auguft.

The little blanquet, which is much lefs than the former, of a pale colour, and the flefh tender, and full of a rich mufky juice. It ripens about the latter end of Auguft.

The long-ftalked blanquet has a very fmooth fkin, white, and a little coloured towards the fun, and is full of a rich fugary juice. It becomes ripe at the latter end of Auguft.

The fkinlefs or early ruffelet, which is of a reddifh colour, the fkin extremely thin, and the flefh melting and full of a rich fugary juice. It ripens in the latter end of Auguft.

The mufk robine, or queen's pear, (alfo called the amber pear,) which is fmall, and of a yellow colour when ripe; it has a rich mufky flavour, and is a great bearer. It ripens about the latter end of Auguft.

The mufk drone, which has a fkin of a yellow colour when ripe, and a rich mufky tafte; but is apt to grow mealy, if left too long on the tree. It ripens about the beginning of September.

The red orange, which is of a greenifh colour, but the fide next the fun changes to a purple colour, when ripe; the flefh is melting, and the juice fugary, with a little perfume. It ripens in the beginning of Auguft.

The caffolette, or green mufcat, is a fmall greenifh pear, with fome fpecks in the fkin. It is full of a rich perfumed juice, and ripens in the latter end of September.

The great onion, brown admired, or king of fummer, which is of a brownifh colour next the fun, and becomes ripe in the beginning of September.

The mufk orange, in which the fkin is green, and the flefh melting. It ripens in the beginning of September.

The avorat, or Auguft mufcat, which has a fmooth fkin of a whitifh yellow colour; the juice is richly fugared and perfumed, and it is efteemed one of the beft fummer pears yet known. It is a great bearer, and becomes ripe in the beginning of September.

The rofe, or thorny rofe, which is fhaped like the great onion pear, but much larger, of a yellowifh-green colour, but a little inclining to red next the fun. The flefh is breaking, and the juice mufky. It becomes ripe in the beginning of September.

The poire du puchet, which has the flefh foft and tender, and the juice fugary. It ripens in the beginning of September.

The perfumed pear, which is of a deep red colour, fpotted with brown; the flefh melting, but dry, and has a perfumed flavour. It ripens in the beginning of September.

The falviati, which is red and yellow next the fun, but whitifh on the other fide; the flefh is tender, and the juice fugary and perfumed. It ripens about the middle of September.

The rofe water, which has the fkin rough, and of a brown colour, the juice very fweet, tafting like rofe-water. It ripens in the latter end of September.

The ruffelet, in which the flefh is foft and tender, and the juice agreeably perfumed. It ripens in the latter end of September.

The great mouthwater, which has the flefh melting and full of juice. It ripens about the latter end of September.

The prince's pear, which has a highly-flavoured juice, and is a great bearer, ripening about the latter end of September.

The fummer bergamot, which is fometimes called Hamden's bergamot. The flefh is melting, and the juice highly perfumed. It ripens about the latter end of September.

The autumn bergamot, which is fmaller than the former; the flefh is melting, and the juice highly perfumed. It is a great bearer, and ripens in the beginning of October.

The fummer bonchrétien, which is very full of juice, and is of a rich perfumed flavour. It ripens about the middle of September.

The beurré rouge, (the red butter pear,) which has the flefh very melting and full of a rich fugary juice. It ripens in the beginning of October, and, when firft gathered from the tree, is one of the very beft forts of pears.

The dean's pear, which has the flefh melting and full of juice, which is very cold. It is a great bearer, and ripens in the beginning of October.

The Swifs bergamot has a melting flefh, and is full of juice. It ripens in the beginning of October.

The long green, in which the flefh is melting and full of juice. It ripens in the latter end of October. It is, by fome, reckoned the fame with the mouthwater.

The white and grey monfieur John, which are the fame; the difference of their colour proceeding from the different foils and fituations wherein they grow, or the ftocks on which they are grafted. If this pear be rightly managed, there are not many forts in the fame feafon to be compared with it. The flefh is breaking, and full of a rich fugared juice. It ripens in the latter end of October or beginning of November.

The flowered mufcat, which is an excellent pear; the flefh is very tender, and of a delicate flavour. It ripens in November.

The vine pear, which is of a dark red colour; the flefh very melting, and full of a clammy juice. It comes into eating in November.

The rouffeline pear, which is of a deep red colour, with fpots of grey; the flefh is very tender and delicate, and the juice very fweet, with an agreeable perfume. It ripens about the latter end of October, but does not keep.

The knave's pear, which has the flefh fine and tender, and the juice very much fugared. It ripens in the latter end of October.

The marquis pear is a pear which, when it does not change yellow in ripening, is feldom good; but if it does, the flefh will be tender, delicate, and very full of juice, which is fugared. It comes into eating in November.

The Crafane pear, which has the flefh extremely tender and buttery, and full of a rich fugared juice. It is the very beft pear of the feafon, and comes into eating about the latter end of December.

The Lanfac, or Dauphiné pear, which has the flefh yellow, tender, and melting; the juice is fugared, and a little perfumed. It is in eating the beginning of December.

The martin fec (the dry martin), which is almoft like the ruffelet in fhape and colour; the flefh is breaking and fine; and the juice fugared, with a little perfume. It is in eating about the beginning of December.

The amadot, which is rather dry, but high-flavoured: it is in eating about the middle of December.

The little lard pear, which is extremely fine; the flefh melting; the juice much fugared, and has an agreeable mufky flavour. It is in eating the latter end of December, and is efteemed one of the beft fruits in that feafon.

The Louifbon (the good Lewis), which has the flefh extremely tender, and full of a very fweet juice. It is in eating about the middle of December.

The Colmar pear, which is very tender, and the juice greatly fugared. It is in eating about the beginning of January, and is efteemed an excellent fruit.

The l'efchafferie, which has the flefh melting and buttery; the

the juice is fugary, with a little perfume. It is in eating about the firft of January. It bears beft on ftandards.

The virgouleufe pear, which is efteemed by fome as one of the beft fruits of the feafon; the flefh is melting, and full of a rich juice. It is in eating about the firft of January. In dry and cold feafons it is very apt to crack, which greatly diminifhes its value.

The ambrette, which is efteemed a very good pear; the flefh is quite melting, and full of fweet perfumed juice. It comes into eating about the beginning of January.

The epine d'hyver (the winter thorn pear), which has a very tender buttery pulp, of an agreeable tafte, with a fweet juice highly perfumed. It is in eating about the latter end of December.

The St. Germain pear, which is a fine fruit and keeps long; the flefh is melting, and very full of juice, which in a dry feafon, or if planted on a warm dry foil, is very fweet. It is in eating from December till February. Mr. Forfyth remarks, that it is "an excellent bearer, when planted as a dwarf ftandard, and comes in fucceffion after the fame fort of pears on wall-trees are over."

The St. Auftin, which is pretty full of juice, and which is often a little fharp; the flefh is tender but not buttery. It is in eating the latter end of December, and continues good two months or longer.

The Spanifh bonchrêtien, which is a large fine pear; the flefh is breaking, and the juice fweet. It is in eating in January.

The wilding of Caffay, which is alfo called the fmall winter butter pear, is a fmall fruit; the flefh is melting, and the juice very rich: it is an excellent bearer on ftandards. It is in eating in January.

The martin fire, or the lord martin, which is a good fruit; the flefh is breaking and full of juice, which is very fweet and a little perfumed. It is in eating in January.

Th winter ruffelet, which has the flefh buttery and melting, and generally full of a fweet juice. It is in eating in the latter end of January.

The franc real, or the golden end of winter, which is only efteemed for baking.

The brown beurré, which is of a reddifh-brown colour on the fide next the fun, and yellowifh on the other fide. The flefh is melting, and full of a rich juice. It ripens in October, and is efteemed an excellent pear.

The Holland bergamot, amofelle, or lord Cheney's, which is a very good pear; the flefh is half buttery and tender, and the juice is highly flavoured. It keeps from the end of January till April.

The German mufcat, which is an excellent pear; it is buttery and tender, and the juice is highly flavoured. It is in eating from February till April or May.

The pear of Naples, or Eafter St. Germain, which is half-breaking; the juice is fweet, and a little vinous. It is in eating in March.

The winter bonchrêtien, which is very large; the flefh is tender and breaking, and is very full of a rich fugared juice. It is in eating from the end of March till June.

The la paftorelle, which is tender and buttery, and the juice fweet. It is in eating in March.

The St. Martial, or the angelic pear, which has the flefh tender and buttery, and the juice very fweet. It is in eating in March.

The wilding of Chaumontelle, which is melting, the juice very rich, and a little perfumed. It is in eating in January.

The brown St. Germain, which is a very fine high-flavoured pear on dwarfs and ftandards, and comes in after the wall St. Germain. It continues in eating from December to the end of March.

The pear d'Auch, which was introduced by the late duke of Northumberland. It much refembles the Colmar, but is fuller towards the ftalk. It is in eating from Chriftmas to April, and is, without exception, the beft of all the winter pears.

The fwan's egg, which is a middle-fized pear, in a fhape like an egg; it is of a green colour, thinly covered with brown; the flefh is melting, and full of a pleafant mufky juice. It comes in eating in November. It is healthy, and bears well either as a ftandard or in any other way.

The bergamot de pafque, which has alfo the following names: the terling, the amofelle, the Paddington, and the Tarquin. It is a fine handfome fruit, green when gathered, and of a yellowifh or ftraw-colour when ripe. It comes into eating about the month of April, continues till June, and makes a very handfome appearance at table.

The golden beurré, which is a very fine pear; it is of a beautiful fcarlet colour next the fun, and of a gold colour on the other fide. The flefh is melting, and the juice high-flavoured. It ripens in October. It fucceeds beft on an eaft afpect, and a loamy foil. It is a plentiful bearer. Mr. Forfyth obferves, that it "was introduced from Burgundy by the late marfhal Conway, and was firft raifed, in this country, at his feat of Park Place, near Henley-upon-Thames, now the feat of lord Malmefbury."

The Williams's feedling pear, which refembles a fummer bonchrêtien, but is more juicy, is a great bearer, and ripens in September. Mr. Forfyth fays that it "will be a valuable acquifition to the market-gardeners, as it immediately fucceeds the Windfor pear."

The citron de Carmes, which is a middle-fized pear, of a yellowifh-green caft, full at the eye; of a round fhape, but tapering a little towards the ftalk, which is long. It becomes ripe in July.

And the true golden beurré, which in fhape and fize refembles the brown beurré; but is of a reddifh-brown colour next the fun. It is a very fine pear, but does not keep long. It comes into eating in October.

Mr. Forfyth gives the following felection from Anderfon's and Co's. Catalogue of Edinburgh.

Of the Summer Kinds.—The pear James, which is foon ripe, and foon rotten, has a little flavour, and is the earlieft pear in Scotland.

The early carnock, which is indifferent, of a yellow colour, and bright-red towards the fun; making a beautiful ftandard tree.

The lemon, lady's lemon, or lady Lamont, which is indifferently good, but principally valued for coming early, and being a good bearer in common.

The green pear of Pinkey, which is a fmall green pear, nearly round, of a fweetifh tafte or flavour.

The forrow cow, a Clydefdale pear, which is a large pear with a fhort ftalk; flat towards the eye; the colour red and yellow; the flefh tender, and mufked in its flavour.

The pear fanch, a Clydefdale pear, which is a big-bellied beautiful pear; the tree large, a great bearer, and fit for an orchard; but the fruit is not very good.

The grey honey, which is a pretty good pear.

The green orange pear, or orange vert, which is a very good pear.

The brute bone, chaw good, or the pope's pear, which is only an indifferent fort.

The golden knap, fuppofed Scotch, which is a fmall fummer pear, of tolerably good qualities.

The

The early achan, an indifferent fruit; greatly inferior to the winter pear of that name.

The hanging leaf, which is the name in Clydefdale, is good and beautiful; almoft round; its colour red and yellow; a delicious fweetnefs is found in its tafte.

The Scots bergamot, which is a large good pear, of a yellow and red colour; the flefh tender and juicy.

The Longueville, which is very good, but a precarious bearer; fuppofed French, though not in their catalogues under that name.

The mufked bonchrétien, gratioli, cucumber, or Spinola's pear, which is a very good pear when grafted on a free ftock; its pulp being fomewhat between fhort and tender, with a great deal of perfumed juice, its colour red on one fide, and white on the other.

And the faffron pear, which is a pretty large well-fhaped pear, fit for the orchard or the field.

Of the Autumnal Kinds.—The keather, which is a Clydefdale pear, of middling fize, and oblong fhape, its juice agreeable.

The French carnock, which is tolerably good.

The elfhin haft, or good-man pear, which is a long pear, flat towards the eye: its colour green and yellow; its flefh hard, dry, and fweet in the tafte.

The Drummond, or late Scotch carnock, which is very good, if eaten before it grows mealy; its colour a bright red and yellow.

The vicar, an oblong pear, with the colour yellow, red, and ftriped; tender, fweet, and mufked, but dry in eating.

The royal orange bergamot, which differs from the orange bergamot in being yellower, and fometimes having a faint red on one fide.

The green pear of Yair, which is fweet, juicy, and melting; of a moderate fize; taking its name from Yair, on Tweed-fide, where it was firft difcovered.

The rob hind, which is very indifferent.

The le befideri, the wilding of the foreft of Heri, in Bretagne, which is a yellowifh pear, of middle fize, but which is indifferent.

The unicorn pear, which is of a beautiful red and yellow colour; but rather auftere in the tafte or flavour.

Of the Winter Kinds.—The winter achan, which is a Scotch pear; among the beft early winter pears, and equal to moft of thofe of the French kind.

The brier bufh, which is Scotch; a good pear, and will ripen in moft feafons; it is a fmall pear, of a firm fubftance, and fweet tafte.

The Brompton park, which is a feedling fent by Jefferys of that name.

The round winter, which is a Clydefdale pear, a very excellent winter pear.

The poir portrail, or gate pear, which is proper for baking.

The la double fleur, or the double-flowering pear, which is a large flat beautiful pear, with a fmooth fkin, and blufh colour on one fide, and yellow on the other: it is the beft to preferve, taking a beautiful red colour from the fire.

And to thefe the following lift is added:—The Ambrofia pear, the Afhton town, the autumn mufk bonchrêtien, the bifhop's thumb, the bloody pear, proper for baking, the brocas bergamot, the barland, proper for perry, the befideri, fit for baking, the beurré du roi, the black pear, or Worcefter, fit for baking, the Britannia, the burdelieu, the Doyenne, or St. Michael, the caftillac, fit for baking, the Eafter St. Germain, the Ganfel's bergamot, the golden beurré, the grey beurré, the grey good-wife, the green fugar, the green bergamot, the Huntingdon pear, the huffcap, proper for perry, the king's Catharine, the lammas, the London fugar, the mufcat almain, the mufk blanquet, the Oldfield, proper for perry, the orange bergamot, the pear piper, the pyrus pollveria, the red admirable, the rough cap, proper for perry, the Scotch bergamot, the feven-angled, the filver-ftriped, the Spanifh red warden, beft for baking, the fquafh, proper for perry, the ftriped verte longue, and the white beurré.

And for fmall gardens, where there is room only for a few trees, the following are recommended as proper for furnifhing a regular fucceffion of fruit.

Summer Kinds.—The mufk pear, the green chiffel, the jargonelle, the fummer bergamot, and the fummer bonchrêtien.

Of the Autumn Kinds.—The orange bergamot, the autumn bergamot, the Ganfel's bergamot, the brown beurré, the Doyenne, or St. Michael, and the fwan's egg.

Of the Winter Kinds.—The Craffane, the Chaumontelle, the St. Germain, the Colmar, the d'Auch, the l'efchafferie, the winter bonchrêtien, and the bergamot de pafque.

And the fecond fort, in its wild ftate, is called the crab, or wilding, and is armed with thorns, as well as the wild pear. Miller mentions two varieties in the fruit of the crab, one white, the other purple towards the fun; but it is commonly yellowifh-green with a tinge of red. And alfo a variety with variegated leaves.

There are a great many varieties of the apple, but the following are given by Mr. Forfyth as the moft deferving of attention.

The Acklam's ruffet, which is a fmall Yorkfhire apple, of a ruffet colour toward the fun, and yellow on the other fide; it becomes ripe in January, and keeps till March.

The aromatic pippin, which is a very good apple, of a bright ruffet next the fun; and the flefh has a fine aromatic flavour. It ripens in October.

The Baxter's pearmain, which is a real Norfolk apple, of a handfome fize, and pale-green colour, full of fmall dark fpots. It is a fine kitchen fruit, and will keep till April. It is alfo a good eating apple.

The beauty of Kent, which is a fine large apple, refembling a codlin. It is ftreaked with a fine red towards the fun, and of a beautiful yellow, with fome ftreaks of red on the other fide. It is a very good apple, coming into eating in September, and keeping till the latter end of April.

The belle grifdeline, which is a new feedling raifed at Norwich, of much beauty, and never failing to afford crops. It was firft propagated by Mr. Lindley, who gave it this name. It is a handfome apple, refembling the burfdoff, of a yellow colour, with red towards the fun, and an excellent table apple, keeping till March.

The Bell's pearmain, which is a real Norfolk apple, large and handfome; red toward the fun, and yellow on the other fide. It is a fine kitchen fruit, and pretty good to eat raw, keeping till June.

The beft pool, which is a middle-fized apple, of a pale-green colour, ftreaked with red towards the fun. It is a good apple, in eating from January to April.

The black apple, which is a middle-fized fruit, of a dark mahogany colour next the fun, but fainter on the other fide. It is of a pleafant fweet tafte, keeping till the middle of April.

The Bland's fummer pippin, which is a handfome apple, of a gold colour, and an agreeable flavour. It is a great bearer, ripe in September, and keeps till Chriftmas.

The Blatche's fine fmall table apple, which is about the fize

fize of a fmall golden pippin; red toward the fun, and green on the other fide. It has a fugary tafte, and comes into eating in January.

The boomrey, which is a pretty large handfome apple, of a flat fhape, and deep-red colour; and the flefh is ftreaked with red. It is not fit to eat raw, but will do well for cyder, or for the kitchen. It keeps till April.

The Bovey redftreak, which is a handfome apple, of a flattifh fhape, beautifully ftreaked with a bright red next the eye, which is fmall, and of a yellow colour about the footftalk. It keeps till the latter end of October.

The broad-eyed pippin, which is a fine large apple, with a very large eye; the colour is a greenifh-yellow, with a little red toward the fun. It is a good apple, and keeps till May.

The brandy apple, which is about the fize of a golden pippin, flat-fhaped, and of a yellowifh ruffet colour. It is of a pleafant flavour; comes into eating in January, and keeps till March.

The burfdoff, or queen's apple, which is a beautiful fruit, red next the fun, and of a fine yellow on the other fide. It is a very fine apple; in Mr. Forfyth's opinion, next in perfection to the golden pippin, and about the fame fize. It is of a good flavour; ripening in January, and keeping till March.

The carnation apple, which is a beautiful middle-fized fruit, finely ftriped with red. It is ripe in January, and keeps till May.

The Carbury pippin, which in fize and fhape refembles the French crab, and is of a deep green colour. It is a good baking apple, keeping till March.

The caraway ruffet, which is a handfome ruffet-coloured apple, about the fize of a nonpareil.

The calville, red and white, which are good apples, and of a vinous tafte. Some have a red and fome a white pulp, the white being reckoned of a moft delicious tafte. They are in eating in September, and the following month.

The cat's-head, which is a large oblong apple, of a greenifh-yellow colour, with a little brownifh-red next the fun; fometimes the colour inclines to a ruffet. It is a good baking apple, and is in eating from October to December.

The cockagee, which is a conical-fhaped middle-fized apple, red on that fide next the fun, and of a fine yellow colour on the other. If properly managed, the fruit keeps till February. It is a famous cyder apple, and alfo bakes well.

The codlin, which is generally the firft apple that is brought to market. Its fruit is fo well known that it needs no defcription. It is in eating from July to December; and is good either for baking or boiling.

The Cornifh nonpareil, which is rather under the middle fize, is a little flatted, and of a ruffet colour. It is a very good apple, and keeps till the middle of March.

The Cornifh pearmain, which is of a middling fize, and long fhape; of a dull-green colour on one fide, and ruffet on the other. It is a very good apple, and keeps till the latter end of April.

The Court-of-Wick pippin, which is defcribed by Mr. Billingfly, in his "Survey of Somerfetfhire," as "the favourite apple, both as a table and cyder-fruit, taking its name from the fpot where it was firft produced. It originated from the pip or feed of the golden pippin, and may be confidered as a beautiful variety of that fruit. In fhape, colour, and flavour, it has not its fuperior: the tree is large, handfome, and fpreading, and a very luxuriant bearer. On the whole, it cannot be too ftrongly recommended." It is larger than the golden pippin, of a yellowifh-green colour, and a little tinged with red next the fun. It comes into eating in January.

The Cockles pippin, which is a handfome oval-fhaped apple, below the middle fize, of a ruffet colour, mixed with yellow and red. It keeps till April.

The corpendu, or hanging body, which is a very large apple, and has a red caft on the fide towards the fun; but is pale on the other fide. It takes its name from always hanging downwards; and comes into eating in September.

The Dalmahoy pippin, which is about the fize of a golden pippin, of a green colour, and a little ftreaked with red towards the fun. It has a tolerably good flavour, rather fharp; and is in eating from September to February.

The Dimock's red, which is under the middle fize, of a fine red colour, intermixed with a little yellow on the fide from the fun. It is ripe in January, and keeps till March.

The Dredge's feedling, which is a fine large apple, ftriped with red next the fun, and of a yellowifh-green on the other fide. This is an excellent kitchen apple, of a pleafant tafte, and keeps till the latter end of January.

The Dredge's beauty of Wilts, which is a beautiful apple, of a good fize, and one of the fineft yet known in point of general utility. It is of a fine bright yellow colour, fpotted with red towards the fun; and has an excellent vinous flavour. It is good either for the table or baking, and keeps till March.

The Dredge's ruffet, which is a fmall apple, of a greenifh-ruffet colour, and of a pleafant flavour. It is ripe in November, and keeps till Midfummer.

The Dredge's white lily, which is a fine apple, of an exceeding high flavour, and keeps till March.

The Dredge's fair maid of Wifhford, which is a fine middle-fized apple, of a yellowifh-green colour, with fome ruffet next the fun, of an excellent flavour. It is a great bearer, and is in eating from Chriftmas to Eafter, being an excellent defert apple.

The Dredge's queen Charlotte, which is a beautiful middle-fized apple, of a gold colour, with red towards the fun. It is of an excellent flavour, comes into eating about Chriftmas, and keeps till February.

The Dredge's fame, which is a good fized apple, red towards the fun, and ftreaked like the Ribfton pippin on the other fide. It is a moft excellent apple, being in eating from Eafter to Middfummer.

The dumpling apple, which is a handfome apple, and rather above the middle fize, flat fhaped, and of a greenifh-yellow colour, with fome faint ftreaks of red. It keeps till March.

The Dutch queening, which is a large apple, fomewhat refembling the cat's-head in fhape. The colour is red next the fun, and green on the other fide, with fometimes a little red. The fruit is fit only for the kitchen, and for making cyder. It is ripe in January, keeping till the end of March.

The Elton's yellow kernel, which is a handfome middle-fized apple, of a yellow colour. It is a good table apple, being in eating from January to March.

The Englifh rennet, which is a handfome apple, beautifully ftreaked with red, but darkeft towards the fun; of a tolerable flavour, but apt to grow mealy when kept too long. It keeps till the middle of May.

The embroidered apple, which is pretty large, and the ftripes of red very broad, from which circumftance it takes its name. It is commonly ufed as a kitchen apple, becoming ripe in October.

The everlafting ftriped apple, which is below the middle fize, of a conical fhape. The colour is a ftriped green towards the footftalk, and red towards the eye.

The fameufe, which is a pretty large apple, of a beautiful dark red, with a little yellow on the fide from the fun. Its flefh is very white, and full of a rich fugary juice; coming into eating about the latter end of October. It was introduced from Canada by Mr. Barclay of Brompton.

The fenouillet, ou pomme d'anis, the fennel or anife apple, which is a middle-fized fruit, of a grey colour; the pulp is tender, and has a fpicy tafte, like anifeed. It becomes ripe in September and October.

The flower of Kent, which is a large handfome apple, of a yellow colour, and pretty good flavour. It keeps till the middle of April.

The fox-whelp, which is a fmall apple, ftreaked with red. It is ripe in January. It is a cyder apple.

The Franklin's golden pippin, which is a handfome middle-fized apple, of a conical fhape and gold colour, beautifully marked with dark fpots. The fruit has a fine aromatic flavour, and deferves the firft place at the table; but it is a very fhy bearer. It comes into eating about the middle of November.

The French crab, which is a large handfome apple, of a deep green colour, with a little red next the fun. It will keep all the year; is a good baking apple, and, if the fummer be warm, pretty good for eating, and is a great bearer.

The French codlin, which is a pretty large apple, of a conical fhape, and green colour, with red towards the fun, coming into eating in January.

The Fearn's pippin, which is of the fhape and fize of a nonpareil. It is of a beautiful fcarlet next the fun, and of a golden yellow on the other fide. It makes a fine fhow at table, and keeps till the latter end of February.

The French Spaniard, which is a large apple, in form of a hexagonal prifm with the angles a little rounded, and of a yellowifh-green colour; it is pretty good, and keeps till the latter end of April.

The French or white rennet, which is a large fruit, of a yellowifh-green colour, with fome grey fpots. It has a fugary juice, and is good either for eating or baking.

The Gargey pippin, which is a handfome conical-fhaped apple, under the middle fize, of a greenifh-yellow colour, with a little red towards the fun. This is a pretty good apple, and keeps till May.

The gilliflower, which is a fine handfome apple, red towards the fun, and of a yellowifh-green on the other fide, having a fine flavour, and keeping till the latter end of March.

The golden rennet, which is a beautiful apple, a little flatted; of a fine red colour towards the fun, and yellow on the other fide. It is a good eating apple, and keeps till February.

The golden ruffet, which is a fine middle-fized apple, of a golden ruffet colour, from which it takes its name. It is a good apple, and keeps long.

The golden pearmain, which is a fine apple, above the middle fize, of a fine deep red towards the fun, with a little yellow on the other fide; when much expofed to the fun it is fometimes red all over.

The golden Mundi, which is a fine handfome apple, beautifully ftreaked with red; of a good flavour, excellent for baking, and will keep till January. It is a good fauce apple.

The golden Glocefter, which is a handfome middle-fized apple, of a flat fhape, and gold colour, with red toward the fun. It is a good apple, and keeps till March.

The golden knob is a handfome though rather fmall apple, of a fine gold colour, fometimes inclining to a ruffet. It has a pleafant flavour.

The golden pippin is well known; and the French own it to be of Englifh origin. It is almoft peculiar to this country; for there are few countries abroad where it fucceeds well. It is yellow as gold; the juice is very fweet; the fkin (efpecially where expofed to the fun) is often freckled with dark yellow fpots. It is certainly the moft ancient, as well as the moft excellent, apple that we have. It ripens in October, and keeps through the winter. It has feveral fub-varieties.

The Godolphin apple, which is a very handfome large fine fruit, ftreaked with red on the fide next the fun, and of a yellowifh colour on the other fide. It is in eating from the latter end of September to December.

The green dragon, which is a fine large apple, of an excellent flavour, and pale-green colour. It is rather too large for the table, and is therefore moftly ufed as a kitchen apple. It keeps till March.

The great or large ruffet, which is a middle-fized fruit, of a ruffet colour, with a little dark-red toward the fun. A pretty good apple, and keeps till April.

The Griddleton pippin, which is a large angular-fhaped apple, of a green colour, with a little blufh towards the fun. It is a baking apple, and keeps till March.

The Grumas's pippin, which is about the fize and fhape of a golden pippin; of a dingy-green colour next the fun, and of a dull yellow on the other fide. It is ripe in January, and keeps till April.

The Hagloe crab, which is a yellow-coloured conical-fhaped apple, below the middle fize. It is ripe in January; but is only fit for making cyder, or for baking.

The hall-door, which is a fine large apple, of a flat fhape, beautifully ftreaked with red toward the fun, and of a greenifh-yellow on the other fide. It is of a fine flavour, and is in eating from January till March.

The Hallingbury, which is a large flat-fhaped apple, with large ridges from the bafe to the crown. It is of a beautiful red toward the fun, and of a yellowifh colour on the other fide and towards the eye.

The Hampfhire nonfuch, which is a pretty large well-fhaped apple, of a greenifh-yellow colour, ftreaked with red. It keeps till the latter end of November.

The Harvey's ruffet, which is fo called in Cornwall, is a large ruffet-coloured apple, with a little red toward the fun. It is a famous kitchen fruit, and tolerably good raw, with a mufky flavour.

The Holland pippin, which is a middle-fized apple of a flattifh fhape. Its colour is yellow, in fome places inclining to green, with, fometimes, a little red toward the fun. It is a pretty good apple, keeping till the middle of April.

The hollow-eyed pippin, which is a middle-fized apple, of a yellow colour, beautifully fpotted with red toward the fun; and the eye is pretty deep. It is a good fharp-flavoured apple, keeping till the middle of May.

The hollow-eyed rennet of Cornwall, which is a handfome flat-fhaped apple, under the middle fize, of a greenifh-yellow colour, fometimes intermixed with ruffet. It is of an excellent flavour, and keeps till April.

The hedge apple, which is a new fruit, of middle fize and handfome conical fhape, red toward the fun, and of a ftraw colour on the other fide. It is of a tolerably good flavour, and keeps till the latter end of April.

The hogfhead apple, which is a fmall red fruit; the flefh is red, and the tafte auftere. It is a cyder apple, becomes ripe in January, and keeps till March.

The Hubbard's, or the ruffet pearmain, which is a real Norfolk apple; and, though not handfome, is one of the beft table apples. It is of a dark ruffet colour, becomes ripe in January, and keeps till April.

The John apple, which is a middle-fized handfome fruit, of a green colour, with a little red toward the fun; the footftalk being very fmall. It is an excellent cyder and baking apple, from Devonfhire; it is of an excellent flavour, and keeps till March.

The Ifle of Wight pippin, which is a handfome middle-fized apple, of a greenifh-yellow colour.

The juneting, or jenneting, which is a fmall yellowifh apple, red on the fide next the fun. It is a pretty fruit for early variety, and ripens about the latter end of June or beginning of the following month.

The kernel redftreak, which is of a greenifh-yellow, with broad ftreaks of a dark-red all over it, and a yellow ground finely fpeckled with red next the fun.

The kernel pearmain, which is a fmall handfome apple, red toward the fun, and of a yellowifh-green mixed with red on the other fide. It is of a good flavour, keeping till the middle of May.

The Kentifh pippin, which is a good fized apple, finely ftreaked with red. It is of a fine flavour, comes into eating about Chriftmas, and keeps till February.

The Kentifh nonpareil, which is a handfome flat-fhaped apple, of a light-ruffet colour, inclining to red toward the fun. It is of a good flavour, and keeps till May.

The king of the pippins, which is a middle-fized apple, of a fine gold colour, a little ftreaked with red towards the fun. It is ripe in January, and keeps till the latter end of March, when it becomes mealy.

The king apple, which is a middle-fized apple, of a conical fhape; and its colour is that of a beautiful red intermixed with a little yellow on one fide. This apple is of a pleafant fugary tafte, and keeps till the latter end of April.

The Kirke's feedling, which is a beautiful apple of a fine red colour towards the bafe, and yellow towards the eye. The footftalk is flender, and the eye large.

The Kirke's fcarlet pearmain, which is a handfome middle-fized apple, of a beautiful red toward the fun, and a little yellow on the other fide; becoming ripe in January.

The Kirke's fcarlet admirable, which is a good apple for baking, and of a beautiful fcarlet colour, is in eating about the month of January.

The Kentifh fill-bafket, which is a fpecies of codlin, of a large fize, and generally ufed for baking. It is in eating from Auguft to October.

The Kirton or crack'd pippin, which is a middle-fized apple, of a greenifh-yellow colour, with little dark fpots. The coat is generally rough towards the footftalk. It is a good apple for the table, coming into eating in September.

The lady's finger, which is an excellent table apple, of a conical fhape; red next the fun, and of a yellowifh caft on the other fide, having a fweet pleafant flavour, and keeping till May.

The large ftyre, which is a handfome cyder apple, of a yellow colour, with a little red next the fun. It becomes ripe in November.

The Lifbon pippin, which is a handfome middle-fized apple, of a flat fhape, a fine red toward the fun, and a reddifh-yellow on the other fide. The flefh is firm, and has a fharp pleafant tafte. It comes into eating in November.

The Loan's pearmain, which is a large oval-fhaped apple, of a dull green colour intermixed with a brownifh-red, deepeft next the fun. It is a pretty good table apple, of a fharp tafte, ripening in September, and keeping till May, but is apt to grow mealy.

The London pippin, or five-crowned pippin, which is a fine large apple, of a green colour, ftreaked with red toward the fun. It refembles the Ribfton pippin, but is larger. It has a pretty agreeable tafte; and will come into eating about the latter end of November. It is good for the kitchen and table; and a moft abundant bearer. It keeps till the middle of April.

The le calville d'automne, the autumn calville, which is a large fruit, of an oblong figure, and of a fine red colour toward the fun, having a vinous juice, and is much efteemed by the French.

The long laffer, which is a middle-fized apple, of an angular fhape, and fine yellow colour, with a beautiful red next the fun. It is of a tolerable flavour, and keeps till the middle of May, but is apt to become mealy.

The lemon pippin, which is a handfome oval-fhaped apple, of a gold colour. It is of a fine flavour, and will keep till the beginning of March.

The long feam, which is a large angular-fhaped baking apple of a pretty good flavour, with light green colour. It keeps till the latter end of January.

The lord Cheney's green, which is a middle-fized Yorkfhire apple, refembling the Yorkfhire greening. It is of a dark green colour, with a little of a chocolate colour next the fun. It is a baking apple, and keeps till the middle of May.

The lord Arundel's apple, which is large, of an angular fhape; the colour is green, with a little dingy red towards the fun. It is from France, and good for fauce, keeping well.

The lord Camden's rennet, which is a good-fized feedling, of a yellow colour, with a little brownifh-red next the fun. It is a good flavoured apple, and keeps till March.

The Lucas's pippin, which is a handfome, middle-fized, cylindrical-fhaped apple, of a beautiful orange colour. It is a pretty good fruit, and keeps till the latter end of April.

The maiden's blufh, which is a fmall apple, of a dark mahogany colour next the fun, but paler on the other fide, and fometimes of a greenifh caft. The tafte is auftere, and of courfe this fruit is not fit for the table; but does very well for baking, or for cider. It keeps till the beginning of March.

The Mansfield tart, which is a large Nottingham apple, but moft known in Yorkfhire. It is handfome, of a green colour, having a little caft of brownifh-red, with dark fpots next the fun, being a baking apple, and keeping till February.

The May gennet, which is rather under the middle fize, of a greenifh-yellow colour, flightly ftreaked with red next the fun. It keeps till April.

The major Hemmings's apple, which is a handfome middle-fized fruit, of a light green colour, with a little brownifh-red towards the fun. It is an excellent apple.

The margil, which is an excellent apple, about the fize of a nonpareil. It is of a red colour, with fome yellow on one fide; continues in ufe from November to the latter end of March; and is often fold in the London markets for a nonpareil.

The Margaret apple, which is a fine and beautiful fruit, yellow, ftriped with red, of a delicate tafte, fweet fcent, and generally eaten off the tree. It is ripe in Auguft.

The Minchall crabb, which is a handfome middle-fized Lancafhire apple, of a yellow colour, with fome brown fpots.

ſpots. It is common in the Mancheſter markets, and keeps till April.

The monſtrous rennet, which is a very large apple, turning red towards the ſun, and of a dark green on the other ſide. It is generally preſerved on account of its magnitude, as the fleſh is apt to be mealy. It becomes ripe in October.

The mother rennet, which is rather under the middle ſize, of a greeniſh colour, with a little bluſh towards the ſun. The eye is large and deep, and the footſtalk ſmall.

The New-England pippin, which is a large angular-ſhaped apple, of a green colour, with a little browniſh-red towards the ſun. It has a pretty good flavour, and keeps till March.

The Newton pippin, which, according to Mr. Forſyth, is an American apple, but ſaid to be originally from Devonſhire. It is a fine large apple, of a greeniſh-yellow colour and red, with dark ſpots next the ſun. When much expoſed, it is of a beautiful red towards the ſun, and of a gold colour on the other ſide. It has a fine flavour when not kept till it is too ripe, as then it becomes mealy. It is in eating from November to January.

The new red muſt, which is a fine large apple, of a pale red towards the footſtalk, and of a greeniſh colour towards the eye. It is a cider apple, and fit for baking.

The new red pippin, which is a beautiful middle-ſized apple, of a darp red colour, with a mixture of yellow on the ſide from the ſun. It keeps till March.

The nonſuch, which is a good bearer, and very fit either for the table or kitchen; the cooks, however, complain that it makes but a very ſmall proportion of ſauce. It is ripe in September and October.

The nine-ſquare, which, according to Forſyth, is a Glouceſterſhire apple. It is a large angular-ſhaped fruit, of a fine red towards the ſun, and yellow on the other ſide, with a ſmall mixture of red, keeping till April.

The Norfolk colman, which is a middle-ſized apple, of a mahogany colour towards the ſun, and a dark green on the other ſide. It keeps till Auguſt.

The Norfolk beefin, which is a good-ſized apple, rather flatted, of a deep red colour towards the eye, but paler towards the footſtalk.

The Norfolk paradiſe, which is a large apple, of a dark red colour towards the ſun, and green on the other ſide. It is a nice baking apple, and of a tolerable flavour for eating. It keeps till the middle of May.

The Norfolk ſtoring, which is a pretty large apple, of a dark red colour towards the footſtalk, and green towards the eye. It is of a pleaſant ſharp flavour, being in eating from the latter end of January to the latter end of April.

The northern greening, which is a fine oblong apple, full at the footſtalk, of a pale green colour, with a little red towards the ſun. It is nearly of an equal ſize from the baſe to the crown, and has a fine flavour, being ripe in January.

The nonpareil, which is a fruit deſervedly valued for the briſkneſs of its taſte. It is ſeldom ripe before Chriſtmas, and, if well preſerved, will keep till May. It is juſtly eſteemed one of the beſt apples that have been yet known.

The oak peg, or oaken pin, which is an oval-ſhaped middle-ſized fruit, of a green colour ſtriped with white. It is very full towards the footſtalk, which is ſmall, keeping till June.

The old Engliſh pearmain, which is an oval-ſhaped apple, of a middle ſize, and fine red colour, with a little yellow towards the eye. It is of a pleaſant ſweet flavour; and is in eating from January to March.

The old red muſt, which is a fine large apple, ſomewhat reſembling the new red muſt, both in ſhape and colour, with the addition of dark red ſpots towards the footſtalk.

The old red pippin, which is a middle-ſized apple, red towards the ſun, and of a greeniſh colour on the other ſide. It is a good apple, and keeps till March.

The orange pippin, which is about the ſize of a large golden pippin; of a beautiful gold colour, with a little pale red towards the ſun. It is a handſome apple, of a good flavour, and makes a fine appearance at table, being in eating in October, and keeps till March, but gets flat in the taſte when too long kept.

The Orleans pippin, which is a ſmall flat-ſhaped apple, of a dark red colour, reſembling the Orleans plum.

The paradiſe pippin, which is a handſome middle-ſized apple, of a reddiſh caſt. It comes into eating in October, but will not keep. It grows mealy when too ripe.

The pauſon, which is below the middle ſize, of a conical ſhape, and of a greeniſh-yellow, or light green colour. It is ripe in January.

The Pile's ruſſet, which is a middle-ſized longiſh-ſhaped apple, ruſſet about the footſtalk, yellow towards the middle, and of a browniſh-red about the eye. It is a very firm fruit, of a ſharp acid flavour, being much eſteemed for baking. It ripens in October, and will keep till April.

The pigeonette, which is rather below the middle ſize, of a conical ſhape. It is of a pink colour, pretty dark towards the ſun.

The Pearſon's pippin, which is a nice apple, about the ſize of a large golden pippin, of a yellowiſh colour, and the form a little flat. In Devonſhire, according to Mr. Forſyth, they put theſe pippins into the oven juſt after the bread is drawn, laying a weight over them to flatten them, in the ſame manner as they do the beefin in Norfolk, and bring them to table as a ſweetmeat. It is a very good deſert-apple, and keeps till March.

The pomme griſe, which is a fine apple, from Canada, of a flattiſh form, and ruſſet colour, ſtreaked beautifully with red. It ripens late, and keeps till March. It is an excellent eating apple.

The pomme d'api, which is much valued for its colour, being of a bright red. The tree is a good bearer, and the fruit is not ſubject to be ſhaken with high winds. The fruit ſhould be ſuffered to hang on the tree till October or November, if the froſt do not ſet in. It comes into eating in February and March, and keeps long; but is more admired for its beauty than its flavour, or fineneſs of taſte.

The pomme violette, the violet apple, which is a pretty large fruit, of a pale green, ſtriped with red towards the ſun. It has a ſugary juice, and a flavour of violets, from which it takes its name. It ripens in October, and continues in eating till February, or later.

The pomroy, or king's apple, which ripens nearly as ſoon as the juneting, and though not ſo beautifully covered, is larger and much better taſted. It has a ſub-variety, which is a winter apple.

The pound pippin, which is a large handſome apple, of a greeniſh colour, and is good for baking. It becomes ripe in January.

The poor man's profit, which is a dingy coloured oval-ſhaped apple, below the middle ſize. It is raiſed freely from cuttings; and keeps till January.

The queening, which is from Glouceſterſhire, is a large apple, of irregular ſhape, having large ridges from the baſe to the crown. It is of a dark red, but deepeſt towards the ſun. It is a good cider apple, and bakes well, keeping till the latter end of November.

The queening's kernel, which is a fine apple, above the middle fize, of a deep red colour. Covered very thick with fmall whitifh fpecks. It is a tolerably good apple, and keeps till the latter end of April.

The queen's pippin, which is a fmall handfome apple, of a yellowifh-green colour, fometimes inclining to red on the fide next the fun. It is a fine-flavoured apple, very fit for the table, coming into eating in January, and keeping till May, but is apt to grow mealy when kept too long. Mr. Forfyth fays, "the tree never grows to the height of other apple-trees."

The quince-apple, which is a middle-fized fruit, of a yellow colour, with a little red towards the eye. It is of a pleafant fharp flavour, ripe in January, and keeps till April.

The Ramborn, which is a large fruit, of a fine red next the fun, and ftriped with a yellowifh-green. It ripens about the middle of September.

The red pearmain, which is fmaller than the pearmains in general. It is of a deep red, with a little yellow on one fide. A pleafant fweet apple, and keeps till the middle of April.

The red-ftreak, which is a handfome middle-fized apple, beautifully ftreaked with red. It is a good cider apple, becoming ripe in January.

The red-ftreak feedling, from Longleat, which is from the Dorfetfhire red-ftreak, is a beautiful apple, of a yellow colour, ftreaked with red, particularly next the fun. Forfyth fays, it is fold in the Bath and Briftol markets in the latter end of September, and beginning of October. It is a pretty good apple, but does not keep long.

The red bag, which is a beautiful large Herefordfhire apple, of a longifh fhape, ftreaked all over with a dark red; and is in eating about the middle of October.

The red muft, which refembles the old red muft in fhape; but is of a dark red colour towards the fun, and yellow on the other fide. It is ripe about the middle of November.

The rennette grife, which is a middle-fized fruit, of a grey colour next the fun; it is a very good juicy apple, of a quick flavour, and ripens about the latter end of October.

The red fweet, which is a fmall round apple, red towards the fun, and of a greenifh-yellow on the other fide. It is a good bearer, according to Forfyth, "and much efteemed among the country people of Cornwall, for making a kind of tart or pie, one of their dainties at Chriftmas." It is a pretty good table apple, and keeps till March.

The Ribfton pippin, which is a fine apple, from Ribfton Hall, near Knarefborough, in Yorkfhire. It is a little ftreaked with red towards the fun, and yellow on the other fide, being one of the beft apples for eating and baking, and continues in ufe from the end of October till April. It bears very well as a dwarf, and no garden fhould be without it.

The Robinfon's pippin, which is about the fize of a golden pippin, of a green colour, and partakes of the flavour both of a golden pippin, and a nonpareil. It keeps till May.

The royal George, which is a fine large apple, of a beautiful yellow on one fide, and green on the other. It is a good apple, and keeps till June; but then grows mealy.

The royal nonpareil, which is a handfome apple, of a flattifh fhape, with a fmall footftalk and fine eye. It is about the fize of a common nonpareil, of a green colour, with red towards the fun. It is ripe in January, and keeps till the latter end of March.

The royal pearmain, which is a fine large apple, beautifully ftreaked with red. It is ripe in January, and keeps till March, being a pretty good apple.

The royal ruffet, or leather-coat ruffet, which is a large fruit, and one of the beft kitchen apples that we have. It is alfo a pleafant eating apple, and a great bearer, being in ufe from October to April.

The ruffet pippin, which is of a rough ruffet colour towards the fun, and of a green colour, fometimes inclining to yellow, on the other fide. It is a good keeping apple, and fit either for baking or eating raw. It is ripe about the beginning of February, and keeps till March.

The fummer pearmain, which is ftriped with red next the fun; the flefh is foft, but foon turns mealy; fo that it is not much efteemed. It is in eating in Auguft and September.

The filver pippin, which is a handfome middle-fized conical-fhaped apple, of a fine yellow colour, with a faint blufh towards the fun. The flefh is firm and very white, and of an excellent flavour. It keeps till the middle of May, or later.

The feek no farther, which is a handfome apple, rather above the middle fize, of a pale green colour, a little ftreaked with red. It is of a pleafant though not very high flavour; and is in eating from January to May; but is apt to be mealy when kept longer than the beginning of April.

The Sykehoufe, which is a handfome middle-fized apple, from Sykehoufe in Yorkfhire, of an orange colour towards the fun, fometimes inclining to red, and yellow on the other fide. This is a fine eating apple; ripe in January, and keeps till April.

The ftone pippin, which is of a green colour, ftreaked with red towards the fun. It is of a fharp tafte, and is in eating from January till the middle of May.

The Stoup codlin, which is a large handfome apple, of a pale-green colour, with a little red towards the fun. It is a baking apple, of a pleafant tafte, and keeps till May.

The ftriped nonpareil ruffet, which is a handfome apple, of a greenifh-ruffet colour, with a little brownifh-red towards the fun. It is about the fize of a large nonpareil, is ripe in January, and keeps till March.

The fpice apple, which is a handfome middle-fized angular-fhaped apple, of a yellow colour, and a pleafant flavour. It is ripe in January, and keeps till March.

The Skerm's kernel, which is a conical-fhaped middle-fized apple, beautifully ftreaked with red, deepeft towards the eye, and having a good deal of yellow towards the footftalk. It is ripe in January, and keeps till March.

The fpice rennet, which is a handfome apple, below the middle fize, red towards the fun, and yellow on the other fide.

The Spanifh pearmain, which is a middle-fized oblong apple of a carnation colour, and dark-red towards the fun. It is a pretty good apple, and keeps till the beginning of May.

The Spanifh onion, which is a handfome round apple of a ruffet colour, with a dull red towards the fun. This apple, which is rather below the middle fize, is very good for defert, keeping till March.

The Sharp's ruffet, which is below the middle fize, of a brownifh-red colour towards the fun, and a pale-green on the other fide. It is fhaped like the fruftum of a cone; is of a pretty good flavour; and keeps till May.

The Spencer's pippin, which is a middle-fized apple, of a yellowifh colour, with many dark fpots, being a baking apple, and keeping till the middle of May.

The Tankerton, which is a conical-fhaped yellow apple, with fometimes a little blufh towards the fun. It is an excellent

excellent ſauce apple, and bakes well, being of an agreeable taſte, but too large for the table. It will keep till February.

The tranſparent apple, which was introduced from St. Peterſburg; but it is more curious than uſeful: a tree or two, therefore, will be ſufficient for a garden. It ripens in September or October.

The Trevoider rennet, which is a ſmall handſome ruſſet-coloured apple, of an excellent flavour, and will keep till May.

The white corpendu, which is a middle-ſized long-ſhaped apple, of a yellowiſh colour. It is a good eating apple, and ripens in January.

The ward apple, which is a beautiful flat-ſhaped apple, rather below the middle ſize, of a fine red towards the eye, and of a yellowiſh-green towards the footſtalk. It is a ſharp flavoured fruit, and keeps till June.

The Wheeler's ruſſet, which is of middling ſize, the fleſh firm, and of a quick acid flavour; it is an excellent kitchen fruit, and keeps long. It ripens in October.

The wine ruſſet, which is a middle-ſized conical-ſhaped apple, of a dark ruſſet colour, and ſharp flavour. It keeps till the latter end of April.

The Wheeler's extreme, which reſembles the pomme griſe, and is about the ſize of a nonpareil. It is a flat-ſhaped apple, beautifully clouded with red on a yellowiſh-ruſſet ground; is of an excellent flavour, and keeps till April.

The white muſt, which is a middle-ſized handſome apple, of a greeniſh-yellow colour, with a little red towards the ſun; the flavour is rather tart, but agreeable. It is ripe in January.

The Whitmore pippin, which is a good-ſized handſome apple, ſtreaked with red towards the ſun, and of a pale-yellow on the other ſide. It has firm fleſh, of a tolerably good flavour, and is in eating from November to the latter end of April, or later.

The Wiltſhire cat's-head, which is a large handſome apple, red towards the ſun, and green on the other ſide. It is a very fine baking apple, and of a good flavour, being ripe in January.

The winter pearmain, or Herefordſhire pearmain, which is of a fine red next the ſun, and ſtriped with red on the other ſide; the fleſh is juicy, and ſtews well. It is fit for uſe in November, and, if properly managed, will keep till the latter end of March.

The winter pomroy, which is a pretty large conical-ſhaped apple, of a dark-green colour, a little ſtreaked with red towards the ſun. The coat is rather tough. It is a good baking apple, keeping till January.

The winter box apple, which is a middle-ſized fruit, of a light green colour, and keeps till February.

The woodcock, which is a good-ſized apple, of a dark red next the ſun, and paler, with a little mixture of yellow, on the other ſide. It is ripe in January, and keeps till March, being a good cider apple.

The Wright's nonpareil, which is a Salopian apple, being a great bearer, of a good ſize, and a little flatted. It is a good kitchen apple, and keeps till June. The tree is ſmaller in ſize than moſt other apple-trees.

The Yorkſhire greening, which is a good-ſized flatted apple, of a dull-red colour, with a little green towards the eye. It keeps till Auguſt, or often later.

The ſorts of apples adviſed for a ſmall garden are the following: the juneting, the golden pippins, the nonſuch, the Ribſton pippin, the nonpareils, the queen's apple, the Sykehouſe, the golden rennet, the aromatic pippin, the grey Leadington, the ſcarlet pearmain, the lemon pippin, the pomme griſe, the French crab, and different ſorts of ruſſetins and codlins, for baking.

But there are other varieties and ſub-varieties that may be equally valuable with many of the above ſorts.

Of the ſixth ſort there are the following varieties: the pear quince, with oblong-ovate leaves, and an oblong fruit lengthened at the baſe; the apple quince, with ovate leaves and a rounder fruit; the Portugal quince, with obovate leaves, and an oblong fruit, which is more juicy and leſs harſh than the others, and therefore the moſt valuable.

The quince is a very beautiful tree when in flower, as well as when the fruit is ripe in the autumn, and was cultivated in this country at an early period. According to Mr. Forſyth, the beſt ſort for planting in the fruit-garden is the Portugal, being the fitteſt for baking or ſtewing. It is of a fine purple colour when dreſſed, and is much better for marmalade than any of the other ſorts. The oblong kind, and the apple quince, are alſo planted in theſe ſituations, and other ſorts are employed in the ſhrubberies for producing variety. The above ſorts are likewiſe valuable for mixing with apples in making pies, puddings, &c. as they add a quickneſs to the flavour when flat.

Method of Culture in the Pear Kind.—Theſe trees are raiſed by grafting and budding upon any kinds of pear ſtocks; occaſionally upon quince ſtocks; and ſometimes upon white-thorn ſtocks; but the firſt ſort are preferable for general uſe to have large trees, and the ſecond for moderate growers.

The numerous varieties of theſe trees having been firſt accidentally obtained from ſeed, and as theſe ſeedlings rarely produce the ſame ſorts again, the approved kinds are continued and increaſed only by grafting or budding upon ſtocks raiſed from the kernels of the kinds juſt mentioned. In order to reſtrain the growth of theſe trees, white-thorn ſtocks have alſo been uſed; but theſe are not ſo generally ſucceſsful, and are almoſt in total diſuſe in the nurſeries: of courſe pear ſtocks are proper for general uſe, for principal large trees, both for walls, eſpaliers, and ſtandards; and quince ſtocks for ſmaller growths. For raiſing the ſtocks, the ſeeds or kernels of the different ſorts ſhould be ſown in the latter end of autumn, as November, or December, or early in the ſpring, in beds of light earth, covering them near an inch deep; they come up in the ſpring: and in autumn, winter, or ſpring following, the ſtrongeſt ſhould be planted out in nurſery-rows to remain for grafting and budding, for which, after having from one to two or three years' growth, they will be of proper ſize.

The operations of grafting and budding ſhould be performed in the uſual method; the former in the ſpring, and the latter in ſummer. (See GRAFTING and BUDDING.) For this purpoſe the grafts and buds ſhould be procured from ſuch trees as produce the fineſt fruit of the reſpective ſorts; thoſe deſigned as dwarfs for walls, eſpaliers, or ſtandard-dwarfs, being grafted or budded near the bottom; and in thoſe for half or full ſtandards, the ſtocks may either be previouſly trained up from three or four to ſeven or eight feet high to form a ſtem, then grafted near the top, or be grafted low in the ſtock, like the dwarfs, and the firſt main ſhoot trained for a ſtem the above height: the grafted trees, both dwarfs and ſtandards, ſhoot the ſame year, but the budded ones not till the ſpring after; and when their heads are two years old from the grafting and budding, they may, if thought proper, be planted out for good, or remain longer in the nurſery, as may be found convenient.

The dwarfs for walls, eſpaliers, &c. whether they remain longer in the nurſery, or be tranſplanted at a year old into the garden, ſhould have the firſt ſhoots from the graft or bud,

bud, when a year old, headed down in March to five or fix eyes, to force out a proper fupply of four, fix, or more lateral branches near the ground, to furnifh the wall or efpalier with bearers quite from the bottom, thefe readily producing others to cover the upper part.

Standards, fuppofing them to be grafted on high ftocks, may either be headed near the top of the ftock, or permitted to run up, as the cafe may require, fo that if fhortened it will force out laterals near the head of the ftem, and form a more fpreading full head; and if fuffered to run up with the firft fhoots entire, they form higher and generally more upright heads in the end. Such ftandards, however, as are grafted or budded as low in the ftock as for dwarfs, muft have the firft fhoot trained upright at full length, fix or feven feet high for a ftem: if for full ftandards, they may either be topped at fix feet height, to force out laterals near that part to form a fpreading head, or fuffered to run and branch in its own way to form a more erect and higher head.

The headed trees, both dwarfs and ftandards, on being cut down in the fpring, foon branch out from all the eyes immediately below; when care fhould be taken during the fummer to trim off all fhoots from the ftem, fuffering all the top fhoots to remain entire; when they will form handfome beginning young heads by the end of fummer, and in autumn, winter, or fpring following, may be finally planted out into the garden, &c.

When from neceffity they are retained longer in the nurfery, the whole fhould have proper pruning to reform irregular growths, and the different trees be trained accordingly, fuffering the whole to branch away at full length, not fhortening any after the above general heading down, when a year old, except it fhould feem occafionally neceffary, either to reduce any cafual irregularity, or to procure a more full fupply of lower branches; after which no further general fhortening fhould be practifed to thefe fort of trees; for, after having obtained a proper fet of regular branches near the head of the ftem, they readily furnifh more in their turn to increafe the head on the upper part.

In regard to planting out the trees, they are moftly of proper growth for this purpofe when from one or two to four or five years old, from the graft or bud; but if larger trees are required, thofe of fix or eight years old may be fafely tranfplanted; younger trees, however, always fucceed well, even when only two or three years old.

In felecting pear-trees for planting, Mr. Forfyth advifes the choofing of the oldeft trees that can be found inftead of the young ones, and fuch as have ftrong ftems; to have them carefully taken up, with as much of the roots as poffible, and carefully planted, after cutting in the roots a little, fpreading them as horizontally as can be done. Then to fill up all round the roots with light dry mould; forcing it in, about thofe which lie hollow, with a fharp-pointed ftick; filling the whole up to the top without treading the mould, till the hole be firft filled with as much water as it will contain, leaving it a day or two until the ground has abforbed the water; then to throw on fome frefh dry mould and tread it as hard as poffible, filling the hole up again with mould to within an inch of the top, and giving it a fecond watering, leaving the mould about three inches higher than the border, to fettle of itfelf, and to receive the rain that falls, for at leaft a month. When the mould has become quite dry, it may be trodden a fecond time; then make a large bafon all round the tree, and giving it another watering, mulching the top over with fome rotten leaves or dung, continuing to water the trees once a week in dry weather, and fprinkling the tops frequently with a pot, or hand engine, to keep the wood from fhrivelling till they have taken frefh root; and where the trees are planted againft a wall, the ftems fhould ftand floping towards it; the lower parts of them being fix inches from the bottom of the wall, to give them room to grow, as when planted clofe to the wall at bottom, the ftems, in growing, will be confined on the back, grow flat, and be very unfightly. If any roots are in the way, to hinder it from being planted near enough to the wall, they muft be cut off; at the fame time taking care that the tree does not lean to either fide, but that, when viewed in front, it appear perfectly upright. Sometimes ftandards and half-ftandards are feen planted a foot or two from the wall, which gives them a very difagreeable appearance; fix inches is, he thinks, quite fufficient. Much care fhould be taken not to wound the ftem or root of the tree in planting.

When young trees have two ftems, he advifes always to cut off one of them, leaving the ftouteft and ftraighteft, planting that fide outwards which has moft buds on it.

It is added, that when the buds begin to break well, the trees fhould be headed down to three or four eyes, to fill the wall with fine wood, but never afterward, except the leading fhoot to fill the wall, leaving the fore-right fhoots to be pruned, as hereafter directed. He has had fome trees that had forty pears on them the fecond year; while fome of the fame kind bore only eleven pears the fourteenth year after planting, with the common method of pruning. When fuch old trees as recommended above cannot be procured, the ftouteft and cleaneft of the one-year's old grafting fhould be provided. Where any of thefe trees become ftunted after a number of years, they fhould be headed down as hereafter directed, which will bring them into frefh vigour and fruitfulnefs. The proper feafon for planting them out is any time in open weather from the end of October till March, but the autumn or early winter are the moft advantageous periods. They fucceed well in any common garden foil, or good fertile orchard-ground, or field, that is not very wet, or of a ftiff or ftubborn quality, but moderately light and friable to the depth of one fpade at leaft, and if more the better. The ground fhould be prepared by proper trenching one or two fpades deep, as the depth of good foil will admit, wholly if for a full plantation, or only along the place for each row of trees, in the place for each tree; or only a hole for each tree at proper diftances. The proper diftance for planting the dwarf forts for walls or on efpaliers, is for thofe on free ftocks at not lefs than twenty feet, but if twenty-five, or more, the better, efpecially if the walls be rather low, &c. that there may be full fcope to extend their branches confiderably in a horizontal direction, as they will effectually fill that fpace, or even much more if it be allowed them; but they are often planted much nearer together. It is however of importance to give thefe trees fufficient room, and the higher the walls the better, as is evident by thofe trees growing againft the ends of high buildings, as they extend themfelves very confiderably every way. Some plant cherry-trees or other moderate fhooting fruit-trees in the intervals for a few years, till the pears advance in growth and approach one another, when they fhould be removed. They are to be planted in the ufual way, with their heads entire. See PLANTING.

However, for trees that are dwarfed by grafting or budding upon quince ftocks, from fifteen to eighteen feet may be a proper diftance for planting, either for walls or efpaliers. In refpect to the diftance at which pear-trees fhould be planted againft walls, it is obferved by Mr. Forfyth that when they are grafted on free ftocks, fuch as colmars, pear d'auche, crafanes, l'efchafferies, virgouleufes, and winter and fummer bonchrêtiens, it fhould at leaft be twelve yards diftant

diftant from each other, fuppofing the walls to be from welve to fixteen feet high; but when they are only ten feet, fifteen yards will be little enough for the purpofe.

And where they are planted on fouth walls, vines, peaches, nectarines, or apricots, may be planted between them, till the trees extend fo far as nearly to meet each other; then they may be removed to any other fituation in the garden where they are wanted. And where the pears are planted on weft walls, the fame fort of trees may be planted between them as on fouth walls; the fruit on a weft afpect will come into ufe to fucceed that on the fouth. On an eaft wall different forts of plums and cherries may be planted between the pear-trees till they almoft meet, then tranfplanted as ftandards or wall trees.

It is advifed that the borders for pear-trees in a large garden fhould not be lefs than from ten to twenty feet wide, with a foot-path about three feet from the wall, covered over at top with coal-afhes or road-fand, to make a dry walk for getting at the trees to cut and nail them, to gather the fruit, &c. And that the depth of the mould for them fhould never be lefs than three feet, laying the beft mould at top, to encourage the roots to come as near the furface as poffible. If the bottom be clay, it will be very neceffary, once in every five or fix years, to open the ground round the roots of the trees, and cut off all the large ones that are inclining to run into the clay; as, by this practice, the trees will throw out frefh roots that will run near the furface, provided the mould is good near the top of the borders. And it is fuggefted that a crop of early peas, lettuces, fpinach, or any other fmall crops, may be grown on the borders, during the winter and fpring; but no late crops by any means. If the ground can be fpared, he would advife to have no fummer crops, but keep the borders hoed, in particular after rain; otherwife the ground, if a ftrong loamy or clayey foil, will be apt to crack in dry weather; but by frequent ftirring between wet and dry this will in a great meafure be prevented, and the fun's rays admitted into the mould, which will greatly heighten the flavour of the fruit. When you can conveniently fpare the borders in winter, they fhould be ridged up to fweeten the mould, which may be very well done if you fow early peas on the fides of the ridges; which is by far the beft way to preferve the peas from the froft, and to prevent them from rotting, which will fometimes happen, if the land be ftrong, before they begin to vegetate; or, you may fow an early crop of carrots or fpinach on thefe borders.

With refpect to the general management in the training and pruning of thefe trees, if the young wall and efpalier trees thus planted are only one year old from the graft or bud, having their firft fhoots of a year old entire, thefe fhould in the fpring be headed down to five or fix inches, to force out lower horizontal branches; but if they have been previoufly headed, as advifed above, and have thrown out laterals to form a regular fet of horizontal branches, confifting of fix or more near the bottom, they fhould not now be fhortened, but trained to the wall or efpalier at full length horizontally, preferving an equal number on each fide five or fix inches afunder; they will readily emit a further fupply of horizontal fhoots to cover the wall, &c. regularly upward, and at the fame time not being fhortened, they gradually form themfelves for bearing, as every fhortening of the branches of thefe trees retards their bearing a year at leaft; if, however, there is a want of branches, fome of the middlemoft may be pruned fhort, and trained to the wall or efpalier. According as the trees fhoot in fummer, a further fupply of all the regular fhoots in every part where they occur, fhould be trained in at full length, unlefs it fhall feem neceffary to prune fome ftrong fhoots to obtain a greater fupply of horizontal branches the fame year, in order to furnifh the head as foon as poffible; at this time, however, difplace all the fore-right and other irregular growths of the year, continuing the fupply of regular fhoots clofe to the wall, as they advance in length during their fummer's growth. And in the winter pruning, the fupply of fhoots attained in fummer fhould be well examined, felecting all thofe that are well placed and properly fituated for training in, to increafe the number of horizontal branches on each fide, which fhould be left wholly entire, and at the fame time retrenching any fuperfluities and ill-placed fhoots omitted in fummer; then the whole fupply of regular horizontal branches in every part fhould be trained in ftraight and clofe to the wall or efpalier, equally on both fides of the tree, every branch at the full length, at four, five, or fix inches apart. See Wall, Espalier-*Trees*, and Pruning.

But there is another method fometimes practifed in training thefe trees for walls and efpaliers, which is, that after their firft heading down, and having thrown out feveral laterals, to felect three of the ftrongeft and moft regularly placed, one on each fide and one in the middle, nailing the two fide ones horizontally at full length, and the middle one upright: the tree having produced a further fupply of fhoots in the following year, add two or four of them as fide branches, arranging them on each fide of the ftem as the two former, training the middle fhoot ftill in an upright direction; obferving that where it does not furnifh horizontals low enough, it may be fhortened fo as to make it throw out fhoots at any requifite height, continuing the middle one always upward for a ftem, and the fide ones for bearers. In either of thefe methods of training the trees, continue yearly increafing the number of horizontal fhoots, till the full fpace of walling or efpalier is regularly covered with bearers at equal diftances, conftantly continuing them all at full length, as far as the fcope of walling, &c. will permit; as they naturally form fruit-fpurs at every eye, almoft their whole length, and the fame branches continue in a fruitful ftate a great length of time. When the trees have once filled the wall or efpalier with branches, they need but very little further fupply for many years, and that only occafionally, according as any worn-out or decayed branch occurs, and wants renewing with young wood. See Pruning.

And in the after-prunings in the fummer, which fhould be begun in May, or early in June, rub off all the fuperfluous and unneceffary fhoots of the year, and all fore-right and other ill-placed fhoots, retrenching them quite clofe, being careful to leave the terminating fhoot of every horizontal or bearer entire; and referving here and there a well-placed fhoot, towards the lower parts in particular, and where there are any apparent vacancies, to train up between the mother branches, till winter pruning, when, if not wanted, they muft be retrenched.

But in the winter pruning, which may be performed any time from the fall of the leaf until March, the branches fhould be generally examined, to fee if they are any where too much crowded, or trained irregularly; and where any fuch occur, they fhould be regulated as they may require; and where there are any vacancies, fome contiguous fhoots, referved in the fummer dreffing, fhould be laid in, and all the other fhoots not wanted muft be cut clean out clofe to the branches, being careful ftill to preferve the terminating fhoot of every branch entire, in all parts, as far as the allotted fpace admits, likewife all the fruit-fpurs in every part, faftening in all the branches regularly at full length. In pruning old trees at this feafon, where decayed and worn-out branches occur, they fhould be cut out, and young wood trained in its

its ftead; likewife, where any branch, through age or any other defect, is become barren, it fhould be retrenched, and fome eligible lower young branch, or fhoot, be laid in its place.

Where any of the choicer forts of thefe trees are become worn-out and barren, they fhould be renewed with young bearers, by heading the branches wholly down near the bottom in winter or fpring, when they break out in the old wood, and in the following fummer furnifh a large fupply of ftrong young fhoots, which fhould be trained according to the rules already laid down, when they will foon form a fort of new tree, and bear good fruit. After each winter pruning, the trees which are againft walls and efpaliers require a general nailing, &c. which fhould always be done with great regularity. See WALL-*Trees*, and ESPALIER-*Trees*.

The mode of training dwarf ftandard-trees of this fort is fhewn in fpeaking of trees of that kind. See DWARF-*Trees*.

In refpect to the culture of the borders where this fort of wall or efpalier-trees are growing, it is commonly digging them once more every year, adding manure occafionally in common with the other parts of the garden; but if fome good rotten dung be applied every other year, and the ground well dug or trenched every winter, it greatly promotes the fize and perfection of the fruit. In regard to ftandard-trees of this kind, any of the forts bear plentifully in any open fituation, though the fruit may not always be fo large and fine as thofe of wall and efpalier-trees: fummer and autumn pears, however, ripen in great perfection on ftandards, as alfo moft of the common winter pears. In planting them, trees of from two or three to four or five years old, having tolerable heads, are of a proper age and fize for the purpofe, and are preferable to older trees for any general plantation. They fhould be planted with all their heads entire, except retrenching any very irregular-placed branch, in the ufual manner of tree-planting. See PLANTING.

In their future growth they fhould be fuffered to branch naturally, fo as to form large branchy heads, fuffering them all to remain entire. The general culture of this fort of trees, in refpect to pruning, is very trifling, and only required occafionally, probably only once in feveral years; fuch as the retrenching any irregular growing branches, and thinning fuch branches as are very much crowded, cutting out all the decayed wood, and eradicating fuckers from the roots and ftems. See PRUNING.

When ftandard-trees are fituated in a garden, in which the ground is neceffarily dug over and trenched annually for the reception of the under crops, and occafionally enriched with dung, they generally produce finer fruit than in orchards, or other places where the ground is not in fimilar culture.

Mr. Forfyth obferves, that the method of pruning pear-trees is very different from that practifed for apple-trees in general, in which the conftant practice has been to leave great fpurs as big as a man's arm, ftanding out from the walls, from one foot to eighteen inches and upwards. The conftant pruning inevitably brings on the canker; and by the fpurs ftanding out fo far from the wall, the bloffom and fruit are liable to be much injured by the froft and blighting winds, and thus the fap will not have a free circulation all over the tree. The fap will always find its way firft to the extremities of the fhoots; and the fpurs will only receive it in a fmall proportion, as it returns from the ends of the branches; and the fruit ftanding at fo great a diftance from the wall is too much expofed to the weather, and, of courfe, is liable to be hard, fpotted, and kernelly.

The following method he has practifed where the trees were all over cankered, and the fruit fmall, and not fit to be fent to the table. He cut the tops off as near as poffible to where they were grafted, always obferving to cut as clofe to a joint or bud as poffible. The buds are hardly perceptible, but it can always be known where the joints, or forks, are, by the branches breaking out of the fides. He adds, that finding the pear-trees in Kenfington gardens in a very cankery and unfruitful ftate in the years 1784 and 1785, he took out the old mould from the borders againft the walls, and put in frefh loam in its ftead; at the fame time he pruned and nailed the trees in the common way, and left them in that ftate upwards of eighteen months, to fee what effect the frefh mould would have on them; but to his great furprife he found that it had no effect. After this trial he began to confider what fhould be done in order to recover thefe old trees. In this attempt he began with cutting down four old and decayed pear-trees of different kinds, near to the place where they had been grafted: this operation was performed on the 15th of May, 1786. Finding that they put forth fine fhoots, he headed down four more on the 20th of June in the fame year (for by this time the former had fhoots of a foot long), which did equally well, and bore fome fruit in the following year. One of the firft four he headed down was a St. Germain, which produced nineteen fine large well-flavoured pears next year, and in the third bore more fruit than it did in its former ftate when it was four times the fize. He left feven trees upon an eaft wall, treated according to the common method of pruning, which bore the following number of pears upon each tree. Epine d'hyver produced eighty-fix pears, and the tree fpread fifteen yards; a crafane produced one hundred pears, and the tree fpread fourteen yards; another crafane produced fixteen pears, and the tree fpread ten yards; a virgouleufe produced one hundred and fifty pears, and the tree fpread nine yards; a colmar produced one hundred and fifty pears, and the tree fpread nine yards; another colmar produced feventy-nine pears, and the tree fpread ten yards; a l'efchallerie produced fixty pears.

But feven trees headed down and pruned according to his own method, leaving the fore-right fhoots in fummer, bore as follows, in the fourth year after heading: a Louifbonne bore four hundred and fixty-three pears, and the tree fpread nine yards; another Louifbonne bore three hundred and ninety-one pears, and fpread eight yards; a colmar bore two hundred and thirteen pears, and fpread fix yards; a brown beurré bore five hundred and three pears; another brown beurré bore five hundred and fifty pears; a crafane bore five hundred and twenty pears; a virgouleufe bore five hundred and eighty pears. And he adds, that the branches of the four laft trees fpread nearly in the fame proportion as the firft three. He alfo ftates that a young beurré, the fecond year after heading, bore two hundred and thirty pears; and a St. Germain four hundred. All the above trees ftood in the fame afpect and the fame wall, and the fruit was numbered in the fame year. A great many pears which dropped from the trees are not reckoned. The trees that were pruned according to the old practice covered at leaft one-third more wall than the other.

From this ftatement it appears that the trees headed down bore upwards of five times the quantity of fruit that the others did; and that it keeps increafing in proportion to the progrefs of the trees. This is an important ftatement in the culture and management of old trees of this fort; and the following fact with refpect to ftandards is deferving of great attention: On the 20th of June he headed feveral ftandards that were almoft deftroyed by the canker; fome of them were fo loaded with fruit the following year, that he was

was obliged to prop the branches, to prevent their being broken down by the weight of it. In the fourth year after these standards were headed down, one of them bore two thousand eight hundred and forty pears. There were three standards on the same border with the above, two of which were St. Germain; the old tree was of the same kind. One of these trees, twenty years old, had five hundred pears on it, which was a great crop for its size: so that there were on the old tree, which had been headed down not quite four years, two thousand three hundred and forty pears more than on the tree of twenty years' growth. When the men numbered the pears, there was near a barrowful of windfalls at the bottom of the old tree, which were not included. These and other statements are given in his useful treatise on the "Culture of Fruit-Trees."

The following is the method he pursues in training trees that are cut near to the place where they are grafted. In the month of March, every year, he shortens the leading shoot to a foot or eighteen inches, according to its strength: this shoot will, if the tree be strong, grow from five to seven feet long, in one season; and, if left to nature, would run up without throwing out side-shoots. The reason for thus shortening the leading shoot is to make it throw out side-shoots, and if it be done close to a bud, it will frequently cover the cut in one season, leaving only a cicatrix. When the shoots are very strong, he cuts the leading ones twice in one season; by this method he gets two sets of side-shoots in one year, which enable him the sooner to cover the wall. The first cutting is performed any time during the spring, and the second about the middle of June. When you prune the trees, and cut the fore-right shoots, which should be done in February or March, always cut close to an eye or bud, observing where you see the greatest number of leaves at the lower bud, and cut at them; for at the footstalk of every one of these will be produced a flower-bud. The same will hold good in cutting the superfluous shoots on standard pears. He adds, that you will have in some sorts of pears, in a favourable season, from five to nine pears in a cluster. This cutting should not be later than March, or the beginning of April, on account of the leading shoot beginning to grow: the next topping, when the leading shoot grows quick enough to admit of it, should be about the middle of June; and the length of the shoots should be according to their strength, having from three eyes or buds, to six on a side. It is added, that the cankery part beginning to affect the new bark, he cut off all the canker at the bottom, and plastered the place with some cow-dung, mixed with wood-ashes and powder of burnt bones, put into as much urine and soap-suds as would make it of the consistence of thick paint; this he laid on with a painter's brush. After it had been applied about three hours, he patted it gently down, with his hand, close to the tree. By so doing, he gets rid of all the air-bubbles that may be under the composition, and makes it adhere to the tree, preventing it from being washed off by heavy rains. And in the beginning of August he shortens the fore-right shoots to about four inches long; by this time the shoot will have made its full growth for the season, and will produce fine strong eyes for the following year. Such shoots as grow near the stem of the tree, if any are wanted to fill up the wall, may be tucked-in as directed for peaches. This will prevent them from looking unsightly, and save them from the fury of the autumnal and winter winds. He further advises, that whenever the trunk is hollow, it be followed under ground till you have cut out all the decayed parts and rotten roots, otherwise you will lose the tree. By proceeding according to the foregoing directions, the roots will be renewed, while the tree is forming a fine handsome head. In the mean time the borders should be trenched, taking up all the roots, and adding some fresh mould to them, if you can conveniently get it; if you cannot, remove all the sour mould that is about the roots of the trees, and put in some taken from the border, at a distance from the wall; always remembering to lay the top spit next to the roots of the trees; also, to mix some vegetable mould, from the melon and cucumber beds, with rotten leaves, as a manure for the borders. He has headed down many trees that had not this preparation; and yet they throve very well, but did not send forth such fine roots and shoots as those that were so prepared. He concludes by observing, that if the above directions be followed, more pears will be procured in three or four years than can be done in twenty-five years by planting young trees, and pruning and managing them in the common way. It is added, that if it should be found, that, before the pears arrive at half their natural size, they get stunted, after cold blighting winds, and frosty nights, he would recommend a new operation to be performed when the weather begins to grow mild, which is to take a sharp penknife, and with the point of it make an incision through the rind of the pear from the footstalk to the eye, in the same way as in scarifying a bark-bound tree, taking care to penetrate as little into the flesh of the pear as possible. At the same time beat up some fresh cow-dung with wood-ashes, and with your fore-finger rub in a little of this composition where you made the scarification; as the wound heals, the composition will be discharged from the fruit; this will prevent the pears from cracking and bursting, which renders them good for nothing. The sorts that are most liable to this disorder are, he observes, the colmar, virgouleuse, and crasane. He only, however, recommends this operation for wall pears, as it may be thought by some a troublesome operation,and it will certainly take up some time.

Signs of Ripeness in the Fruit.—The maturity of the pear is generally known by its changing from a green to a yellow, or reddish colour, &c. and by the frequent falling from the tree; and when, with a gentle twist or turn upwards, it easily quits its hold: but these signs of ripeness are more particularly observable in summer and autumn pears; as winter pears, not being maturely ripe when gathered, often require a good pull before they quit the branches.

The summer pears ripen in succession in different sorts, from about the beginning or middle of July till the middle of September; many of the earliest ripening all at once, as it were, and continuing good but a few days, either on the tree or when gathered, nor will any of the sorts keep good long; and none of these sorts should hang on the tree till soft ripe, as in that case most of them would be mealy and insipid. These sorts should be gathered as soon as they are arrived to full growth, and just begin to colour and discover maturity, but before they become soft and mellow. For family use, they may be gathered from the tree according as they attain perfection; but the general crops of each sort should be always taken down before they ripen fully, and be laid in any dry room; none of the kinds will keep long, some only a few days, and scarcely any of them above a fortnight, though from different varieties ripening at different times, the succession is continued for eight or ten weeks.

The autumn sorts ripen in different varieties, from about the middle of September till the end of October; some of the forwardest become eatable on the tree, others requiring to lie some time after being gathered before they acquire perfection. The different sorts of these pears should be gathered according as they arrive to maturity: those designed to keep some time, may be gathered in dry weather, just when they have attained full growth, as shewn by their frequent dropping, and by their readily quitting the trees on being handled, and laid in a dry close room, or in baskets, each sort separately.

The winter kinds attain their full growth on the trees about the end of October or beginning of November; but the eatable kinds do not acquire maturity for that purpose on the tree, or for some considerable time after they are gathered, some probably in a month, others two or three, and some more, and some sorts not till the spring following. But the baking kinds may be used any time from October or November during their continuance. All winter pears should be indulged with as full growth on the tree as the weather will permit, even until the end of October, or first week in November, in the later kinds, if the season continues mild: be cautious, however, to get them gathered before attacked by much frost. And in gathering all the sorts for keeping, dry weather should be chosen, and when the fruit is also quite dry, being careful not to bruise them. See FRUIT.

Method of Forcing Pears.—These sorts of trees are sometimes forced by artificial heat, in some of the prime early kinds, to obtain a portion of fruit as early in the season as possible. This is effected by means of hot-walls and forcing-frames; having previously some trees of the choicest early summer pears, such as the jargonelle, or any other early sort, trained as wall-trees against a south wall, till advanced to some tolerable state of bearing; being then inclosed with glass frames, in the manner of forcing-frames or hot-walls, and having internally either flues for fire-heat, erected forward and extending long-ways, or otherwise a pit arranged in that direction, in the interval or space between the trees and the glass-work, for a bark or dung hot-bed; and by one or other of these methods a proper degree of artificial heat is produced internally to force an early growth in the trees, and forward them to early flowering and fruiting, managing them in the common way, as other trees in forcing-frames, so as to have some ripe fruit early in June, or some time in that month.

Method of Culture in the Apple Kind.—The whole of the varieties of the apple were first accidentally obtained by raising them from the kernels of the fruit; but as these cannot be depended upon to continue the same sort of fruit, grafting is the mode made use of to increase and continue the different varieties of them, which is performed upon crab, or any kind of apple stocks, raised from the kernels, for dwarfs as well as standards: and sometimes upon codlin and paradise apple stocks raised from cuttings and layers, when designed to have espaliers and other dwarf trees, or for small standards, as low as possible, to be confined within a moderate space: some sorts may also be raised by layers and cuttings, as the common codlin.

Stocks.—The method of raising the different sorts of stocks for the purpose is, in the crab and apple stocks, from the kernels of the fruit; but in the codlin and paradise stocks by cuttings and layers, to continue them with certainty of the same kinds and moderate growths. The crab and apple stocks may be raised from the kernels of any of the sorts, procuring them in autumn or winter, either from the fruit, or from such as have been pressed for verjuice and cider, clearing them from the grossest part of the pulp; then sowing them in beds of light earth, moderately thick, over the bed, or in drills, covering them about an inch deep. They come up in the spring; when, if the season prove dry, they should be watered occasionally, to forward and strengthen the growth of the plants; and in the autumn, winter, or spring following, the largest may be planted out in nursery-rows, shortening their tap-roots a little, and placing them in lines two feet and a half asunder, to remain for grafting: after having from one to two or three years' growth, they will be fit for grafting upon, particularly for dwarfs, or even for full and half standards, if intended to form the stem from the graft, which is an eligible method for these trees; but if the stock is to form the stem, they require three or four years' growth, to rise to a proper height, seven feet for full, and four or five for half standards. The modes of grafting all the sorts is the same as for other fruit-trees, and should be performed in March, either by whip or cleft-grafting, according to the size of the stock. See GRAFTING.

Having provided proper grafts of the different sorts of apples intended to be raised, the stocks designed for dwarfs of all sorts must be grafted within six inches of the ground; and the standards may also be grafted low, one shoot from the graft being trained up for a stem, or on tall stocks, at five or six feet in height, but for low and half standards, at from two or three, to four or five feet, and lower for dwarf standards. The grafts of all the sorts shoot the same year; and, by the autumn following, the trees having formed little heads, consisting of two, three, or four shoots, may then be planted out finally where they are to remain, or be retained a year or two, or longer, in the nursery, as may be requisite, training them for the purposes intended, as dwarfs, espaliers, &c. &c., and uprights for standards, heading the dwarfs down in March following, within six inches of the graft, to force out more lateral shoots below to form a fuller head, proceeding immediately to turn them near the bottom, so as to fill the espalier, &c. equally with branches, quite from within six or eight inches of the ground, regularly upward. In the standards, those grafted low must be trained with one shoot upright, at full length, for a stem, five or six feet high at least, for full standards before it is topped; though if grafted on tall stocks of height sufficient for a stem, the shoots from the graft may either be headed to five or six eyes; or, if to form a more spreading head, remain entire, and aspire more in height, and assume a more upright growth: in all the modes of training, care should be taken to keep the stems clear from all lateral shoots, displacing all such as soon as they appear, encouraging only a proper set of branches at top to form the head. When these trees have heads from one to two or three years old from the graft, they are of a proper age for planting out; though trees of four or five years old will also succeed very well, and even those of six or eight years' growth may also be safely planted if required. The nursery-grounds are mostly furnished with all the varieties of these trees for sale, either quite young from the graft, or trained of several years' growth.

Choice of Trees.—In choosing the different kinds of trees for planting, care should be taken to have a collection of the principal varieties, both in espaliers and standards, in proportion to the extent of the ground, as the trees of the best sorts are as easily raised and cultivated as the indifferent ones, allotting a smaller portion of the summer kinds, as such as ripen from August to about the middle of September, for immediate use off the trees, as they will not keep long; a larger supply of the autumn sorts, and most of all of the winter keeping apples: observing, in the summer kinds, that it is advisable to allot a principal supply of the common codlin in small standards, as being generally both a great bearer, and the fruit the most useful of the summer apples for culinary purposes, from its young green growth

growth in June or July, till its full maturity in Auguſt and September, when it becomes alſo a good eating apple: and as the tree is a moderate grower, it admits of being planted in ſmall ſtandards cloſer or more abundant in a ſmall extent of ground than moſt of the principal apple kinds.

In chooſing apple-trees from the nurſery, they ſhould, Mr. Forſyth ſays, have ſtrong, ſtraight, and clean ſtems. And he adviſes not to ſuffer the dwarf trees to run higher than twelve feet, as otherwiſe they become naked at bottom, the fruit is liable to be blown down, and the tops broken by high winds.

The proper ſeaſon for planting all the ſorts of apples is, in mild weather, from the end of October till March; but when planted in autumn, or early in winter, they eſtabliſh themſelves more firmly before the drought of the following ſummer. They ſucceed in any common ſoil and open ſituation, except in low very moiſt land, in which they are apt to canker, and ſoon go off: in a pliable mellow loam they generally anſwer very well. The ground ſhould be properly prepared, by good trenching, where the ranges of trees are to ſtand.

In the planting of eſpalier apple-trees they ſhould be ranged at no leſs than eighteen or twenty feet diſtance; the latter eſpecially for trees grafted on crab or apple ſtocks, which being free ſhooters, the branches readily fill that ſpace. For the trees grafted on codlin and paradiſe ſtocks, fifteen or eighteen feet may be ſufficient; though the latter, in particular, is ſometimes planted only twelve or fifteen feet aſunder, as being a very moderate ſhooter: it is, however, adviſable to allow every ſort full room, according to their growth, to have proper ſpace to extend their branches always at full length. The trees ſhould be planted with all their heads entire, only retrenching any very irregular growths, that do not range conſiſtently with the intended form, and pruning any broken roots. Then having opened a proper hole for each tree, plant them in the uſual manner, being careful to place them with their branches ranging the way of the eſpalier. As ſoon as the earth of the holes and of the roots is properly ſettled, all the branches ſhould be trained in horizontally to the right and left, an equal number on each ſide at full length, as above.

The general culture in eſpalier trees thus planted and trained, as the ſame branches or bearers continue fruitful many years, is to continue them as long as they remain of proper growths, conſtantly giving them a ſummer and winter pruning annually, as explained above. In wall-trees alſo, any of the principal choice varieties of eating apples may be trained, to forward and improve the growth, beauty, and flavour of the fruit; ſuch as jennetings, Margaret apple, golden pippins, golden rennets, pearmains, &c. or any other approved eating kinds, a tree or two of a ſort, againſt a ſouth, ſouth-weſt, or eaſt wall.

Standard apples, when planted in the garden, ſhould be arranged thinly, to admit of under crops growing freely, without being ſhaded by their ſpreading branches. Full ſtandards ſhould be chiefly planted for the general crops, and half and dwarf ſtandards for variety. The ſtandards, when trained as above, ſhould be planted out with all their heads entire, when in the kitchen garden, at thirty feet diſtance in the rows; and for an orchard, thirty feet diſtance every way. In planting, for each tree a wide hole ſhould be opened, trimming any long ſtraggling and broken roots, leaving all the others entire, and planting them with the uſual care. As ſoon as planted out, every tree ſhould be well ſtaked to ſupport them firmly upright, and prevent their being diſturbed in rooting by winds. See ORCHARD and PLANTING.

Smaller growing ſtandards, ſuch as codlins, or other low ſtandards grafted upon codlin ſtocks, and dwarfs upon theſe or paradiſe ſtocks, may, if required, be planted only at fifteen or twenty feet diſtance in the rows, and not leſs than twenty-five feet between the lines of trees; though, if there be room to allow a greater diſtance both ways, it will be advantageous, eſpecially in planting in kitchen gardens, in which it would be proper to allow double that diſtance between the rows of trees, of the larger growths of theſe kinds. The ſtandards thus planted with their heads entire, ſhould be ſuffered to advance with their branches at full length, and in general take their natural growth, when they ſoon form numerous natural ſpurs in every part for bearing.

In reſpect to pruning theſe ſtandards, little is required, only the occaſional retrenching any irregular croſs-placed bough, or the reducing to order any very long rambler; or when the head is become greatly crowded and confuſed to thin out ſome of the moſt irregular growths, likewiſe all ſtrong ſhoots growing upright in the middle of the head, and all dead wood, and ſuckers from the ſtem and root.

As to half and dwarf ſtandards of theſe trees, they may be diſperſed in different parts of the garden to cauſe variety, managing them as the full ſtandards. The former on dwarf paradiſe ſtocks, being very moderate ſhooters, may be planted in a little compaſs; and are ſometimes planted in pots for curioſity, to place on a table, amidſt a deſert, with the fruit growing on them. See DWARF-*Trees*.

It is obſerved by Mr. Forſyth, that in heading down old decayed apple-trees, for the ſake of ſymmetry, it will be neceſſary to cut at the forked branch as near as can be to the upper ſide of the fork, cutting them in a ſloping manner to carry off the wet, at the ſame time rounding the edges. To begin at the lower branches, cutting juſt above the lower fork; and proceeding upwards, cutting the reſt of the branches from one to ſix joints, or forks, according to their ſtrength, till you have finiſhed cutting-in the whole head. If any of theſe branches ſhould have the canker, all the infected part muſt be cut out. When the tree is all prepared; the compoſition ſhould be immediately applied, beginning at the top of the tree, and finiſhing with the powder of wood-aſhes and burnt bones as you deſcend, which will ſave it from being rubbed off during the operation; and the compoſition will prevent the ſun and air from injuring the naked inner bark. A tree thus prepared, will in the courſe of three or four years, produce more and finer fruit than a maiden tree that has been planted upwards of twenty years.

Theſe directions, if properly attended to, will be ſufficient, it is ſuppoſed, to enable any one to bring old decayed trees into a healthy bearing ſtate.

It is believed, that in large orchards and gardens, it may be neceſſary, at firſt, to head down only every other tree; cutting ſome of the branches of the reſt, which are in a decayed and cankery ſtate, and which bear no fruit. This will be preparing them to throw out new wood, and furniſh the tree much ſooner with bearing branches. He recommends the performing of the operation as early as poſſible; as by ſo doing the wood will be the ſtronger, as in May, or the two following months.

And it is added, that when the trees are become hollow, the ſame method ſhould be followed as directed for plums; but by no means to cut them down unleſs the tops are quite decayed; obſerving to cut the looſe rotten wood clean out of the hollow and other decayed parts, applying the compoſition; at the ſame time to open the ground, and cut out

 all

all the rotten parts that may be found in the lower part of the ftem, together with all the decayed roots, which, if this be not done, will infallibly injure the frefh wood and bark, and prevent a cure from being effected. He would recommend heading down all apple-trees that are much cankered and have ill-fhaped heads; as by fo doing much labour will be faved, and the trees will amply pay the proprietor. He advifes never to fhorten the young branches, except they are very thin, when it will be neceffary to do fo to fill the trees with young wood: nor prune any of the young wood: nor prune any of the young fhoots the fecond year (he means the year after they are cut), as many of the eyes, almoft to the end of the fhoot, will, if it be ftrong, become fruit-buds next year; and fo on every year. It is contended, that in the month of May in the firft year after the trees have been fo cut, it will be neceffary to go over them, and rub off with your finger and thumb all the fuperfluous young fhoots; leaving from three to fix eyes on each fhoot, according to the fize and ftrength of the branch cut. Thefe fhoots will bear from three to four years; by which time they will be pretty much exhaufted by the great quantity of fruit produced from them: they fhould then be cut down to two eyes to produce new wood. He always leaves three different years' branches on the tree, when the firft fhoot is cut off. This is fully fhewn in a plate in his ufeful work; and the next fhoot will be full of fruit-buds, if it has not been fhortened: when it begins to grow weak, it fhould be cut off; and the next cutting muft be made when the former branch is tired of bearing: by proceeding thus all over the tree with care and attention, the advantages of this method of pruning, above the common mode, will foon be perceived; as by it you will be able to keep the trees in a conftant ftate of bearing, which, if left to nature, would only produce a crop of fruit once in two or three years. When the fhoot that is done bearing is cut off, the compofition fhould conftantly be applied, rubbing off the fhoots where they are too numerous.

It is fuppofed, that the beft time to prune apple-trees is in the month of April, or in May, after the operation has been performed on the peaches, nectarines, and cherries: and that foon after this pruning, about the middle of May, it will be proper to look over the trees, and to pick off any caterpillars that may be on them. It will then be feen what fhoots are infected with the canker, and which might have efcaped your notice at the time of pruning; and wherever you obferve the leaft appearance of infection, which may be known by the wood appearing of a brownifh colour, the fhoot muft be cut down till you come to the found white wood. The fmall fhoots that crofs each other fhould be cut off, leaving the ftrongeft to fill up the tree, and make a fine handfome head. The fuckers that fpring from the root fhould be carefully grubbed up, and the fide-fhoots from the ftem cut off; for, if left to grow, they greatly weaken the tree. The knobs, where old branches have been cut off, fhould alfo be pared away, leaving the furface of the tree as fmooth as poffible: after which, the compofition fhould be applied: the young bark will foon begin to grow, and by degrees cover the old wounds with a frefh fmooth furface, and thus prevent the canker from gaining ground on the tree. He has feen fome old wounds of confiderable fize, healed over in one year: and he adds, in confirmation of the utility of this practice, that the trees which he pruned and dreffed, as above directed, in the courfe of the fummer, 1795, are all perfectly cured, the wounds being filled up with found wood, and covered over with new bark: they all continue in a healthy ftate, and bear fine handfome fruit. And he has advifed feveral nurferymen to follow the practice, heading down their apple-trees after the feafon of drawing for fale is over. Meffrs. Gray and Wear have headed a great many of fuch trees as were formerly thrown into the faggot-pile, and have been amply recompenfed for their trouble. Trees thus headed down, provided the ftems be ftrong, will, he thinks, in the firft and fecond year, produce as much fruit as will refund the purchafe-money; befides, a great deal of time will be faved, which would be loft by planting younger trees: as, where you can procure trees of the above defcription that have been headed down three or more years, they will be all covered with fruit buds; and, if carefully taken up and planted in the autumn, if the feafon proves favourable, they will have a tolerable crop of fruit the firft year. Such trees muft not be headed down like maiden trees, but only thinned off where the branches run acrofs and rub againft one another, which fhould never be fuffered in thefe cafes. He fays, he would never recommend training apple-trees as efpaliers; as by doing fo the air is kept from the quarters of the garden; and by conftant pruning and cutting off all the fide-fhoots which you cannot tie to the efpaliers, you prevent them from bearing, and, moreover, bring on the canker. And when the dwarf trees have handfome heads, more and much finer fruit will be gotten from one of them than from fix efpaliers; at the fame time, a free air is admitted to the crops in the quarters, and the conftant expence of the ftakes and labour, in laying the trees to the efpaliers is faved. Efpaliers may, he obferves, be converted into dwarf ftandards by fhortening the branches at different lengths, fo as that they may be able to fupport themfelves without the ftakes; but not to fhorten them all regularly; and if cut with judgment, as near to a leading fhoot, or an eye, as poffible, they will in the courfe of two years form fine heads, and in the third year bear fix times the fruit as they did in their former ftate, and of a finer flavour. The fame method of pruning as already laid down for ftandard apple-trees is alfo applicable to efpaliers.

It is remarked, that the borders where you make your croffings in gardens fhould be fix or eight feet broad at leaft, to let the trees fpread on each fide, at the diftance of twelve feet from tree to tree, and they fhould be well trenched, two feet and a half deep at leaft. If there fhould be gravel, or four clay, it muft be taken out, and good mould put in its place; leaving the ground as rough as poffible for the froft and rain to mellow it. When you level the ground it fhould be done after rain; you may then fow fome fmall crops in the border; fuch as lettuce or fpinach, or cabbage for tranfplanting; but let not any of the braffica tribe come to full growth. Leaving cabbage and broccoli on borders, near fruit-trees, draws the ground very much, fills the borders with infects, and alfo prevents the fun and air from penetrating into the ground. And when the fun can have free accefs to the border, it adds much to the flavour of the fruit. If you can fpare the ground on the crofs-borders in winter, it will be of great fervice to the trees to ridge it up as loofe as you can, and let it lie in that ftate all winter, to mellow and fweeten.

Where the foil is ftrong, he would recommend planting of apple-trees that are grafted on paradife ftocks; but if the foil be light, free ftocks will do much better: and when the ground is ftrong clay or brick-earth, it fhould be mixed with old lime-rubbifh or coal-afhes, ftreet-dung, or fand: but what he ufes for the borders againft the walls, and which he prefers to every other manure, is a vegetable mould produced from leaves of trees. Of this a good coat fhould be given once in two or three years, which will be fufficient, he thinks, for the borders where the wall-trees ftand, and much better than dung, which he by no means

approves

approves of for trees, unlefs it be perfectly rotten and mixed up with mould.

In refpect to grafting old apple-trees, he fays, it frequently happens, that through fome miftake or other, after waiting ten or twelve years for a tree to come into a bearing ftate, it is found that the fruit is neither fit for the table nor kitchen; in fuch cafes they fhould always be grafted the following fpring, obferving to graft on the fineft and healthieft fhoots, and as near as poffible to the old graft, and where the crofs-fhoots break out; as by fo doing you will have fome fruit the fecond year; and in the third, if properly managed, you will have as much as on a maiden tree of fifteen years ftanding; the canker, if any, muft be carefully pared off the branch, and the fcion muft be taken from a found healthy tree. Whenever an incifion is made for budding or grafting, from that moment the canker begins. He would, therefore, recommend to thofe employed in budding or grafting, as foon as the incifion is made, and the bud or graft inferted, to rub in with the finger, or a brufh, fome of the compofition before the bafs is tied on: then to cover the bafs all over with the compofition as thick as it can be laid on with a brufh, working it well in. If this operation be performed in a proper manner, and in a moift feafon, it will anfwer every purpofe without applying any grafting clay: as he has frequently done it, and found it fucceed perfectly to his wifhes. The matting which is wrapped round the bud fhould not be flackened too foon; for in that cafe you will find the incifion opened, which very often occafions the death of the bud. If, fays he, nurferymen and gardeners would give this method a fair trial, and ufe the fame compofition as he ufes for curing defects in trees, inftead of loam and horfe-dung (which binds fo hard as to prevent the rain and moifture from penetrating to the graft to moiften the wood and bark), they would find that the grafts would fucceed much better. The compofition, for this purpofe, fhould be rather fofter than grafting clay generally is; and inftead of applying fo large a mafs as is generally done of clay, it need not, in moft cafes, be more than two or three inches in circumference, to effect the purpofe.

Apples come to full growth in different forts fucceffively, from July until the end of October: the fummer kinds continue but a fhort time, but the autumn and winter apples keep from two or three to fix or eight months and longer, in different varieties. The figns of perfection or full growth of the different forts of apples, are by their affuming a lively colour, emitting a fragrant odour, frequently falling from the tree, and by quitting their hold eafily on being handled.

Gathering.—In the gathering of all the forts of apples for keeping, dry weather fhould always be chofen, and when the trees and fruit are alfo perfectly dry: obferve likewife, in gathering apples for the table, and all kinds of apples defigned for keeping any confiderable time, that they be pulled one and one by hand. See FRUIT.

The other fpecies may be increafed by grafting and budding them upon the common crab-ftock: they fhould have fheltered fituations, as they are rather tender while young. Thefe trees afford ornament and variety in the clumps and fhrubbery parts of pleafure-grounds.

Method of Culture in the Quince Kind.—Thefe trees may be raifed from the kernels of the fruit fown in autumn; but there is no depending on having the fame fort of good fruit from feedlings, nor will they foon become bearers. But the feveral varieties may be continued the fame by cuttings and layers; alfo by fuckers from fuch trees as grow upon their own roots, and likewife be increafed by grafting and budding upon their own pear-ftocks, raifed from the kernels in the fame manner as for apples.

The raifing by cuttings, layers, and fuckers, is performed in autumn, winter, or fpring, choofing young wood for the cuttings and layers, which fhould be planted and laid in the common method, when they will be rooted by the following autumn, then planted out into nurfery rows two feet afunder; plant the fuckers alfo at the fame diftance, and then train the whole for the purpofes intended: if for ftandards, run them up with a ftem to any defired height, from three to five or fix feet, then encourage them to branch out at top, to form a head; and thofe defigned as dwarfs muft be headed near the ground, and trained accordingly for efpaliers, or dwarf ftandards, as directed under thofe articles: the grafting or budding is effected on quince or pear-ftocks, and trained as above. When they have formed tolerable heads, they fhould be planted out finally.

Mr. Forfyth advifes that the layers or cuttings fhould be planted in a fhady place, in rows at about a foot diftant from each other, and about three inches from plant to plant in the rows; mulching them with rotten leaves, or rotten dung, which will keep the ground about them moift; and watering them frequently in hot weather. About Michaelmas thofe that are well rooted may be planted out, and thofe that are not fhould remain another year. They may alfo be propagated by budding or grafting; and thefe trees will bear fooner, and be more fruitful than thofe raifed by any other method.

He obferves, that the quince-tree may be pruned much in the fame way as an apple-tree, taking care to cut out all the old difeafed and dead wood, and the crofs branches in the middle of the tree, which are apt to injure each other by friction. In general you will find old trees much hurt by injudicious pruning: in that cafe they fhould be headed down, cutting out all the cankery parts, and alfo all the difeafed and dead wood where the tree is hollow, or where large branches have been cut or broken off, applying the compofition as for apple-trees: and as quince-trees are very apt to have rough bark, and to be bark-bound, in thefe cafes it will be neceffary to fhave off the rough bark with a draw-knife, and to fcarify them when bark-bound, brufhing them over with the compofition. It is alfo advifed to plant quince-trees at a proper diftance from apples and pears, as bees and the wind may mix the farina, and occafion the apples or pears to degenerate.

Standard quinces, defigned as fruit-trees, may be ftationed in the garden or orchard, and fome by the fides of any water, pond, watery-ditch, &c. as they delight in moifture, fuffering the whole to take their own natural growth: and as efpaliers, they may be arranged in affemblage with other moderate growing trees, fuch as apples and pears on paradife and quince-ftocks, cherries, &c. being trained as directed for apples and pears in efpaliers. They may alfo be planted in fhrubberies, either as full or low ftandards, and permitted to take their own way of growth. See ORCHARD.

PYSTERA, in *Ancient Geography*, an ifland fituated on the coaft of Afia Minor, over-againft Smyrna. Pliny.

PYTHAGORAS, in *Biography*. See PYTHAGOREANS.

Pofterity has been very liberal to this philofopher, in beftowing upon him all fuch inventions as others had neglected to claim, particularly in mufic; for there is fcarcely any part of it, as a fcience, with which he has not been invefted by his generous followers in biography.

Mufical ratios have been affigned to him, with the method of determining the gravity or acutenefs of founds by the greater or lefs degree of velocity in the vibrations of ftrings; the

the addition of an eighth to the lyre (Pliny, lib. ii. cap. 2.); the harmony of the fpheres (Plato); and the Greek mufical notation (Boethius). His right, indeed, to fome of thefe difcoveries has been difputed by feveral authors, who have given them to others with as little reafon, perhaps, as they had been before beftowed upon him.

But there is one difcovery, relative to mufic, that has, at all times, been unanimoufly affigned to him, which, however, appears to us extremely doubtful, not only whether it was made by him, but whether, in the manner it is related, it was ever made by any one.

We are told by Nicomachus, Gaudentius, Jamblichus, Macrobius, and all their commentators, "that Pythagoras, one day meditating on the want of fome rule to guide the ear, analogous to what had been ufed to help the other fenfes, chanced to pafs by a blackfmith's fhop, and obferving that the hammers, which were four in number, founded very harmonioufly, he had them weighed, and found them to be in the proportion of 6, 8, 9, and 12. Upon this he fufpended four ftrings, of equal length and thicknefs, &c. faftened weights, in the above-mentioned proportions, to each of them refpectively, and found that they gave the fame founds that the hammers had done; *viz.* the fourth, fifth, and octave to the graveft tone; which laft interval did not make part of the mufical fyftem before; for the Greeks had gone no farther than the heptachord, or feven ftrings, till that time." Principles and Power of Harmony, p. 8.

This is the fubftance of the account, as it has been lately abridged by Mr. Stillingfleet, who points out many incredible circumftances with refpect to the ftory in general, and denies that the weights 6, 8, 9, 12, would give the intervals pretended; but feems not to have feen the leaft difficulty in the fact, relative to *different hammers producing different founds upon the fame anvil.* The frontifpiece to M. Marpurg's Hiftory of Mufic, reprefents the Samian fage in the act of *weighing* the *hammers*.

But though both hammers and anvil have been fwallowed by ancients and moderns, and have paffed through them from one to another, with an oftrich-like digeftion, upon examination and experiment it appears, that hammers of different fize and weight will no more produce *different tones* upon the *fame anvil*, than bows or clappers of different fizes, will from the *fame ftring* or *bell*.

Indeed, both the hammers and anvils of antiquity muft have been of a conftruction very different from thofe of our *degenerate days*, if they produced any tones that were ftrictly *mufical*. Of the millions of well-organized mortals, who have paffed by blackfmiths' fhops, fince the time of Pythagoras, we believe no one was ever detained by a *fingle note*, much lefs by an harmonious *concord*, from thofe Vulcanian inftruments. A different kind of noife, indeed, will be produced by hammers of different weights and fizes; but it feems not to be in the power of the moft fubtle ear to difcover the leaft imaginable difference with refpect to gravity or acutenefs. But though *different noifes* may be produced from different bodies, in proportion to their fize and folidity, and every room, chair, and table, in a houfe, has a particular tone, yet thefe noifes can never be afcertained like mufical tones, which depend upon reiterated and regular vibrations of the aliquot parts of a ftring, or other elaftic body; and in wind inftruments, upon the undulations of the air conveyed into a tube. Noife may, indeed, be *forced* from a mufical ftring, or inftrument, by violence; but noife proceeding from bodies non-elaftic, or immufical, can never be *foftened* into found. M. Rouffeau (Dict. de Muf. art. *Bruit*) has ingenioufly imagined that noife is of the fame nature as found, with this difference, that to produce found, the *one* tone, with its confonant harmonics only, fhould be heard; fuch as the 8th, 12th, 15th, and 17th; whereas noife is produced by a jarring multitude of different tones, or even by one tone, when its vibrations are fo violent as to render audible a confiderable number of diffonant tones, of which the vibrations feldom or never coincide; fuch as the 7th, 9th, 11th, &c.

The long belief of this ftory proves that philofophers themfelves have fometimes taken facts upon truft, without verifying them by experiment. And as the tone of the hammers was afferted without proof, fo was the effect of their different weights faftened to ftrings: this Galileo difcovered. The numbers 6, 8, 9, 12, applied to different lengths of ftrings, would, indeed, give the intervals mentioned. But it is proved, that to produce thofe intervals by the *tenfion* of different weights, the weights muft be the fquares of thofe numbers; that is, 36, 64, 81, 144. It is aftonifhing how the blunder had been echoed from author to author, without experiment, till the time of Galileo. And Bontempi, in trying the power of weights upon ftrings in the Pythagoric proportions of 6, 8, 9, 12, found, that inftead of giving the 4th, 5th, and 8th of the graveft tone, they produced only the minor 3d, major 3d, and tritonus; fo that the whole account falls to the ground. But though modern incredulity and experiment have robbed Pythagoras of the glory of difcovering mufical ratios by *accident*, he has been allowed the fuperior merit of arriving at them by meditation and defign. At leaft the invention of the harmonical canon, or monochord, has been afcribed to him both by ancient and modern writers. (See MONOCHORD.) See Ariftid. Quint. p. 116. Prin. and Power of Harm. Hift. des Mathem. par. Montucla. Euler, Tentamen novæ Theor. Muf. and all the writers upon harmonics and temperament.

We fhall enter no deeper into this fubject here, than is abfolutely neceffary to explain the nature of the difcovery attributed to Pythagoras, to which mufic is indebted for the honourable appellation of *fcience*.

Pythagoras fuppofed the air to be the *vehicle* of found, and the agitation of that element occafioned by a fimilar agitation in the parts of the founding body, to be the *caufe* of it. The vibrations of a ftring, or any other fonorous body, being communicated to the air, affected the auditory nerves with the fenfation of found; and this found, according to him, was acute or grave, in proportion as the vibrations were quick or flow. It was alfo known, by experiment, that of two ftrings equal in every thing but length, the fhorter made the quickeft vibrations, and gave the acuter found; in other words, that the number of vibrations made in the fame time by two ftrings of different lengths, were inverfely as thofe lengths; that is, the greater the length, the fmaller the number of vibrations in any given time. By thefe difcoveries it was that found, confidered in the vibrations that caufe it, and the dimenfions of the vibrating or fonorous body, was reduced to quantity, and as fuch, became fubject to calculation, and expreffible by numbers. Thus, for inftance, the two founds that form an octave are expreffed by the numbers 1 and 2; which reprefent either the number of vibrations in a given time, or the length of the ftrings; and mean nothing more myfterious than that the acuter found vibrates twice, while the graver vibrates once; or, that the ftring producing the lower found is twice the length of that which gives the upper. If we confider the vibrations, the higher found is as 2, the lower as 1: the reverfe, if we confider only the lengths. In the fame manner, and in the fame fenfe, the 5th is expreffed by the ratio of 2 to 3, and the 4th by that of 3 to 4.

Such was the ancient philosophy of sounds, of which Pythagoras is recorded as the first teacher. But how much of this theory was founded on experiment and demonstration, and how much of it upon hypothesis; how much of it was known, and how much taken for granted, cannot certainly be determined. The story just now discussed is too much embarrassed with absurdities and impossibilities to guide us to any probable conjecture, as to the method by which Pythagoras *actually* arrived at his conclusions.

The discovery, as far as it relates to the length of strings, was easily made, because it depended upon an obvious experiment. It was, likewise, easily perceived, that a short string vibrated with more velocity than a long one; but between the certainty of this general fact, and the certainty that the vibrations were in a ratio exactly the inverse of the lengths, there is a considerable gulph. (See Smith's Harmonics, sect. i. art. 7, and note f.) We have no account of the bridge upon which Pythagoras got safely over. Experiment, here, is out of the question; for the slowest vibrations that produce musical sound, are far too quick to be counted or distinguished. The inference, however, was natural, though it does not appear that the ancients were able to support it by strict and scientific proof.

Indeed it was so late as the beginning of the present century, (1714. See Phil. Transf. and Methodus incrementorum directa et inversa, by Dr. Brook Taylor,) before this ancient theory of sound was fully confirmed, and the laws of vibrations, and the whole doctrine of musical strings, established upon the solid basis of mathematical demonstration.

The second musical improvement attributed to Pythagoras, was the addition of an eighth string to the lyre, which, before his time, had only seven, and was thence called a heptachord. It is supposed by several ancient writers, that the scale of this instrument, which was that of Terpander, consisted of two conjoint tetrachords, E F G A B ♭ C D; and that Pythagoras, by adding an eighth sound, at the top, and altering the tuning of the fifth, formed this scale: E F G A, B C D e, or a similar scale, consisting of two disjunct tetrachords.

How this scale was generated by the triple progression, or series of perfect 5ths, the abbé Roussier has lately very well discussed, in his "Memoire sur la Musique des Anciens." We shall endeavour to explain what is meant by the triple progression in music, which is the basis of this ingenious hypothesis; referring the reader to the Memoire itself for his proofs, as inserting them here would require too much time and space for a work of this nature.

Let any sound be representnd by unity, or the number 1; and as the 3d part of a string has been found to produce the 12th, or octave of the 5th above the whole string, a series of 5ths may be represented by a triple geometric progression of numbers, continually multiplied by 3, as 1 3 9 27 81 243 729; and these terms may be equally supposed to represent 12ths, or 5ths, either ascending or descending. For whether we divide by 3, or multiply by 3, the terms will be in the proportion of a 12th, or octave to the 5th, either way. The abbé Roussier, imagining that the ancients sung their scale backwards, as we should call it, by descending, annexes to his numbers the sounds following:

Term	I	II	III	IV	V	VI	VII
	1	3	9	27	81	243	729
	B	E	A	D	G	C	F

out of which series of 5ths, by arranging the sounds in diatonic order, may be formed the heptachord, or 7th, B C D E F G A; and to these, adding the duple of the highest sound, in the proportion of 2 to 1, the abbé supposes that Pythagoras acquired the octave, or proslambanomenos. This is throwing a mite into the charity-box of poor Pythagoras, without, however, telling us in what reign the obolum was coined; for we have met with no ancient author who bestows the invention of proslambanomenos upon this philosopher. The abbé does not let him or his followers stop here, but supposes an 8th term, 2187, added to the progression given above, by which a B ♭ was obtained, which furnished the minor semitone below B ♮. The system of Pythagoras, according to the abbé, was bounded by this 8th term, and the principle upon which it was built being lost, the Greeks penetrated no farther into the regions of modulation, where they might have enriched their music, but contented themselves, in after-times, with transpositions of this series of sound.

The abbé Roussier imagines, however, that though Pythagoras went no farther than the eighth term in triple progression, yet the Egyptians, in very high antiquity, extended the series to twelve terms, which would give every possible mode and genus perfect. A curious circumstance is observed by the same author, p. 28, § 47, with respect to the musical system of the Chinese, which well deserves mention here. "In collecting," says he, "what has already been advanced concerning the original formation of the Chinese system, it appears to begin precisely where the Greek left off, that is, at the VIIIth term of the triple progression, which is pursued as far as the XIIth term, by which series, arranged diatonically, the Chinese acquire their scale, e ♭, D ♭, B ♭, A ♭, G ♭, E ♭, in descending: or, as Rameau expresses the same intervals, in sharps, ascending, G✱, A✱, C✱, D✱, E✱, g✱."—It is observable that both these scales, which are wholly without semitones, are Scottish, and correspond with the natural scale of the old simple enharmonic, given p. 34. M. Jamard, a late French writer on music, pushing calculation still further than either the Egyptians or Chinese, has obtained, by pursuing the harmonic series, 1, 2, 3, 4, &c. &c. not only the enharmonic diesis, but even the minute intervals in the warbling of birds; it is wonderful he did not apply his ratios to human speech.

After musical ratios were discovered and reduced to numbers, they were made by Pythagoras and his followers, the type of order and just proportion in all things: hence virtue, friendship, good government, celestial motion, the human soul, and God himself, were harmony.

This discovery gave birth to various species of music, far more strange and inconceivable than chromatic and enharmonic: such as divine music, mundane music, elementary music, and many other divisions and subdivisions, upon which Zarlino, Kircher, and almost all the old writers, never fail to expatiate with wonderful complacence. It is, perhaps, equally to the credit and advantage of music and philosophy, that they have long descended from these heights, and taken their proper and separate stations upon *earth*: that we no longer admit of music that cannot be *heard*, or of philosophy that cannot be *understood*.

Aristides Quintilianus assures us, that music comprehends arithmetic, geometry, physics, and metaphysics, and teaches every thing, from *solfaing* the scale, to the nature and construction of the soul of man and the soul of the universe. To confirm this, he quotes, as a *divine saying*, a most curious account of the *end* and *business* of music, from one master Panacmus, which informs us that the province of music is not only to arrange musical sounds, and to regulate the voice, but to unite and harmonize every thing in nature. This writer, p. 102, in solving the question, whence it is that the soul is so easily affected by instrumental music, acquaints us, in the Pythagorean way, how the soul, frisking about, and

playing

playing all kinds of tricks in the purer regions of ſpace, approaches by degrees to our groſs atmoſphere; gets a taſte for matter and ſolidity, and at length acquires a warm and comfortable body to cover her nakedneſs. Here ſhe picks up nerves and arteries; there membranes; here ſpirit or breath; and all in a moſt extraordinary manner; eſpecially the arteries and nerves: for what ſhould they be made of, but the *circles* and *lines* of the ſpheres, in which the ſoul gets entangled in her paſſage, like a fly in a ſpider's web. Thus, continues he, the body becomes ſimilar in its texture to inſtruments of the wind and ſtringed kind. The nerves and arteries are ſtrings, and at the ſame time they are pipes filled with wind. "What wonder, then," ſays Ariſtides Quintilianus, "if the ſoul, being thus intimately connected with a body ſimilar in conſtruction to thoſe inſtruments, ſhould ſympathize with their motions."

Maſter Thomas Mace, author of a moſt delectable book, called "Muſick's Monument," would have been an excellent Pythagorean; for he maintains that the myſtery of the Trinity is perſpicuouſly made plain by the connection of the three harmonical concords, 1, 3, 5; that muſic and divinity are nearly allied; and that the contemplation of concord and diſcord, of the nature of the octave and uniſon, will ſo ſtrengthen a man's faith, "that he ſhall never after degenerate into that *groſs ſub-beaſtical ſin* of atheiſm." P. 268.

Pythagoras is ſaid, by the writers of his life, to have regarded muſic as ſomething celeſtial and divine, and to have had ſuch an opinion of its power over the human affections, that, according to the Egyptian ſyſtem, he ordered his diſciples to be waked every morning, and lulled to ſleep every night, by ſweet ſounds. He likewiſe conſidered it as greatly conducive to health, and made uſe of it in diſorders of the body, as well as in thoſe of the mind. His biographers and ſecretaries even pretend to tell us what kind of muſic he applied upon theſe occaſions. Grave and ſolemn, we may be certain; and vocal, ſay they, was preferred to inſtrumental, and the lyre to the flute, not only for its decency and gravity, but becauſe inſtruction could be conveyed to the mind, by means of articulation in ſinging, at the ſame time as the ear was delighted by ſweet ſounds. This was ſaid to have been the opinion of Minerva. In very high antiquity mankind gave human wiſdom to their gods, and afterwards took it from them, to beſtow it on mortals.

In peruſing the liſt of illuſtrious men, who have ſprung from the ſchool of Pythagoras, it appears that the love and cultivation of muſic was ſo much a part of their diſcipline, that almoſt every one of them left a treatiſe behind him upon the ſubject.

PYTHAGORAS's *Table*. See TABLE.

PYTHAGOREA, in *Botany*, received that appellation from Loureiro, in memory of the famous Pythagoras, who is ſaid to have written a book on the qualities of plants.—Loureir. Cochinch. 243. Claſs and order, *Octandria Tetragynia*. Nat. Ord. . . . . .

Gen. Ch. *Cal.* Perianth inferior, bell-ſhaped, of ſeven or eight linear, hairy, coloured leaves. *Cor.* ſuperior, bell-ſhaped, of ſeven or eight lanceolate, concave, hairy petals, the length of the calyx. *Stam.* Filaments eight, awlſhaped, longer than the corolla; anthers roundiſh, two-lobed. *Piſt.* Germen between the calyx and corolla, nearly ovate, hairy; ſtyles four, awl-ſhaped, reflexed, ſhorter than the ſtamens; ſtigmas acute. *Peric.* Capſule ovate, of four cells. *Seeds* numerous, roundiſh.

Eſſ. Ch. Calyx of ſeven or eight leaves, inferior. Corolla of ſeven or eight petals, ſuperior. Capſule of four cells, with many ſeeds.

1. P. *cochinchinenſis.*—Native of Cochinchina, where it is called *Xuong cá tiâ nhỏ lá.* A ſmall *tree*, with numerous branches. *Leaves* nearly ſeſſile, ovato-lanceolate, ſerrated, ſmooth; their longitudinal ribs red at the extremity. *Cluſters* axillary, long, nearly ſimple, with ſhort partial ſtalks. *Flowers* white.

Such is Loureiro's account, but we have no knowledge of the plant he deſcribes, nor can we offer any conjecture reſpecting its natural affinity. We have no faith in the exiſtence of a germen ſuperior to the calyx and inferior to the corolla, the only inſtance of the kind which Linnæus ever imagined, in *Sanguiſorba*, proving not well founded.

PYTHAGOREAN, or PYTHAGORIC *Syſtem*, among the *Ancients*, was the ſame with the Copernican ſyſtem among the moderns. See SYSTEM.

It was thus called, as having been maintained and cultivated by Pythagoras, and his followers; not that it was invented by him, for it was much older.

PYTHAGOREANS, a ſect of ancient philoſophers, who adhered to the doctrine of Pythagoras.

Pythagoras, the founder of this ſect, was of Samos, the ſon of a lapidary, and a pupil of Pherecydes, and flouriſhed (ſays Bayle) about five hundred years before Chriſt, in the time of Tarquin, the laſt king of Rome, and not in Numa's time, as many authors have ſuppoſed. See Cicero Tuſcul. Queſt. lib. iv. cap. 1.

The time of his birth, however, has been much diſputed. Dr. Bentley, in his "Diſſertation on the Epiſtles of Phalaris," relying chiefly on the authority of Eratoſthenes, refers the birth of Pythagoras to the 4th year of the 43d olympiad, B.C. 608. Lloyd, in his "Diſſertation concerning the Chronology of Pythagoras," aſcribes his birth to the 3d year of the 48th olympiad, B.C. 586. Dodwell places it in the 4th year of the 52d olympiad, B.C. 569, reſting in this date chiefly on the authority of Porphyry and Jamblichus. Upon the whole, the opinion of Lloyd ſeems to be the moſt probable, which is, that he was born about the year B.C. 586, and that he died about the 3d year of the 68th olympiad, B.C. 506; ſo that it ſeems pretty certain, that he was not born earlier than the 4th year of the 43d olympiad, B.C. 605, nor later than the 4th year of the 52d, B.C. 569. If we admit only the credible particulars of his childhood and early education, and pay no attention to the tales of Jamblichus and others, who even aſſerted that he was the ſon of God, we ſhall find that he was firſt inſtructed in his own country by Creſphilus, and afterwards by Pherecydes, in the iſland of Scyrus, and that after having paid his laſt tribute of reſpect to his preceptor, he returned to Samos, and purſued his ſtudies under the direction of his firſt maſter. Jamblichus, and other later biographers, mention his journey into Ionia, and his interviews with Thales and Anaximander, but of this journey we have no authentic record, nor is any effect of it diſcernible in his doctrine, which is eſſentially different from that of the Ionic ſchool. His firſt journey from the Grecian iſlands was probably into Egypt, which was celebrated in his time for that kind of wiſdom which beſt ſuited his genius and temper. In his way thither, Jamblichus aſſerts that he viſited Phœnicia, and converſed with the prophets and philoſophers that were the ſucceſſors of Mochus the Phyſiologiſt; which Mochus, Selden, and ſome others, will have to be Moſes.

Nor is it thought at all improbable that Pythagoras might wiſh to acquaint himſelf with the Phœnician philoſophy, of which he muſt, without doubt, have received a general report from his father, and from other merchants who traded to this coaſt. But that he derived his knowledge of numbers from the Phœnicians is not at all probable, becauſe their acquaintance with numbers extended no further than to the practical ſcience of arithmetic. It has been ſaid, indeed, that Pythagoras travelled, not only into Egypt and Chaldæa, but even into the Indies, to inform his underſtanding with regard to all branches of ſcience and prevalent cuſtoms; and that after returning to his own country, being unable to bear the tyranny of Polycrates, he retired into the eaſtern part of Italy, then called Magna Græcia, and eſtabliſhed his ſect, denominated from this circumſtance the "Italic Sect," or "Italic ſchool." Whatever opinion is entertained of this journey to the Eaſt, to which Le Clerc gives no credit, we muſt altogether reject other ſtories of his viſiting the temple on mount Carmel, and remaining there for ſeveral days, without food, paſſing among the inhabitants for a good dæmon, and obtaining from them religious honours; and of his proceeding into India, and there paſſing through ſeveral ceremonies of the Moſaic law.

Pythagoras, whilſt he was in Egypt, was introduced by the recommendation of Polycrates, tyrant of Samos, to Amaſis, king of Egypt, a diſtinguiſhed patron of literary men, and thus obtained acceſs to the colleges of the prieſts. Having found it difficult to gain this privilege, he performed many ſevere and troubleſome preliminary ceremonies, and even ſubmitted to circumciſion, a preſcribed condition of his admiſſion. He paſſed twenty-two years in Egypt, availing himſelf of all poſſible means of information with regard to the recondite doctrines of the Egyptian prieſts, as well as their aſtronomy and geometry, and Egyptian learning in its moſt unlimited extent.

Many writers of reputation, both Pagan and Chriſtian, who flouriſhed after the commencement of the Chriſtian era, relate, that after Pythagoras had left Egypt, he viſited the Perſian and Chaldæan Magi, and proceeded ſo far as to have intercourſe with the Indian Gymnoſophiſts. Jamblichus aſſerts, that he was taken captive by the victorious army of Cambyſes, and carried to Babylon, where he acquainted himſelf with the learning and philoſophy of the Eaſt; and that after the expiration of twelve years, when he was in the 60th year of his age, he returned to Samos. The circumſtance of his having viſited the Perſian magi is alſo mentioned by Cicero, Euſebius, Lactantius, and Valerius Maximus, though they take no notice of his captivity. In this journey to the Eaſt, as ſome have maintained, he attended upon the inſtructions of the celebrated Perſian ſage, Zoroaſter; and others, who have placed the life of Zoroaſter in an earlier period than that of Pythagoras, have aſſerted, that he converſed with certain Jewiſh prophets, who were at that time in Babylon, in a ſtate of captivity, and thus became acquainted with the Jewiſh laws and cuſtoms. However, ſeveral objections, particularly of a chronological kind, have been alleged againſt the narrative of Pythagoras's journey to the Eaſt. Chronologiſts unanimouſly agree, that Cambyſes invaded Egypt in the fifth year of his reign, or the third year of the 63d olympiad. According to Jamblichus, Pythagoras, after ſtaying twelve years in Babylon, and viſiting ſeveral other countries, went into Italy in the 62d olympiad. The ſame date is affixed to this journey by Diodorus and Clemens Alexandrinus; whilſt others place it about fourteen years earlier. Hence it appears, that if Pythagoras left the Eaſt before the 62d olympiad, after remaining there twelve years, he could not have been carried thither by Cambyſes in the 63d olympiad. Moreover, the whole narration of Pythagoras's journey into the Eaſt is contradicted by the expreſs authority of Antiphon (quoted by Porphyry), who ſays that Pythagoras, after his reſidence in Egypt, returned into Ionia, and opened a ſchool in his own country; and that, at the age of forty years, finding himſelf haraſſed by the tyranny of Polycrates, he withdrew into Italy; and according to this account, we have no interval for the ſuppoſed eaſtern expedition. The reality of this expedition is teſtified either by certain Alexandrian Platoniſts, who were deſirous of exalting, as much as poſſible, the wiſdom of thoſe ancient philoſophers, whom they conſidered as the oracles of wiſdom, or by certain Jewiſh and Chriſtian writers, who were diſpoſed to credit every tale which tended to give probability to the opinion that the Pythagorean doctrine was derived from the Oriental philoſophers, and ultimately from the Hebrew ſcriptures. In either caſe the authenticity of the relation is liable to juſt ſuſpicion; nor is there any probable argument to prove, that Pythagoras received inſtruction from any prophet of the Hebrew nation, during his ſuppoſed reſidence at Babylon. Brucker concurs with thoſe writers who are diſpoſed to reject this ſtory of Pythagoras's eaſtern journey as a mere fiction, and who concludes that, having never paſſed from Egypt to the Eaſt, he returned thence immediately to Samos. The ſtory of his having viſited the northern Druids is ſo deſtitute of probability and of evidence, as to merit no regard.

After his return from Egypt to his native iſland, he wiſhed to communicate the benefit of his twenty years' reſearches and ſtudies to his fellow-citizens, and with this view he attempted to inſtitute a ſchool for their inſtruction in the elements of ſcience; propoſing to adopt the Egyptian mode of teaching, and to communicate his doctrines under a ſymbolical form: but the Samians were either too ſtupid or too indolent to profit by his inſtructions. Although he was obliged to relinquiſh his deſign, he did not altogether abandon it. In order to engage the attention of his countrymen by ſome other means, he repaired to Delos; and after preſenting an offering of cakes to Apollo, he there received, or pretended to receive, moral dogmas from the prieſteſs, which he afterwards delivered to his diſciples under the character of divine precepts. With the ſame views he alſo viſited the iſland of Crete, ſo celebrated in mythological hiſtory; where he was conducted by the Corybantes, or prieſts of Cybele, into the cave of mount Ida, in which Jupiter is ſaid to have been buried. Here he converſed with Epimenides, an eminent pretender to prophetic powers, and was by him initiated into the moſt ſacred myſteries of Greece. About the ſame time he viſited Sparta and Elis, and was preſent during the celebration of the Olympic games, where he is ſaid to have exhibited a golden thigh to Abaris, in order to convince him that he was Apollo. Beſides other places which he viſited during his ſtay in Greece, he repaired to Phlius, where he firſt aſſumed the appellation of philoſopher. (See PHILOSOPHER.) Having thus added to the ſtores of learning which he had previouſly accumulated, and acquired a kind of authority which was calculated to command reſpect, he returned to Samos, and made a ſecond attempt, more ſucceſsful than his firſt, for eſtabliſhing a ſchool of philoſophy. In a ſemicircular kind of building, which the Samians had uſed as a place of reſort for public buſineſs, he delivered with an aſſumed authority of a ſacred nature, popular precepts of morality; and he alſo provided for himſelf a ſecret cave, into which he retired with his intimate friends and profeſſed diſciples, and here he gave his followers daily inſtructions, accompanied with a conſiderable parade of myſtery, in the more abſtruſe parts of philoſophy. His fame, and the multitude of his followers, increaſed. What he failed to accompliſh by the mere force of learning and ability, he effected by concealing his doctrines under the veil of myſterious ſymbols, and iſſuing forth his precepts as reſponſes from a divine oracle. About the beginning of the 59th olympiad, Pythagoras, deſirous of eſcaping the tyrannical government exercised in his native island by Syloson, the brother of Polycrates, left Samos, and, as we have already hinted, passed over into Italy, and attempted to establish his school among the colonies of Magna Græcia. It is probable that, in order to obtain credit with the populace, he about this time pretended to possess a power of performing miracles, and practised many arts of imposture. The first place at which he arrived in Italy was Crotona, a city in the bay of Tarentum, the inhabitants of which were very corrupt in their manners. But such were his reputation and influence, that he was treated with great respect, and people of all classes assembled to hear his discourses; insomuch that the manners of the citizens were soon totally changed from great luxury and licentiousness to strict sobriety and frugality. It is said that 600 (some say 2000), persons were prevailed upon to submit to the strict discipline which he required, and to throw their effects into a common stock for the benefit of the whole fraternity. The influence of his philosophy extended from Crotona to many other cities of Magna Græcia, and obtained for Pythagoras from his followers a degree of respect little short of adoration. If he had contented himself with delivering doctrines of philosophy and precepts of practical wisdom, he might probably have continued his labours, without molestation, to the end of his life. But he manifested a strong propensity towards political innovations; and he employed his influence in urging the people to the strenuous assertion of their rights, against the encroachments of their tyrannical governors. This course of conduct raised against him a very powerful opposition, which he was unable to resist and contend against, and which obliged him to retire to Metapontum. Here he found himself still surrounded with enemies, and was under a necessity of seeking an asylum in the temple of the Muses, where, not being supplied by his friends with sufficient food, he perished with hunger. The time of his death is uncertain; but according to the Chronicon of Eusebius, he died in the third year of the 68th olympiad, B. C. 506, after having lived, according to the most probable statement of his birth, to the age of 80 years. After his death his followers paid a superstitious respect to his memory. They erected statues in honour of him, converted his house at Crotona into a temple of Ceres, the street in which it stood was called the Museum, and appealed to him as a divinity, swearing by his name.

It appears, from the history of this philosopher, that with all his talents and learning, he owed much of his celebrity and authority to imposture. His whole manner of life confirms this opinion. Clothed in a long white robe, with a flowing beard, and, as some say, with a golden crown on his head, he preserved among the people, and in the presence of his disciples, a commanding gravity and majesty of aspect. He recurred to music for promoting the tranquillity of his mind, frequently singing, for this purpose, hymns of Thales, Hesiod, and Homer. He had such an entire command over himself, that he was never seen to express, in his countenance, grief, joy, or anger. He refrained from animal food, and confined himself to a frugal vegetable diet, excluding from his simple bill of fare, for mystical reasons, pulse or beans. By this artificial demeanour, Pythagoras appeared among the vulgar as a being of an order superior to the common condition of humanity, and persuaded them that he had received his doctrine from heaven. Pythagoras married Theano of Crotona, or, as some say, of Crete, by whom he had two sons, Telauges and Mnesarchus, who, after his death, took the charge of his school. Whether this philosopher left behind him any writings has been a subject of dispute. Many works have been enumerated under his name by Laertius, Jamblichus, and Pliny; but it is the declared opinion of Plutarch, Josephus, Lucian, and others, that there were no genuine works of Pythagoras extant; and it appears highly probable, from the pains which he took to confine his doctrine to his own school during his life, that he never committed his philosophical system to writing, and that the pieces to which his name was affixed at an early period, were written by some of his followers, upon the principles imbibed in his school. The famous golden verses attributed to Pythagoras, and illustrated with a commentary by Hierocles, were not written by our philosopher, but are to be ascribed to Epicharmus, or Empedocles. They may, however, be considered as a brief summary of his popular doctrines.

His "Method of instruction," formed upon the Egyptian model, was "exoteric," and "esoteric," that is, public and private. Those auditors, who attended his public lectures, did not properly belong to his school; but followed their usual mode of living. His select disciples, called his companions and friends, were such as submitted to a peculiar plan of discipline, and were admitted, by a long course of instruction, into all the mysteries of his *esoteric* doctrine.

Previously to the admission of any person into this fraternity, Pythagoras examined his features and external appearance; inquired how he had been accustomed to behave towards his parents and friends; marked his manner of laughing, conversing, and keeping silence; and observed what passions he was most inclined to indulge; with what kind of company he chose to associate; how he passed his leisure moments; and what incidents appeared to excite in him the strongest emotions of joy or sorrow. Nor after this examination was any one admitted into his society, till he was fully persuaded of the docility of his disposition, the gentleness of his manners, his power of retaining in silence what he was taught, and, in fine, his capacity of becoming a true philosopher. After the first probationary admission, the fortitude and self-command of the candidate were put to the trial by a long course of severe abstinence and rigorous exercise. The course of abstinence and self-denial comprehended food and drink, and clothing, all which were of the most plain and simple kind: and the exercises prescribed were such as could not be performed without pain and fatigue. To teach them humility and industry, he exposed them, for three years, to a continued course of contradiction, ridicule, and contempt, among their fellows. In order to restrain the powerful passion of avarice, he required his disciples to submit to voluntary poverty; he deprived them of all command over their own property, by casting the possessions of each individual into a common stock, to be distributed by proper officers, as occasion required. After this sequestration of their goods, they lived together on the footing of perfect equality, and sat down together daily at a common table. If any one afterwards repented of the connection, he was at liberty to depart, and might reclaim, from the general fund, his whole contribution. That his disciples might acquire a habit of entire docility, Pythagoras enjoined upon them, from their first admission, a long term of silence, called εχεμυθια. This initiatory silence, which probably consisted in refraining from speech, not only during the hours of instruction, but through the whole term of initiation, continued from two to five years, according to the propensity discovered by the pupil towards conceit and loquacity. With regard to himself, this was a judicious expedient, as it checked impertinent curiosity, and prevented every inconvenience of contradiction. Accordingly his disciples silenced all doubts and refuted all objections, by appealing to his authority. Αὐτὸς ἔφα, *ipse dixit*, decided every dispute. Moreover, during the years of initiation, the disciples were prohibited from seeing their master, or hearing his lectures, except from behind a curtain, or receiving instruction from some inferior preceptor.

To the members of the esoteric school (who were called γνήσιοι ὁμιλῆται, genuine disciples) belonged the peculiar privilege of receiving a full explanation of the whole doctrine of Pythagoras, which was delivered to others in brief precepts and dogmas, under the concealment of symbols. Disciples of this class were permitted to take minutes of their master's lectures, in writing, as well as to propose questions, and offer remarks, upon every subject of discourse. These were particularly distinguished by the appellation of the "Pythagoreans;" they were also called "Mathematicians," from the studies upon which they entered immediately after their initiation. After having made a sufficient progress in geometrical science, they proceeded to the study of nature, the investigation of primary principles, and the knowledge of God. Those who pursued these sublime speculations were called "Theorists," and those who devoted themselves more particularly to theology, were styled σεβαστικοὶ, religious. Others, according to their abilities and inclinations, were engaged in the study of morals, economics, and policy; and were afterwards employed in managing the affairs of the fraternity, or sent into the cities of Greece, to instruct them in the principles of government, or assist them in the institution of laws.

The brethren of the Pythagorean college at Crotona, called κοινόβιον, *coenobium*, about 600 in number, lived together as in one family, with their wives and children; and the whole business of the society was conducted with the most perfect regularity. Every day commenced with deliberation upon the manner in which it should be spent; and concluded with a retrospect of the events that had occurred, and of the business that had been transacted. They rose before the sun, that they might pay him homage; after which they repeated select verses from Homer and other poets, and made use of music, both vocal and instrumental, to enliven their spirits and fit them for the business of the day. They then employed several hours in the study of science. These were succeeded by an interval of leisure, which was commonly spent in a solitary walk for the purpose of contemplation. The next portion of the day was allotted to conversation. The hour immediately before dinner was filled up with various kinds of athletic exercises. Their dinner consisted chiefly of bread, honey, and water; for after they were perfectly initiated, they wholly denied themselves the use of wine. The remainder of the day was devoted to civil and domestic affairs, conversation, bathing, and religious ceremonies.

The "exoteric" disciples of Pythagoras were taught, after the Egyptian manner, by images and symbols, obscure and almost unintelligible to those who were not initiated into the mysteries of the school; and those who were admitted to this privilege were under the strictest obligation of silence with regard to the recondite doctrines of their master. The wisdom of Pythagoras, that it might not pass into the ears of the vulgar, was committed chiefly to memory; and when they found it necessary to make use of writing, they took care not to suffer their minutes to pass beyond the limits of the school.

Clemens observes, that the two orders above described corresponded very exactly to those among the Hebrews; for in the schools of the prophets there were two classes, *viz.* the sons of the prophets, who were the scholars; and the doctors or masters, who were also called *perfecti*: and among the Levites, the novices or tyros, who had their quinquennial exercises, by way of preparation. Lastly, even among the proselytes there were two orders; *exoterici*, or proselytes of the gate; and *intrinseci* or *perfecti*, proselytes of the covenant. He adds, it is highly probable, that Pythagoras himself had been a proselyte of the gate, if not of the covenant.

Gale endeavours to prove, that Pythagoras borrowed his philosophy from that of the Jews; to this end producing the authorities of many of the fathers, and ancient authors; and even pointing out the tracks and footsteps of Moses in several parts of Pythagoras's doctrine.

After the dissolution of the assembly of Pythagoras's disciples by the faction of Cylo, a man of wealth and distinction at Crotona, it was thought necessary by Lysis and Archippus, in order to preserve the Pythagorean doctrine from oblivion, to reduce it to a systematic summary; at the same time, however, strongly enjoining their children to preserve these memoirs secret, and to transmit them in confidence to their posterity. From this time books began to multiply among the followers of Pythagoras, till at length, in the time of Plato, Philolaus exposed the Pythagorean records to sale, and Archytas of Tarentum gave Plato a copy of his commentaries upon the aphorisms and precepts of his master. Of the imperfect records of the Pythagorean philosophy left by Lysis, Archytas, and others, nothing has escaped the wreck of time, except perhaps sundry fragments collected by the diligence of Stobæus, concerning the authenticity of which there are some grounds for suspicion; and which, if admitted as genuine, will only exhibit an imperfect view of the moral and political doctrine of Pythagoras under the disguise of symbolical and enigmatical language. The strict injunction of secrecy, which was given by oath to the initiated Pythagoreans, has effectually prevented any original records of their doctrine concerning Nature and God from passing down to posterity. On this head we are to rely entirely for information, and indeed concerning the whole doctrine of Pythagoras, upon Plato and his followers. Plato himself, while he enriched his system with stores from the magazine of Pythagoras, accommodated the Pythagorean doctrines, as he also did those of his master Socrates, to his own system, and thus gave an imperfect, and, we may suppose, in many particulars, a false representation of the doctrines of the Samian philosopher. It was farther corrupted by the followers of Plato, even in the old academy, and afterwards in the Alexandrian school. To which we may add, that the doctrine of Pythagoras itself, probably in its original state, and certainly in every form under which it has been transmitted to us, was observed, not only by symbolical, but by mathematical language, which is rather adapted to perplex than to illustrate metaphysical conceptions. In this fault Pythagoras was afterwards imitated by Plato, Aristotle, and others.

We extract from Brucker the following faint delineation of the Pythagorean philosophy: The end of philosophy is to free the mind from those incumbrances, which hinder its progress towards perfection, and to raise it to the contemplation of immutable truth, and the knowledge of divine and spiritual objects. This effect must be produced by easy steps, lest the mind, hitherto conversant only with sensible things, should revolt at the change. The first step towards wisdom is the study of mathematics, a science which contemplates objects that lie in the middle way between corporeal and incorporeal beings, and as it were on the confines of both, and which most advantageously inures the mind to

contemplation,

contemplation. The whole courſe of mathematical ſcience may be divided into four parts: two reſpecting numbers, and two reſpecting magnitude. Number may be conſidered either abſtractedly in itſelf, or as applied to ſome object. The former ſcience is arithmetic; of the latter kind is muſic. Magnitude may be conſidered as at reſt, or as in motion; the ſcience which treats of the former is geometry, that which treats of the latter is aſtronomy.

Arithmetic is the nobleſt ſcience; numbers the firſt object of ſtudy, and a perfect acquaintance with numbers the higheſt good. Numbers are either ſcientific or intelligible.

Scientific number is the production of the powers involved in unity, or the progreſſion of multitude from the monad or unity, and its return to the ſame. *Unity* and *one* are to be diſtinguiſhed from each other; the former being an abſtract conception, the latter belonging to things capable of being numbered. Number is not infinite, but is the ſource of that infinite diviſibility into equal parts, which is the property of all bodies.

Intelligible numbers are thoſe which ſubſiſted in the divine mind before all things, from which every thing hath received its form, and which always remain immutably the ſame. It is the model, or archetype, after which the world, in all its parts, is framed. Numbers are the cauſe of eſſence to beings: *τοὺς ἀριθμοὺς αἰτίας εἶναι τῆς οὐσίας.*

The monad, or unity, is that quantity, which, being deprived of all number, remains fixed; whence called monad, from *τοῦ μένειν*. It is the fountain of all number. The duad is imperfect and paſſive, and the cauſe of increaſe and diviſion. The triad, compoſed of the monad and duad, partakes of the nature of both. The tetrad, tetractys, or quaternion number, is the moſt perfect. The decad, which is the ſum of the four former, comprehends all arithmetical and muſical proportions.

According to ſome writers, the monad denotes the active principle in nature, or God; the duad, the paſſive principle, or matter; the triad, the world formed by the union of the two former; and the tetractys, the perfection of nature. Some have underſtood by this myſterious number, the four elements; others, the four faculties of the human mind; others, the four cardinal virtues; and others have been ſo abſurd as to ſuppoſe that Pythagoras made uſe of this number to expreſs the name of God, in reference to the word יהוה, by which that name is expreſſed in the Hebrew language. But every attempt to unfold this myſtery has hitherto been unſucceſsful.

The moſt probable explanation of the Pythagoric doctrine of numbers is, that they were uſed as ſymbolical or emblematical repreſentations of the firſt principles and forms of nature, and particularly of thoſe eternal and immutable eſſences, to which Plato afterwards gave the appellation of ideas. Not being able, or not chuſing, to explain in ſimple language the abſtract notions of principles and forms, Pythagoras ſeems to have made uſe of numbers, as geometricians make uſe of diagrams, to aſſiſt the conceptions of ſcholars. More particularly, conceiving ſome analogy between numbers and the intelligent forms which ſubſiſt in the divine mind, he made the former a ſymbol of the latter. As numbers proceed from unity, or the monad, as a ſimple root, whence they branch out into various combinations, and aſſume new properties in their progreſs, ſo he conceived the different forms of nature to recede, at different diſtances, from their common ſource, the pure and ſimple eſſence of deity, and at every degree of diſtance to aſſume certain properties in ſome meaſure analogous to thoſe of number; and hence he concluded, that the origin of things, their emanation from the firſt being, and their ſubſequent progreſſion through various orders, if not capable of a perfectly clear explanation, might, however, be illuſtrated by ſymbols and reſemblances borrowed from numbers.

Next to numbers, muſic had the chief place in the preparatory exerciſes of the Pythagorean ſchool, by means of which the mind was to be raiſed above the dominion of the paſſions, and inured to contemplation. Pythagoras conſidered muſic, not only as an art to be judged of by the ear, but as a ſcience to be reduced to mathematical principles and proportions. We have introduced, under the article PYTHAGORAS, the manner in which he is ſaid to have diſcovered the muſical chords, but ſhall here ſubjoin a more minute account. As Pythagoras was one day reflecting upon the ſubject, happening to paſs by a ſmith's forge, where ſeveral men were ſucceſſively ſtriking with their hammers a piece of heated iron upon an anvil, he remarked, that all the ſounds produced by their ſtrokes were harmonious except one. The ſounds, which he obſerved to be chords, were the octave, the fifth, and the third; but that ſound which he perceived to lie between the third and the fifth he found to be diſcordant. Going into the work-ſhop, he obſerved, that the diverſity of ſounds aroſe, not from the form of the hammers, nor from the force with which they were ſtruck, nor from the poſition of the iron, but merely from the difference of weight in the hammers. Taking, therefore, the exact weight of the ſeveral hammers, he went home, and ſuſpended four ſtrings of the ſame ſubſtance, length, and thickneſs, and twiſted in the ſame degree, and hung a weight at the lower end of each, reſpectively equal to the weight of the hammers: upon ſtriking the ſtrings, he found, that the muſical chords of the ſtrings correſponded with thoſe of the hammers. Hence it is ſaid, that he proceeded to form a muſical ſcale, and to conſtruct ſtringed inſtruments. His ſcale was, after his death, engraved in braſs, and preſerved in the temple of Juno at Samos.

Pythagoras conceived that the celeſtial ſpheres in which the planets move, ſtriking upon the æther through which they paſs, muſt produce a ſound; and that this ſound muſt vary, according to the diverſity of their magnitude, velocity, and relative diſtance. Taking it for granted, that every thing reſpecting the heavenly bodies is adjuſted with perfect regularity, he further imagined, that all the circumſtances neceſſary to render the ſounds produced by their motion harmonious, were fixed in ſuch exact proportions, that the moſt perfect harmony is produced by their revolutions. This fanciful doctrine reſpecting the muſic of the ſpheres gave riſe to the names which Pythagoras applied to muſical tones. The laſt note in the muſical octave he called *hypate*, becauſe he ſuppoſed the ſphere of Saturn, the higheſt planet, to give the deepeſt tone; and the higheſt note he called *neate*, from the ſphere of the moon, which being the loweſt, or neareſt the earth, he imagined, produced the ſhrilleſt ſound. In like manner of the reſt. It was ſaid of Pythagoras by his followers, who heſitated at no aſſertion, however improbable, which might ſeem to exalt their maſter's fame, that he was the only mortal ſo far favoured by the gods as to be permitted to hear the celeſtial muſic of the ſpheres. Pythagoras applied muſic to the cure of diſeaſes both bodily and mental. It was, as we have ſeen, the cuſtom of his ſchool, to compoſe their minds for reſt in the evening, and to prepare themſelves for action in the morning, by ſuitable airs, which they performed upon the lute, or other ſtringed inſtruments. The muſic was, however, always accompanied with verſe, ſo that it may be doubted, whether the effect was to be aſcribed more to the muſician

or

or to the poet. It is faid of Clinius, a Pythagorean, that whenever he perceived himfelf inclined to anger, fpleen, or other reftlefs paffions, he took up his lute, and that it never failed to reftore the tranquillity of his mind. Of Pythagoras himfelf it is related, that he checked a young man, who, in the midft of his revels, was meditating fome act of Bacchanalian madnefs, by ordering the mufician, who had inflamed his paffions by Phrygian airs, to change the mufic on a fudden into the flow and folemn Doric mood. If the ftories which are related by the ancients concerning the wonderful effects of their mufic are to be credited, we muft acknowledge we are ftrangers to the method by which thefe effects were produced.

Befides arithmetic and mufic, Pythagoras cultivated geometry, which he had learned in Egypt; but he greatly improved it, by inveftigating many new theorems, and by digefting its principles, in an order more perfectly fyftematical than had before been done. Several Grecians, about the time of Pythagoras, applied themfelves to mathematical learning, particularly Thales in Ionia. But Pythagoras feems to have done more than any other philofopher of this period towards reducing geometry to a regular fcience. His definition of a point is, a monad or unity with pofition. He taught that a geometrical point correfponds to unity in arithmetic, a line to two, a fuperficies to three, a folid to four. Of the geometrical theorems afcribed to Pythagoras, the following are the principal: that the interior angles of every triangle are together equal to two right angles; that the only polygons which will fill up the whole fpace about a given point, are the equilateral triangle, the fquare, and the hexagon; the firft to be taken fix times, the fecond four times, and the third three times; and that, in rectangular triangles, the fquare of the fide which fubtends the right angle is equal to the two fquares of the fides which contain the right angle. Upon the invention of this latter propofition (Euclid, l. i. prop. 47.), Plutarch fays, that Pythagoras offered an ox, others, an hecatomb, to the gods. But this ftory is thought by Cicero inconfiftent with the inftitutions of Pythagoras, which, as he fuppofes, did not admit of animal facrifices. Pythagoras inferred the ftature of Hercules from the length of the Olympic courfe, which meafured fix hundred of his feet. Obferving how much fhorter a courfe fix hundred times the length of the foot of an ordinary-fized man was than the Olympic courfe, he inferred, by the law of proportion, the length of Hercules's foot; whence the ufual proportion of the length of the foot to the height of a man enabled him to determine the problem. Pythagoras alfo applied geometrical ideas as fymbolical expreffions of bodies, and of natural principles; but nothing certain, or intelligible, is preferved on this head.

On aftronomy, the doctrine of Pythagoras, or, however, of the ancient Pythagoreans, was as follows:

The term heaven either denotes the fphere of the fixed ftars, or the whole fpace between the fixed ftars and the moon, or the whole world, including both the celeftial fpheres and the earth. There are ten celeftial fpheres, nine of which are vifible to us; namely, that of the fixed ftars, thofe of the feven planets, and that of the earth; the tenth is the antichthon, or an invifible fphere oppofite to the earth, which is neceffary to complete the harmony of nature, as the decad is the completion of numerical harmony. And this antichthon may be the caufe of the greater number of the eclipfes of the fun than of the moon. Fire holds the middle place in the univerfe; or, in the midft of the four elements is placed the fiery globe of unity; the earth is not without motion, nor fituated in the centre of the fpheres, but is one of thofe planets which make their revolution about the fphere of fire. The revolution of Saturn is completed in thirty years, that of Jupiter in twenty, that of Mars in two, that of the Sun, and of Mercury and Venus, in one year. The diftance of the feveral celeftial fpheres from the earth correfpond to the proportion of notes in the mufical fcale. The moon and other planetary globes are habitable. The earth is a globe, which admits of antipodes.

From feveral of thefe particulars refpecting the aftronomical doctrine of Pythagoras, it has been inferred, that he was poffeffed of the true idea of the folar fyftem, which was revived by Copernicus, and has fince been fully eftablifhed by Newton.

From this preparatory ftudy the difciples of the Pythagorean fchool were conducted to the knowledge of natural, theological, and moral fcience. Concerning wifdom, in general, Pythagoras taught, that it is the fcience which is converfant with thofe objects, which are in their nature immutable, eternal, and incorruptible, and therefore alone can properly be faid to exift. The man who applies himfelf to this kind of ftudy is a philofopher. The end of philofophy is, that the human mind may, by fuch contemplation, be affimilated to the divine, and at length be qualified to join the affembly of the gods. In the purfuit of wifdom, the utmoft care muft be taken to raife the mind above the dominion of the paffions, and the influence of fenfible objects, and to difengage it from all corporeal impreffions, that it may be inured to converfe with itfelf, and to contemplate things fpiritual and divine. For this purpofe the affiftance of God, and of good dæmons, muft be invoked by prayer. Philofophy, as it is converfant with fpeculative truth, or with the rules of human conduct, is either theoretical or practical. Practical philofophy is only to be ftudied fo far as may be neceffary for the purpofes of life; theoretical philofophy is the perfection of wifdom. Contemplative wifdom cannot be completely attained, without a total abftraction from the ordinary affairs of life, and a perfect tranquillity and freedom of mind. Hence the neceffity of inftituting a fociety, feparated from the world, for the purpofe of contemplation and ftudy.

Active or moral philofophy, which prefcribes rules and precepts for the conduct of life, according to Ariftotle, was firft taught by Pythagoras, and after his death by Socrates. Among the moral maxims and precepts afcribed to Pythagoras are the following:

Virtue is divided into two branches, private and public. Private virtue refpects education, filence, abftinence from animal food, fortitude, fobriety, and prudence. The powers of the mind are reafon and paffion; and when the latter is preferved in fubjection to the former, virtue is prevalent. Young perfons fhould be inured to fubjection, that they may always find it eafy to fubmit to the authority of reafon. Let them be conducted into the beft courfe of life, and habit will foon render it the moft pleafant. Silence is better than idle words. A wife man will prepare himfelf for every thing which is not in his own power. Do what you judge to be right, whatever the vulgar may think of you; if you defpife their praife, defpife alfo their cenfure. It is inconfiftent with fortitude to relinquifh the ftation appointed by the Supreme Lord, before we obtain his permiffion. Sobriety is the ftrength of the foul, for it preferves its reafon unclouded by paffion. No man ought to be efteemed free, who has not the perfect command of himfelf. Drunkennefs is a temporary phrenfy. That which is good and becoming is rather to be purfued, than that which is pleafant. The defire of fuperfluity is foolifh, becaufe it knows

no

no limits. All animal pleafures fhould rather be poftponed, than enjoyed before their time; and fhould only be enjoyed according to nature, and with fobriety. Much forethought and difcretion is neceffary in the production and education of children. Wifdom and virtue are our beft defence; every other guard is weak and unftable. It requires much wifdom to give right names to things.

Concerning public virtue, the doctrine of Pythagoras, as it is tranfmitted to the prefent time, refpects converfation, friendfhip, religious worfhip, reverence to the dead, and legiflation. Upon thefe heads he is faid to have taught thus:

Converfation fhould be adapted to the characters and condition of the perfons with whom we converfe: that difcourfe and behaviour, which might be proper among young perfons, may be exceedingly improper between the young and aged. Propriety and feafonablenefs are the firft things to be regarded in converfation. In all fociety, a due regard muft be had to fubordination. Refpect is due to a worthy ftranger, fometimes in preference even to countrymen or relations. It is better that thofe who converfe with you fhould refpect you, than that they fhould fear you; for refpect produces admiration, but fear produces hatred. It is an evident proof of a good education, to be able to endure the want of it in others. Between friends, the utmoft care fhould be taken to avoid contention, which can only be done by fhunning as much as poffible all occafions of ftrife, fuppreffing refentment, and exercifing mutual forbearance. Reproof and correction are ufeful and becoming from the elder to the younger; efpecially when they are accompanied, on the part of the reprover, with evident tokens of affection.

Mutual confidence is never for a moment to be interrupted between friends, whether in jeft or earneft; for nothing can heal the wounds which are made by deceit. A friend muft never be forfaken in adverfity, nor for any infirmity in human nature, excepting only invincible obftinacy and depravity. Before we abandon a friend, we fhould endeavour, by actions as well as words, to reclaim him. True friendfhip is a kind of union which is immortal.

The defign and object of all moral precepts is to lead men to the imitation of God. Since the Deity directs all things, every good thing is to be fought for from him alone; and nothing is to be done which is contrary to his pleafure. Whilft we are performing divine rites, piety fhould dwell in the mind. The gods are to be worfhipped not under fuch images as reprefent the forms of men, but by fuch fymbols as are fuitable to their nature, by fimple luftrations and offerings, and with purity of heart. Gods and heroes are to be worfhipped with different degrees of homage, according to their nature. Oaths are in no cafe to be violated.

The bodies of the dead are not to be burned. Next to gods and dæmons, the higheft reverence is due to parents and legiflators; and the laws and cuftoms of our country are to be religioufly obferved.—Thus much concerning the active or moral philofophy of Pythagoras.

Theoretical philofophy, which treats of nature and its origin, was the higheft object of ftudy of the Pythagorean fchool, and included all thofe profound myfteries, which thofe, who have been ambitious to report what Pythagoras faid behind the curtain, have endeavoured to unfold. Upon this fubject, nothing can be advanced with certainty, efpecially refpecting theology, the doctrine of which, Pythagoras, after the manner of the Egyptian priefts, was peculiarly careful to hide under the veil of fymbols, probably through fear of difturbing the popular fuperftitions. The ancients have not, however, left us without fome grounds of conjecture.

With refpect to God, Pythagoras appears to have taught, that he is the Univerfal Mind, diffufed through all things, the fource of all animal life, the proper and intrinfic caufe of all motion, in fubftance fimilar to light, in nature like truth, the firft principle of the univerfe, incapable of pain, invifible, incorruptible; and only to be comprehended by the mind.

Cicero (Nat. Deor. l. 1. c. 12.) afferts, that Pythagoras conceived God to be a foul pervading all nature, of which every human foul is a portion: and this doctrine was perfectly confonant to the opinions received in the countries which Pythagoras vifited, and where he learned theology. Juftin Martyr (Orat. ad Gentes) exprefsly ranks Pythagoras among the theiftical philofophers. "If any one," fays he, "wifhes to be informed more accurately concerning the doctrine of Pythagoras with refpect to one God, let him hear his opinion, for he fays, God is one: he is not, as fome conjecture, exterior to the world, but, in himfelf entire, pervades the univerfal fphere, fuperintends all productions, is the fupport of all nature, eternal, the fource of all power, the firft fimple principle of all things, the origin of celeftial light, the father of all, the mind and animating principle of the univerfe, the firft mover of all the fpheres." From a variety of paffages that might be cited, we may reafonably infer, that Pythagoras conceived the Deity to be the informing foul of the world, animating it in a manner fimilar to that in which the human foul animates the body.

Subordinate to the Deity, it was taught in the Italic fchool, that there are three orders of intelligence, gods, dæmons, heroes, who are diftinguifhed by their refpective degrees of excellence and dignity, and by the nature of the homage which is due to them; gods being to be preferred in honour to demi-gods or dæmons, and dæmons to heroes or men. Thefe three orders, in the Pythagorean fyftem, were emanations, at different degrees of proximity, from the fupreme intelligence, the particles of fubtle ether affuming a groffer clothing the farther they receded from the fountain. The third order, or heroes, were fuppofed to be invefted with a fubtle material clothing. Hierocles defines a hero to be a rational mind united with a luminous body. If to thefe three fpecies we add a fourth, the human mind, we have the whole fcale of divine emanation, as it was conceived by this fect of philofophers. All thefe they imagined to proceed from God, as the firft fource of intelligence, and to have received from him a pure, fimple, immutable nature. God, being himfelf one, and the origin of all diverfity, they reprefented him under the notion of monad, and fubordinate intelligences, as numbers derived and included in unity. Thus the numbers or derived intelligences of Pythagoras agree with the ideas of Plato, except, perhaps, that the latter were of a nature perfectly fpiritual, but the former were clothed with a fubtle etherial body.

The region of the air was fuppofed by the Pythagoreans to be full of fpirits, dæmons, or heroes, who caufe ficknefs or health to man or beaft, and communicate, at their pleafure, by means of dreams, and other inftruments of divination, the knowledge of future events. That Pythagoras himfelf held this opinion cannot be doubted, if it be true, as his biographers relate, that he profeffed to cure difeafes by incantations. It is probable that he derived it from the Egyptians, among whom it was believed that many difeafes were caufed by demoniacal poffeffions.

The material world, according to Pythagoras, was produced by the energy of the divine intelligence. It is an animated fphere, beyond which is a perfect vacuum. It contains

contains spheres, which revolve with musical harmony. The atmosphere of the earth is a gross, immutable, and morbid mass; but the air, or ether, which surrounds it is pure, healthful, serene, perpetually moving, the region of all divine and immortal natures. The sun, moon, and stars, are inhabited by portions of the divinity, or gods. The sun is a spherical body. Its eclipses are caused by the passing of the moon between it and the earth; those of the moon by the intervention of the *antichthon*, before explained. The moon is inhabited by dæmons. Comets are stars, which are not always seen, but rise at stated periods.

Concerning man, the Pythagoreans taught, that, consisting of an elementary nature, and a divine or rational principle, he is a microcosm, or compendium of the universe; that his soul is a self-moving principle, composed of two parts, the rational, which is a portion of the soul of the world, seated in the brain, and the irrational, which includes the passions, and is seated in the heart; that man participates in both these with the brutes, which, from the temperament of their body, and their want of the power of speech, are incapable of acting rationally; that the sensitive soul, θύμος, perishes, but the rational mind, φρὴν, is immortal, because the source whence it is derived is immortal; that after the rational mind is freed from the chains of the body, it assumes an ethereal vehicle, and passes into the regions of the dead, where it remains till it is sent back to this world, to be the inhabitant of some other body, brutal or human; and that after suffering successive purgations, when it is sufficiently purified, it is received among the gods, and returns to the eternal source from which it first proceeded.

The doctrine of the Pythagoreans, respecting the nature of brute animals, and μετεμψυχώσις, *the transmigration of souls*, were the foundation of their abstinence from animal food, and of the exclusion of animal sacrifices from their religious ceremonies. The latter doctrine is thus beautifully represented by Ovid, who introduces Pythagoras as saying:

" Morte carent animæ: semperque priore relicta
Sede, novis domibus habitant, vivuntque receptæ.
Omnia mutantur; nihil interit; errat et illinc,
Huc venit, hinc illuc, et quoslibet occupet artus
Spiritus, eque feris humana in corpora transit,
Inque feras noster: nec tempore deperit ullo,
Utque novis fragilis signatur cera figuris,
Nec manet ut fuerat, nec formas servat easdem,
Sed tamen ipsa eadem est, animam sic semper eandem,
Esse, sed in varias doceo migrare figuras."

" What then is death, but ancient matter drest
In some new figure, and a varied vest:
Thus all things are but alter'd, nothing dies;
And here and there th' unbodied spirit flies,
By time, or force, or sickness dispossess'd,
And lodges where it lights, in man or beast;
Or hunts without, till ready limbs it find,
And actuates those according to their kind;
From tenement to tenement is tost,
The soul is still the same, the figure only lost:
And as the soften'd wax new seals receives,
This face assumes, and that impression leaves;
Now call'd by one, now by another name,
The form is only chang'd, the wax is still the same;
So death, thus call'd, can but the form deface,
Th' immortal soul flies out in empty space,
To seek her fortune in some other place."

DRYDEN.

This doctrine Pythagoras probably learned in Egypt, where it was commonly taught. Nor is there any sufficient reason for understanding it, as some have done, symbolically.

Among the symbols of Pythagoras, recited by Jamblichus and others, are the following: Adore the sound of the whispering wind. Stir not the fire with a sword. Turn aside from an edged tool. Pass not over a balance. Setting out on a journey, turn not back, for the furies will return with you. Breed nothing that hath crooked talons. Receive not a swallow into your house. Look not in a mirror by the light of a candle. At a sacrifice, pare not your nails. Eat not the heart, or brain. Taste not that which hath fallen from the table. Break not bread. Sleep not at noon. When it thunders, touch the earth. Pluck not a crown. Roast not that which has been boiled. Sail not on the ground. Plant not a palm. Breed a cock, but do not sacrifice it, for it is sacred to the sun and moon. Plant mallows in thy garden, but eat them not. Abstain from beans.

The precept prohibiting the use of beans, is one of the mysteries which the ancient Pythagoreans never disclosed, and which modern ingenuity has in vain attempted to discover. Its meaning was probably rather dietetic, than physical, or moral. But enough of these enigmatical trifles. Pythagorean precepts of more value are such as these: Discourse not of Pythagorean doctrines without light. Above all things govern your tongue. Engrave not the image of God in a ring. Quit not your station without the command of your general. Remember that the paths of virtue and of vice resemble the letter Y. To this symbol Persius refers, when he says,

" Et tibi quæ Samios diduxit litera ramos,
Surgentem dextro monstravit limite collem."

" There has the Samian Y's instructive make
Pointed the road thy doubtful foot should take;
There warn'd thy raw and yet unpractis'd youth,
To tread the rising right-hand path of truth."

Brucker's Hist. Philos. by Enfield, vol. i. b. 2. c. 12.

After the death of Pythagoras, the care and education of his children, and the charge of his school, devolved upon Aristæus of Crotonia, who, having taught the doctrine of Pythagoras 39 years, was succeeded by Mnesarchus, the son of Pythagoras. Pythagorean schools were afterwards conducted in Heraclia by Clinias and Philolaus; at Metapontum by Theorides and Eurytus; and at Tarentum by Archytas, who is said to have been the eighth in succession from Pythagoras. The first person who divulged the Pythagorean doctrine was Philolaus; see his article.

PYTHAGORIC ABACUS. See ABACUS and TABLE.

PYTHAGORIC *Sect*, or *Italic School*. See PYTHAGOREANS.

PYTHAGORIC *Tetractys*. See TETRACTYS.

PYTHAGORIC *Theorem*, or *Proposition*, is the 47th of the first book of Euclid. See TRIANGLE and HYPOTHENUSE.

PYTHEAS, in *Biography*, an ancient mathematician, astronomer, and geographer, was a native of the Greek colony of Marseilles, in Gaul, and flourished in the time of Aristotle and Alexander the Great. He contributed to the improvement of science by accounts which he wrote of his travels and voyages, and other works. To him is attributed a book, entitled γῆς περίοδος, or the circuit of the earth; and in the abridgement of Artemidorus the Ephesian, he is placed in the number of those who have written a "Periplus

"Periplus of the World;" and he is supposed to have written a treatise "De Oceano:" none of these pieces have reached modern times, though some of them were extant in the fourth century. From fragments collected out of Strabo, it appears that Pytheas introduced into them, as the testimony of others, a number of marvellous and incredible circumstances, which drew on him the censure of that author and Polybius. The last named author maintained it to be utterly impossible for a private person, who was even in want, to have travelled so far as he pretended to have done by sea and land. He, however, probably visited all the countries of Europe that are situated upon the ocean, discovered the island of Thule, or Iceland, and penetrated a considerable distance into the Baltic. This fact has been proved by Gassendi, who shews, that Pytheas was well acquainted with the northern countries, and accurately marked the distinction of climates, by the difference which he observed in the length of the days and nights in different latitudes. He also attempts to prove that Eratosthenes and Hipparchus improved their geographical works by availing themselves of the labours of Pytheas, without due acknowledgments of their obligations. There is no doubt that Pytheas was a skilful observer of the heavens, for he taught that there is no star in the precise situation of the pole, and he rendered himself famous among astronomers, by being the first calculator of the meridian altitude of the sun at the summer solstice at Marseilles. This fact he ascertained by erecting a gnomon of a given height, and finding the proportion between that height and the length of the meridian shadow. The result was found to correspond exactly with that of an observation made by Gassendi, at the same place, in the year 1636. To obviate such objections as that advanced by Polybius against the reality of Pytheas' voyages, it has been said, that he probably was furnished with the means of prosecuting them at the public expence. For as the republic of Marseilles was then powerful at sea, largely engaged in commercial pursuits, and sent Euthymenes to make such discoveries in the southern parts of the world, as might lead to the extension of its trade, it seems very probable, that Pytheas was dispatched on the public account into the northern regions for the same purposes.

PYTHEUM, in *Ancient Geography*, a town of Macedonia, in the country of the Pelasgioites. Ptolemy places it between Azorium and Gonnus.

PYTHIA, or PYTHIAN, in *Antiquity*, the priestess of Apollo, by whom he delivered oracles. See DELPHOS.

She was thus called from the god himself, who was entitled *Apollo Pythius*, from his slaying the serpent Python; or, as others will have it, απο τȣ πυθεσθαι, because Apollo, the sun, is the cause of rottenness; or because the carcase of Python was left there to putrefy; or, according to others, from πυνθανομαι, *I enquire*, because people went to hear and consult his oracles.

This priestess was to be a pure virgin. She sat on the covercle, or lid, of a brazen vessel, mounted on a tripod; before she ascended which, after fasting three days, she used to wash her whole body, and especially her hair, in Castalio, a fountain at the foot of Parnassus, where the poets, men inspired by the same deity, used to wash, and drink; and thence, after shaking the laurel-tree that grew by it, and sometimes eating the leaves, which were supposed to conduce to inspiration, and were succeeded by a violent enthusiasm, she delivered her oracles, or rather explained those of the god; *i. e.* she rehearsed a few ambiguous and obscure verses, which were taken for oracles. The oracle being pronounced, she was taken down from the tripod and conducted back to her cell, where she continued for several days, to recover herself from the violent agitation and conflict. Lucan informs us, that speedy death was frequently the consequence of her enthusiasm. See ORACLE.

Diodorus Siculus (lib. xvi.) informs us, that these priestesses were at first virgins, but that after one of them was deflowered by Echecrates, a Thessalian, choice was made of women above fifty years of age; that so they might either be secured from the attempts of lust, or if they should at any time be forced to the violation of their chastity, having passed the time of child-bearing, they might remain undiscovered, and not bring the oracles or religion into contempt; nevertheless they wore the habit of virgins, thereby to signify their purity and virginal modesty.

All the Pythiæ did not seem to have had the same talent at poetry, or to have memory enough to retain their lesson.

Plutarch and Strabo make mention of poets, who were kept in pay, as interpreters of Jupiter, &c.

PYTHIA, or PYTHIAN *Games*, were solemn games instituted in honour of Apollo, and in memory of his killing the serpent Python with his arrows.

The Pythia were celebrated in Macedonia, in a place called *Pythium*. They were next in fame after the Olympic games, but were more ancient than they; for it is pretended they were instituted immediately after the defeat of the serpent. The Pythia were also celebrated at Delphi; and they were these that were the most renowned. Their first founder, and the precise time of their institution, are not known.

The Pythian games, according to Pausanias, were first instituted by Jason or Diomedes, king of Etolia, and restored by Eurylochus of Thessaly, in the third year of the 48th olympiad, or the year of the world 3364, and 584 years before the birth of Christ; from which time the Greeks reckoned sometimes by Pythiades, as they had been accustomed to do by Olympiads. They were at first celebrated every eight years, but afterwards every four years, in the third year of each olympiad; so that the pythiade, which was a term of four years, served as an epocha for the inhabitants of Delphi. At first they consisted of poetical and musical contests, but in process of time they consisted of the other exercises of the pancratium, which were performed in the Olympic games. The victors were crowned with branches of laurel; though, at the first institution, the crown was of beech-leaves. The Romans are said to have adopted these games in the year U.C. 642, and to have given them the name of Apollinares ludi.

A part of Pindar's poems was composed in praise of the victors in the Pythian games. See GAMES.

The critics are divided on the subject of the serpent Python. The poets say, that Juno made use of it to persecute Latona, and prevent her bringing into the world Apollo and Diana, whom she had conceived of Jupiter; and that it was for this reason that Apollo afterwards killed it.

Strabo says, it was no other than a famous villain, one Draco, that Apollo freed the world from. Dickinson, in his "Delphi Phœnicizantes," maintains the Python of the Greeks to be the Typhon of the Phœnicians; and the Typhon of the Phœnicians to be the Og of Scripture; and Apollo, who slew it, he will have to be Joshua. See TYPHON.

PYTHON, in *Ancient Geography*, a name anciently given to the city of Delphi.

PYTHOPOLIS, a town of Asia Minor, in Bithynia, on the river Soloonte, according to Plutarch, founded by Theseus.

Thefeus.—Alfo, a town of Afia Minor, in Caria; afterwards called Niffa.—Alfo, a town of Afiatic Myfia.

PYULCON, from πυον, *pus*, and ἑλκω, *to draw*, an old furgical inftrument anciently employed for drawing the matter out of finufes.

PYURIA, in *Medicine*, from πυον, *pus*, and ουρον, *urine*, a term ufed by Sauvages and others to denote all purulent and mucous difcharges from the bladder. See CATARRHUS *Veficæ*.

PYXIDANTHERA, in *Botany*, from πυξις, *a box*, and ανθηρα, *an anther*, becaufe, according to Michaux, each cell of the anthers opens by a fort of lid; fee DIAPENSIA, to which genus the plant in queftion is referred by Mr. Purfh, in his *Fl. Amer. Sept.* v. 1. 148, under the name of *D. cuneifolia*, after Mr. Salifbury.

PYXIS NAUTICA, in *Navigation*, the feaman's compafs. The word πυξι literally fignifies *a box*.

PYXIS, among *Anatomifts*, is alfo ufed for the cavity of the hip-bone. See ACETABULUM.

PYXIS, a fmall metal cafe for containing the confecrated fpecies in the Catholic church. Anciently it was made in the form of a dove and fufpended over the altar.

PYXUS, in *Ancient Geography*, a fmall river of Italy, in Lucania; which took its rife northward towards Sontia, and running fouthward difcharged itfelf into a gulf of the fame name, E. of Pyxus, or Pyxuntum.

PYXUS, or PYXUNTUM, *Poli-Caftro*, a town of Italy, belonging to Lucania, fituated at the bottom of a fmall gulf, E. of a fmall river of the fame name. It was founded by Mirathus, prince of Zanele and Rhegium, in the year 471 B.C. It became a Roman colony in the year 194 before the fame era.

PYXUS *Promontorium*, a fmall cape of Italy, E. of a peninfula of Laconia, which had on the W. the promontory Palinurum. This promontory is found at the entrance of a fmall gulf of the fame name.

PZINENIN, in *Geography*, a town of Bohemia, in the circle of Boleflau; 12 miles E. of Jung-Buntzel.

Q.

Q, A confonant, borrowed from the Latin or French, for which the Saxons generally ufed cp, *cw*; and the fixteenth letter of the alphabet.

The name of this letter is *cue*, from *queue*, Fr. *tail*; its form being that of an O with a tail.

The Q has this peculiar to it, that it is always followed by an U, and is therefore reckoned among the mutes.

The Q is formed from the Hebrew, ק, *koph*; which moft other languages have borrowed; though fome of them have rejected it again, particularly the Greeks, who now only retain it as a numeral character, called κοππα επισημον.

In effect, there is that refemblance between the Q and the C, in fome languages, and the K in others, that many grammarians, in imitation of the Greeks, banifh the Q as a fuperfluous letter. Papias even affirms, that all the Latin words now wrote with a Q, were written among the ancient Romans with a C; but we want better authorities for this. For, though that may hold in many cafes, infomuch that fome write indifferently *quur*, or *cur*; *cum*, or *quum*; *quotidie*, or *cotidie*, &c. yet it does not thence follow, that they ever wrote *cis*, *cæ*, *cid*, for *quis*, *quæ*, *quid*. What infcriptions authorize fuch a reading?

Far from this, the ancients fometimes fubftituted Q for C; and wrote *quojus*, *quoi*; for *cujus*, *cui*, &c.

Varro, however, and fome other grammarians, as we are told by Cenforinus, &c. would never ufe the Q. The truth is, its ufe or difufe feems to have been fo little fettled, and agreed on, that the poets ufed the Q or C indifferently, as beft fuited their meafures; it being a rule, that the Q joined the two following vowels into one fyllable; and that the C imported them to be divided.

Hence it is, that Lucretius ufes *cuiret* for three fyllables, in lieu of *quiret*; *acua*, for *aqua*; and that Plautus ufes *relicuum*, for *reliquum*; as in *quod dedi, datum non vellem relicuum non*; where the *cuum* muft be two fyllables, otherwife the trochiac verfe will be lame of a foot.

In the French, the found of the Q and K are fo near akin, that fome of their niceft authors think the former might be fpared. Ramus adds, that, till the eftablifhment of royal profeffors in the univerfity of Paris, under Francis I. they always ufed Q in the Latin the fame as in the French; pronouncing *kis*, *kalis*, *kantus*, &c. for *quis*, *qualis*, *quantus*. See K.

Some very learned men make Q a double letter, as well as K and X. According to them, Q is evidently a C and U joined together. It is not enough that the found is the fame, but they fee the traces of the C U in the figure of the Q; the V being only laid obliquely, fo as to come within the cavity of the C; as C<.

To confirm this, they fay the ancients wrote *qi*, *qæ*, *qid*. Though Jof. Scaliger, Littleton, &c. think this is no proof of the point; for in Gruter's infcriptions we find not only the Q, but alfo the C, put for Q U; as *Cintus*, *Quintus*; *ficis* for *fiquis*, &c. Yet nobody ever imagined the C a double letter.

Q, among the *Ancients*, was a numeral letter, fignifying 500; as in the verfe,

"Q velut A cum D quingentos vult numerare."

A dafh over it, as $\overline{Q}$, denoted it to fignify five hundred thoufand.

Q is alfo ufed as an abbreviature in feveral arts. *Q. pl.* in phyficians' bills, ftands for *quantum placet*, or *quantum vis*, as much as you pleafe of a thing; *q. f.* for *quantum fufficit*, or as much as is neceffary.

Q, in the proper names of the Romans, fignifies Quintus, or Quintius. Upon the French coins this letter denotes that they were ftruck at Perpignan.

Q seems the initial of no word in *Music*, except in old madrigals, where it frequently is placed at the top of the page for *quinta pars*, the fifth part, in a polyphonic composition.

Q. D. is frequently used, among *Grammarians*, &c. for *quasi dictum*, as if it were said, &c. or as who should say.

Q. E. D. among *Mathematicians*, signifies *quod erat demonstrandum*, which was to be demonstrated.

Q. E. F. *quod erat faciendum*, which was to be done.

QUAB, in *Ichthyology*, the name of a Russian fish, which some report to be at first a tadpole, then a frog, and at last a fish. Dr. Mounsey, who made many enquiries concerning these pretended changes, apprehends that they are all fabulous. He had an opportunity of seeing the fish itself, and found that they spawned like other fishes, and grew in size, without any appearances to justify the report. He adds, that they delight in very clear water, in rivers with sandy or stony bottoms, and are never found in standing lakes, or in rivers passing through marshy or mossy grounds, where frogs choose most to be. Phil. Trans. vol. xlv. p. 175.

QUABES, in *Geography*, a people of Africa, in the interior country between Rio Sestos and Sierra Leona, inhabiting the southern banks of the river Sestos. They had been formerly conquered by Flansire, king of Folgia; but having thrown off their subjection, they have since remained a free people, though under the protection of the emperor of Monou, or Manou; which empire is called by English geographers, and also by M. d'Anville, Mendi Manow.

QUACHA, or QUAGGA, in *Zoology*. See EQUUS.

QUACHILTO, in *Ornithology*, the name of a very beautiful Brasilian bird, of the moor-hen kind, called also *yacacintli*, and *porphyrio Americanus*. It is the FULICA *Purpurea*, (which see); and is of a fine blackish purple colour, variegated with white; its beak is white while young, but becomes red as it grows older, and has a naked space at its basis, resembling, in some sort, the coot; its legs are of a yellowish-green; it lives about the waters and feeds on fish, yet is a very well-tasted bird. It imitates the crowing of a common cock, and makes its music early in the morning. Marggrave's Hist. Brasil.

QUACHY, in *Zoology*, a name given to the *Coati*, or VIVERRA *Nasua*; which see.

QUACK, in *Medicine*. See EMPIRIC.

QUACKENBRUCK, in *Geography*, a town of Westphalia, in the bishopric of Osnabruck, situated on the river Hase, which runs through it in seven streams, that unite in two below the town; 20 miles N. of Osnabruck. N. lat. 52° 42′. E. long. 8° 3′.

QUADIANS, QUADI, in *Ancient Geography*, a people of Germany, whose territories extended from the Danube to Moravia, and the northern part of Austria. They are comprehended by some writers under the ancient name of Suevi, part of whom forced their way into Spain, and formed a kingdom there. Their country is at present known by the name of Moravia; for it extended from the mountains of Bohemia to the river Marus, now the March, and consequently comprised that province. Ptolemy mentions the following cities in the country of the Quadians; *viz.* Eburodunum, Eburum, Medoslanium, and Celemantia, now, according to Cluverius, Brin, Olmutz, Znaim, and Kalminz. The Quadians were a warlike people, had kings of their own, and agreed in customs, manners, and religion, with the other German nations. They, without doubt, joined their countrymen against Lollius, Germanicus, Caius, and Galba, who attempted to reduce Germany, and to subdue the several nations which inhabited that extensive country. The emperor Domitian marched against them, but was defeated by the Marcomans, and put to flight. The Quadians submitted to the emperor Titus Antoninus, and it appears by his coins, supposed to have been struck about the year 139, that they acknowledged, as sovereign, a king appointed by that prince. They joined the Marcomans, in the famous war made by that people on the empire under the reign of Marcus Aurelius; but being reduced to great distress they sent ambassadors to sue for peace, and with them they restored all the Roman deserters, and about 13,000 prisoners, whom they had taken during the war. They thus obtained peace, upon condition, that they should not traffic, for the future, within the Roman dominions, nor settle within six miles of the Danube; but, disliking these conditions, they again joined the Marcomans, and renewed the war. In the prosecution of this contest, which was long and sanguinary, they were totally defeated; their king Ariogeses was taken prisoner; but the emperor spared his life, confining him to the city of Alexandria, the metropolis of Egypt. The Quadians, however, seem to have continued in arms till the reign of Commodus, who granted them peace upon the following terms: that they should keep at the distance of five miles from the Danube;—that they should surrender their arms, and supply the Romans with a certain number of troops when required;—that they should assemble but once a month in one place, and in the presence of a Roman centurion;—and that they should not make war upon the neighbouring nations without the consent of the people of Rome. In the year 214, the king of the Quadians was Gaiobomar, who was assassinated by order of Caracalla. In the 4th year of the reign of the emperor Valerian, the Quadians joined the Sarmatians, and invading Illyricum, ravaged that province; but they were defeated by Probus, then tribune of a legion, and afterwards emperor. In the year 260, the 7th of the emperor Gallienus, they made a sudden irruption into Pannonia, but they were expelled, without their booty, by Regillianus. Upon the death of Probus, who had kept the barbarians in awe, A.D. 283, the Quadians, in conjunction with the Sarmatians, broke into Illyricum and Thrace, and having ravaged those provinces, and advancing towards Italy, they were met by Carus, the successor of Probus, on the borders of Illyricum, and totally defeated; 16,000 being killed on the spot, and 20,000 being taken prisoners. In the 19th year of the emperor Constantius, the Quadians made an irruption into Pannonia and Mœsia; and having pillaged both provinces, returned home with an immense booty. They returned again in two years, and laid waste Valeria. Constantius was provoked by these invasions, and leaving Milan, advanced to the confines of the Quadians, and conferred with their chiefs, who excused past hostilities, and promised, for the future, to live in peace and amity with the emperor. They soon, however, forgot their promise; and in the following year joined the Sarmatians, and laid waste a great part of Pannonia and Mœsia: but at the approach of Constantius, they repassed the Danube, and returned home. The emperor determining to punish them for their treachery, passed the Danube on a bridge of boats, and began to destroy their country. The Quadians, unable to resist, sued for peace, and obtained it, upon delivering up hostages, and setting at liberty all the prisoners they had taken. In the year 374, their king Gabinius being treacherously murdered by Marcellianus, duke of Valeria, they crossed the Danube in the utmost rage, and falling upon the reapers, in harvest time, killed the greatest number of them, laid waste the country, and took many captives. They afterwards followed Equitius, general of the troops in Illyricum, who had been acceffory to the murder of their king, into Valeria, and committed dreadful devaftations in the countries through which they paffed. In their way they met with two legions, the Pannonian and Mœfian, who had been fent to oppofe them, and taking advantage of a conteft which fubfifted among them about precedency, they cut them both in pieces. In this irruption the Quadians had been joined by the Sarmatians; but the latter were defeated with great flaughter by Theodofius. then duke of Mœfia, and afterwards emperor. Againft the Quadians Valentinian I. marched in perfon; and having made great preparations for his propofed expedition into their country, he took the field; paffed the Danube at Acinium, now Gran, or Buda, in Lower Hungary, entered the enemy's country, and deftroyed it with fire and fword. At length, the Quadians fued for peace; but whilft the emperor was fpeaking to the meffenger with great warmth, and threatening to extirpate their whole nation, he fell to the ground in a fit, and foon afterwards expired. Upon his death a treaty was concluded with the Quadians. Their reftlefs fpirit and difpofition for war manifefted themfelves again in the year 379, when they invaded Illyricum; but they were driven out, with fome lofs, by the emperor Gratian. In 407 they entered Gaul with the other barbarians, over-ran its provinces, and committed dreadful ravages. From this time no farther mention is made of the Quadians; fo that they were either fubdued, or utterly extirpated by the Goths, who had fettled in Pannonia and Illyricum. Anc. Un. Hift. vol. xvii.

QUADRA, in *Building*, any fquare border, or frame, encompaffing a baffo-relievo, pannel, painting, or other work.

The word is alfo ufed, erroneoufly, for a frame or border, of any other form; as round, oval, or the like.

Quadra and Vancouver's *Ifland*, in *Geography*, a name given to the ifland of Nootka, in compliment to fignor Quadra, the Spanifh commander at Nootka Sound, and captain Vancouver, who expected to obtain poffeffion of the fettlement in the year 1792. See Nootka, and Nootka *Sound*.

QUADRAGESIMA, a term fometimes ufed for the time of Lent, becaufe confifting of forty days.

Hence fome monks are faid to lead a quadragefimal life; or to live on quadragefimal food all the year.

Quadragesima *Sunday* is the firft Sunday in Lent; fo called becaufe it is about the fortieth day before Eafter.

On the fame account, the three preceding Sundays are called Quinquagefima, Sexagefima, and Septuagefima.

QUADRAGESIMALS, Quadragesimalia, denote Mid-lent contributions, or offerings.

It was an ancient cuftom for people to vifit their mother-church on Mid-lent Sunday, and to make their offerings at the high altar; and the like was done in Whitfun-week. But as thefe latter oblations, &c. were fometimes commuted for by a payment of pentecoftals, or Whitfun-farthings; fo were the former alfo changed into a cuftomary payment, quadragefimals, denarii quadragefimales; and fometimes Letare, Jerufalem, from a hymn fo called, fung on that day, beginning "Jerufalem, mater omnium," &c.

QUADRANGLE, in *Geometry*, a quadrangular, or quadrilateral figure; or a figure which has four fides, or four angles.

To the clafs of quadrangles, or quadrangular figures, belong the fquare, parallelogram, trapezium, rhombus, and rhomboides.

A fquare, &c. is a regular quadrangle; a trapezium, an irregular one.

Quadrangular figures are not proper for fortification; the flanks, and flanked angles, being too fmall.

QUADRANGULARIS Piscis, the *Square-fifh*, in *Ichthyology*, the name of a fifh, which, in its moft ufual fize, is about fifteen inches long, four inches high in the middle, and three inches and a half over; the forehead is fquare, a little hollow, and, by the eminence of the eye-brows, two inches and a half over; the nofe blunt, and not very fteep, with two holes in the place of noftrils, and the mouth very fmall; the back is a little convex toward the tail, and on the fides a little obtufely angled; as is alfo the belly, which is plain and flat, and a little rifing toward the tail; it has five fins, two near the gills, two near the tail, and the tail-fin, which is confiderably long. Part of the head and tail are covered with a foft fkin, the reft of the body with a kind of cruft, adorned all over with little round knots, reduced for the moft part into hexagonal figures, and fubdivided into equilateral triangles. Grew, Muf. Reg. Sac. p. 110.

QUADRANS, in *Antiquity*, the fourth part of the *as*, or pound. See As.

Quadrans, in our *Cuftoms*, is the fourth part of a penny, or a farthing.

QUADRANT, Quadrans, in *Geometry*, an arc of a circle, containing 90 degrees, or one-fourth of the entire periphery.

Sometimes, alfo, the fpace, or area, included between this arc and two radii, drawn from the centre to each extremity thereof, is called a quadrant, or, more properly, a quadrantal fpace; as being a quarter of the entire circle.

Quadrant alfo denotes a mathematical inftrument, of great ufe in navigation and aftronomy, for the taking of altitudes, angles, &c.

The quadrant is varioufly contrived, and furnifhed with different apparatus, according to the feveral ufes for which it is intended; but they have all this in common, that they confift of a quadrant, or quarter of a circle, whofe limb is divided into 90 degrees; and that they have a plummet fufpended from the centre; and are furnifhed with pinnulæ or fights, through which to look.

Quadrant, *the Common*, or *Surveying*, (reprefented *Plate* VI. *Surveying*, *fig.* 13.) is made of brafs, wood, or other matter, ufually twelve or fifteen inches radius. Its circular limb is divided into 90°, and each of thofe fubdivided into as many equal parts as the fpace will allow, either diagonally or otherwife. On one edge, or femi-diameter, are fixed two immoveable fights; and in the angle, or centre, is hung a thread, with a plummet. To the centre is likewife, fometimes, fixed a label, or moveable index, bearing two other fights, like the index of a telefcope. And, in lieu of the immoveable fights, there is fometimes fitted a telefcope; though this more peculiarly belongs to the aftronomical quadrant.

On the under fide, or face, of the inftrument, are fitted a ball and focket; by means of which it may be put in any pofition, for ufe.

Befides the effentials of the quadrant, there is frequently added on the face, near the centre, a kind of compartiment, called the *quadrat*, or *geometrical fquare*; as in the figure: this, in fome meafure, making a diftinct inftrument of itfelf. See its defcription and ufe under the article Quadrat.

The quadrant is to be ufed in different fituations, according to the dimenfions to be taken. To obferve heights and depths, its plane is difpofed at right angles to the horizon; but to take horizontal diftances, the plane is difpofed parallel to it.

Heights and diftances, again, may be taken two ways;

viz. by means of the fixed fights and plummet, and by the label.

QUADRANT, *Ufe of the Surveying. To take the height or depth of an object with the fixed fights, and plummet.*—Place the quadrant vertically, and the eye under the fight next the arc of the quadrant: thus direct the inftrument to the object, *e. gr.* the top of a tower, till the vifual rays of it ftrike through the fights upon the eye.

This done, the portion of the arc intercepted between the thread and the femidiameter, on which the fights are faftened, fhews the complement of the object's height above the horizon, or its diftance from the zenith; and the other portion of the arc intercepted between the thread and the other femidiameter, fhews the height itfelf of the object above the horizon.

The fame arc likewife gives the quantity of the angle made by the vifual ray, and a horizontal line, parallel to the bafe of the tower.

Note, to obferve depths, the eye muft be placed over that fight next the centre of the quadrant.

From the height or depth of the object in degrees thus found, which fuppofe 35° 35′; and the diftance of the foot of the object from the place of obfervation carefully meafured, which fuppofe 47 feet; its height or depth in feet, yards, &c. is eafily determined by the moft common cafe in trigonometry.

For we have here, in a triangle, one fide given, *viz.* the line meafured, and we have all the angles; for that of the tower is always fuppofed a right angle: the other two, therefore, are equal to another right angle; but the angle obferved is 35° 35′, therefore the other is 54° 25′.

The cafe, then, will be reduced to this: as the fine of 54° 25′ is to 47 feet, fo is the fine of 35° 35′ to a fourth term, *viz.* $33\frac{1}{2}$ feet; to which add the height of the obferver's eye, fuppofe 5 feet; and the fum, $38\frac{1}{2}$ feet, is the height of the tower required.

QUADRANT, *the farther ufe of the, in taking of altitudes of objects, both acceffible and inacceffible,* fee under the article ALTITUDE.

QUADRANT, *Ufe of the, in taking heights and diftances by the index and fights.*—To take, *e. gr.* a height, as that of a tower whofe bafe is acceffible; place the plane of the inftrument at right angles to the plane of the horizon, and one of its edges parallel to it, by means of the plummet, which, in that cafe, will hang down along the other. In this fituation turn the index, till, through the fight, you fee the top of the tower; and the arc of the limb of the quadrant between that fide thereof parallel to the horizon and the index will be the height of the tower in degrees; whence, and from the diftance meafured as before, its height in feet, &c. may be found by calculation, as in the former cafe: or, without calculation, by drawing from the data, on paper, a triangle fimilar to the great one, whofe bafe is the diftance; and its perpendicular, meafured on the fcale, is the height of the tower.

QUADRANT, *Ufe of the, in meafuring horizontal diftances.*—Though the quadrant be a lefs proper inftrument for this purpofe than a theodolite, femicircle, or the like, becaufe angles greater than quadrants cannot be taken by it, yet neceffity fometimes obliges perfons to have recourfe to it.

The manner of its application is the fame with that of the femicircle; all the difference between the two inftruments confifting in this, that the one is an arc of 180°, and can therefore take an angle of any quantity; and the other is only an arc of 90°, and is therefore confined to angles of that quantity. See, therefore, SEMICIRCLE.

QUADRANT, in *Aftronomy,* is an inftrument by which the altitude of a heavenly body is meafured, and is compofed of one-quarter, or one-eighth of a circle, accordingly as the meafurement is made by means of direct vifion, or by the reflected image of the object to be viewed. When a fufpended circle was made ufe of with revolving fights, called an aftrolabe, the accuracy of an obfervation could never be depended on, partly becaufe the radius was fmall, and partly becaufe the inftrument vibrated when fufpended by the hand, and was otherwife inconvenient to ufe, as well as liable to have its equipoife difturbed by the various pofitions of the index and fights: therefore, fuch a portion of the circle was adopted as was competent to meafure the greateft poffible altitude, and an increafe of radius was thereby obtained, which promifed to contribute to accuracy, without affecting the portability of the inftrument. But though the conftruction was varied by different ingenious men, the quadrant was but little, if at all, conducive to the improvement of nautical or of aftronomical fcience, till the application of telefcopic fights, and an improved mode of graduating the limb, together with the addition of a vernier fcale, gave it powers on which the mariner and aftronomer could confide. Quadrants have been conftructed of different materials, fuch as wood, ivory, brafs, &c. and of various dimenfions, agreeably to the ufes for which they were intended, in order to accommodate purchafers of every denomination; but as it is not our province to notice every plaything that has ufurped the appellation of quadrant, we will confine our account to fuch inftruments chiefly as have been of actual fervice in navigation and aftronomy. We have, however, already anticipated the hiftory, we might here have introduced, of the various improvements fucceffively made in quadrants, at the beginning of our article CIRCLE; and under the article GRADUATION we have given, at confiderable length, the different methods of dividing and fubdividing aftronomical inftruments in general; to which articles we beg to refer our readers, who wifh for information on thofe points, and which may be read in conjunction with our prefent article.

Our arrangement of quadrants will be moft fyftematic, if we divide them into two claffes, *viz.* thofe which meafure altitudes by direct vifion, and thofe which determine meafurements in all directions, vertically, horizontally, and obliquely, by means of reflection. The former clafs have been found ufeful in aftronomy chiefly, and the latter in navigation, where the motion of a fhip interferes with the fteadinefs of any fixed pofition of an inftrument.

The firft quadrant, in its rude ftate, was probably a quarter of the aftrolabe enlarged, with fixed fights placed in, or parallel to, the vertical line paffing through zero; and a fine thread, or wire, ftretched by a plummet, indicated the altitude on the divided limb, according to the reprefentation in *fig.* 4. of *Plate* I. of *Aftronomical Inftruments.* This conftruction might be ufed in obfervations of the fun, without injuring the eye of the obferver, by allowing the folar ray to pafs through the firft fight-vane, or hole, fo as to fall on the fecond, at fome diftance from the former, while the thread refted nearly in contact with the elevated limb; but the want of minute, and at the fame time accurate fubdivifions, and the fenfible thicknefs of the thread, were impediments to accuracy that did not admit of remedy, until another mode of reading the altitudes was devifed, and until a method was contrived of rendering the light of the fun tolerable to the eye of an obferver. The former of thefe defiderata was accomplifhed firft by diagonal fcales, with a fiducial edge of an index, and afterwards by that admirable contrivance, fometimes called a Nonius, but more properly denominated a Vernier, from the name of its inventor;

ventor; the latter was effected by femi-opaque glafs, introduced at firft without, but afterwards, with better effect, with telefcopic fights; at the fame time, enlarging the vifual angles fubtended by the fun, and yet diminifhing the intenfity of his light by a partial tranfmiffion through the fmoaked or coloured glafs.

Davis's Quadrant, or Back-Staff.—In the year 1590, captain John Davis, a native of Sandridge, near Dartmouth, previoufly to his failing into the South feas under the command of Mr. Cavendifh, contrived that inftrument, which is reprefented in *fig.* 2. of *Plate* I. of *Aftronomical Inftruments*, and which has been called the *Englifh quadrant*, or *back-ftaff*. This inftrument difpenfed with the ufe of the plumb-line, and confequently was better adapted to nautical purpofes than the old quadrant, or than the fore-ftaff, that preceded it; but wanted the telefcopic fights, which have given fubfequent inftruments the advantage over it. It was, however, probably the firft quadrant in which the horizon was ufed as one of the objects in a back obfervation, and from which the reflecting inftruments afterwards borrowed an ufeful principle, where altitudes are concerned; though it was in the ufe of the *fore-ftaff*, (defcribed under our article CIRCLE,) that the horizon was firft made one of the extreme limits of an altitude, taken by a forward obfervation. Captain Davis found that pear-tree anfwered very well as the material on which his inftrument was conftructed, and an ingenious arrangement of two divided arcs and three vanes conftituted his plan, according to the following defcription. The vane at A was called the horizon-vane; the one feen at B the fhade-vane, becaufe its fhadow fell on the horizon-vane during the inftant of completing an obfervation; and the third, at C, was denominated the fight-vane, by reafon of its being the vane to which the eye was applied in taking an obfervation. The arc of fmaller radius, D E, contained 60°, and the other, F G, of larger radius, contained only 30°, in continuation of the former, making together the whole quadrant. The arc D E was divided into whole degrees only, on account of the fmallnefs of its radius; but the arc F G had its degrees fubdivided by concentric and diagonal lines, as feen in the figure. The manner of afcertaining the altitude of a heavenly body, by the joint ufe of thefe two arcs, is not obvious at firft fight of the inftrument, but may be thus explained. When the altitude of the fun is taken, the horizon-vane is fitted to the extreme end or centre A of the quadrant, and the fhade-vane B is put to within about 10° or 15° of the fuppofed co-altitude, but to a lefs quantity than the co-altitude, while the fight-vane remains for adjuftment on the arc F G. Things being in this ftate, the back of the obferver is turned to the fun, and the quadrant is fo elevated, that the fhadow of the upper edge of the fhade-vane B falls upon the upper edge of the flit in the horizon-vane A, when viewed through the fmall hole in the fight-vane. If now, in this fituation, the horizon is feen through the faid flit, the obfervation is exact; but if not, the fight-vane is moved backwards or forwards on the arc F G, accordingly as the fky or fea is feen, till the horizon appears in its place, while the fhadow of the fhade-vane refts on the required fituation in the flit of the horizon-vane, and then the obfervation is finifhed; and the fum of the two readings on the refpective arcs, B and C, as read by the fiducial edges of the vanes, is the co-altitude or zenith diftance of that limb of the fun, upper or lower, which was obferved from the correfponding limb of the fhadow. If a lens, of a focal length equal to the radius of the fmaller arc, were ufed, the focal luminous point occafioned thereby would be a better object to meafure the place of, than a fhadow with an edge not fufficiently defined. This inftrument, it fhould feem, was not capable of taking the altitude of a ftar or planet, nor of the moon, unlefs her difc was large enough at the time to project a fhadow.

Elton's Quadrant.—An index bearing a fpirit-level, with a vernier-fcale near the fight-vane, was added to the quadrant of Davis fome time afterwards, by one Elton, the ufe of which was to take altitudes *without an horizon;* but the fimilarity of the two inftruments renders a more particular defcription of this addition fuperfluous. An infpection of *fig.* 8. *Plate* I. will fufficiently explain the difference.

Gunter's Quadrant.—Among the numerous and ufeful contrivances of the ingenious profeffor of aftronomy in Grefham college, was a portable quadrant, which now claims our attention, and which was contrived in, or a little before, the year 1618. The object of the inventor was not to conftruct an inftrument capable of meafuring altitudes more accurately than that of captain Davis, which we have juft defcribed, but to make a quadrant fo comprehenfive in its ufes, that, like the logarithmic fcale, which he divided, it might fhew by infpection refults, which had previoufly required long and tedious calculations; and in this point of view it is ftill to be confidered. Befides the quadrantal arc for meafuring altitudes, this inftrument has various curves ftereographically projected on it, fuch as the equator, the tropics, the ecliptic, and the horizon, on a fuppofition that the eye is fituated in one of the poles, all which are reprefented in *fig.* 3. of *Plate* XXIII. of *Aftronomical Inftruments*. The projection, according to Bion, is thus effected; when the quadrantal arc B C has been graduated, from its centre A, with a convenient radius A T, defcribe the arc T D to reprefent one of the tropics; and let the line A T be taken as the tangent of 56° 46′, or half the fun's greateft declination (fuppofed here to be 23° 32′), added to the radius or tangent of 45°; then to find the point E in this line for the equinoctial, there will be this proportion, as the tangent of 56° 46′ : 1000 :: radius : 655; and therefore, if $\frac{655}{1000}$ parts of the line A T be taken, it will be the proper radius of the arc E F, or equinoctial.

To find the centre of the occult arc E D, which reprefents the ecliptic, let the meridional line A D be fo divided by the point G, that if A F be taken as radius, A G may be the tangent of 23° 32′, the fun's greateft declination; in which cafe A G will be $\frac{431}{1000}$ of the line A F, and the occult arc E D defcribed from the point G will be one-fourth of the ecliptic, which may be divided into figns and degrees thus: as radius is to the tangent of any degree's diftance from the neareft equinoctial point, fo is the co-fine of the fun's greateft declination, to the tangent of that degree's right afcenfion; for example, fuppofing the right afcenfion of the firft point of ♉ to be 27° 54′, draw a line from A, the centre of the quadrantal arc, to this degree and minute on the faid arc, and note where it interfects the occult arc of the ecliptic, and this point will be the beginning of the fign ♉; and in like manner any other part may be inferted.

The line E T, or line of declination, may be divided thus; taking A E for the radius of the equinoctial, or tangent of 45°, let the tangents of 46°, 47°, 48°, &c. up to 68° 30′, be fucceffively taken and laid down on the line E T, and the points of excefs above the tangental point of 45° will be the dividing lines of the fcale for 1°, 2°, 3°, &c. up to 23° 32′, or greateft declination.

When the fcale of declination is finifhed, the quadrantal arc may be taken as the meafure of right afcenfions, and then the place of a ftar or any other heavenly body may be inferted on the plane of the quadrant thus; let a line be drawn

drawn from A to the degree and minute of right afcenfion, counted from B towards C, and the point in this line, where an occult arc, drawn through the declination from the centre A, interfects it, will be the place of the heavenly body in queftion.

The two parallel arcs contained between the tropic T D and the quadrantal arc B C, are the fcales of days and months, which are divided by the aid of a table of meridian altitudes of the fun for each day, calculated for the particular latitude, for which the quadrant is conftructed. It is hardly neceffary to obferve, on the conftruction of fuch table, that if the latitude and declination be both north, or both fouth, the declination muft be added to the co-latitude for the greateft altitude; but if of contrary denominations, fubtracted. The degrees and minutes contained in fuch table are transferred into the fcale of months by a line extending acrofs it from the centre A to the quadrantal arc, as before.

The centre of the horizon will be in the meridional line A C, and if a point H be taken fuch, for the co-latitude 38° 28′ for inftance, that A H may be the correfponding tangent to radius A F, then $\frac{7}{10000}$ of that radius will be its diftance from A, and the occult arc defcribed from H, with the extent H E, beginning at E in the equinoctial, and ending at the tropic T D, will be the required horizon. This horizontal arc may be divided thus; as radius is to the fine of the latitude, fo is the tangent of any number of degrees in the horizon, to the tangent of a correfponding arc in the quadrant; and from a table thus conftructed any point in the horizon may be put in by interfection of a line drawn from A to the tabular number as read on the quadrantal arc, as in the former cafes.

A third table of the fun's altitude for inferting the hour lines may be calculated thus; when the fun is in the equator, as radius is to the co-fine of the latitude, fo is the co-fine of any hour from the meridian, to the fine of the fun's altitude at that hour; but when the fun has declination, fay, as the co-fine of the hour from the meridian is to radius, fo is the tangent of the latitude, to the tangent of a fourth arc; then if the latitude and declination have like denominations, and the hour fall between noon and fix o'clock, fubtract the declination from the faid fourth arc, and the remainder will be a fifth arc; but if the latitude and declination have unlike denominations, or the hour be between fix and midnight, add the declination to the fourth arc, and the fum will be a fifth arc, which muft be thus ufed; as the fine of the fourth arc, is to the fine of the latitude, fo is the co-fine of the fifth arc, to the fine of the altitude fought. The determination of fuch table by this fundamental method is however operofe, and Margett's horary tables, which give the fucceffive altitudes in any given latitude, would greatly fhorten the labour, by giving the refults by infpection, which may at the fame time be inferted by transfers from the quadrantal arc, fimilar to thofe we have already defcribed. When the horary points are put in for each fucceffive hour, when the fun is in the equator, at each tropic, and at a few intermediate places, the horary lines may be drawn through the faid points, which will give the hour for any given day, when the inftrument is ufed as hereafter defcribed.

A fourth table, for putting in the azimuth lines, will require the fun's altitude to be calculated for each degree of azimuth, when the fun is at the equator, at each tropic, and at other intermediate places, which may be done thus: when the fun is in the equator, as radius is to the co-fine of the azimuth from the meridian, fo is the tangent of the latitude, to the tangent of the fun's altitude at the azimuth in the equator: but out of the equator the rule is, as the fine of the latitude, is to the fine of the declination, fo is the co-fine of the fun's altitude at the equator at a given azimuth, to the fine of a fourth arc. When the latitude and declination have the fame name, in all azimuths from the prime vertical to the meridian, add this fourth arc to the arc of altitude at the equator; but when the azimuth is above 90°, fubtract the altitude at the equator from this fourth arc; alfo when the latitude and declination have unlike names, fubtract the faid fourth arc from the arc of altitude at the equator, for the altitude at the propofed azimuth. The points correfponding to the tabular numbers, thus afcertained, muft be inferted by interfection of lines drawn from A, as before, to the quadrantal arc B C, and lines uniting thofe points will be the lines of azimuth for each hour in every day of the year. But to complete the inftruments, two fights or vanes muft be fixed on the meridional line A C, and a fmall plumb-line, with an adjuftable bead, muft be fufpended from the point A of the quadrant.

In addition to the lines already defcribed, Gunter's quadrant has fometimes a fquare under the angular point A, called a *quadrat*, as feen in the figure, two fides of which are divided into ten equal parts each, and thefe again fubdivided into others, the ufe of which is to meafure angular diftances; and fometimes the large fquare is fubdivided into a number of fmaller ones, for the purpofe of performing arithmetical proportions by infpection. See Bion on the Conftruction and principal Ufes of Mathematical Inftruments.

It would be tedious to enumerate all the ufes of this quadrant, and to exemplify all the problems that it is capable of performing, or rather of illuftrating (for great accuracy cannot be expected in the indication of fo fmall an inftrument); but we will fpecify a few of the moft ufeful, which may be varied by reverfing the proceffes, and by altering the data, to a great extent.

Problem I.—*To find the Sun's Right Afcenfion.*

Stretch the thread from the point A over the fun's place, as marked in the graduated ecliptic, and the degree cut by it in the quadrantal arc will give the correfponding right afcenfion.

Prob. II.—*To find the Sun's Declination.*

Stretch the thread as before, and flide the bead till it refts on the fun's place for the given day, and then turn it to the fcale of declination, where the correfponding degree will be feen under the bead.

Prob. III.—*To find the Sun's Meridian Altitude on any Day.*

Extend the thread over the day of the month given, in its proper fcale, till it reaches the quadrantal arc, and the fun's greateft altitude for that day will be indicated thereby.

Prob. IV.—*To find the Hour of the Day.*

Extend the thread over the day of the month, and, holding it there, flide the bead till it lies on the line of twelve o'clock; then elevate the quadrant fo that the folar ray may pafs through the upper fight-hole exactly upon the fecond, and allow the plummet to reft, and then the bead will indicate the hour, before or after noon, as the cafe may be. In a fimilar manner the fun's altitude may be meafured by the thread falling on the quadrantal arc, when the folar ray paffes as above defcribed.

Prob. V.—*To find the Sun's Amplitude.*

Let the bead be rectified for the given time, and be brought

brought afterwards to the horizon, while the thread remains ſtretched, and it will indicate the riſing or ſetting amplitude, as the caſe may be.

Prob. VI.—*To find the Aſcenſional Difference.*

Rectify the bead as in the laſt problem, and bring it to the horizon, in which ſituation the thread, extended to the quadrantal arc, will ſhew the aſcenſional difference in degrees, which converted into time will ſhew how much the ſun riſes before ſix in ſummer, and after ſix in winter, and conſequently will give the exact length of the given day.

Prob. VII.—*To find the Sun's Azimuth.*

Rectify the bead for the given time, and obſerve the ſun's altitude as explained in prob. 4. Then extend the thread to the complement of that altitude, and the bead will indicate the azimuth correſponding, and *vice verſâ*.

Prob. VIII.—*To find the Hour of the Night by a Star.*

Put the bead on the thread to the diſtance that will indicate the ſtar's declination, and look through the ſight for the ſtar till the plummet reſts on the plane of the quadrant, and in that ſituation the bead will ſhew, in the hour lines, the ſtar's diſtance in time from the meridian of the place; in the next place ſubtract the ſun's right aſcenſion in time from that of the ſtar, as given in ſome catalogue, and to the remainder add the obſerved diſtance from twelve o'clock in ſidereal time, and the ſum will be the hour nearly, or the approximate diſtance of the ſun from noon, which may be corrected by applying the ſun's variation of right aſcenſion ſince the preceding noon, which in every ſix hours will be about a minute.

Sutton's quadrant, and Collins's ſector on a quadrant, are very ſimilar, both in conſtruction and uſe, to the quadrant we have here deſcribed, and the dial on a card, by Ferguſon, is nearly related to it, particularly as it has been lately improved by the Rev. W. Pearſon.

Of Aſtronomical Quadrants.—The quadrants which we have hitherto deſcribed may be conſidered as by no means perfect, but as approximating only to an inſtrument, that is really uſeful in an obſervatory for determining the exact place of a heavenly body; hence the quadrant, which we propoſe next to deſcribe, has obtained the name of *aſtronomical*, from its ſuperior pretenſions to accuracy in the meaſurement of altitudes taken above the horizon, and therefore merits our more particular attention.

An aſtronomical quadrant may be either portable or fixed; in the former caſe it is uſually mounted on a tripod, with adjuſting ſcrews in the feet, and has a horizontal motion as well as a vertical one, in order that it may take altitudes in any azimuth, or be made to follow the body obſerved in its apparent path; but in the latter caſe it is fixed againſt a ſteady wall, with its plane in, or very nearly in the meridian, and is therefore denominated a *mural quadrant*.

The firſt aſtronomical quadrant, of which we have any account left us, is that which Ptolemy uſed; it was the fourth part of a circle placed faſt againſt a ſtone pier, or quadrangular log of wood, with zero of the arc in the horizontal line, and a pin of wood projecting from the central point threw a ſhadow on the limb when the ſun ſhone, which ſhadow was uſed by way of index: but it is obvious that much accuracy was not to be expected from ſuch an inſtrument, however well conſtructed or divided. We might mention here the quadrants of Tycho Brahé and Hevelius, but the former has been noticed under our article Circle, and the latter was deſtroyed in the conflagration of the owner's houſe in Dantzic. In more recent times, aſtronomical quadrants have been made on accurate principles, and with great care, eſpecially by Graham, Siſſon, Bird, Ramſden, Cary, and Troughton, ſeveral of whoſe inſtruments we will now deſcribe, as far as any difference in their conſtruction renders diſtinct accounts neceſſary. We will proceed, as we have done on former occaſions, chiefly in the order of time, which, generally ſpeaking, will be found to be alſo in the order of ſucceſſive improvements.

Mural Quadrant by Graham.—Before we proceed to deſcribe the mural quadrant, contrived and made by Graham, and fixed at the weſt ſide of the ſtone pillar in the middle room at the Royal Obſervatory at Greenwich, at the expence of king George I., and for the uſe of that eminent aſtronomer Dr. Halley, it may be proper to mention that Flamſteed, and his aſſiſtant Sharp, had previouſly uſed an arc of a circle fixed againſt a ſtone pier in the meridian, which they had themſelves conſtructed, and which was removed at Flamſteed's death. We muſt, therefore, conſider their inſtrument as having been the prototype of Graham's mural quadrant, or arc, as it has been alſo called ſometimes. In *fig.* 4. of *Plate* XXIII. of *Aſtronomical Inſtruments*, is given a repreſentation of the mural quadrant of Graham's conſtruction, which will equally repreſent that of Bird, conſtructed after the ſame model, and which is the ſame that both Dr. Smith, and Stone, the editor of Bion's work, have given in their reſpective accounts.

The body of this quadrant is compoſed chiefly of bars of iron united together, as ſeen in the figure; ſome, to form the plane of the quadrant, placed flat-ways; and others, to give ſtrength and ſtability, fixed edge-ways. Theſe bars are all of the ſame dimenſions, namely 2.9 inches wide, and 0.175 thick, and are united together by right-angled ſhort bent bars in various places, both at the interſections made by the ſides of the ſmall ſquares, and at other ſituations, ſo that while great firmneſs is obtained, great weight is avoided. The quadrantal arc is compoſed of two bars, one of iron, united to the iron frame, and the other of braſs, on which the diviſions are made, as deſcribed under our article Graduation; this braſs bar is pinned faſt to the iron one, and being more ſlender than the iron, accommodates itſelf thereto, and, as time has proved, does not alter the ſhape of the arc, as we have lately been aſſured by Mr. Troughton. The breadth of the limb is 2.2 inches, the braſs limb being more remote than the anterior edge of the iron arc by 1.2 inch, and the ſurface was planed, or rather ſcraped, by a tool fixed to a radial bar, that revolved on a vertical axis of motion, placed in the centre of the arc, and reſting with its ſuperior end in a fixed beam above the plane of the quadrant, when this plane was lying in a horizontal poſition, it being impracticable to put ſo large a body in any ordinary lathe. The original diviſions of Graham were inſerted on two ſeparate arcs, one graduated into 90° and its ſubdiviſions, and the other divided into 96 parts and its ſubdiviſions, as we have before explained in the article juſt referred to; but the diviſions, being laid down by rough dividing, are not now made uſe of, but a quadrantal arc of 96, with its ſubdiviſions, put in by Bird in 1753 between the two arcs of Graham, is that which all obſervations taken by Graham's quadrant are now referred to, and the readings are transformed into degrees, minutes, and ſeconds, by an appropriate table. The readings were at firſt obtained by a double vernier-piece carried by the teleſcope, that revolves round the centre of the arc, one ſide of which vernier-piece read with the arc 90°, and the other with the arc of 96 parts, or grand diviſions; the degree was ſubdivided into 12 parts, or 5′ ſpaces, and 10 parts on its vernier equalled 11 out of the ſaid 12 parts, ſo that

$\frac{1}{120}$

$\frac{1}{11}$ of a degree, or $5'\frac{1}{2}$, was the length of one of the vernier divifions, and $\frac{1}{11}$ of this, or 30″, was the fmalleft quantity indicated by this vernier; but on the arc of 96 grand divifions there was, as in Bird's arc, 16 equal parts, or fubdivifions, in every grand divifion, and the vernier for this arc had 17 divifions on it, occupying the fpace of 16 fubdivifions in the arc, fo that the length of this vernier was $\frac{17}{16}$ of $\frac{90^\circ}{96} = 59'.83$ nearly, and one divifion of it $\frac{59'.83}{17} = 3'.52$ nearly.

Hence in the firft vernier its number 11 is *one lefs* than its equivalent arc contains on the limb of 90°; but in the fecond, the number 17 is *one more* than its equivalent arc contains in the arc of 96 parts, on which account the reading of one vernier is in the direction from right to left, but that of the other, on the contrary, from left to right; one meets, and the other overtakes the dividing ftrokes of the divided limb; and for the fame reafon, in the common Hadley's quadrant, or rather octant, fometimes 19 fubdivifions, and fometimes 21 on the limb, act againft 20 in the vernier, but then the readings are *not* in the *fame direction*. The telefcope is clamped to the arc in any fituation by the mechanifm for flow motion in the ufual way, which probably was firft adopted in one of the large quadrants, and its counterpoife beyond the centre of the arc, gives it the advantage of remaining in any pofition. It has crofs hairs in the focus of the eye-glafs. When the lines of the vernier are none of them coincident with any one on the limb of either quadrantal arc, the portions lefs than what the verniers profefs to indicate were *eftimated* by the eye, by examining the fituation of other pairs of dividing lines, to the right and left of thofe neareft to a coincidence; and to a want of a micrometrical nut to the fcrew of flow motion may be attributed the remark, that has been made, that the readings thus taken, even with fo large radii as 96.85 and 95.8 inches, were not to be depended upon to 10″. That the motion of the telefcope might be quite eafy, and that the centre of the quadrant might be relieved of its weight, the following contrivance was introduced; *a b* reprefents an iron axis laid acrofs the top of the wall, having two brafs plates fixed perpendicularly to its ends, with notches cut in them for this axis to turn in, which axis points to the centre of the quadrant at right angles to its plane: to that end of it next to the quadrant, at *a*, an iron arm, *c d*, is fixed, having two brafs plates, *c e*, *d f*, almoft perpendicular to it; to thefe are rivetted two flender flips of deal, whofe remote ends meet at *g*, near the eye-piece of the telefcope, and are held together by a brafs cap. Through a fmall plate fixed to one fide of a collar, embracing this lower end of the telefcope, there paffes a fcrew-pin at *g*, parallel to the telefcope; which pin, being fcrewed into the cap at the end of the faid flips of deal, holds up the telefcope againft the centre-work, while the flips are braced by other crofs flips of the fame light wood. The counterpoife *i* is fupported by the rod *h i* at *b*, the retiring end of the axis *a b*; and a pair of brafs rollers *k l*, acting againft the limb of the inftrument, give freedom to the motion of the telefcope thus counterpoifed, and complete the conftruction. The quadrant being thus put together, fome ftrong but fmall plates of brafs are made faft to its pofterior face, and bent fo as to fall into as many hold-fafts in the wall, into which they are refpectively fcrewed; but the weight of the whole is fupported chiefly by two pins or bolts inferted into the holes A and B, made in pieces of metal attached to fuch angular points of the iron bars, as beft fupport the centre of gravity of the whole: the pin A is made faft into the wall, but allows a motion round it, and the pin B fixes the quadrant after its extreme radii are adjufted, one horizontal, and the other vertical: this pofition was given by means of a plumb-line of fine filver-wire, that at firft was fo fufpended as to bifect both the centre of the quadrantal arc and the point 90° on the limb, but which was transferred afterwards to an adjuftable point of fufpenfion out of the centre, with a correfponding dot made on the arc of excefs of the limb. The plane of the quadrant was made vertical, as compared with the plumb-line, by the fcrews of the hold-fafts; and the telefcope was adjufted parallel to this plane by comparifon with a tranfit telefcope viewing together both high and low ftars in fucceffion; but the line of collimation of the telefcope could not be fixed properly, as it regarded the true horizontal line of the quadrant paffing through its zero, without the aid of Graham's fector. This fector was, therefore, fo adjufted to a ftar near the zenith, that it meafured the fame zenith-diftance, with its plane turned to the eaft, as it did when turned to the weft, and had its error afcertained in this way, and afterwards an altitude, taken with the quadrant, was made to correfpond with fuch corrected altitude of a ftar taken with the rectified fector in reverfed pofitions, which property the mural quadrant does not poffefs. The method of performing this adjuftment for collimation will be underftood from our directions hereafter given, when treating of *Ramfden's portable aftronomical Quadrant.*

Bird's Mural Quadrant.—After the defcription we have given of Graham's mural quadrant, we fhall have no occafion to dwell long on the ftructure of Bird's, which was made of brafs entirely, after a fimilar model, but divided in both its arcs, of 90°, and of 96 grand parts, with more fkill than Graham proved himfelf mafter of in this part of his labours. Smith and Stone defcribe Graham's quadrant as fixed to the eaft fide of the pier at Greenwich, and looking to the fouth, which was the fituation for taking meridian altitudes of the greateft number of ftars; but fince the year 1753, it has been placed on the weft fide, looking towards the north, and Bird's then took its original place.

This quadrant, which was procured in the time of Dr. Bradley, was firft placed on the weft fide of the pier, in 1750; and the obfervations of himfelf and of Dr. Mafkelyne, taken by it fince it was placed on the eaft fide, have contributed largely to complete the beft catalogues of the heavenly bodies, which otherwife muft have been very defective. While, however, Mr. Pond, the prefent aftronomer royal, was engaged in making his well-known table of declinations, with one of Troughton's circles, at Weftbury, he found reafon to fufpect the accuracy of the total arc of this quadrant, from a comparifon of his own determinations with thofe previoufly made with Bird's quadrant; and a fubfequent examination of the arc by Troughton juftified his fufpicion. With an apparatus exprefsly contrived for the occafion, this celebrated mathematical inftrument-maker meafured the total length of the quadrantal arc, and found it too fmall by 7″, exclufive of another fimilar error of 2″, occafioned by the wear of the axis of motion; though, on a rigid trial of the intermediate divifions, he did not detect more than *one fecond* of error, or rather of *inequality*, among the neighbouring divifions in any part of the arc. This trial was made in the prefence of the prefent aftronomer royal, in the year 1807; and the refult, while it ferves to correct paft obfervations, by the addition of 1″ to every fucceffive 10° of altitude, would have tended to correct all future obfervations by a like addition, had not the large tranfit-circle, lately made and fixed in the fame obfervatory by Troughton,

fuperfeded

fuperfeded the ufe of both the quadrants by its fuperior accuracy. The quadrantal arc of Graham's quadrant has not lately undergone a fimilar trial; but Troughton thinks it probable that the iron inftrument has preferved its figure better than the brafs one, and that confequently the addition of the brafs arc on the face of the iron one has had no undue influence in altering either its temporary or permanent dimenfions. At firft, the telefcope of Bird's quadrant was not braced; but after a trial, it was found to bend a little by a counterpoife of 80 pounds, and was afterwards braced by frame-work furrounding it, that prevented its yielding. A trial was made by Dr. Bradley of the total arc, in January 1753, after it had remained three years on the weft fide of the pillar; and though its weight is eight hundred pounds, the error was found to be not more than *two feconds*. He did the fame again in July, in the year 1759, when it had remained fix years and a half in its new fituation, on the eaft fide of the pillar, and found the arc exactly 90°. Thefe examinations, having been made in the extremes of cold and heat, fhew that change of temperature did not affect the total arc; and that, therefore, the 7″ diminution of the arc, detected by Troughton, is occafioned by a change of figure in the fpace of 48 years. The difference of the readings of the two arcs has never yet amounted to 4″, which is a ftanding proof of the accuracy and fkill of Bird as a divider. Near the eye-piece of the telefcope is a good micrometer, that not only gives flow motion in taking obfervations, but meafures the number of *feconds* that the reading lines of the vernier is fhort of coincidence in any obfervation: and formerly the quantity indicated by the vernier had thefe feconds added, to obtain the whole meafure; but, by Smeaton's advice, the vernier is now difregarded, and the addendum, obtained by feveral turns of the micrometer-fcrew alone, is ufed to complete the fimple reading of the divifions and fubdivifions, or 5′ fpaces; in other words, the fcrew, and not the vernier, fubdivides the laft 5′ fpace in the obferved arc, and gives what is due to the obfervation. The adjuftments of this inftrument, which was made of eight feet radius, on purpofe to take the place of Graham's, are made in all refpects as they are made in its predeceffor; and the fector, which ferves for adjufting Graham's line of collimation by ftars near the zenith, is ufed for the fame purpofe in Bird's quadrant. If any of our readers wifh to fee the original plan of all the feparate parts of Bird's quadrant, and to read his defcription of them, we beg leave to refer them to his quarto pamphlet, entitled "The Method of conftructing Mural Quadrants," publifhed by order of the commiffioners of the Board of Longitude, in the year 1768. In this pamphlet, however, it is not mentioned that the vernier of the arc of 90° fubdivides the fpace of 5′ into ten parts of 30″ each, by having ten divifions thereon, reading with eleven fubdivifions of the limb; but we know that this was the original reading of the vernier.

Jeremiah Siffon's Mural Arc.—Perhaps it would have been more confonant to the order of time, if we had fpoken of the younger Siffon, who was Bird's contemporary, and at one time his employer, next after Graham; but the hiftories of the two mural quadrants at Greenwich being connected, demanded that thefe inftruments fhould follow each other in immediate fucceffion. In the year 1768, Jeremiah Siffon, the fon of Jonathan, made the large mural arc at the king's private obfervatory in Richmond gardens, which extends 45°, or more, beyond a quadrant, and confequently reaches beyond the north pole; which circumftance gives it the advantage of being put in the meridian, by an obfervation of the pole-ftar. The divifions of this arc are into degrees and its fubdivifions, but the ftrokes are not cut very neatly; and the reading, as was the cafe with Bird's quadrant at firft, is performed partly by a vernier, and partly by a micrometer-fcrew. We have felected this inftrument, as a fpecimen of Siffon's conftruction, principally on account of a power that it poffeffes, which is very important, but which probably was not contemplated, and confequently not intended by the maker himfelf: the extenfion of the divided limb, to feveral degrees beyond the north pole, affords the means of ufing this inftrument in the manner that Troughton's large mural circle is now ufed, at Greenwich Obfervatory, by the prefent aftronomer royal; namely, to meafure the polar diftances of the ftars directly from the *true polar point*, without any reference to the latitude of the obfervatory, which method is one of the greateft modern improvements in making aftronomical obfervations. It is much to be defired that this mural arc fhould be divided again by Troughton, or fome other fuperior divider, and that it have microfcopic micrometers applied to it, which may be placed by adjuftment over any optional part of the divifions, and at any affumed diftance from each other; for though it would not then, as it does not now, poffefs the valuable property of oppofite readings, and of a motion in altitude to reverfe the oppofite arcs, by reafon of its being lefs than a femicircle, yet being compactly made, and of large radius, it is capable of receiving divifions fuperior to thofe on the quadrants which we have juft defcribed; and as the fituation and ftructure of the obfervatory are excellent, the appointment of a regular obferver to co-operate with the aftronomer royal would be highly conducive to the interefts of aftronomy. We hope that this hint may be taken up in a quarter where the power exifts of realifing our wifhes in this refpect. Aftronomical clocks, and various other auxiliary inftruments, are already in the obfervatory; fo that the principal expence of inftruments, as well as of an appropriate and elegant building, is already incurred.

Portable Aftronomical Quadrant by Ramfden.—It frequently happens that fuperior artifts vary the conftruction of their inftruments to fuit the views of the purchafer, or the fcale on which they are to be conftructed. We will felect out of the quadrants made by the late ingenious Mr. Ramfden, that which he made for Dr. Shepherd for the obfervatory of Chrift-college, Cambridge, and which profeffor Vince has defcribed at confiderable length in his "Treatife on Practical Aftronomy." The figure exhibiting this quadrant is the 5th of *Plate* XXIII. of *Aftronomical Inftruments*, which requires but little explanation. The tripod on which the quadrant is mounted has fcrews of adjuftment to fet the ftem, on which the horizontal motion is performed, perpendicular, which is proved to be fo in all directions when the plumb-line bifects both the fuperior and inferior dots during the whole revolution round a horizontal circle. The vifible ftem is a brafs tube, and through it afcends a folid fteel vertical axis, which fitting clofely at the fuperior and inferior ends, has not the leaft fhake, and preferves the pofition once given it fo long as the feet fcrews are unmolefted. The telefcope is of the achromatic conftruction, and has the ufual apparatus for flow motion, the fcrew of which is made a micrometer to fubdivide the fmall refiduum of the angle that the vernier alone will not indicate, when the coincidence is not perfect. The telefcope lies on a bar that carries the counterpoife, and in which is the centre of its motion. It has a fyftem of wires in the focus of the eye-glafs, which are adjuftable by fcrews, both upwards and fideways, as well as in a circular direction, fo that the adjuftments for collimation, and for zero in the altitude circle, may be effected thereby. The point of fufpenfion of the plumb-line is alfo adjuftable by a proper fcrew apparatus. At the top of the vertical tube, or ſtem, is a ſmall horizontal circle with a clamping apparatus for ſlow horizontal motion, by means of which the whole quadrant, with its attached teleſcope, turns gradually round in azimuth. When obſervations are made in or near the zenith, the plumb-line falls in the way of the teleſcope, and is obliged to be removed, on which account the large quadrant made by Ramſden for the duke of Marlborough, and now placed at Blenheim, has the plumb-line ſuſpended at the poſterior face of the inſtrument. This inconvenience is, however, remedied by the addition of a ſpirit-level ſuſpended from an adjuſtable horizontal braſs rod, under the uppermoſt radial bar of the quadrant, and this level not only ſupplies the place of the plumb-line when taken off, but at all times ſerves as a check on its adjuſtment, and, when furniſhed with a graduated ſcale, may very well be made its ſubſtitute. The conſtruction of Ramſden's portable quadrant was probably borrowed from Bird's, as well as his method of dividing the larger inſtruments that exceeded the reach of his dividing engine; but the inſtrument before us has no other horizontal or azimuth circle, except what is uſed plain, for the purpoſe of giving ſlow motion. Neither is there a ſecond horizontal teleſcope fixed permanently in that ſituation by which the teleſcope of obſervation may have its collimation determined, and the zero of its vernier adjuſted.

The vernier of this quadrant reads with two ſets of diviſions, like that of the mural quadrant by Bird, but the radius being ſmall, the ſubdiviſions are made into four parts each; the inner arc is divided into 90°, and the ſubdiviſions into 15′ each, but the outer one into 96 parts, or grand diviſions, and theſe again each into four parts, or ſubdiviſions; and thoſe two arcs operate as a check on each other. The micrometer ſub-divides the 15′ into 3″; but it is neceſſary to convert the reading of the arc of 96 grand diviſions into a correſponding quantity, expreſſed in degrees, minutes, and ſeconds, which may be done by direct proportion, or, which is more feaſible, by a table that we have ſubjoined, calculated for this purpoſe. The readings of the arc of 96 are put down with titles *diviſions*, *ſub-diviſions*, and *vernier*, where 16 (and ſometimes 32) on the vernier are equal to *one* ſub-diviſion, and *four* ſub-diviſions to *one* diviſion; for example, ſuppoſe the reading to be thus, 21 div. 2 ſub. 11 ver. we ſhall have from the table

			°	′	″
Diviſions	21	=	19	41	15.
Sub-diviſions	2	=		28	7.5
Vernier	$\frac{11}{16}$	=		9	40.1
Total			20	19	2.6

When, however, the coincidence of the vernier is not perfect, the quantity brought up by the micrometer-ſcrew muſt be added as a fractional portion of 52.″8, which is the value of one ſtep of the vernier, when 16 is the number of ſteps, but if 32 are inſerted, then 26″.4 would be the value of one ſtep forwards from zero.

A Table for the Reduction of the Grand Diviſions, Sub-diviſions, and Vernier, of the Arc of 96, into Degrees, Minutes, and Seconds.

Grand Diviſions.						Sub-diviſions.		Vernier.

Adjuſtments.—

Adjuftments.—1. *To adjuft the axis of the pedeftal vertical.*—This adjuftment may be performed either by the *plumb-line* or by the *level*, both which methods we will explain in fucceffion. We have already faid that when the wire of the plumb-line will continue to bifect both the upper and lower dot, while the inftrument is turned quite round in azimuth, its axis is vertical in all directions, but this could not be effected unlefs the plumb-line paffing through the two dots were alfo parallel to the axis; this adjuftment, therefore, is made partly by the fcrews at the feet of the tripod, and partly by the fcrew that moves the piece bearing the upper dot in a lateral direction. In the firft place then turn the quadrant in azimuth till its plane, or, which is the fame thing, the telefcope lies parallel to a line joining any two of the three feet, and turn one of thefe two fcrews till the wire bifects the lower dot, and with the proper fcrew bring the upper dot to the fame wire; then reverfe the telefcope by turning 180° in azimuth, and if both dots are again bifected, the axis is vertical in the direction that the telefcope has pointed; in the next place turn the telefcope the fpace of a quadrant till it points in the fame direction as the third foot of the tripod, and make the wire bifect the lower dot by the fcrew of this foot, and it will be found to bifect the upper dot alfo, if the firft adjuftment of the dot was properly made, but if not, repeat the operation till both dots are bifected in all the reverfed fituations of the telefcope, and then the axis will be vertical in every direction.

In making this adjuftment by the level alone, the procefs muft be thus; firft, the level muft be made parallel to the rod on which it hangs, and fecondly, this rod muft be put perfectly horizontal, and the level will then be horizontal alfo, with the bubble in the middle. In order to make the level parallel to the rod, place it parallel to a line joining two of the feet fcrews, and bring the bubble to the middle by one of the feet fcrews in queftion; then take off and reverfe the pofition of the level, and if the bubble is found in the middle now, the parallelifm is perfect, if not, one half of the error muft be rectified by the fame foot-fcrew, and the other half by the adjufting fcrews at the end of the rod, by releafing one and fcrewing up the other. A repetition or two of this procefs will make the bubble ftand in the middle in both of the reverfed fituations. In the next place, with the level thus parallel to the rod of fufpenfion, turn the quadrant round its axis an entire femicircle as nearly as can be eftimated, and if the bubble will now reft in the middle, the rod is level, and being at right angles with the axis of the quadrant's motion, proves that this axis is vertical in every direction; but if the bubble is found to run to one end of the tube, bring it one halfway back by the rod's adjufting fcrews, releafing one and fixing the other, as the cafe may be, and the other half by the proper foot-fcrew. A repetition of this procefs will foon fettle the bubble in the middle during a whole revolution in azimuth, and then the adjuftment of the axis is perfect, as well as of the rod and level.

2. The fecond adjuftment is that by which the *line of collimation* of the telefcope is made parallel to the horizontal line that paffes from the centre of the quadrant to zero on the limb, or quadrantal arc, at the fame time that zero on the vernier coincides with zero on the limb. This important adjuftment may be made in feveral ways, fome of which are tedious and otherwife objectionable; but we will confine ourfelves to two which apply, one to the vertical, and the other to the horizontal line of the quadrant, which two methods, when duly effected, will not only check each other, but detect the error of the *total arc*, if there is any, at the fame time; which is an acquifition of the utmoft importance. Firft then, to adjuft by the vertical line, let the axis of the quadrant be firft made truly perpendicular in all directions by the adjuftment we have already defcribed, and fix on a ftar within a few degrees of the zenith, when exactly on the meridian, and meafure its altitude by the crofs-wire in the field of view in the ufual way, and note down the refult; do the fame on a fucceffive night foon after, if poffible on an evening of fimilar temperature, with the quadrant turned half round in azimuth, and note again the refult; if thefe readings prove to be at equal diftances from the point 90°, one on the quadrantal arc, and the other on the arc of *excefs* beyond 90°, the horizontal wire is truly placed in the eye-piece, but if not, *half* of the difference of the readings muft be corrected by the proper fcrew for raifing or lowering the faid wire. This may be done by directing the telefcope to a diftant mark till the crofs-wire bifects it, then by moving the fcrew of flow motion of the vernier the *half quantity* required, and by bringing back (up or down) the crofs-wire thus difplaced to its original mark again. This operation repeated will place the crofs-wire in fuch fituation, that zero on the vernier will be in its proper place with refpect to the point 90°; or the *half difference* thus afcertained may remain, without altering the crofs-wire, as an *error of adjuftment* to be conftantly applied with the fign + or −, as the cafe may be, in all fubfequent obfervations. Again, to adjuft by the horizontal line paffing through zero of the quadrantal arc, it will be neceffary to have a fecond telefcope turning on pivots in adjuftable Ys attached to the back of the quadrant, on the fame level with the faid horizontal line of the quadrant. This telefcope may be called the *adjufting* telefcope, and may be alfo ufed to *watch* a diftant mark, before and after an altitude is taken, in order to detect any deviation in the pofition of the vertical axis, that may happen during the operation of meafuring. Let the adjufting telefcope bifect a fine diftant mark with its crofs-wire, and turn the tube of the telefcope round one halfway on its pivots, as it lies in a horizontal pofition, and if the wire now bifects the fame mark it is truly fixed, if not, look out for a new mark a little higher or lower, as the cafe may be, and make it cut that in the reverfed pofitions of the crofs-wire, by means of the proper fcrew for this purpofe; now this adjufting telefcope will be adjufted for collimation: in the next place, put zero on the vernier to zero on the limb, and direct the telefcope of obfervation to the fame diftant mark, by which the adjufting telefcope had its wire adjufted, and let this mark be bifected by both telefcopes, the level and plumb-line at the fame time fhewing that the vertical axis is perpendicular; now turn the quadrant half round in azimuth, and reverfe the adjufting telefcope fo as to view the fame diftant mark again, and if it is found to bifect it as before, the horizontal line of the quadrant is right, and alfo the quadrantal arc without error, fuppofing the telefcope of obfervation to have its adjuftment for collimation as fixed by the point 90°, above defcribed; but if this adjuftment of the point zero on the limb be *firft made*, half the apparent error muft be rectified by the fcrew at the eye-piece, by means of reverfed pofitions and new marks; and then afterwards the adjuftment by a ftar near the zenith will detect the error of the whole arc. If, however, no error in the total arc exifts, then the adjuftment for collimation may be made either from the horizontal or from the vertical meafurement, as may be moft convenient; one of which is more practicable by day, and the other by night. When this delicate and very effential adjuftment is finally fettled, the object-glafs of the telefcope fhould not be difturbed, and therefore it would be advifeable to have its interior furface well cleaned previoufly.

It was taken for granted that the crofs-wire was perfectly

horizontal

horizontal during the time the preceding adjuftment was made, or, which is the fame thing, that the parallel vertical wires were perpendicular to the horizon. This is proved in a fimple manner thus; direct the telefcope to a fine fmall diftant mark, and make the adjuftment for vifion, if neceffary; then if one of the vertical wires will continue to bifect the faid mark through the whole field of view while the telefcope is elevated or depreffed, the wires are right, but if not, they muft be made fo by the proper fcrews for that purpofe, near the focus of the eye-glafs. This preparation ought to precede the laft adjuftment, and when once made, feldom requires altering, except in cafe of accidental injury.

It has alfo been affumed in the preceding adjuftment, that the maker of the inftrument placed the plane of the quadrant parallel to the axis of its motion, and alfo the line of collimation of the telefcope parallel to the faid plane. The former may be known to be true thus; if, when the plumb-line is adjufted, at its centre of fufpenfion, juft to efcape touching the limb, (which fhould always be the cafe,) the quadrant's motion in azimuth will not alter it in this refpect, the plane is truly fixed; but if not, the fcrews, that fix the quadrant to its axis, muft be reforted to for the alteration, which is beft done by the maker. When there is no plumb-line, a fmall fpirit-level, fixed at right angles to the plane of the quadrant, will anfwer the fame purpofe; for the refting of the bubble during the quadrant's revolution in azimuth, will be a proof that the plane to which it is at right angles is vertical. With refpect to the parallel pofition of the telefcope, as this is guided by the vernier fliding on the limb, it is the bufinefs of the maker to adjuft it properly, which he will beft do by a comparifon with a good tranfit inftrument of the paffages of a high and of a low ftar in each of the two inftruments; but a *fmall* deviation of the telefcope with refpect to parallelifm, though to be avoided if practicable, will not fenfibly affect the meafurement of altitudes, which is the fole bufinefs of this inftrument. If, however, this deviation is confiderable, the eye-end of the telefcope muft be fet nearer to or farther from the limb, as the cafe may be, by the maker himfelf. We have been the more minute in defcribing thefe adjuftments, not only becaufe they are indifpenfably neceffary in making good obfervations, but becaufe they will apply, one or other of them, by means of the plumb-line, or of the fpirit-level, to all other aftronomical quadrants that have a motion in azimuth.

We have before us the drawing of a large and beautiful quadrant made by Mr. Cary, for Leopold, the late grand duke of Tufcany, with two telefcopes and a graduated azimuth circle, but the defcription we have given of Ramfden's inftrument will equally apply to his, except as to the dimenfions.

Portable Aftronomical Quadrant by Troughton.—Though we have defcribed Ramfden's portable aftronomical quadrant with much minutenefs, and have detailed the moft ufeful methods of making fuch adjuftments as will apply to the other portable quadrants that have a motion in azimuth, yet we fhould do violence to our own feelings, as well as to the ingenuity of an exifting artift of the firft eminence, if we withheld from the public eye the great improvements that he has made in this inftrument fince the death of Ramfden. *Fig.* 6. of the fame plate that contains Ramfden's inftrument, is a reduced perfpective view of the improved aftronomical quadrant of Troughton, which was made by him and fent to Bilboa in Spain, about the time that aftronomical circles began to be conftructed. It has been afferted, under our article CIRCLE, that this inftrument, as conftructed by Troughton, (and we may now add, by Thomas Jones, who has learnt his mode of dividing,) is greatly fuperior to any quadrant that can be made, on account of properties which the circle exclufively poffeffes; but fo far as a quadrant's accuracy can be depended on, Troughton's improved conftruction is to be preferred to all others. And, indeed, when we confider that fimplicity, fteadinefs of performance, and permanence of the adjuftments once made in this inftrument, are properties which it peculiarly poffeffes, along with comparative cheapnefs, it is probable that there will always be purchafers, when fuch an inftrument is on fale, provided the improver will confent to make fuch inftrument with limited powers, when he can have rapid fale for thofe which he now conftructs, with all the advantages that the circle affords.

The radius of this quadrant is three feet, and the body is made double, that is, of two quadrantal frames united into one, by fmall pillars holding their planes parallel, and enfuring the two properties, not often united in other men's inftruments, of lightnefs and ftrength at the fame time. The tripod, on which the quadrant is fupported, is a frame of mahogany, braced in different directions, fo as to refift any ordinary preffure, when the quadrant is put in motion, or the telefcope ufed. The three feet-fcrews are furnifhed with each a Hooke's joint and long handle, fo that the obferver may make an adjuftment with any of thefe fcrews without ftooping, and confequently without withdrawing his attention from the plumb-line apparatus, or fpirit-level, that indicate the quantity of adjuftment that may be neceffary from any individual fcrew. About the middle of this pedeftal, or frame-work of the tripod, is a three-armed horizontal bracing piece, on which the ftem of the quadrant refts; and this ftem is kept vertical by a focket of brafs made faft to the centre of the table, that furmounts the pedeftal, in which focket the vertical axis turns both fteadily and freely, while it refts on the three-armed bracing piece below. The azimuth or horizontal circle is centered on this axis, but fo as to admit of a motion round it of about two degrees, for the purpofe of putting the zero of the quadrant right when the telefcope is in the plane of the meridian. This fmall motion is produced by the tangent fcrew feen in front, and the other tangent fcrew regulates the flow motion of the telefcope and vernier, by taking hold of the folid vernier plate, that reads at oppofite points, and that may be clamped, when in ufe, to the azimuth circle, which is alfo a folid circular plate of brafs, fubdivided into 10′ fpaces, and reading by the verniers alone to 10″.

The vernier or index-plate is of confiderable depth, and hollow, terminating with a chamfered edge below, and contains in it a triangular frame not feen, foldered to it, and oppofed, for the fake of ftrength, by another fimilar frame feen above its plane. From the frame within the hollow index-plate arife three fmall pillars, which fupport the upper triangular frame at the three corners, and paffing through it receive fo many milled nuts on their tapped ends, by which means the whole are compactly united. Thefe milled nuts are ufeful for adjufting the plane of the quadrant parallel to the vertical axis of the quadrant's motion in azimuth; and it is here where the quadrant is to be feparated from the ftand for clofe package. Upon the upper triangular frame is foldered faft a fhort but ftrong conical tube, that fupports the long column that terminates with a fupplementary cone. From nearly the lower extremity of this long column a couple of braces afcend about twenty inches to the upper part of the body of the quadrant, and, by being made faft to it, complete the fteadinefs of the ftructure in an admirable manner. The telefcope, which is about forty-two inches long, and achromatic, as well as furnifhed with an adjuftable fyftem of Spider's threads, tapers from the object-glafs down-

downwards, to prevent any inclination to bending by its weight, and has an axis of motion of four inches and a half long, that passes through the thick pillar, that connects the two quadrantal portions of the double frame at the exact centre of motion, and of the divided arc. The counterpoise is applied at the redundant end of the telescope, and the vernier borne by its end, near the eye-piece, divides the 5′ spaces of the vertical arc into 5″, while a micrometrical microscope, attached to the metal of the telescope, subdivides this last quantity into *single seconds*. A nicely ground spirit-level hangs on the horizontal bar, with its proper adjustment apparatus, which alone will ascertain the position of the quadrant to a *second;* but, as if this were not sufficient, a plumb-line is made to descend, free from dust, or agitation by the wind, from an adjustable point of suspension through the hollow column, where there is little or no disturbance from a motion in azimuth, and ensures the position still more certainly. The water vessel in which the plummet is immersed, to prevent vibration, is contained in the hollow short cone before described, as containing a triangular frame within it, and the situation of the wire is examined in two directions, at right angles to each other, by microscopes looking across the bore of the column, at a convenient height for the observer to see without a change of position of his body, when he has been just observing at the telescope. The mark used for each wire to bisect is a luminous disc, known by the name of *Ramsden's ghost*, from its being only the *image* of a luminous point without substance, occasioned by a contracted aperture of a tube, fixed at the remote side of the column into which light enters, and by which it is directed without parallax. Besides these appendages, there is a secondary or adjusting telescope, such as the elder Sisson made for his spirit-level, and such as we have already described, as furnishing the means of adjusting the horizontal line of a quadrant that moves in azimuth, and of ascertaining the error of the whole quadrantal arc, by comparison with the adjustment by a star near the zenith. (See *Portable Astronomical Quadrant by Ramsden*, before described.) Lastly, the radial bars that bear the quadrantal arc, taper downwards from the centre, thereby giving strength to the part most liable to alter its figure by weight, as it is supposed Bird's mural quadrant has done in a small degree for want of such precaution. This quadrant has an arc of excess at each end, and is capable of all the adjustments we have above described in an exquisite degree.

Of Nautical Quadrants, measuring by Reflection.

Sir Isaac Newton's reflecting Quadrant.—A manuscript account of a quadrant, measuring altitudes and distances by reflection, of the hand-writing of sir Isaac Newton, was found among the papers of Dr. Halley after his death, which quadrant, according to Stone, was actually made in the year 1672, when Dr. Halley was preparing to go to the South seas, to make an addition to his catalogue of fixed stars; but the manuscript account was not produced, or even mentioned, when Hadley's instrument was shewn to the Royal society, nor was made known till the year 1742. (See Phil. Trans. N° 465.) Hence some doubt has been entertained whether sir Isaac Newton or Hadley was the first inventor of the reflecting quadrant. The most probable inference is, that each invented his own, seeing that though the principle is the same in both constructions, yet the mode of applying it is different, as will be seen from a comparison of the figures, and from our description of each in succession. Sir Isaac Newton's quadrant was preserved for several years at the house of Mr. Heath, who was a mathematical instrument maker in the Strand, London, and it is probably in existence at this time. Dr. Hooke is also said, by Dr. Pratt, to have invented a quadrant that was, or might be, used at sea with one reflection only; and, indeed, he is asserted to have been the first man who proposed the use of a *mirror* in a nautical instrument. See Circle.

Sir Isaac Newton's quadrant, represented by *fig.* 7. of *Plate* I. of *Astronomical Instruments*, consists of an entire sectoral plate of brass, P Q R S, to the plane of which the telescope A B is fixed and lies parallel, and an index, which is moveable about an axis of motion at A. The limb D Q was accurately divided into half degrees, and, as is said, half minutes, on a scale of four feet radius, and was subdivided by a diagonal scale into $\frac{1}{12}$th of a minute. The principle on which this semi-division is founded is this; *viz.* "If a fixed ray of light be reflected at a plane reflector, and if the reflector be made to revolve about an axis perpendicular to the plane passing through the incident and reflected rays, which may be called the plane of reflection, the angular velocity of the reflected ray will be *double* to the angular velocity of the reflector." See Vince's Practical Astronomy, p. 7, &c.

Hence one small mirror, G, is made fast to the plane of the sectoral plate, and perpendicular thereto, but inclined in an angle of 45° to the axis, or length of the telescope, and in such a way, as to cover one half of the aperture, while another similar mirror is borne by the index, in such a position, that when the index is at zero, both the mirrors are not only perpendicular to the plane of the quadrant, or rather octant, but are parallel to each other. Now, according to the principle that we have just mentioned, when the index is moved forward, a ray of light from any fixed luminous body, when caught by the index mirror, will be reflected on the fixed mirror, and an eye directed through the fixed telescope towards the said body, will see it divide into two bodies the instant that the index begins to move; that is, the body itself will be seen *stationary* through one half of the telescope's aperture, and its *image* will be seen in the other half *in motion*, and this motion has double the velocity that the index has, which bears the revolving reflector; and on this account it is, that the divisions for half degrees and half minutes, are read as whole degrees and whole minutes, as well as the $\frac{1}{12}$th read as $\frac{1}{6}$th by the diagonal scale. From this short explanation of the principle and structure of sir Isaac Newton's reflecting quadrant, it is easy to perceive that the construction is derived immediately from the principle in the simplest, though in practice not the best manner; for the instrument itself illustrates the principle in the most obvious way; but, from its magnitude and mode of being used, it is very inconvenient to be supported without a stand, which on board a ship is inadmissible.

Perhaps it might be on this account that Dr. Halley did not pay more attention to it than he appears to have done, according to the information that we at this distance of time possess. However, it is evident, that the instrument before us is capable of measuring either vertical, horizontal, or oblique angles, in the way it professes.

Cole's Quadrant by single Reflection.—*Fig.* 2. of *Plate* XXIII. of *Astronomical Instruments*, is the figure of an instrument, which, like Dr. Hooke's contrivance, measured altitudes by single reflection, as we conceive, the drawing having fallen into our hands without the description. An arc composed of an entire quadrant, and an index with a single mirror fixed to it at its centre of motion, constitute its leading features, while a sight-vane, at the remote end of the prolonged index, instead of a telescope, has a plane hole, through which the sun is viewed after reflection from the index-glass, his rays having first passed through a coloured glass.

glafs. This conftruction, with the addition of fir Ifaac Newton's fecond mirror, would conftitute an union of two inftruments, that would greatly refemble the combination adopted by Mr. Hadley, which follows next in our lift of quadrants; but which may not have been copied from fuch union; for Cole has got the vernier fcale, which is preferable to the diagonal one adopted by Hadley, and therefore probably he followed Hadley, though the quadrant before us has not recommended itfelf to general ufe, as being an improvement.

Hadley's Quadrant.—As we cannot help confidering Hadley's *quadrant*, or more properly *octant*, as a near relative at leaft to his friend fir Ifaac Newton's, we will defcribe it next in order, while the principle of its conftruction is frefh in the reader's memory. The circumftance of Mr. Hadley's being prefident of the Royal Society was favourable to the early notice of his inftrument; and the intereft that the Britifh nation took, and muft ever take, from its infular fituation, in nautical improvements, contributed to its early adoption, at a time when fuch an inftrument was greatly wanted.

Mr. Hadley, we learn, tried various modifications in the conftruction, but that which has been approved from long ufage is the one we fhall felect for defcription. *Fig.* 1. in *Plate* XXIII. of *Aftronomical Inftruments*, is the reprefentation of Hadley's octant, as it is now conftructed with a vernier, which it had not at firft, and which is preferable to the diagonal divifions at firft applied by Hadley, as well as by fir Ifaac Newton. For the fake of lightnefs, united with ftrength, the frame of the inftrument, when made of any of the hard woods, is put together ufually as is reprefented in the figure, but when made all in brafs, and particularly when the limb is extended to 120 half degrees, reading as 120°, in which cafe it is called a *fextant*, the beft modern makers make it double; that is, have two feparate light frames, united by fhort pillars, ftanding at right angles to their planes, which thus become parallel. This conftruction, we believe, was introduced by Mr. Troughton, and allows a more fteady motion to all the moveable and adjuftable parts, by lengthening their axes of motion, which penetrate acrofs both parts of the double frame, and by that contrivance have longer bearings. But we are now propofing to defcribe a quadrant of Hadley's own conftruction. A B C is a frame of fome hard wood, fuch as ebony, which may be of any convenient radius, from eighteen inches downwards to three, or lefs, if required for the pocket, and A D is the index bearing the vernier at D, together with the ufual clamping apparatus for flow motion, in making the contact in any obfervation. This apparatus, together with the powers of the vernier, and mode of ufing it, have been explained under our article Circle, (fee alfo Vernier,) and therefore may be referred to by the reader unacquainted with their ufes. When the radius is very fmall, the vernier fubdivides half degrees, and has thirty divifions on it, but has twenty or fifteen, accordingly as the degree of the limb is fubdivided into *thirds* or *fourths* of a degree. The peculiar excellence of this inftrument, either in the form of an octant or fextant, is, that all forts of angles can be meafured with it on board a fhip, even while the fhip is toffed by the waves; and alfo, that it requires no other auxiliary means, than the natural horizon, which at fea is always, or moftly prefent, when a heavenly body can be feen. The plumb-line and fpirit-level are equally difpenfed with: to which may be added, that, if any accidental injury be received, a circumftance not improbable in the hands of failors, the adjuftments are fo fimple, that, generally fpeaking, the derangements may be eafily rectified. In the beft inftruments, a fmall telefcope is fcrewed into the fight-vane, which not only prevents parallax, by limiting the line of fight between two parallel wires, but affifts the fight greatly in obtaining exact contacts. There is ufually an arc of excefs at each end of the limb, one of which is ufeful in adjufting the index-error by the fun or moon, and the other is ferviceable when angular diftances are meafured beyond a quadrantal arc; indeed it would be well if the arc were always extended to meafure 120°, or more, for then a fextant would be competent to meafure all forts of angles that the mariner can require, to find his latitude, time, and longitude.

When the octant has not the tangent fcrew of flow motion for adjuftment in making the contact, the index is nicely moved by hand, and then fixed by a fcrew behind it for this purpofe, and in either cafe the examination and noting down of the altitude, or horizontal angle taken, may be read at any time, for hours afterwards, which is another important advantage that this inftrument poffeffes in common with the fextant; for where more obfervers than two are not prefent, one obferver may thus manage to take both an altitude and a diftance in a lunar obfervation with two feparate inftruments in quick fucceffion, while another obferver is taking the altitude of the fecond object; or with the help of Margett's horary tables, the fecond altitude may be had by infpection, when the hour, latitude, and declination of the body are known, in which cafe *one obferver* can take a lunar obfervation with tolerable accuracy. The limb of the inftrument is beft of metal, fuch as brafs, filver, or platina, when made and divided in the beft way by a fuperior dividing engine, fuch as Troughton's; but in ordinary inftruments a piece of ivory is frequently let into the wood, and fometimes the divifions are made even on the wood itfelf, which is liable to be affected by moifture. The index is moft frequently entirely of brafs, and wider as it afcends to the centre of motion, to prevent lateral bending, which would deftroy the accuracy of the readings. When an obfervation is made by the larger fort, the right hand fhould be applied to the lower extremity of the index to give it fteady motion, while the left holds the lower end of the remote radial bar; and the plane of the inftrument muft be kept in the line that joins the two objects, of which the horizon is one, when an altitude is taken, and then the inftrument is held vertical. In bringing down the image of an object to the horizon by a *fore* obfervation, the body of the obferver muft gradually incline towards the horizon, and a little vibrating motion will affift in determining the exact plane of contact; but in taking a horizontal angle, the obferver will handle the inftrument as beft fuits his convenience. The mirror at A is placed over the centre of motion of the index, in a direction pointing to zero on the vernier, and perpendicular to the flat face of the index: this index-glafs, being completely filvered, reflects the light it receives directly at right angles on the glafs E, when the zero of the vernier is at the zero of the limb; but as the limb proceeds forwards, this angle alters, and, as we have faid, is *double* of the meafure of the real angle to be meafured and indicated. This glafs E is alfo fixed perpendicular, and has fcrews of adjuftment for perpendicularity above its focket of brafs, and a tail-piece with a fixing-fcrew behind the frame, for fixing the parallelifm; the want of which is called the *index-error*: one half only of this glafs, which is called the *fore-horizon* glafs, is filvered, and the other half remains unfilvered, in order that both the direct rays tranfmitted through the unfilvered part, and the reflected rays coming from the filvered part, may meet at the eye, on which account the middle of this glafs, where the line of feparation croffes, is the part to be viewed

viewed in making a contact, otherwise both the image of one object, and the substance of the other, could not be seen at the same instant. F is the sight-vane, with two holes, usually an upper and a lower, inserted into the first radial bar of the frame, so that the holes are at the same distance from the plane of the instrument as the line of separation is in the half-silvered glass E, to prevent parallax of the reflected rays, and in the best instruments this vane, with its telescope, has an adjustable motion to and from the plane, in order that more or less light may fall on either of the bodies observed, which is not only useful, but necessary, in taking a lunar distance; for by this adjustment the image of one body may be made as luminous as the real body of the other, by increasing the light of one, while it decreases that of the other; that is, by making more of the silvered, or of the unsilvered part of glass E, fall before the object-glass of the small telescope, when this adjustment is necessary. It may be necessary to observe here, that every silvered glass of sensible thickness has two reflections, one on the anterior, and the other, which is the principal one, on the posterior or silvered face, and in many cases errors may be occasioned by these double reflections; to remedy which, Dr. Maskelyne proposed, that the silvered portion of the posterior face should be ground rough and painted black, taking care that the grinding be so performed, that the line of separation between the polished and unpolished parts be parallel to the plane of the octant. In the *back* horizon-glass, which is that seen with its sight-vane at G, with adjustments similar to those of the *fore* horizon-glass at E, the whole posterior face is silvered, except a slit, that divides it in a line parallel to the plane of the frame, through which slit the body is observed in a back observation. But when the sun is the body observed, his light is generally too intense for the eye to bear, particularly when the small telescope is used; to render the rays tolerable to the eye, a coloured glass, or glasses, must be interposed, and a blank tube instead of a telescope be used, by which means the sun may be viewed without doing injury to the eye; and usually a system of coloured glasses are slided into a square hole, as at H, and a joint in each allows them, or any one of them, to be brought forwards into the situation where the direct rays must pass to the eye. The same remedy is also sometimes applied at the eye-piece of the blank tube, when the sun alone is observed. The plane of the back horizon-glass is placed not only parallel to the plane of the frame, but at right angles to the plane of the fore horizon-glass, in order that the same readings may apply in both kinds of observation, and this object was effected by the maker by the simple rectangular position of the two horizon glasses to each other, and by reversing the position of the body in making a back observation; for as the inclination of the index-glass to the fore horizon-glass gives *double* the angle directly measured; so *twice* the *complement* of this inclination to the back horizon-glass gives the same quantity, and on the same part of the graduated limb, when measured in a reversed position.

Adjustments.—The adjustments of every instrument are of the utmost importance to the accuracy of observations taken thereby, but they are particularly so in the instrument before us, because a small deviation from parallelism in the fore horizon-glass, or from perpendicularity in the back horizon-glass, as compared with the index-glass, (with the vernier at zero of the limb,) will *double* the *error* occasioned by it in the quiescent situation, as soon as motion is given to the index-glass. 1. The first adjustment is, *to set the index-glass perpendicular to the plane of the instrument:* this is done by first sliding the index to about 40° or 45° of the limb, while the octant is held with its plane nearly parallel to the horizon, then a glance into the index-glass will shew, whether the sharp edge of the limb seen by reflection, is an exact and straight continuation of the same edge of the limb seen by direct vision, and if this is not the case, it must be made so by the screws that adjust the bed of the mirror; and in all cases where two screws are to be used, one must be released as much as the other is screwed inwards. Dr. Mackay proposes to place two small pieces of metal as adjusting tools, with each a horizontal line drawn on it, at equal heights from the plane of the limb, at some distance from each other, so that the horizontal line of one may be a continuation of the horizontal line of the other, when one is viewed by reflection, and the other by direct vision, but the sharp edge of the inner part of the limb will answer all ordinary purposes. 2. The second adjustment is, *to set the fore horizon-glass perpendicular to the plane of the instrument:* this is done by first fixing the zero of the vernier at zero on the limb, and while the plane of the frame is held parallel to the horizon, by applying the eye to the lower hole of its sight-vane; then if the horizon, or any distant horizontal line, appear to be a straight line, the glass is placed perpendicular already; but if the parts seen by reflection and by direct vision do not constitute a straight line, they must be made to do so by the screws at the bed of the glass, one or other of which must be screwed in, as the fracture of the line demands; that is, if the line seen by reflection appear *above* that seen by direct vision, that screw must be urged *inwards* which is on the *farther* glass, and *vice versâ*, until the fractured line be straight. 3. The third adjustment is, *to rectify for the index-error* of the fore horizon-glass, or to place it parallel to the index-glass, when the zero of the vernier is placed at zero on the limb. To do this properly, a bright distant object must be chosen, such as the sun, moon, or star, and while the zeros coincide, look through the vane, or telescope, and observe if the body and its image coincide; that is, if the image is invisible: in this case, the fore horizon-glass is parallel to the index-glass, or is truly adjusted; but if not, release the tail-piece or lever behind this horizon-glass, and with the thumb-piece give it a small motion, till the body and its image coincide, in which situation it must be fixed by the fixing nut before released. Sometimes the act of screwing will displace in some degree the tail-piece, and thereby again occasion a sensible index-error. When this cannot be completely avoided, the error must be ascertained and allowed for with its sign + or — in every subsequent observation, while it remains unaltered. This error may be ascertained by measuring the diameter of the sun, first forwards on the limb, and then backwards on the arc of excess, and one half of the difference of the measures will be the *index-error* + or —, as the case may be. 4. The fourth adjustment is, *to set the back horizon-glass perpendicular to the plane of the instrument:* this adjustment is similar to the second, and may be performed by the directions there given, supposing them to be for the back horizon-glass and its vane, instead of the fore horizon-glass. 5. The fifth and last adjustment is, *to set the back horizon-glass perpendicular to the plane of the index-glass produced, the zero of the vernier being placed at zero on the limb:* this adjustment at sea is performed thus; let the vernier be put as much to the right of zero, as is equal to twice the dip of the horizon, in the situation where the observer stands, then hold the quadrant in a vertical position, and apply the eye to the back-horizon vane: now, if the horizon seen by reflection happen to coincide with that seen by direct vision, the glass is already right; but if not, the lever or tail-piece behind the frame at this place must be released by the proper fixing screw,

ſcrew, and turned ſlowly by the thumb-ſcrew or nut, till this coincidence is perfect, and then the lever muſt be made faſt again; the reflected horizon will be inverted when viewed in the manner here deſcribed. When the inſtrument is uſed in a back obſervation on the land, which is not likely to happen often, the adjuſtment will require ſome artificial aid: by Dollond's method, an index is applied to the back horizon-glaſs, by which it may be put parallel to the fore horizon-glaſs, by the third adjuſtment applied thereto, and then, by a graduated arc of 90°, inſerted on purpoſe, the index of the back horizon-glaſs is ſet perpendicular to its former ſituation, and conſequently is made perpendicular to the plane of the fore horizon-glaſs. By Mr. Blair's method, the under edge of the index-glaſs is ground and poliſhed, ſo as to be at right angles to the plane of the glaſs, and hence the back horizon-glaſs is adjuſted, by making the direct and reflected horizons agree, while the vernier ſtands at zero on the limb, exactly as is done in the third adjuſtment. But we are to ſuppoſe the inſtrument not furniſhed with either of the above named auxiliary means; when this is the caſe, a long level ſpace muſt be choſen in ſome common or park, where three ſtaves can be put up in the ſame ſtraight line exactly, and at an interval from each other of not leſs than 500 yards, but if 600 or 700 the better; then, the vernier being truly placed at zero, let the plane of the octant be held horizontally with its back horizon-glaſs exactly on the top of the middle ſtaff, and let one of the rods be viewed directly through the back ſight-vane, then if the other rod, ſeen by reflection, coincide with it, the poſition of the back horizon-glaſs is true, but if not, it muſt be made ſo, by the tail-piece behind, as before directed; if in fixing the tail-piece a derangement ſhould take place, which cannot be *exactly* done away by a ſecond or third trial, then the index-error for the back obſervation muſt be aſcertained.

This error may be obtained by reverſed obſervations by two methods; thus, let the coincidence of the two extreme ſtaves be made from the middle ſtaff as juſt directed, by a motion of the vernier, inſtead of the tail-piece of the back horizon-glaſs, and read the quantity moved forwards or backwards; then turn the downward face of the frame upwards, and repeat the operation, and read again; now, if theſe two readings are found to be one on the limb, and the other on the arc of exceſs, half of their difference will be the error ſought, + or −; but if they both are read on the ſame ſide of zero, half their ſum, + or −, will be the error; when they are both read on the limb, or if the greater quantity be read on the limb, when the leſs is on the arc of exceſs, the ſign will be −, and *vice verſâ*. By the ſecond method, inſtead of reverſing the plane of the inſtrument, let the obſerver reverſe his poſition, making the right-hand ſtaff to be the left-hand one, and *vice verſâ*, and then let him repeat his firſt obſervation, with the ſame face of his inſtrument up that he had in that, and the ſame reſult will follow, that was obtained by reverſing the plane of the inſtrument. Theſe two modes of obtaining the error in queſtion, by reverſed obſervations, may be made to check each other, and will then give an average of the two reſults, for the error to be applied to each ſubſequent obſervation, taken with the back horizon-glaſs in its laſt determined poſition.

Examination of the Inſtrument.—Theſe ſeveral adjuſtments being finiſhed, the obſerver might proceed to make his obſervations, provided he could rely on the ſkill and credit of the maker of his inſtrument; but if not, he would act prudently to examine the materials of which it is compoſed, before he relies on its performance, and alſo to put to ſome teſt the accuracy of the diviſions on the vernier and limb, as well as the care that has been taken in ſelecting glaſſes of uniform thickneſs, and of good poliſh. The exactneſs of the total arc may be aſcertained from compariſon with meaſurements taken with a circle, or ſome well-known ſuperior inſtrument; or by careful trigonometrical meaſurement on ſome level and extenſive ground, where the ſides of the triangle can be accurately meaſured, for which purpoſe Troughton's new chain of five-feet links is admirably calculated: but the intermediate diviſions may be examined by the vernier itſelf, by ſtepping the arc with it; and if all parts of the arc are found alike divided, when examined by the coincidence of the extreme ſtrokes of the vernier, the intermediate ſtrokes of the vernier itſelf may laſtly be examined by the ſtrokes on the limb taken in various places. Dr. Mackay recommends a table of corrections to be made, in caſe of errors being detected in the dividing, but we ſhould rather recommend new diviſions from a good engine, the inſerting of which can now be performed at a trifling expence. When the planes of the mirrors are examined, try if a candle reflected appears in two images; if it does, the two faces of the glaſs are not parallel, and conſequently the glaſs is not fit for its purpoſe.

To try whether the ſurfaces of the mirrors be perfect planes, bring two diſtinct diſtant objects into good contact, and let them be ſeen at the upper edge of the ſilvered part; then move the inſtrument in its own plane, and move the image and body along the line of ſeparation or edge of the ſilvered part, and if the coincidence is not diſturbed the plane is perfect, but not otherwiſe. Alſo, when an obſervation is taken of the ſun, and the vernier has been fixed by the fixing ſcrew, read the altitude, as the dark glaſs, or glaſſes, may have been uſed; then remove them from the ſocket that holds them, and reverſe their planes, by putting their remote faces neareſt; and if, after this change, the ſame altitude is given, the planes are parallel, otherwiſe *half the difference* muſt be applied, in all ſuch caſes, as an *error* of the *coloured glaſſes*. This examination is beſt made exactly at noon, when the ſun's altitude is not ſenſibly changed during the examination; unleſs a good chronometer or regulator, duly regulated, and put to exact time, be at hand; for then the ſucceſſive examinations may take place at equal diſtances from noon. Or the ſame thing may be done by means of a luminous object placed at a diſtance, and ſo elevated, that an artificial horizon may give its *double* altitude before and after the coloured glaſſes are reverſed in poſition. The beſt artificial horizons are either a veſſel of pure mercury, with a roof of good glaſs framed over it to prevent agitation by the wind; or otherwiſe a piece of black glaſs, well poliſhed, and placed on ſcrews of adjuſtment, with a good ſpirit-level in a glaſs tube, ſo ground, that it will reverſe in poſition, and will place the glaſs in a perfect level in the two requiſite directions, at right angles to each other.

It may be proper to examine further if the two holes in the ſight-vane are ſo made that the ſun or other luminous body dazzles the eye more in looking through one, than in looking through the other, the intention being that one ſhall take in more of the ſilvered part, and the other more of the unſilvered part of the glaſs, ſo as to accommodate the quantity of direct light to the ſtrength of the eye.

Illuſtration of the Uſe.—When Hadley's octant, or ſextant, is uſed for altitudes at ſea, the ſun, moon, or ſtar, as the caſe may be, muſt be viewed in the way that the eye can beſt bear, with or without the dark glaſſes, teleſcope, &c. as occaſion may require, and as experience will dictate; and in a fore obſervation the body obſerved muſt have its image brought gradually down, ſo as to be in exact contact with the

the horizon: if the ſun or moon be obſerved, either the upper or lower limb muſt be ſubſtituted for the centre, and the obſervation muſt be afterwards reduced to the centre, by applying the ſemi-diameter, + or —, from the proper column for the given day, as given in the Nautical Almanac, or Ephemeris; in doing this, the face of the obſerver muſt be turned towards the object whoſe altitude is to be meaſured, and while the index is gradually moved forward along the limb, the image will deſcend till it approaches the horizon: in this ſituation, care muſt be taken that the contact of the image be made with the viſible horizon at the line of ſeparation, between the ſilvered and unſilvered parts of the fore horizon-glaſs, that both objects may be viſible together; and alſo that the index may not be puſhed too far, ſo as to require a retrograde motion in finiſhing the contact: therefore fix the clamping piece, if there is a tangent ſcrew, and complete the contact by a ſlow motion, and the altitude will remain unaltered till the vernier has been examined by a magnifying glaſs, which ought always to be at hand, to aſſiſt the eye in examining the coincidence of ſome one line of the vernier with ſome line of the limb; or, when there is not an exact coincidence, in eſtimating the quantity that is beyond coincidence, as compared with the contiguous quantity that is ſhort of it. To ſucceed well in perfecting a fore obſervation taken at the horizon, the obſerver muſt learn to give a vibratory ſlow motion of his body to the right and left, his heel being the centre of motion, that the image obſerved may be made to move backwards and forwards in the arc of a circle, of which the horizon is a tangent, in order that the altitude may not be taken at one ſide of the tangental point, and conſequently be too great. Care muſt alſo be taken that the faint ſecondary image reflected from the poſterior face be not miſtaken for the primary image, reflected from the proper, or anterior face of the mirror. When the altitude is marked down, as read on the limb and vernier, the corrections muſt be applied, for either the ſun or moon, for parallax, refraction, dip of the horizon, and ſemi-diameter, before the true altitude of the centre is obtained: but for a ſtar no parallax is wanted, nor yet allowance for ſemi-diameter; theſe apparently diminutive bodies being ſituated at ſuch an immenſe diſtance from the earth, as to ſubtend no ſenſible angle, nor to have any perceptible parallax in altitude.

It is from meridian altitudes thus taken, that, by the application of a heavenly body's declination, + or —, as the body may be below or above the equator, the co-latitude, and conſequently the latitude, is readily determined; and alſo, the latitude being known, from an altitude taken towards the eaſt or weſt, that the time is determined at one obſervation, but more accurately by a ſeries of equal altitudes taken at oppoſite ſides of the meridian; the reduction, however, for the ſun's change of declination during the interval, muſt, in this caſe, be taken from tables of correction for equal altitudes, ſuch as are contained in the pamphlet of the late Mr. Wales.

In making the *back* obſervation, the coloured glaſs, or glaſſes, muſt be ſelected, as before, to ſuit the eye, and the plane of the inſtrument held vertically, as in the fore obſervation, but the face of the obſerver muſt view the point of the horizon *oppoſite* the ſun, or that pointed to by his own ſhadow; firſt, let the eye be directed through the vane of the back horizon-glaſs to the tranſparent ſlit that divides the mirror, and let it view the horizon, then move the index till the image of the ſun is juſt ſeen on the ſilvered part of the glaſs; a vibratory motion now given to the octant from the eye, as the centre of motion, will make the ſun's image move in a curve of which the convex part appears uppermoſt; in this ſituation, let the ſlow motion by the tangent ſcrew, if any, bring this image till one of its limbs coincides with the horizon ſeen through the tranſparent ſlit, and the obſerved altitude will be determined as before. Whenever the horizon is clear both before and behind the obſerver, he may reverſe his inſtrument and alſo his body haſtily, when the ſun is on the meridian, and make the fore and back obſervations check each other, which will alſo, from time to time, prove the reſpective poſitions of the two mirrors, and lead to a detection of the error of the back horizon-glaſs, when that of the former is known, which it may always be from a double meaſure, one back and one forwards, of the ſun's diameter. If the difference of the altitudes of the ſame body taken both ways be equal to the known index-error of the fore horizon-glaſs, it will be known that the back horizon-glaſs has no error; but if the ſaid quantities are not the ſame, their difference, + or —, will be the index-error of the back horizon-glaſs; hence the back horizon-glaſs may be adjuſted from a knowledge of the error of adjuſtment of the fore horizon-glaſs, which method, we believe, was never before ſuggeſted.

QUADRANT, *Hadley's, Theory of.* It is a firſt principle in optics, that the angle of incidence, whatever be the inclination of the incident ray, is equal to the angle of reflection, *i. e.* if the angle of incidence D B A be 30°, the angle of reflection D B C will be alſo 30°. It is alſo plain, that if while the radiant A (*Plate* II. *Navigation, figs.* 1 and 2.) remains in the ſame place, the mirror E F, by revolving round B, moves into the poſition fe, then the alteration in the angle between the incident and reflected ray will be double to the angle ſhewing the change of poſition in the mirror. Suppoſe the mirror changes 10° from the radiant, then the perpendicular B D goes 10° farther from the radiant A into the poſition B d; and the incident angle d B A is 40°, and the reflected angle d B c is 40°; ſo the angle A B C is altered from 60° to 80°; a difference of 20° for 10° change of poſition in the mirror. Suppoſe again the mirror to change, in poſition, 10° towards the radiant A, then the perpendicular is changed into B d, 10° nearer to the radiant; and the angle D B A of 30° becomes d B A of 20° = d B c; ſo that the angle A B c is 40°, whereas A B C was 60°; that is, by altering the poſition of the mirror 10°, the angle A B C was altered 20°. It may be otherwiſe demonſtrated, that with a Hadley's quadrant, the angle of elevation under which an object is ſeen, is equal to twice the arc which the index has paſſed over. The inſtrument or angle A C B (*fig.* 3.) is 45°; $a\,b$ is a reflecting glaſs fixed parallel to C B; C D is the index with a reflecting glaſs at G, ſo fixed as to be parallel to $a\,b$, when C D coincides with C B; S the ſun; S G a ſolar ray reflected from G to F, and from F to E, the place of the eye; and H F E the horizontal line at the time of the obſervation. Then will the angle of elevation I G S be equal to twice the angle B C D; for the angle of reflection D G F = the angle of incidence S G C = C G L. And the angle of reflection b F E = the angle of incidence a F G = F L E ($a\,b$ being parallel to L E) = F E L. But I G C = H P C = P C E + P E C (the external angle being equal to the two internal and oppoſite) = P C E + F L E = P C E + G C L + C G L. Or, I G C = I G S + S G C = P C E (or G C L) G C L + C G L = 2 B C D + C G L. Conſequently I G S = 2 B C D. See Robertſon's Navigation, book ix. p. 295, &c. p. 390, &c.

Mr. Mitchell has recommended Hadley's quadrant for ſurveying, and eſpecially the ſurveying of harbours, and alſo for piloting ſhips into harbours. Phil. Tranſ. vol. lv. art. 10. p. 70.

Mr. Wales, in captain Cook's Voyage, applied it to meafuring the quantity eclipfed in an eclipfe of the fun; in which operation it anfwers the purpofe of a micrometer, to a great degree of certainty. See an account of the improvements fuggefted in the conftruction of thefe inftruments, and alfo of the various ufes to which they may be applied, in Magellan's Defcription des Octants & Sextants Anglois, &c. 4to.

Other quadrants have been contrived fince, by fome ingenious artifts, all of which have their merit; but the particulars of their conftruction are too many for this place; and perhaps, on the whole, nothing preferable to Mr. Hadley's invention has yet been found.

Quadrant, *Horodictical*, is a pretty commodious inftrument; thus called from its ufe in telling the hour of the day.

Its conftruction is fo fimple and eafy, and its application fo ready, that we fhall defcribe both, for the ufe of fome who may want other conveniences.

Quadrant, *Conftruction and Ufe of the Horodictical.* From the centre of the quadrant, C, (*Plate* XIX. *Aftronomy, fig.* 8.) whofe limb A B is divided into 90°, defcribe feven concentric circles at intervals, at pleafure; and to thefe add the figns of the zodiac in the order they are reprefented in the fcheme.

2. Applying a ruler to the centre C, and the limb A B, mark upon the feveral parallels the degrees correfponding to the altitude of the fun when therein, for the given hours; connect the points belonging to the fame hour with a curve line, to which add the number of the hour. To the radius C A fit a couple of fights, and to the centre of the quadrant C, tie a thread with a plummet; and, upon a thread, a bead to flide.

If, now, the bead be brought to the parallel in which the fun is, and the quadrant be directed to the fun till a vifual ray pafs through the fights, the bead will fhew the hour.

For the plummet, in this fituation, cuts all the parallels in the degrees correfponding to the fun's altitude. Since, then, the bead is in the parallel which the fun then defcribes, and through the degrees of altitude to which the fun is elevated every hour there pafs hour-lines, the bead muft fhew the prefent hour. Some perfons, who are not very nice, reprefent the hour-lines by arcs of circles, or even by ftraight lines; and that without any fenfible error.

Quardant, *Sinical*, is an inftrument of ufe in navigation. It is reprefented *Plate* II. *Navigation, fig.* 4, and confifts of feveral concentric quadrantal arcs, divided into eight equal parts by radii, with parallel right lines croffing each other at right angles.

Now any of the arcs, *e. gr.* B C, may be accounted a quadrant, of any of the great circles of the fphere, chiefly of the horizon and meridian: if, then, B C be taken for a quadrant, *e. gr.* of the horizon, either of the fides, *e. gr.* A B, may reprefent the meridian; and the other, A C, will reprefent a parallel, or line of eaft and weft; and all the other lines parallel to A B will alfo be meridians; and all thofe parallel to A C will be eaft and weft parallels, or eaft and weft lines.

Again, the eight fpaces into which the arcs are divided by the radii, reprefent the eight points of the compafs in a quarter of the horizon; each containing 11° 15'.

The arc B C is likewife divided into 90°, and each degree is fubdivided into 12', diagonalwife.

To the centre is fixed a thread, as A L; which being laid over any degree of the quadrant, ferves to divide the horizon.

If the finical quadrant be taken for a fourth part of the meridian, one fide thereof, A B, may be taken for the common radius of the meridian and the equator; and then the other, A C, will be half the axis of the world. The degrees of the circumference, B C, will reprefent degrees of latitude, and the parallels to the fide A B, affumed from every point of latitude to the axis A C, will be radii of the parallels of latitude, as likewife the fine-complements of thofe latitudes.

Suppofe, then, it be required to find the degrees of longitude contained in 83 of the leffer leagues, in the parallel of 48°. Lay the thread over 48° of latitude, on the circumference, and count thence the 83 leagues, on A B, beginning at A; thefe will terminate at H, allowing every fmall interval four leagues, and the interval between the broad lines twenty leagues. Then tracing out the parallel H G, from the point H to the thread; the part A G of the thread fhews that 125 greater, or equinoctial leagues, make 6° 15', allowing twenty leagues to a degree, and three minutes for one league; and therefore that 83 leffer leagues A H, which make the difference of longitude of the courfe, and are equal to the radius of the parallel G I, make 6° 15' of the faid parallel.

If the fhip fail on an oblique courfe, fuch courfe, befides the north and fouth greater leagues, gives leffer leagues eafterly and wefterly; to be reduced to degrees of longitude of the equator. But thefe leagues being made neither on the parallel of departure, nor on that of arrival, but in all the intermediate ones, we muft find a mean proportional parallel between them.

To find this, we have on the inftrument a fcale of crofs latitudes. Suppofe, then, it were required to find a mean parallel between the parallels of 40° and 60°. With your compaffes take the middle between the 40th and 60th degree on the fcale: this middle point will terminate againft the 51ft degree, which is the mean parallel required.

Quadrant, *Ufe of the Sinical.* There are formed triangles upon this inftrument fimilar to thofe made by a fhip's way, with the meridians and parallels; the fides of which triangles are meafured by the equal intervals between the concentric quadrants, and the lines N. and S.E. and W.

The lines and arcs are diftinguifhed, every fifth, by a broader line; fo that if each interval be taken for one league, there will be five between one broad line and another; and if every interval be taken for four leagues, then there will be twenty leagues, which make a fea degree, from one broad line to the other.

Now, fuppofe a fhip to have failed 150 leagues northeaft, one fourth north; which is the third point, and makes an angle of 33° 45' with the north part of the meridian. Here are given two things; *viz.* the courfe, and the diftance failed; by which a triangle may be found on the inftrument, fimilar to that made by the fhip's courfe, and her longitude and latitude; and hence may the unknown parts of the triangle be found.

Thus, fuppofing the centre A to reprefent the place of departure; count, by means of the concentric arcs, along the point the fhip failed on, as A D, 150 leagues from A to D; then is the point D the place the fhip is arrived at, which note. This done, let D E be parallel to the fide A C; and then there will be formed a right-angled triangle A E D, fimilar to that of the fhip's courfe, difference of longitude, and latitude: the fide A E gives 125 leagues for the difference of latitude northwards; which makes 6° 15', reckoning twenty leagues to a degree, &c. and the fide D E gives 83 leffer leagues anfwering to the parallels; which

which being reduced, as shewn above, gives the difference of longitude. And thus is the whole triangle found.

QUADRANT, in *Gunnery*, called also the *gunner's square*, is an instrument serving to elevate or point cannons, mortars, &c. according to the places they are to be levelled or directed to.

It consists of two branches, made of brass or wood; one about a foot long, eight lines broad, and one line in thickness; the other four inches long, and of the same thickness and breadth as the former. Between these branches is a quadrant divided into ninety degrees, beginning from the shorter branch, and furnished with a thread and plummet. See its figure represented in *Plate* I. *Gunnery*, *fig.* 5.

The use of this instrument is easy; nothing more being required but to place the longest branch in the mouth of the cannon or mortar, and elevate or lower it, till the thread cuts the degree necessary to hit a proposed object. See *Pointing of a* GUN.

Sometimes, also, on one of the surfaces of the long branch, is noted the division of diameters, and weights of iron bullets; as also the bores of pieces. See CALIBER.

QUADRANT *of Altitude*, is an appendage of the artificial globe, consisting of a lamina or slip of brass, the length of a quadrant of one of the great circles of the globe; and divided into ninety degrees.

At the end, where the divisions terminate, there is a nut rivetted on, and furnished with a screw, by means of which the instrument is fitted on to the meridian; and is moveable round upon the rivet, to all points of the horizon. See its figure in *Plate* XIX. *Astronomy*, *fig.* 9.

Its use is to serve as a scale in measuring of altitudes, amplitudes, azimuths, &c. See the manner of its application under the *Use of the* GLOBE.

QUADRANTAL, in *Antiquity*, a vessel in use among the Romans for the measuring of liquids.

It was at first called *amphora*; and afterward *quadrantal*, from its form, which was square every way, like a die.

Its capacity was eighty libræ, or pounds of water, which made forty-eight sextaries, two urnæ, or eight congii.

QUADRANTAL *Space*, in *Geometry*. See QUADRANT.

QUADRANTAL *Triangle*, is a spherical triangle, one of whose sides at least is a quadrant of a circle, and one of its angles a right angle.

QUADRANTATA TERRÆ, in our *Ancient Law Books*, is used for a quarter of an acre, now called a *rood*; which see.

QUADRAS ISLES, in *Geography*, islands situated on the N.W. coast of North America, between Pintard's sound and the straits of Fuca; among which lies NOOTKA'S *sound*, which see. They were so called by Capt. Ingraham, after the name of a Spanish commander of two schooners, who passed through this channel in the year 1792.

QUADRAT, QUADRATUM, called also *geometrical square*, and *line of shadows*, is an additional member on the face of the common Gunter's and Sutton's quadrants; of some use in taking altitudes, &c.

The quadrat more distinctly exhibited in *Plate* VI. *Surveying*, *fig.* 13. has each of its sides divided into a hundred equal parts, commencing from the extremes; so that the number 100 falls on the angle, representing tangents to the arc of the limb.

The divisions are distinguished by little lines from 5 to 5, and by numbers from 10 to 10; and the divisions being occasionally produced across, form a kind of lattice, consisting of 10,000 little squares.

The proportion here is, as radius is to the tangent of the angle of altitude at the place of observation (*i. e.* to the parts of the quadrat cut by the thread), so is the distance between the station and the foot of the object, to its height above the eye. See ALTITUDE.

Use of the Quadrat, Geometrical Square, or *Line of Shadows.* 1. The quadrant being vertically placed, and the sights directed to the top of the tower, or other object, whose height is required; if the thread cut the side of the quadrat marked *right shadows*, the distance from the base of the tower to the point of station is less than the tower's height. If the thread falls on the diagonal of the square, the distance is just equal to the height. If it fall on that side marked *versed shadows*, the distance exceeds the height.

Hence, measuring the distance, the height is found by the rule of three; inasmuch as there are three terms given. Indeed, their disposition is not always the same; for when the thread cuts the side of right shadows, the first term in the rule of three ought to be that part of the side cut by the thread; the second, the side of the square; and the third, the distance measured. If the thread cut the other side, the first term is the whole side of the square; the second, the parts of the side cut by the thread; and the third, the distance.

For an instance of each. Suppose, *e. gr.* in looking at the top of a steeple, the thread cut the side of right shadows in the point 40, and that the distance measures 20 poles, the case then will stand thus: as 40 is to 100, so is 20 to a fourth term, which we find to be 50; the height of the steeple in poles. Again, supposing the thread to fall on the other side, in the point 60, and the distance to measure 35 poles; the terms are to be disposed thus: as 100 is to 60, so is 35 to a fourth term, *viz.* 21, the height required. See ALTITUDE.

Use of the Quadrat without Calculation.—The preceding cases may be formed without calculation, where the divisions of the square are produced both ways, so as to form the area into little squares.

Thus, suppose, 1. The thread to fall on 40 in the side of right shadows, and the distance be measured 20 poles; seek among the little squares for that perpendicular to the side which is 20 parts from the thread; this perpendicular will cut the side of the square next the centre, in the point 50, which is the height required in poles.

2. If the thread cuts the side of versed shadows in the point 60, and the distance be 35 poles; count 35 parts on the side of the quadrat from the centre; count also the divisions of the perpendicular from the point 35 to the thread, which will be 21, the height of the tower in poles.

Note, In all cases the height of the centre of the instrument is to be added. See ALTITUDE, and SHADOW.

QUADRAT, in *Astrology*, called also *Quartile*, an aspect of the heavenly bodies, in which they are distant from each other a quadrant, or ninety degrees. See ASPECT.

QUADRAT, in *Printing*, is a sort of space; that is, a piece of metal, cast like the letters, to be used occasionally in composing, in order to form the intervals between words, at the end of lines, &c. See PRINTING.

There are quadrats of divers sizes, as *m* quadrats, *n* quadrats, &c. which are respectively of the dimensions of such letters.

QUADRATA, in *Ancient Geography*, a town of Higher Pannonia, placed on the banks of the Save by Antonine's Itinerary.

QUADRATA, in *Geography*, a town of Naples, in the province of Bari; five miles N.W. of Ruvo.

QUADRATA is the Italian term in canto fermo for Gregorian or square black notes.

QUADRATA *Legio*, among the Romans. See *Square* LEGION.

QUADRATIC EQUATION, in *Algebra*, is an equation of which the higheſt power of the unknown quantity riſes only to the ſecond degree. If this power enters alone, it is called a *ſimple quadratic;* and when the ſecond power and ſimple quantity both occur, it is termed an *adfected quadratic* equation, thus:

$x^2 \pm a x = b$, is an *adfected quadratic*, and

$x^2 = b$, or $a x^2 = b$, a *ſimple quadratic* equation.

Some authors claſs all ſuch equations as contain two different powers of the unknown quantity, the one being the double of the other, under the general term quadratics, ſuch as $x^4 \pm a x^2 = b$, $x^{2m} \pm a x^m = b$, &c. each of which is called a quadratic equation, becauſe their ſolution depends upon preciſely the ſame principles as the former.

Every quadratic may be reduced to the form $x^2 + a x = b$; in which it is, however, to be underſtood, that a and b may be either poſitive or negative; and the general ſolution of it is expreſſed by the formula

$$x = \frac{-a}{2} \pm \sqrt{\left(\frac{a^2}{4} + b\right)}$$

If we give to a and b all the variety of ſigns they admit of, quadratic equations may be divided into four diſtinct claſſes, *viz.*

1. $x^2 + a x = - b$
2. $x^2 - a x = - b$
3. $x^2 + a x = + b$
4. $x^2 - a x = + b$;

and their ſeveral roots will be exhibited by the following formulæ, *viz.*

1. $x = \frac{-a}{2} \pm \sqrt{\left(\frac{a^2}{4} - b\right)}$
2. $x = \frac{a}{2} \pm \sqrt{\left(\frac{a^2}{4} - b\right)}$
3. $x = \frac{-a}{2} \pm \sqrt{\left(\frac{a^2}{4} + b\right)}$
4. $x = \frac{a}{2} \pm \sqrt{\left(\frac{a^2}{4} + b\right)}$

See EQUATIONS.

From theſe forms it is obvious that every quadratic equation has two roots ariſing out of the ambiguous ſign $\pm$, prefixed to the ſecond member of the root. It is alſo obvious, that if in the 1ſt and 2d form, b be greater than $\frac{a^2}{4}$, the two roots in both forms are imaginary, or impoſſible; but if b be leſs than $\frac{a^2}{4}$, then they are in each form both real, being in the 1ſt both negative, and in the 2d both poſitive; becauſe the quantity exhibited under the radical form is, in both equations, leſs than that without the radical; and conſequently both the ſum and difference will have the ſame ſign as $\frac{a}{2}$.

In the 3d and 4th forms, the roots are neceſſarily both real, but one poſitive and the other negative; the 3d form having its greateſt root negative, and 4th its greateſt root poſitive; as is obvious by inſpection.

It is, however, not neceſſary to conſider quadratic equations under theſe four forms, as the ſolution of them all may be reduced to one general rule, as exhibited in the preceding part of this article, and which may be given in words as follows. Having reduced the propoſed equation to any one of the above forms, the roots of it will be equal to half the co-efficient of the ſecond term, with its ſign changed; plus and minus the ſquare root of the ſquare of that half co-efficient prefixed to b, with its proper ſign, whether plus or minus. The principles on which the preceding formulæ are obtained, are theſe, *viz.* $(x \pm \frac{1}{2} a)^2 = x^2 \pm a x + \frac{1}{4} a^2$; therefore, if an equation be propoſed under the form $x^2 \pm a x = \pm b$, by adding $\frac{1}{4} a^2$ to both ſides, we ſtill preſerve the equality, and render the firſt ſide a complete ſquare, that is, we have

$$x^2 \pm a x + \tfrac{1}{4} a^2 = \tfrac{1}{4} a^2 \pm b;$$

and, by extraction,

$$x \pm \tfrac{1}{2} a = \pm \sqrt{(\tfrac{1}{4} a^2 \pm b)};$$

conſequently

$$x = \mp \frac{a}{2} \pm \sqrt{(\tfrac{1}{4} a^2 \pm b)},$$

which form includes all the preceding formulæ. We ſhall not here give the ſolution of any examples, as the reader will find ſufficient exerciſes under the article EQUATION; but it may not be amiſs to ſhew other methods of obtaining the roots of quadratic equations, *viz.* by ſines and tangents, continued fractions, &c.

The Solution of Quadratic Equations by means of a Table of Sines, Tangents, &c.—Here, referring to our preceding four forms, the ſolution of them may be exhibited as follows:

Form 1. $x^2 + a x = - b$.

Put $\frac{2}{a} \sqrt{b} = \text{ſin. } z$; then

$$x = \begin{cases} - \sqrt{b} \times \text{tan. } \frac{1}{2} z \\ - \sqrt{b} \times \text{cot. } \frac{1}{2} z \end{cases} \quad \text{or,}$$

$$x = \begin{cases} - \frac{1}{2} a \, (1 - \text{coſ. } z) \\ - \frac{1}{2} a \, (1 + \text{coſ. } z) \end{cases}$$

Form 2. $x^2 - a x = - b$.

Put $\frac{2}{a} \sqrt{b} = \text{ſin. } z$; then

$$x = \begin{cases} + \sqrt{b} \times \text{tan. } \frac{1}{2} z \\ + \sqrt{b} \times \text{cot. } \frac{1}{2} z \end{cases} \quad \text{or,}$$

$$x = \begin{cases} + \frac{1}{2} a \, (1 - \text{coſ. } z) \\ + \frac{1}{2} a \, (1 + \text{coſ. } z) \end{cases}$$

Form 3. $x^2 + a x = b$.

Put $\frac{2}{a} \sqrt{b} = \text{tan. } z$; then

$$x = \begin{cases} + \sqrt{b} \times \text{tan. } \frac{1}{2} z \\ - \sqrt{b} \times \text{cot. } \frac{1}{2} z \end{cases} \quad \text{or,}$$

$$x = \begin{cases} + \frac{1}{2} a \, (\text{ſec. } z - 1) \\ - \frac{1}{2} a \, (\text{ſec. } z + 1) \end{cases}$$

Form 4. $x^2 - a x = b$.

Put $\frac{2}{a} \sqrt{b} = \text{tan. } z$; then

$$x = \begin{cases} + \sqrt{b} \times \text{cot. } \frac{1}{2} z \\ - \sqrt{b} \times \text{tan. } \frac{1}{2} z \end{cases} \quad \text{or,}$$

$$x = \begin{cases} + \frac{1}{2} a \, (\text{ſec. } z + 1) \\ - \frac{1}{2} a \, (\text{ſec. } z - 1) \end{cases}$$

The above formulæ reſult immediately from the conſtruction of quadratic equations. Thus, in the two firſt forms, let A B, (*Plate* XIII. *fig.* 6. *Analyſis*,) repreſent a, and C D = $\sqrt{b}$, then A D and D B will be the required roots from the known conſtruction of equations. See CONSTRUCTION.

Now here it is obvious that the ſin. z repreſents the ſin. of C E D, C E D, and therefore angle D C B, which is $= \frac{1}{2}$ angle C E D, $= \frac{1}{2}$ angle z. Confequently D B $=$ C D $\times$ tan. $\frac{1}{2} z$, and A D $=$ C D $\times$ cot. $\frac{1}{2} z$, becaufe the angle C A D $=$ the angle B C D; which agree with the leading formulæ above given. As to the two latter formulæ for the two firft cafes, they are obvious without any explanation.

In the 3d and 4th cafes, let A B reprefent a, and D C $= \sqrt{b}$, then A D and D B will reprefent the two roots; join B C, and draw D E parallel to B C, fo fhall C E $=$ B D, and the angle C D E $= \frac{1}{2}$ the angle B O C. Now here the tan. z will reprefent the tan. of B O C, and $\frac{1}{2} z =$ C D E; but C E $=$ B D is obvioufly equal to D C $\times$ tan. C D E $= \sqrt{b} \times$ tan. $\frac{1}{2} z$; and in the fame manner A D $= \sqrt{b} \times$ cot. $\frac{1}{2} z$. The two latter formulæ require no illuftration.

The fame refults might have been obtained, though not perhaps quite fo obvioufly, from the preceding analytical folution.

There are but few cafes in which it is advifable to employ the methods above defcribed to the folution of quadratics, and therefore one example will be confidered a fufficient illuftration.

Exam.—Given $x^2 + \frac{7}{44} x = \frac{1695}{12716}$, to find the two roots of the equation by fines and tangents.

Here tan. $z = \frac{88}{7} \sqrt{\frac{1695}{12716}}$

log. 1695	3.2291697
log. 12716	4.1043505
	2) $-$ 1.1248192
log. $\sqrt{\frac{1695}{12716}}$	$-$ 1.5624096
log. 88	1.9444827
co. log. 7	9.1549020
log. tan. z	10.6617943

whence $z = 77° \; 42' \; 32''$, and $\frac{1}{2} z = 38° \; 51' \; 16''$

log. tan. $\frac{1}{2} z$	9.9061115
log. $\sqrt{\frac{1695}{12716}}$	$-$ 1.5624096
	9.4685211
deduct radius	10.0000000
log. x	$-$ 1.4685211

or $x =$ .2941176 the pofitive root; and if cot. $\frac{1}{2} z$ be taken inftead of tan. $\frac{1}{2} z$, the other value of x will be found $=$ $-$ .4532085. See Bonnycaftle's Algebra, vol. i. p. 141.

For the folution of quadratic equations by the method of *continued fractions*, we muft refer the reader to the "Effai fur la Théorie des Nombres," by Le Gendre.

The root of a quadratic equation may be exhibited under the form of a continued furd, as follows:

Let $x^2 - a x = b$, or $x^2 = a x + b$; then

$$x = \sqrt{b + a x}$$

Or, by fubftituting for x, under the radical, its whole value $\sqrt{b + a x}$, we have

$$x = \sqrt{b + a \sqrt{b + a x}}$$

Subftituting again for x as above, we obtain

$$x = \sqrt{b + a \sqrt{b + a \sqrt{b + a x}}}$$

and by continuing thus our fucceffive fubftitutions for x, we have

$$x = \sqrt{b + a \sqrt{b + a \sqrt{b + a \sqrt{b + \&c.}}}}$$

which is an analytical expreffion for the pofitive value of x in the propofed equation.

It is obvious, however, that fuch an expreffion as this is of little or no ufe for folving quadratic equations; but we have by means of the latter, a very ready means of finding the ultimate value of fuch a continued furd. Suppofe, for example, the value of the following continued furd were required, *viz.*

$$\sqrt{12 + \sqrt{12 + \sqrt{12 + \sqrt{12 + \&c.}}}}$$

Affume

$$x = \sqrt{12 + \sqrt{12 + \sqrt{12 + \sqrt{12 + \&c.}}}}$$

By fquaring both fides

$$x^2 = 12 + \sqrt{12 + \sqrt{12 + \sqrt{12 + \&c.}}}$$

Or, fince the latter part

$$\sqrt{12 + \sqrt{12 + \sqrt{12 + \&c.}}} = x$$

this becomes

$$x^2 = 12 + x, \text{ or } x^2 - x = 12;$$

whence $x = \frac{1}{2} \pm \sqrt{12\frac{1}{4}} = 4$, which is the value of the infinite furd propofed.

Again, let there be propofed the following infinite furd, *viz.*

$$\sqrt{5 + 4 \sqrt{5 + 4 \sqrt{5 + \&c.}}}$$

Affume the infinite fum $= x$, then by fquaring

$$x^2 = 5 + 4 \sqrt{5 + 4 \sqrt{5 + 4 \sqrt{5 + \&c.}}}, \text{ or}$$

$$x^2 = 5 + 4 x, \text{ or } x^2 - 4 x = 5;$$

whence $x = 2 \pm \sqrt{4 + 5} = 5$, the value fought. For other examples of this kind, fee SURDS.

QUADRATING *of a Piece*, among *Gunners*, is the feeing that a piece of ordnance be duly placed, and poifed in its carriages; and that its wheels be of an equal height, &c.

QUADRATO, in *Mufic.* See QUADRO.

QUADRATO-CUBUS, QUADRATO-QUADRATO-CUBUS, and QUADRATO-CUBO-CUBUS, are names ufed by Diophantus, Vieta Oughtred, and others, for the fifth, feventh, and eighth powers of numbers. See POWER.

QUADRATO-QUADRATUM, or BIQUADRATUM, the fourth power of numbers; or the product of the cube multiplied by the root.

QUADRATRIX, in *Geometry*, a mechanical line, by means of which we would find right lines equal to the circumference

cumference of circles, or other curves, and of the ſeveral parts of it.

Or, more accurately, the quadratrix of a curve is a tranſcendental curve deſcribed on the ſame axis, the ſemi-ordinates of which being given, the quadrature of the correſpondent parts in the other curve is likewiſe given. See Curve.

Thus, *e. gr.* the curve A N D (*Plate* XIII. *Analyſis*, *fig.* 7.) may be called the quadratrix of the parabola A M C, ſince it is demonſtrated, that A P M A is $=$ PN^2, or $APMA = AP \times PN$, or $APMA = PN \times a$, a conſtant quantity, &c.

The moſt eminent of theſe quadratrices are, that of Dinoſtrates, and that of Mr. Tſchirnhauſen, for the circle; that of Mr. Perks for the hyperbola.

Quadratrix *of Dinoſtrates*, is a curve A M *m m* (*fig.* 8.) by which the quadrature of the circle is effected, though not geometrically, but mechanically; it is thus called from its inventor Dinoſtrates.

Its geneſis is thus: divide the quadrantal arc A N B into any number of equal parts, in N, *n*, &c. by a continual biſection; divide the radius A C into the ſame number of parts in the points P, *p*, &c. Draw radii C N, C *n*, &c. Laſtly, on the points P, *p*, &c. erect perpendiculars P M, *p m*, &c. The curve formed by connecting theſe lines is the quadratrix of Dinoſtrates.

This curve may be deſcribed by continual motion; if we ſuppoſe the radius C N by its extreme N to deſcribe uniformly the arc A B, and at the ſame time a ruler P M, always parallel to itſelf, to move uniformly along A C, in ſuch a manner that when the ruler P M arrives at C, the radius C N may coincide with C B; and thus the continual interſection of C N with the ruler P M will deſcribe the quadratrix A M D.

Here, from the conſtruction, $ANB : AN :: AC : AP$; and therefore, if $ANB = a$, $AC = b$, $AN = x$, $AP = y$; $ay = bx$. See Quadrature.

Quadratrix *Tſchirnhauſiana*, is a tranſcendental curve A M *m m* B (*fig.* 9.) by which the quadrature of the circle is likewiſe effected; invented by Mr. Tſchirnhauſen, in imitation of that of Dinoſtrates.

Its geneſis is thus conceived; divide the quadrant A N B, and its radius A C, into equal parts, as in the former; and from the points P, *p*, &c. draw the right lines P M, *p m*, &c. parallel to C B; and from the points N, *n*, &c. the right lines N M, *n m*, &c. parallel to A C. The points A, M *m*, being connected, the quadratrix is formed; in which $ANB : AN :: AC : AP$. And therefore, if $AB = a$, and $AC = b$, $AN = x$, and $AP = y$; $ay = bz$. See Quadrature.

This curve may be alſo deſcribed by continued motion, if two rulers, N M and P M, perpendicular to each other, be made to move uniformly and parallel to themſelves, the one along the quadrant of the circle A C, and the other along the radius.

QUADRATUM-CUBI, Quadrato-quadrato-quadratum, and Quadratum *Surdoſolidi*, &c. are names uſed by the Arabs for the ſixth, eighth, and tenth powers of numbers. See Power.

Quadratum *Os*, in *Comparative Anatomy*, *os carré* of the French; a ſmall bone in the head of birds, to which the lower mandible is articulated. See Birds, in *Comparative Anatomy*, in the diviſion relating to the bones.

QUADRATURE, in *Geometry*, ſignifies literally the finding of a ſquare equal in area to any given figure, which was the method the ancients made uſe of when they had in view the determination of the ſurface of any ſpace; but the term *quadrature* has now a more indefinite ſignification; implying, in general, the determination of the area of a figure, without any reference to the geometrical exhibition of it, in a ſquare or other rectilinear form.

All rectilinear figures being immediately reduced to, or dependent upon, the area of triangles, their quadratures have been known from the higheſt antiquity; but the quadratures of curvilineal ſpaces are, with very few exceptions, of modern date, two only having been known till near the beginning of the eighteenth century.

The firſt curvilinear ſpace whoſe quadrature was accurately determined, was the lune of Hippocrates, of which an account will be found under the article Lune. Archimedes next found the area of the common parabola; which he obtained in a very ingenious manner, by inſcribing an iſoſceles triangle in the parabola, then two iſoſceles triangles on the equal ſides of the former, four others on theſe, and ſo on, which he found to have a certain relation, decreaſing in the proportion $1, \frac{1}{4}, \frac{1}{16}$, &c. the infinite ſum of which ſeries would therefore expreſs the area of the parabola, or the area of all the triangles of which he thus conceived it to be compoſed; and which ſum he found to be $1\frac{1}{3}$ or $\frac{2}{3}$ of the circumſcribing rectangle. After this time, a period of near two thouſand years elapſed, without producing the quadrature of a ſingle curvilinear figure, although the ſubject ſeems to have engaged the attention of the moſt eminent mathematicians during that long interval, particularly the quadrature of the circle. This figure, being the moſt ſimple in appearance and conſtruction of any contained under a curve line, was well calculated to excite the curioſity of mathematicians. Archimedes doubtleſs attempted the ſolution of this problem; but failing in producing the exact quadrature, he contented himſelf with giving an approximation, ſhewing by the inſcription and circumſcription of a polygon of ninety-ſix ſides, that the diameter being 1, the circumference was greater than $3\frac{10}{71}$, but leſs than $3\frac{10}{70}$; and as it was known, even before the time of Archimedes, that the area of a circle is equal to that of a right-angled triangle, whoſe altitude is equal to the radius, and baſe equal to the circumference of the circle, it follows, that the area would be greater than $\frac{223}{284}$, but leſs than $\frac{220}{280}$.

It would be uſeleſs to attempt in this place to enumerate the various abſurd quadratures which have been, from time to time, publiſhed by minor geometers, with all that conceit and confidence which ſeldom fail to accompany inferiority. Some attributed their ſucceſs to divine inſpiration; others to their own ſuperior talents: ſome offered large ſums of money to thoſe who ſhould diſcover any error in their inveſtigation, while others expected great rewards from their government, as a recompence for their diſcovery, fooliſhly attaching great importance to a problem, which, if it could be accurately ſolved, would ſerve no other purpoſe but to gratify the curioſity of mathematicians. Many of theſe attempts, however, have been rendered ſomewhat amuſing by an exceſs of abſurdity. This is particularly the caſe with regard to the work of Jaime Falcon, a Spaniard of the order of Nôtre Dame, of Monteſa, publiſhed at Anvers in 1587. This treatiſe opens with a dialogue in verſe between himſelf and the circle, which thanks him very affectionately for having ſquared him; but the good and modeſt knight attributes all the honour of the diſcovery to the holy patron of his order. See Montucla's "Hiſtoire des Recherches ſur la Quadrature du Circle;" or his "Hiſtoire des Mathematiques," vol. iv. p. 619.

Referring thoſe readers who have the curioſity to examine the reveries above-mentioned to the two preceding works, we propoſe to give here an abſtract from the ſame, of what

has

has been done on this ſubject, by way of approximation. We have already obſerved that Archimedes was the firſt who gave an approximation of the ratio of the diameter to the circumference of a circle, placing it between the limits 1 to $3\frac{10}{70}$, and 1 to $3\frac{10}{71}$; and it is ſaid that Apollonius and Philo found more accurate approximations, which, however, have not been tranſmitted to us.

Towards the year 1585, Metius, combatting the falſe quadrature of Simon Duchêne, gave the ratio of 113 to 355, which is very exact, being only $\frac{3}{10000000}$ in exceſs. Vieta found a ſtill nearer approximation, carrying it to ten decimals, whereas the former is true only to ſix places. He alſo gave a kind of ſeries, the infinite ſum of which was equal to the entire circle.

Adrianus Romanus carried the approximation to ſeventeen figures, and Ludolph van Ceulen to thirty-ſix; which he publiſhed in his work "De Circulo et Adſcriptis;" and of which Snellius publiſhed a Latin tranſlation in 1619. He afterwards verified Van Ceulen's approximation by ſome theorems of his own invention, which greatly facilitated the computation, and which he publiſhed in 1621, under the title of "Willebrordi Snellii Cyclometricus de Circuli Dimenſione, &c."

Deſcartes found a geometrical conſtruction from which it was eaſy to draw an expreſſion in the form of a ſeries; and Huygens afterwards diſcovered ſome curious theorems connected with this ſubject, but did not advance the approximation, though he made ſome uſeful rules for approximating towards the length of the circular arc.

One of the moſt curious diſcoveries connected with this ſubject, which had yet been publiſhed, was that given by Wallis in his "Arithmetica Infinitorum," in 1655: where he ſhews that the ratio of a circle to the ſquare of its diameter, is truly expreſſed by the infinite fraction

$$\frac{3^2 \cdot 5^2 \cdot 7^2 \cdot 9^2 \cdot 11^2 \cdot \&c.}{2. \; 4^2. \; 6^2. \; 8^2. \; 10^2. \; 12^2. \; \&c.}$$

If we limit ourſelves, as we muſt do to, a finite number of terms, we ſhall have a ratio alternately too great and too ſmall, according as we take an even or an odd number of terms: thus, $\frac{3}{2}$ is too great; $\frac{3 \cdot 3}{2 \cdot 4}$ too ſmall; $\frac{3 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 4}$ too great; and $\frac{3 \cdot 3 \cdot 5 \cdot 5}{2 \cdot 4 \cdot 4 \cdot 6}$ too ſmall, and ſo on; but each of theſe is a nearer approximation than the preceding ones. But in order to approach ſtill nearer in both caſes, the author propoſed to multiply the whole product by the ſquare root of a binomial, *viz.* unity, plus unity divided by the laſt figure, with which the ſeries terminated either in the numerator or denominator; in which caſe, the product will be a much nearer approximation; it will be too great if we uſe the laſt figure of the numerator, and too ſmall if the laſt of the denominator. Thus we ſhall have for the ratio ſought, alternately in exceſs and defect.

In exceſs.	In defect.
$\frac{3 \cdot 3 \cdot 5 \cdot 5}{2 \cdot 4 \cdot 4 \cdot 6} \surd (1 \times \frac{1}{5})$	$\frac{3 \cdot 3 \cdot 5 \cdot 5}{2 \cdot 4 \cdot 4 \cdot 5} \surd (1 \times \frac{1}{6})$
$\frac{3 \cdot 3 \cdot 5 \cdot 5 \cdot 7 \cdot 7}{2 \cdot 4 \cdot 4 . 6 . 6 . 8} \surd (1 \times \frac{1}{7})$	$\frac{3 \cdot 3 \cdot 5 \cdot 5 \cdot 7 \cdot 7}{2 \cdot 4 \cdot 4 . 6 . 6 . 8} \surd (1 \times \frac{1}{8})$
&c.	&c.

Prior to the above ſeries of Dr. Wallis, however, ſome thing of an equivalent expreſſion, though given under a different form, was diſcovered by lord Brounker, which is as follows. The circle itſelf being 1, the ſquare of its diameter is expreſſed by the infinite continued fraction.

$$1 + \cfrac{1}{2 + \cfrac{3^2}{2 + \cfrac{5^2}{2 + \cfrac{7^2}{2 + \cfrac{9^2}{2 + \&c.}}}}}$$

of which the law of the denominators is obvious. See Circle.

Such was the progreſs which mathematicians had made towards the ſolution of this intereſting problem prior to the invention of fluxions, which, by reducing the quadrature of all curves to one general principle, again revived the hopes of ſucceſs with regard to the circle, notwithſtanding ſome pretended demonſtrations of its impoſſibility; and its quadrature was accordingly again attempted with the greateſt eagerneſs. The quadrature of a ſpace, and the rectification of a curve, were now reduced to that of finding the fluent of a given fluxion but ſtill the problem was found to be incapable of a general ſolution in infinite terms. The fluxion of a given fluent was found to be always aſſignable, but the converſe propoſition, *viz.* of finding the fluent of a given fluxion, could only be effected in particular caſes; and amongſt the exceptions, to the great regret and diſappointment of geometricians, was included the caſe of the circle with regard to every form of fluxion under which it could be obtained. Some exceedingly near approximations have, however, ſince been made towards the true ratio of the diameter to the circumference of the circle, but theſe belonging rather to the article Rectification than to Quadrature, we ſhall enter again upon the ſubject under the former term, and ſhall occupy the remainder of the preſent article on the quadrature of curves in general.

On the Quadrature of Curves by Fluxions. In order to exhibit more diſtinctly and at large the uſe of fluxions, according to the modern method of notation, in finding the areas of curves, we ſhall premiſe the two following caſes.

Caſe 1.—Let A R C (*Plate* XIII. *Analyſis*, *fig.* 10.) be a curve of any kind, whoſe ordinates R *b*, C B, are perpendicular to an axis A B. Imagine a right line *b* R *g*, perpendicular to A B, to move parallel to itſelf from A towards B; and let its velocity, or the fluxion of the abſciſſe A *b*, in any propoſed ſituation of that line, be denoted by *b d*; then will the rectangle *b n* expreſs the fluxion of the generated area A *b* R, which (if A $b = x$, and b R $= y$) will be $= y \dot{x}$: whence, by ſubſtituting for y or $\dot{x}$ (according to the equation of the curve,) and taking the fluent, the area itſelf will become known.

Caſe 2.—Let A R M (*fig.* 11.) be any curve whoſe ordinates C R, C R, are all referred to a point or centre; and conceive a right line C R H to revolve about the given centre C, and a point R to move along the ſaid line, ſo as to deſcribe the curve live A R M. If this point were to move from Q, without changing its direction or velocity, it would proceed along the tangent Q S (inſtead of the curve), and deſcribe areas Q *s* C, Q S C, about the centre C, proportional to the times in which they were deſcribed; becauſe, having the ſame altitude C P, they are as the baſes Q *s* and Q S. Conſequently, if R S be taken to denote the value of $\dot{z}$ the fluxion of the curve line A R, the correſponding fluxion

fluxion of the area A R C will be juftly reprefented by the uniformly generated triangle Q C S; which, expreffing C P by s, will be $= \frac{QS \times CP}{2} = \frac{s\dot{z}}{2}$: whence the area itfelf may be determined. But fince, in many cafes, the value of $\dot{z}$ cannot be computed (from the property of the curve) without trouble, the two following expreffions, for the fluxion of the area, will be found more commodious, *viz.* $\frac{sy\dot{y}}{2t}$ and $\frac{y^2\dot{x}}{2a}$; where $t =$ R P, and $x =$ the arc B N of a circle, defcribed about the centre C, at any diftance $a =$ C B. Thefe expreffions are derived from that above in the following manner; *viz.* $\dot{z} : \dot{y} :: y\,(CR) : t\,(RP)$; therefore $\dot{z} = \frac{y\dot{y}}{t}$; confequently $\frac{s\dot{z}}{2} = \frac{sy\dot{y}}{2t}$. Moreover, becaufe the celerity of R in the direction of the tangent is denoted by $\dot{z}$, that in a direction perpendicular to C Q (whereby the point R revolves about the centre C) will, therefore, be $= \frac{CP}{CR} \times \dot{z} = \frac{s\dot{z}}{y}$; which, being to $\dot{x}$ the celerity of the point N about the fame centre as the diftance or radius C R (y) to the radius C N (a), we fhall, by multiplying extremes and means, have $\frac{as\dot{z}}{y} = y\dot{x}$, and, confequently, $\frac{s\dot{z}}{2} = \frac{y^2\dot{x}}{2a}$. In the examples fubjoined, the letters x, y, z, and u will be ufed to denote the abfciffe, ordinate, curve-line, and area refpectively.

Quadrature *of a Right-angled Triangle.* Let the bafe A H (*fig.* 12.) $= a$, the perpendicular H M $= b$, and let A B (x) be any portion of the bafe, confidered as a flowing quantity, and B R (y) be the correfponding ordinate. Then, the triangles A H M and A B R being fimilar, we fhall have $a : b :: x : y = \frac{bx}{a}$. Whence $y\dot{x}$ (the fluxion of the area A B R) $= \frac{bx\dot{x}}{a}$; and its fluent (fee *Inverfe Method of* Fluxions) or the area itfelf $= \frac{bx^2}{2a}$, which, when $x = a$, and B R coincides with H M, will become $\frac{ab}{2} = \frac{AH \times HM}{2}$ = the area of the whole triangle A H M. See *Menfuration of* Triangles.

Quadrature *of a Circular Sector.* Let A O R (*fig.* 13.) be the fector; A O or O R, its radius, $= a$, the arc A R, confidered as variable by the motion of R, $= z$, and R r $= \dot{z}$; the fluxion of the area will be $\frac{a\dot{z}}{2}$ = the triangle O R r: whence the area itfelf is $= \frac{az}{2} = AO \times \frac{1}{2}AR$: that is, the area of any circle is expreffed by a rectangle under half the circumference and half the diameter. See Circle.

Quadrature *of a Semicircle.* Let the femicircle be A R E H (*fig.* 14.); its diameter A H $= a$, A B $= x$, and B R $= y$, &c. and we have y^2 (BR^2) $= ax - x^2$ (A B $\times$ B H), and, confequently, $\dot{u}$ ($y\dot{x}$) $= \dot{x}\sqrt{(ax - x^2)} = a^{\frac{1}{2}} x^{\frac{1}{2}} \dot{x} \times \left(1 - \frac{x}{a}\right)^{\frac{1}{2}}$; which expreffion being refolved into an infinite feries, we fhall have $\dot{u} = a^{\frac{1}{2}} x^{\frac{1}{2}} \dot{x} \times \left(1 - \frac{x}{2a} - \frac{x^2}{8a^2} - \frac{x^3}{16a^3} - \frac{5x^4}{128a^4}, \&c.\right) = a^{\frac{1}{2}} \times \left(x^{\frac{1}{2}}\dot{x} - \frac{x^{\frac{3}{2}}\dot{x}}{2a} - \frac{x^{\frac{5}{2}}\dot{x}}{8a^2} - \frac{x^{\frac{7}{2}}\dot{x}}{16a^3}\right)$, &c. Whence, the fluent of every term being taken, there will arife $u = a^{\frac{1}{2}} \times \left(\frac{2x^{\frac{3}{2}}}{3} - \frac{x^{\frac{5}{2}}}{5a} - \frac{x^{\frac{7}{2}}}{28a^2} - \frac{x^{\frac{9}{2}}}{72a^3} - \frac{5x^{\frac{11}{2}}}{704a^4}, \&c.\right) = x\sqrt{ax} \times \left(\frac{2}{3} - \frac{x}{5a} - \frac{x^2}{28a^2} - \frac{x^3}{72a^3} - \frac{5x^4}{704a}, \&c.\right)$ = the area A B R. When $x = \frac{1}{2}a$, the ordinate B R will coincide with the radius O E; in which cafe the area becomes $= \frac{1}{2}a\sqrt{\frac{1}{2}aa} \times (\frac{2}{3} - \frac{1}{10} - \frac{1}{112} - \frac{1}{576} - \frac{5}{11264}, \&c.) = \frac{a^2\sqrt{\frac{1}{8}}}{2} \times (0.6666 - 0.1 - 0.0089 - 0.0017 - 0.0004, \&c.) = 0.1964\,a^2$; which, multiplied by 2, gives $0.3928\,a^2$ for the area of the femicircle, nearly. In order to obtain a more converging feries, let the arc A R be $= \frac{1}{3}$ A E $= 30°$, and the fine B R (being half the chord of double the arc or half the fide of a hexagon, *i. e.* half the radius), will be $= \frac{1}{2}$ A O; and A B (x) $=$ A O $-$ O B $=$ A O $- \sqrt{(OR^2 - BR^2)}$; which, radius being 1, will be $= 0.1339746$ nearly: fubftitute this quantity, with the value of a in the above feries, $\sqrt{ax^3} \times (\frac{2}{3} - \frac{x}{5a} - \frac{x^2}{28a^2} - \&c.)$ and we fhall have $0.0693505 \times (0.6666666 - 0.0133975 - 0.0001603 - 0.0000042 - \&c.) = 0.0693505 \times 0.6531046 = 0.0452931$ = the area A B R: which, added to the area O B R ($=$ O B $\times \frac{1}{2}$ B R $= \sqrt{\frac{3}{4}} \times \frac{1}{4} = 0.2165063$) gives 0.2617994 for the area of the fector A O R; the treble of which, or 0.7853982 (A R being $= \frac{1}{3}$ A E), will be the content of the whole quadrant A O E; which number, found by taking only four terms of the feries, is true to the laft decimal place.

We might have found a feries of more rapid convergency, but fhall referve that part of our inveftigation for the article Rectification.

Quadrature *of the Lunes.* See Lunes.

Quadrature *of the Ellipfe.* The ellipfe, alfo, is a curve whofe precife quadrature in definite terms is not yet effected. Indeed the area of an ellipfe, being an exact mean proportional between the areas of the circles defcribed upon its two axes, is obvioufly dependent upon the latter; and it is, therefore, ufelefs to repeat the operation.

Quadrature *of the Parabola.* Let the curve A R M H (*fig.* 15.), be the common parabola, in which y^2 (BR^2) $= ax$ (A B $\times$ a, the parameter). See Conic *Sections.* Whence we have $y = a^{\frac{1}{2}} x^{\frac{1}{2}}$, and $\dot{u}$ ($y\dot{x}$) $= a^{\frac{1}{2}} x^{\frac{1}{2}} \dot{x}$; and, therefore, $u = \frac{2}{3} \times a^{\frac{1}{2}} x^{\frac{3}{2}} = \frac{2}{3} a^{\frac{1}{2}} x^{\frac{1}{2}} \times x = \frac{2}{3} yx = \frac{2}{3} \times$ A B $\times$ B R. Hence a parabola is $\frac{2}{3}$ of a rectangle of the fame bafe and altitude.

The value of the area may alfo eafily be found in terms of y. Thus x being $= \frac{y^2}{a}$, we have $\dot{x} = \frac{2y\dot{y}}{a}$, and $\dot{u}$ ($y\dot{x}$) $= \frac{2y^2\dot{y}}{a}$: whence $u = \frac{2y^3}{3a} = \frac{2y}{3} \times \frac{y^2}{a} = \frac{2y}{3} \times x = \frac{2}{3} \times$ A B $\times$ B R. See Parabola.

In the cubic parabola, whofe equation is $p^2 x = y^3$; we have

have $y = p^{\frac{2}{3}} x^{\frac{1}{3}}$; multiply this by $\dot{x}$, and we have $y\dot{x} = p^{\frac{2}{3}} x^{\frac{1}{3}} \dot{x}$, for the fluxion of the area. Therefore fluent $y\dot{x} = \frac{3}{4} p^{\frac{2}{3}} x^{\frac{4}{3}} = \frac{3}{4}$ of xy, that is, area $= \frac{3}{4}$ of circumfcribing rectangle.

And in the fame manner, it will be found that in the general parabola, whofe equation is $a^{n-1} x = y^n$; the area $= \frac{n}{n+1} \times$ circumfcribing rectangle.

QUADRATURE *of the Hyperbola.* The analytical quadrature of this curve was firft given by N. Mercator of Holftein, the firft inventor of infinite feriefes. But Mercator finding his feries by divifion, fir Ifaac Newton and M. Leibnitz improved upon his method; the one feeking them by the extraction of roots, the other by a feries prefuppofed. See HYPERBOLA.

QUADRATURE *of the Afymptotic Spaces in an Hyperbola.* Let D E F (*fig.* 16.) be an hyperbola, of which the afymptotes are C M and C N; to find the area E G H F, comprehended between the ordinates G E and F H.

Let C G $= a$, G E $= b$, G H $= x$, F H $= y$; then by the property of the hyperbola, C G $\times$ G E $=$ C H $\times$ H F, or $ab = (a - x) y$, or $y = \frac{ab}{a+x}$; and, therefore, $y\dot{x} = \frac{ab\dot{x}}{a+x}$; the fluent of which is $ab \times$ hyp. log. $(a + x)$, which fluent, however, requires a correction, for when $x = 0$, the area $= 0$; but the above expreffion when $x = 0$ is $ab \times$ hyp. log. of a, therefore the correction is $- ab \times$ hyp. log. of a, that is, the correct fluent which expreffes the area is $ab \times$ hyp. log. $(a + x) - ab \times$ hyp. log. a, or area E G F H $= ab \times$ hyp. log. $\frac{a+x}{a}$.

If C G and G E each $= 1$; $y\dot{x} = \frac{\dot{x}}{1+x}$, the fluent of which is hyp. log. $(1 + x)$, which requires no correction.

QUADRATURE *of the Cycloid.* Let C A L (*fig.* 17.) be a cycloid, A D the axis, A B D the generating circle, A F a tangent at the vertex, C F parallel to A D.

Take any point P in the arc, and draw P M perpendicular to A M. Then the fluxion of the external area A M P $=$ P M $\times$ the fluxion of A M.

Let A E $= x$, A D $= 2a$; then B E $= \sqrt{(2ax - x^2)}$ and the fluxion of B E $= \frac{(a-x)\dot{x}}{\sqrt{(2ax - x^2)}}$.

Alfo P B $=$ the arc B A; therefore the fluxion of P B $= \frac{a\dot{x}}{\sqrt{(2ax - x^2)}}$; and the fluxion of P B $+$ B E, or of A M $= \frac{(2a - x)\dot{x}}{\sqrt{(2ax - x^2)}}$; therefore the fluxion of the area A P M, or P M, $\times$ by the fluxion A M $= \frac{(2ax - x^2)\dot{x}}{\sqrt{(2ax - x^2)}} = \dot{x}\sqrt{(2ax - x^2)}$.

But the fluent of this fluxion is the fame as that found above for a circle, whofe radius is a, and verfed fine x; that is, the area A B E; and, therefore, when $x = 2a$, the whole external area C F A is equal to the area of the femicircle A B D. But C D being equal to the femicircumference A D, the whole rectangle C D A F $=$ four times the femicircle A B D, and confequently the internal area A C D $=$ three times the femicircle A B D; or the whole area of the cycloid equal three times the area of its generating circle.

QUADRATURE *of the Logiftic,* or *Logarithmic Curve.* Let the fubtangent P T (*fig.* 18.) $= a$, P M $= x$, P $p = dx$; then will

$$\frac{y\dot{x}}{\dot{y}} = a$$

$$y\dot{x} = a\dot{y}$$

and fluent of $y\dot{x} = ay$.

Wherefore the indeterminate fpace H P M I, is equal to the rectangle of P M into P T.

Hence, 1. Let Q S $= z$; then will the indeterminate fpace I S Q H $= az$; and, confequently, S M P Q $= ay - az = a(y - z)$; that is, the fpace intercepted between the two logiftic femiordinates is equal to the rectangle of the fubtangent into the difference of the femiordinates.

2. Therefore the fpace B A P M is to the fpace P M S Q as the difference of the femiordinates A B and P M is to the difference of the femiordinates P M and S Q. See LOGARITHMIC *Curve.*

QUADRATURE *of the Logarithmic Spiral.* Let C B A C (*fig.* 19.), be the area propofed: let the right line A T touch the curve at A, upon which, from the centre C, let fall the perpendicular C T: then, fince by the nature of the curve, the angle T A C is every where the fame, the ratio of A T (t) to C T (s) will be conftant: and, therefore, the fluent of $\frac{s}{t} \times \frac{y\dot{y}}{2} = \frac{s}{t} \times \frac{y^2}{4} =$ the required area.

QUADRATURE *of the Spiral of Archimedes.* Let C R R (*fig.* 20.) be the curve, whofe area C R g C is required. Let A C be a tangent at the centre C, about which centre, with any radius A C ($= a$), fuppofe a circle A gg to be defcribed: then the arc or abfcifs A g correfponding to any propofed ordinate C R, being to that ordinate in a conftant ratio (*e. gr.* as m to n) we have x (A g) $= \frac{my}{n}$; therefore $\dot{u} = \frac{y^2\dot{x}}{2a} = \frac{my^2\dot{y}}{2an}$; confequently $u = \frac{my^3}{6an} =$ the area C R R g C. See SPIRAL *of Archimedes.*

QUADRATURE *of Defcartes' Curve,* which is defined by the expreffion, $b^2 : x^2 :: b - x : y$.

$$\text{Since } b^2 y = bx^2 - x^3$$
$$y = (bx^2 - x^3) \div b^2$$
$$y\dot{x} = (bx^2\dot{x} - x^3\dot{x}) \div b^2$$
$$\text{flu. } y\dot{x} = x^3 \div 3b - x^4 \div 4b^2.$$

QUADRATURE *of all Curves comprehended under the general Equation,* $y = \sqrt[m]{(x + a)}$.

$$\text{Since } y = (x + a)^{\frac{1}{m}}$$
$$y\dot{x} = \dot{x}(x + a)^{\frac{1}{m}}$$
$$\text{Make } (x + a)^{\frac{1}{m}} = v$$
$$\text{Then } x + a = v^m, \text{ or } x = v^m - a$$
$$\text{Whence } \dot{x} = mv^{m-1}\dot{v}$$

$y\dot{x} = mv^m\dot{v}$, the fluent of which is $\frac{mv^{m+1}}{m+1} = \frac{m}{m+1}(x + a)(x + a)^{\frac{1}{m}} = \frac{m}{m+1}(x + a)^{\frac{m+1}{m}}$.

Let $x = 0$; the remainder will be $\frac{m}{m+1} a \sqrt[m]{a}$.

Whence,

Whence, the area of the curve $= \frac{m}{m+1}(x+a)\sqrt[m]{(x+a)}$ $- \frac{m\,a}{m+1}\sqrt[m]{a}$.

See on the fubject of this article Maclaurin's Fluxions, and Simpfon's Fluxions, vol. i. fect. 7. p. 121, &c.

QUADRATURE, in *Aftronomy*, that afpect, or fituation of the moon, when fhe is 90 degrees diftant from the fun.

Or, the quadrature is when fhe is in a middle point of her orbit, between the points of conjunction and oppofition; which happens twice in each revolution, *viz.* in the firft and third quarter.

When the moon is in her quadrature, fhe exhibits that phafis which we call the half-moon, *i. e.* fhe fhines with juft half her face; and is faid to be bifected, or dichotomized.

In the moon's progrefs from the fyzygies to her quadrature, her gravity towards the earth is continually increafing by the action of the fun; and her motion is retarded for the fame reafon. Her motion then, in her orbit, is floweft as her gravity to the earth is greateft when in the quadratures.

In her recefs from the quadratures to the fyzygies, the gravity continually decreafes, and the velocity increafes. The ratio is thus: as radius is to the fum, or difference of one and a half the cofine of double the diftance of the moon from the fyzygy, and half the radius; fo is the addition of gravity in the quadratures to the diminution or increafe of it in any other fituation. See SYZYGY.

Hence the moon's orbit is more convex in the quadratures, than in the fyzygies; and hence the circular figure of the moon's orbit is changed into an oval, whofe greater axis goes through the quadratures; and hence, alfo, the moon is lefs diftant from the earth at the fyzygies, and more at the quadratures.

It is no wonder, therefore, that the moon fhould approach nearer the earth when her gravity is diminifhed; that accefs not being the immediate effect of this diminution, but of the inflexion of the orbit towards the quadratures.

In the quadratures, and within thirty-five degrees of them, the apfides of the moon go backwards, or move *in antecedentia*; but they move forwards in the fyzygies. See APSIDES.

The moon's orbit undergoes various alterations in each revolution. Its excentricity is the greateft when the line of the apfides is in the fyzygies; and the leaft, when in the quadratures.

Confidering one entire revolution, the nodes move flower and flower as the moon approaches the quadratures, and they reft when fhe is in them; but confidering feveral revolutions, the nodes go back fafter in the quadratures.

The inclination of the plane of the moon's orbit increafes as the nodes go from the fyzygies, and is greateft when the nodes are in the quadratures. See MOON and NODES.

QUADRATURE *Lines*, or *Lines of Quadrature*, are two lines frequently placed on Gunter's fector.

They are marked with the letter Q, and the figures 5, 6, 7, 8, 9, 10; of which Q fignifies the fide of a fquare, and the other figures the fides of polygons of 5, 6, 7, &c. fides. S there ftands for the femi-diameter of a circle; and 90 for a line equal to ninety degrees in circumference.

QUADRATUS, in *Biography*, an early Chriftian writer, who flourifhed under the reigns of Trajan and Adrian. He is ftyled by Jerome and Eufebius "a difciple of the apoftles," and he was reported to have been endowed with the gift of prophecy. According to Eufebius, Quadratus prefented to the emperor Adrian, in the year 126, an apology for the Chriftian religion, with a view of mitigating the fufferings inflicted upon the profeffors of that period. This is fuppofed to have been the firft written apology prefented on the fame fubject to any of the Roman emperors, and it produced a confiderable effect on the mind of Adrian. Of this work only a fragment remains, which is preferved by Eufebius, and which is extremely valuable on account of the teftimony which it affords to the reality of the miracles of Chrift and his apoftles, by afferting that fome of thofe miracles were wrought on perfons who were living at the time when Quadratus wrote. Nothing is known refpecting the time and manner of his death. Lardner.

QUADRATUS, in *Anatomy*, a name given to feveral mufcles of the body, on account of their form.

QUADRATUS *Femoris*, *le carré*, *ifchio-trochantérien*; is fituated at the upper and back part of the thigh, and extends from the tuberofity of the ifchium to the great trochanter. It is flattened, quadrilateral, and tolerably thick. The pofterior furface is covered by the gluteus maximus, the fciatic nerve, and the femi-membranofus; the anterior furface covers the obturator externus, the extremity of the tendon of the pfoas magnus, and the back of the trochanter minor. The fuperior edge is parallel to the inferior geminus; and the inferior to the upper fibres of the adductor magnus. The inner edge, or origin of the mufcle, is fixed to the outer fide of the tuberofity of the ifchium, in front of the femi-membranofus; the outer is attached to the bony ridge, which runs from the great to the fmall trochanter. It is tendinous at its two attachments, and flefhy in other parts. It will rotate the thigh outwards upon the pelvis; or, if the former be fixed, it will move the pelvis upon the thigh. When the thigh has been carried upwards and outwards, it will reftore the limb to its natural pofition.

QUADRATUS *Genæ*, a mufcle of the lower lip; fee the article DEGLUTITION, where it is defcribed under the name of *depreffor labii inferioris*.

QUADRATUS *Lumborum*. See LUMBORUM.

QUADRATUS *Occipitis*, a name of the pofterior or occipital portion of the *Epicranius*; which fee.

QUADRELLA, in *Geography*, a town of Naples, in Lavora; 20 miles E.N.E. of Naples.

QUADRELS, in *Building*, a kind of artificial ftones, perfectly fquare; whence their name. They are made of a chalky, or whitifh and pliable earth, &c. dried in the fhade for at leaft two years.

They were formerly in great requeft among the Italian architects.

QUADRICEPS, in *Anatomy*, a name under which it has been propofed to defcribe the extenfors of the knee-joint, *viz.* the vaftus internus and externus, the cruræus, and rectus; and the adductors of the thigh, with the pectinalis.

QUADRIGA, formed from *quatuor*, *four*, and *jugum*, *yoke*, in *Antiquity*, a car, or chariot, drawn by four horfes, harneffed abreaft.

Various are the accounts we have of the inventor of the quadriga. Cicero makes it the invention of Minerva. Hyginus attributes it to Erichthonius IV. king of the Athenians; which fentiment Virgil alfo follows in his Georgics, lib. iii. ver. 113. Æfchylus gives Prometheus the honour of it. Tertullian, De Spectac. lib. ix. fays, it was invented among the Argians, by Trochilus, in honour of Juno; and at Rome, by Romulus, in honour of Mars, or Quirinus. Ado of Vienne, Chronic. act iii. will have it to have been invented by one Procidus, about the time of the eftablifhment of the kingdom of Athens. Laziardels, Hift.

Hist. Univerf. Epitom. lib. xxiv. fays the fame of Triptolemus. Laftly, if there be not opinions enough already, Herodotus gives us another; and fays, the Greeks borrowed it from the Libyans. Pliny tells us, that his feal was a quadriga, lib. xvi.

On the reverfes of medals we frequently fee Victory, or the emperor, in a quadriga, holding the reins of the horfes; whence thefe coins are called, among the curious, *nummi quadrigati*, and *victoriati*. See BIGATI.

QUADRIGA, from *quatuor* and *juga*, yokes, in *Surgery*, a bandage for the fternum and ribs, fo called from its refemblance to the trappings of a four-horfe car. It was formerly employed in cafes of fractured ribs; but, as it is not now in ufe, a more particular account of it feems unneceffary.

QUADRIGEMINA CORPORA, in *Anatomy*, a part of the brain, known more commonly by the terms nates and teftes. See BRAIN.

QUADRILATERAL, in *Geometry*, a figure whofe perimeter confifts of four right lines, making four angles; whence it is alfo called a quadrangular figure.

If the feveral angles be right, the figure is a rectangular quadrilateral. If oblique, an oblique-angular quadrilateral.

If the fides of a quadrilateral be equal, and the angles right, the figure is a fquare.

If the fides be equal, but the angles unequal, the figure is a rhombus.

If the angles be equal, and the fides unequal, the figure is a rectangle.

If only the oppofite angles and fides be equal, the quadrilateral is a rhomboides.

If the oppofite angles and fides be unequal, the quadrilateral is a trapezium.

If any fide of a quadrilateral, infcribed in a circle, be produced out of the circle, the external angle will be equal to the oppofite, internal angle.

Hence, the two oppofite angles of any quadrilateral figure infcribed in a circle, always make two right angles: and, therefore, no oblique-angled parallelogram can have a circle defcribed about it, becaufe its oppofite angles being equal, muft together be greater or lefs than two right angles. See CIRCLE.

QUADRILL, QUADRILLA, a little troop or company of cavaliers, pompoufly dreffed and mounted; for the performance of caroufals, jufts, tournaments, runnings at the ring, and other gallant divertifements.

The word is borrowed from the Italian, being a diminutive of *fquadra*, a company of foldiers ranged in a fquare: for *fquadrare* is, properly, to difpofe any thing fquare; whence their *quadriglia*, the French *fquadrille* and *quadrille*, and our *quadrill*. The French formerly wrote *fquadrille*, and *efquadrille*.

A regular caroufal is to have at leaft four, and at moft twelve, quadrills.

Of thefe quadrills, each is to confift of at leaft three cavaliers, and at moft of twelve.

The quadrills are diftinguifhed by the form of their habits, or the diverfity of their colours.

QUADRILLE, a well-known game at cards; and which has been, in feveral cafes, the object of mathematical computations. See M. De Moivre's Doctrine of Chances, 3d edit. p. 97, &c.

QUADRIO, FRANCESCO SAVERIO, in *Biography*, a Jefuit, author of a voluminous hiftory and defcription of every kind of Italian poetry, "Della ftoria e della Ragione d'ogni Poefia," eight vols. 4to. publifhed at Bologna between the years 1739 and 1752.

The author feems a mere compiler, without felection, tafte, or accuracy. It is a heavy work, hardly interefting enough to ftimulate a regular perufal; and from the diforder of arrangement, very difficult to confult. Crefcembeni is as fuperior to Quadrio in every requifite of an hiftorian of literature, as Tirabofchi is to Crefcimbeni.

QUADRIPARTITION, the dividing by four; or a taking of the fourth part of any number, or quantity.

Hence quadripartite, &c. fomething divided into four.

QUADRIREME, QUADRIREMIS, a galley, or veffel, with four oars on a fide; the invention of which was attributed by the ancients to the Carthaginians.

QUADRISETÆ, the four-haired flies, a term ufed by the writers in natural hiftory to exprefs thofe flies of the feticaude or hair-tailed kind, which have four hairs or briftles growing from the tail, as the others have three, two, or one.

QUADRIVIUM, the centre of four ways, where four roads meet and crofs each other. By ftatute, pofts with infcriptions are to be fet up at fuch crofs-ways, as a direction to travellers, &c. 8 & 9 W. III. c. 10.

QUADRIVIUM, befides the centre of four ways, was a fcholaftic divifion, ufed in the middle ages in our univerfities, to exprefs the higheft clafs of philofophical learning and fcience; comprehending arithmetic, geometry, aftronomy, and mufic: as the trivium did grammar, rhetoric, and logic. During this period, mufic, fuch as it was, muft have been highly prized to be ranked with the moft fublime fciences, and thought an effential part of a learned education.

QUADRO, Ital. literally means fquare, and in mufic, at prefent, it implies a natural, ♮, or Gothic B, in oppofition to *tondo*, round, or the round ♭, ufed for a flat. The durum hexachord is fometimes called the quadro hexachord, from the circumftance of B being ♮.

It was the opinion of Padre Martini and the prince abbot of St. Blafius, that accents and points, enlarged, disfigured, and lengthened, became mufical characters for time as well as tune. At firft, when lines and fpaces were ufed, from their being chiefly employed in a fquare form for writing the chants eftablifhed by St. Gregory, they acquired the name of Gregorian notes, quadrata, and in barbarous Latin, quadriquarta. As the church is flow in receiving new doctrines, and generally a century later in admitting thofe improvements or corruptions in mufic (the reader may call them which he pleafes) that are adopted by the laity as the fortunate efforts of cultivated genius, the notation of chants was at firft cenfured and prohibited by feveral councils; and figurative harmony being regarded as a *crying fin* by pope John XXII., was formally excommunicated by a bull from the conclave 1321. See NOTES, and TIME-TABLE.

QUADRUGATA TERRÆ, in *Old Law Records*, denotes a team-land; or fo much as can be tilled by four horfes.

QUADRULA, in *Natural Hiftory*, a word fometimes ufed in the fame fenfe as teffela, and fpoken of the cubic pyrites. Sometimes it is ufed alfo as the name of thofe little fpangles of fhining matter that are mixed among fand. Thefe are generally fragments of talc; and are of various colours, white, yellow, and blackifh.

Solinus has ufed the word quadrula to exprefs the fragments of yellow talc that are found in that fand called *ammochryfos*, or golden fand. He miftakes thefe fhining particles for maffes of real gold, and makes the fand itfelf a kind of precious fubftance ranked among the gems, and brought from Perfia; but in this he does not agree with the reft of the ancients.

QUADRUPED. The effential character of quadrupeds

peds is, that they have a hairy body and four feet, and that the females are viviparous, and give fuck to their young.

Quadrupeds are diftinguifhed, by the number of their feet, from other animals, which have only two feet, as birds; from thofe which have no feet, as fifhes and reptiles; and from thofe which have more than two feet, as infects.

Ariftotle diftributes quadrupeds into three claffes; denominating thofe whofe feet are terminated by a hoof in one piece, *folipedes;* thofe which have a cloven hoof he diftinguifhed by the name of forked or cloven-footed; and thofe whofe feet are digitated he called *fiffipedes.* With this general divifion he contented himfelf, without defcending to a methodical diftribution of each clafs into their feveral orders, genera, &c. Gefner, Aldrovand, Jonfton, and many other naturalifts, have adopted the diftribution of Ariftotle: but we are indebted for the regular fyftematic arrangement of quadrupeds to Mr. Ray, who publifhed his "Synopfis Methodica Animalium Quadrupedum et Serpentini generis," &c. in 1693. According to this writer, quadrupeds are divided into thofe which are hoofed, *ungulata;* and thofe which are clawed, or digitate, *unguiculata.*

Quadrupeds, *Hoofed*, are either,

1. *Whole-hoofed, folipeda,* μωνοχηλα, μωνυχα, *folidungula;* as the horfe and afs, the onager or wild afs, the mule; and the zebra of Africa, or the fine ftriped Indian or African afs, almoft like a mule in form and ftature.

Of the whole-hoofed kind, Ariftotle has obferved, that no one hath two horns (he might have faid any horns); no one hath the talus, or aftragalus; nor have the males any appearance of teats.

2. *Cloven-footed:* and that either, 1. Into two divifions only; as the διχηλα, or bifulcate kind; which are again fubdivided into fuch as are,

Firft, *Ruminant,* μηρυκαζοντα, that is, fuch as chew the cud; and thefe either have hollow and perpetual horns, as the bull, fheep, and goat kind; or deciduous horns, as the hart and deer kind, which ufually fhed their horns annually.

Of the *bull* kind are reckoned thefe; the common bos or bullock, of which the male is taurus, the female vacca; the German urus, urochs, or aurochs; the bifon; the bonafus; the bubalus, or bufalo; and the bos Africanus of Bellonius, Obf. lib. ii. c. 50. which he takes to be the bubalus of the ancients.

Of the *fheep* kind, befides the common fort, are reckoned the Arabian ovis laticauda, whofe tail is fometimes of thirty pounds weight; the ovis ftrepficeros Cretica Bellonii; the ovis Africana, with fhort hair inftead of wool; and the ovis Guineenfis, or Angolenfis, of Marcgrave, Hift. Brafil. lib. vi. c. 10.

Of the *goat* kind are, befides the common capra domeftica, the ibex, or German fteinbock, found on the tops of the alps; the rupicapra, French chamois, or German gems; the gazella Africana, or antelope; the gazella Indica; the gazella Africana with fhorter, annulated, and bent horns; the capra fylveftris Africana Grimmii; the capra Mambrina, or Syriaca of Gefner; the bucephalus, or mofchelaphus Caii, in Gefner; the tragelaphus Caii, in Gefner; and the tragelaphus of Bellonius.

Of the *hart*, or *deer* kind, are reckoned, the cervus, ελαφος, or red deer; the cervus platyceros, or palmatus, the fallow deer; alce, or the elk; rangifer, the rein deer; the axis Plinii, according to Bellonius; the caprea Plinii, the cuguacu-ete, and cuguacu-apara, of Marcgrave; the caprea Groenlandica.

Secondly, of animals whofe feet are divided into two parts only, and which do not chew the cud, there is only the hog and fwine kind. Under this head, befides the common fwine, are reckoned the wild boar, or fwine; the Guineenfis Marcgravii; the porcus Indicus, or babyrouffa; the tajacu or aper Mexicanus mofchiferus of Dr. Tyfon, called, by Marcgrave, tajacu caaigoara; by others, quauhtla coymatl, and quapizotl; and by Acofta, and fome others, zaino.

2. There are fome quadrupeds, whofe hoof is cloven into four divifions, and thefe feem to be not ruminant; as the rhinoceros, the hippopotamus, the tapijerete of Brafil, the capy-bara of Brafil, and the animal mofchiferum.

Quadrupeds, *Clawed* or *Digitate.* Of this kind, there is, firft, a fort whofe claws are not divided or feparated, but adhere to one another, and are covered with one common fkin, but with obtufe nails, fticking out round the margin of the foot; as the elephant, which is anomalous, and not clearly referrible to this kind, or to that of cloven-footed quadrupeds.

A fecond fpecies of this digitate kind of quadrupeds, which has only two claws, is the camel; and though thefe have no horns, they both ruminate, and have alfo the four ftomachs of horned ruminant animals.

Of the camel there are two forts; one having but one hunch on the back, the other two.

To this kind alfo belong the Peruvian glama, which fome have reckoned among the fheep kind; as alfo the pacos, the ovis Indica, or Peruviana vulgo, which is much lefs than the glama.

A third fpecies of this unguiculate kind includes fuch animals as the Greeks called Πλατυωνυχα, and Ανθρωπομορφα, which have the foot divided into many claws, with broad nails on them; as the ape and monkey kind.

Of thefe, fome have no tails, and are called fimiæ, or apes: others have tails, and are called monkies, cercopitheci; and fuch as have either long or fhort tails, if they are of a larger fize, are called papiones, or baboons. There are great numbers and varieties of this fpecies of quadrupeds; of which naturalifts have defcribed thefe, *viz.* the orang-outang, or homo fylveftris of Dr. Tyfon, defcribed by him in a particular difcourfe; the guariba of Brafil, Marcgravii; the cagui of Brafil, greater and leffer; the cay of the fame region, defcribed by Lerius; the caitaia of the fame country; the cercopithecus barbatus Guineenfis, two or three forts of it; the cercopithecus Angolenfis major; the cercopithecus non barbatus Clufii; the cercopithecus Cluf. called fagouin. Laftly, if apes and monkies have their fnouts very prominent, like dogs, they are called cynocephali.

A fourth fpecies of this unguiculate kind is, when, though the claws are many, yet they are not covered at the end with broad flat nails, like monkies or apes; but are rather like the talons of hawks, &c. crooked and fharp-pointed.

Thefe, in refpect of their teeth, may be divided into fuch as have many dentes primores, or incifores (that is, cutting teeth) in each jaw, of which there are two forts; a greater, which either have a fhort, round head, as the cat kind; or a leffer fort, having a long flender body, with very fhort legs, as the weafel or vermin kind. There are alfo fome of this fpecies of quadrupeds which have only two large remarkable teeth in each jaw: thefe are the hare kind; and thefe live only upon herbs, grafs, &c.

Of the *cat* kind of quadrupeds are reckoned to be the lion; the tyger; the pardalis, whofe male is pardus, and female panthera; the leopard; the lupus cervarius, or lynx; the catus pardus, or cat-a-mountain; the common cat; and the bear.

Of the *dog* kind are reckoned the wolf; the lupus aureus, or jackall; befides the common dog, of which kind they

they enumerate the maſtive, or maſtiff; the canis venaticus Graius, Græcus, or Scoticus, the greyhound; Graius Hibernicus, or the Iriſh greyhound; the canis venaticus ſagax, indagator, ſectator ferarum, &c. the hound; canis venaticus Hiſpanicus, or aviarius, the ſpaniel for land or water; vertagus, or tumbler; canis Οικεῖος, or domeſticus, the houſe-dog; canis melitæus, or the lap-dog; canis Getulus, or Iſlandicus, the ſhock: and of all theſe ſorts there are many varieties of mongrels, and hybridous breeds.

Other ſpecies of the dog kind are, the fox; the animal zibethicum, or civet-cat, as it is corruptly called, but by its teeth and ſnout is plainly of the dog tribe; the American coati, or rackoon, or rattoon; the yzquiepatl; the carigueya, maritucaca, carigoy, ropoza, or opoſſum; the taiubi; the taxus, or meles, the badger, grey, or pate; the lutra, or otter. To theſe ſome add the phoca, ſea-calf or ſeal; the equus marinus, morſe, or ſea-horſe, miſtaken by ſome for the hippopotamus; the Dutch call him walrus, the Danes and Icelanders roſmarus; laſtly, the manati, or vacca marina, the ſea-cow.

Of the *vermin*, or *weaſel* kind of quadrupeds, is, firſt, the muſtela vulgaris, the common weaſel, in Yorkſhire called foumart, or fitchet, γαλεη: the viverra Indica, called quil and quirpele; another ſort called mungo, and mungathia, of a reddiſh-grey; the muſtela, ermine, or ſtoat, and muſtela ſylveſtris, the ferret; putorius, the pole-cat; martes, or foyna, the martin, or martlet; muſtella zibellina, the ſable: laſtly, the genetta; and the ichneumon Bellonii.

Of the *hare* kind of quadrupeds are, firſt, lepus, or the common hare; cuniculus, the rabbet, or coney; tapeti, or Braſil coney, and the aperea of Braſil; the hyſtrix, or porcupine, and the hyſtrix Americanus, or cuanda of Braſil; caſtor, fiber, or the beaver; ſciurus vulg. or ſquirrel; the Virginian, Zeylandic, Barbary, and American flying ſquirrel; mus domeſticus, major and minor, the common rat and mouſe: to theſe alſo may be referred mus major aquaticus, the water-rat; the muſk-rat, mus avellanarum, major and minor; the dormouſe or ſleeper, mus Noricus, Cricetus, Alpinus, ſeu marmotta; the cavia cobaya, or cuniculus Americanus, the Guinea-pig; the aguti, and paca of Braſil; the mus Norwegicus, or leming; the glis Geſneri, or the rell; the mus Indicus, &c.

Quadrupeds, *Anomalous*. To theſe ſeveral kinds, the following anomalous ones muſt alſo be added:

1. Such four-footed viviparous animals as have a longiſh ſnout, with their feet divided into many claws, and toes, and having teeth; as the echinus terreſtris, or common urchin, or hedge-hog; erinaceus Indicus albus; tatu or ármadillo prima of Marcgrave; tatuete of Braſil, or the ſecond ſpecies of the armadillo, according to Marcgrave; tatu apara, his third ſpecies of armadillo; tatu muſtelinus, Soc. Reg. Muſ. the weaſel-headed armadillo; talpa, the molewarp, or moldwarp; and the mus araneus, ſhrew, hardy ſhrew, ſhrewmouſe.

2. Quadrupedous and viviparous animals with a longiſh ſnout, having their feet divided into many claws or toes, but without teeth; as the tamandua guacu of Braſil, Marcgravii, urſus formicarius Cardani, the great antbear; the tamandua of Braſil, or Marcgrave, the leſſer ant-bear.

3. Anomalous flying quadrupeds, with a ſhorter ſnout, and their feet divided as above; being of the bat kind, or flitter-mice, of which there are ſeveral ſizes, and of different forms.

4. There is one very anomalous animal, which has but three claws on each foot; and that is the ai or ignavus of Marcgrave, the ſloth or ſluggard.

5. Viviparous and ſanguineous quadrupeds, breathing with lungs, but having only one ventricle in the heart; as the rana aquatica, the frog, or froſh; rana arborea, ſeu ranunculus viridis, the ſmall tree or green frog; bufo, ſive rubeta, the toad; teſtudo, the tortoiſe, in Greek χελωνη; of theſe there are land and water ones, and many different ſpecies in foreign parts.

6. Oviparous quadrupeds, with a long tail ſtretched out horizontally. Such are the lizard kind; as lacertus omnium maximus, the crocodile; cordylus, ſive caudiverbera, uromaſtrix Græcis, larger than the green lizard; tapayaxin Novæ Hiſpaniæ, or lacertus orbicularis of Hernandez; lacertus vulgaris, the common eft, ſwift, or newt; lacertus viridis, the green lizard; lacertus fucetanus Aldrovandi, at Rome and Naples called the tarantula; lacertus Indicus, called ſenembi and iguana; lacertus Braſilienſis, called tejuguacu, and temapara by Marcgrave; the taraguira ameiva, taraguico Arcuraba, Americima, Curapopeba, Teiunhana, &c. of Marcgrave; the lacertus Indicus; the ſcincus, or crocodilus terreſtris; the ſeps, or lacerta chalcidica, a kind of footed ſerpent; ſtellio, the ſwift, or ſpotted lizard; ſalamandra, called the ſalamandra aquatica, the water-eft, lacerta volans Indica; and the chamæleo, or cameleon.

This ſyſtem of Mr. Ray obtained very generally among naturaliſts, till, in the year 1735, Linnæus firſt publiſhed his ſyſtem. This was followed by ſeveral others, varying in the arrangement of the animal kingdom, even to the laſt edition of 1767. Under the claſs, which he denominates *Mammalia*, (which ſee,) he comprehends not only all the animals which we call quadrupeds (the lizard genus, or rather the reptiles pedati excepted), but alſo the cetaceous order, or whales, cachalots, and porpeſſes: juſtifying this arrangement of whales with quadrupeds, from the agreement of theſe animals in the ſtructure of the heart, in the reſpiration by means of lungs, in their having moveable eye-lids and ears, in being viviparous, furniſhed with teeth, and other particulars, by which they differ ſo materially from fiſhes, as more than to counterbalance their living with them in the ſame element. The mammalia are divided into ſeven orders, the diſtinctions of which are principally eſtabliſhed on the difference in the numbers, ſituation, and form of the three kinds of teeth, *viz.* the primores or inciſores, called fore-teeth, or cutting-teeth; the laniarii or canini, called dog-teeth, canine or lacerating teeth; and the molares, double teeth or grinders. But Linnæus does not entirely neglect the feet. See the characters of the ſeveral orders under Primates, Brutæ, Feræ, Glis, Pecora, Bellua, and *Cete* or Whale. This part of the Linnæan ſyſtem, including a few ſpecies deſcribed in the Appendix of the third tome, and in the Mantiſſa of 1771, contains about two hundred and thirty ſpecies.

Mr. Pennant, in his "Synopſis of Quadrupeds," and profeſſor Martin, in his "Elements of Natural Hiſtory," by including ſome animals that were unknown to Linnæus, and giving the rank of ſpecies to ſeveral that were conſidered by him as varieties, have extended the number of mammalia to two hundred and eighty-nine ſpecies. Mr. Klein, in 1751, publiſhed a new ſyſtem of quadrupeds, intitled "Quadrup. Diſpoſitio breviſque Hiſt. Natur." in which he diſtributes them into two orders, the firſt comprehending thoſe whoſe feet are terminated by one or more hoofs, and the ſecond thoſe which are digitated; and each of theſe orders is ſubdivided into five families or claſſes. In his firſt order he follows the general arrangement of Mr. Ray, which he has conſiderably improved: but in the ſecond, by a ſervile regard to a method founded on the number of toes, he has combined very oppoſite animals; the camel and the ſloth, the mole and the bat,

bat, the glutton and apes. Mr. Briffon, in 1756, publifhed another fyftem, in which he has arranged animals by the number or defect of their teeth; beginning with thofe that are toothlefs, fuch as the ant-eater, and ending with thofe that have the greateft number, fuch as the opoffum. By this arrangement, fome quadrupeds, very diftant from each other in their manners, are too nearly connected. We fhall fay nothing of Mr. Buffon's "Hiftory of Quadrupeds," though it contains much valuable information, becaufe he feems to have difregarded fyftematic arrangement. Mr. Pennant has introduced fome ufeful alterations in his "Hiftory of Quadrupeds;" this ingenious naturalift has followed Mr. Ray in his greater divifion of animals into *hoofed* and *digitated*; but, after the manner of Mr. Klein, he has formed feparate genera of the rhinoceros, hippopotamus, tapiir, and mufk. The apes are continued in the rank in which Mr. Ray placed them, and are followed by the maucaucos. The carnivorous animals are arranged according to the fyftem of Linnæus, omitting the feal, mole, fhrew, and hedge-hog. The herbivorous or frugivorous quadrupeds occupy the clafs affigned to them by Mr. Ray, to which he has allotted likewife the fhrew, the mole, and the hedge-hog. The fourth fection of digitated quadrupeds confifts of thofe which are abfolutely deftitute of cutting teeth, fuch as the floth and armadillo. The fifth fection is formed of thofe which are deftitute of teeth of every kind, fuch as the manis and ant-eater. The third and fourth orders or divifions which Mr. Pennant has added, are the *pinnated* and the *winged* quadrupeds: the firft comprehends the walrus, the feals, and (in conformity to preceding writers) the manati. But thefe, he obferves, feem as the links between the quadrupeds and the cetaceous animals. The bats are winged quadrupeds, and form the next gradation from this to the clafs of birds. See Pennant's Hift. of Quadrupeds, ed. 8vo. 1781. Preface. See Classification.

Quadrupeds, *Alated.* Among the many fabulous things with which natural hiftory has been loaded, ftories of flying quadrupeds feem to claim a very high rank; the gryphon, the quadruped dragon, and a great many other imaginary animals, having been introduced fo ferioufly among the defcriptions of real animals, that too many have been taught to believe them. Scheuchzer, in his "Phyfica Sacra Jobi," has done much toward difcountenancing fuch relations; and Hyacinthus Gemma, who has written exprefsly "De Fabulofis Animalibus," has added much on the fame occafion; yet all is not done. The world have late hiftories of lemmas and bafilifks, which never exifted but in the imagination of the relator, or in the fubtle contrivance of the fabricator; as is evidently the cafe in the bafilifks which we find in the mufeums of the curious, and which are all made out of the ray-fifh. And the generality of readers are fo fond of any thing that is marvellous, that thefe things are fure to be remembered, while perhaps all the truths in the book are forgotten.

Upon the whole, the ftandard of the flying or alated quadrupeds feems to be properly enough reducible to this: that the words flying and alated are not fynonimous terms, and that there are three kinds of flying among the quadruped clafs. The firft abfolute and fwift, flying as perfect as in birds: this peculiarly belongs to the bat; which is the only alated or winged quadruped, properly fpeaking. 2. An imperfect flying by means of certain membranes ferving as wings, but imperfectly, and not turning quick, or enduring long flights: fuch is the flying of the lizard, which is not properly an alated animal. And laftly, the imperfect flying of the fquirrel kind, which even in that fpecies called, by way of eminence, the flying fquirrel, is not properly flying, but only long leaping; the creature being able to turn but very little out of a right line, and only to fufpend itfelf during a fhort time in a leap from a high place to a lower. Phil. Tranf. N° 247. p. 34.

Quadrupeds, in *Agriculture*, all fuch animals as walk on four legs, and are of the domeftic kind, as horfes, neat cattle, fheep, fwine, and many other forts, which are beneficial either for the purpofes of working, fattening, or in any other way. Some animals of this nature are difpofed for one of thefe purpofes in preference to others; while others are capable of being made to ferve more than one of them. Thus, horfes of the lighter and more active kind are adapted to the faddle, and fome forts of road work, and thofe of the more heavy fort to all defcriptions of team work in the field or other places. And neat cattle of the ox kind, in the lefs heavy breeds, as the Devonfhire, Herefordfhire, and fome others, are well fuited to team labour as well as fattening; while thofe of the more heavy forts, as the Lancafhire breed, or long horfes, &c. are better calculated for feeding only. Among fheep, fome breeds are valuable for their mutton as well as their wool; fome for the former, or latter, of thefe articles only; and others again for their ready difpofition in taking on flefh. In fwine, fome breeds are much better formed than others; require much lefs food, in proportion to their fizes, in keeping and fattening, and are more difpofed to feed, &c.

The fame is likewife the cafe with fome other animals of this defcription, which fhould conftantly be taken into the account in felecting and choofing them for the ufe of the farmer.

Quadrupeds of all forts, fhould alfo, in all cafes, be well adapted in their numbers, natures, and kinds, to the qualities of the lands as farms, their extents, and the quantities of labour to be performed upon them, as much in the fuccefs of farming depends on this being properly done. They fhould likewife be conftantly well kept and in proper condition, according to the different intentions for which they are defigned, as badly fed or half-ftarved animals never anfwer any good purpofe for the farmer, they always requiring a much larger proportion of food for reftoring or bringing them again into proper order and for fattening them, than would otherwife have been neceffary; and they never ultimately turn out fo well, or produce fo much advantage, as might have been the cafe under other circumftances. And, in labouring animals, where this is the cafe, they are never capable of performing nearly fo much work, in confequence of which a vaft continual lofs is fuftained, though fcarcely perceived. See Live-*Stock*, and Team.

QUADRUPLATORES, among the Romans, were informers, who had the fourth part of the confifcated goods for their pains.

QUADRUPLE, a fum or number multiplied by four, or taken four times.

Quadruple is particularly ufed for a gold coin, worth four times as much as that of which it is the quadruple.

The quadruple of the Spanifh piftole is a piece of four piftoles, called alfo the *double doubloon.*

The quadruple of the louis d'or is a piece of gold coined in the reign of Louis XIII. in 1641. The legend on one fide is CHRISTUS VINCIT, REGNAT, IMPERAT: and on the middle of this fide it has a crofs with four crowns, and cantoned in four fleurs-de-lis: on the other fide it has the legend, LUDOVICUS DECIMUS TERTIUS DEI GRATIA FRANCORUM REX, with the head of Louis XIII. Its value under this king was twenty livres.

Quadruple *Croche*, in *French Mufic*, is a note with four hooks or four ties, one degree quicker than our demifemiquaver,

femiquaver, and for which we have no name. The term *croche*, in French a quaver, is not derived from *crotchet*, but from the tail being *crooked*. And why our crotchet, with a *ftraight tail*, has its name, is a whimfical abfurdity, for which we are unable to account.

QUÆ *eft eadem*, in *Pleading*, is ufed to fupply the want of a traverfe. (2 Lill. Abr. 405.) In a *claufum fregit* fuch a day, the defendant pleads the plaintiff's licence to him to enter on the fame day, and that *virtute inde* he entered; he need not fay, *quæ eft eadem tranfgreffio*.

QUÆ *Plura*, a writ that anciently lay where inquifition had been made by an efcheator, of fuch lands or tenements as any man died feifed of, and all was fuppofed not to be found by the office or inquifition.

This writ was to inquire what more lands or tenements the parties died feifed of. But it is now made ufelefs, by taking away the courts of wards and offices poft mortem.

QUÆ *Servitia*. See PER *quæ fervitia*.

QUÆRENS *non invenit plegium*, a return made by the fheriff upon a writ directed to him with this claufe, *viz. Si A. fecerit B. fecurum de clamore fuo profequendo, &c.* F. N. B. 38.

QUAERNES, in *Geography*, a town of Norway; 55 miles N. of Romfdal.

QUÆSTA, in our *Ancient Writers*, denotes an indulgence, or remiffion of penance, expofed to fale by the popes.

QUÆSTIONARII, in our *Ancient Law Books*, were people who went about with indulgences from door to door, defiring charity either for themfelves or others.

Matt. Weft obferves, 1240, that the king, "Terram fuam per papale queftionarios, depauperari, &c. permifit."

QUÆSTOR. See QUESTOR.

QUÆSTUS, in *Law*, is that eftate, or thofe effects, which a man hath by acquifition or purchafe; in contradiftinction to *hæreditas*, which is what he hath by defcent. See ACQUEST, and GOODS.

Glanv. lib. vii. "aut habet hæreditatem tantum, vel quæftum tantum, aut hereditatem & quæftum."

QUAG, in *Agriculture*, a name given to any fort of wet, fwampy, moraffy, or boggy fituation in land, which has a tremulous or fhaking feel under the foot, and which produces nothing but a coarfe graffy herbage that is unfit for the food of animals. Low as well as high grounds are fubject to fpots of this kind wherever water is confined and retained near the furface. They are to be removed by proper means of draining, and the application of folid earthy matters of different kinds upon the furfaces of them, with the ufe of rollers in order to confolidate the whole. See BOG and SWAMP.

QUAGGA, in *Zoology*. See EQUUS.

QUAGLIATI, PAOLO, in *Biography*, the mufic-mafter of the celebrated traveller, Pietro della Valle, at Rome, in the beginning of the 17th century. His difciple, della Valle, fays, "that he was an excellent maeftro di cappella, who introduced a new fpecies of mufic into the Roman churches, not only in compofitions for a fingle voice (*monodie*), but for two, three, or four, and very often more voices, in chorus, ending with a numerous crowd of many choirs or choruffes, finging together; fpecimens of which may be feen in many of his motets that have been fince printed. And the mufic of my *cart*, or moveable-ftage, compofed by the fame Quagliati, in my own room, chiefly in the manner he found moft agreeable to me, and performed in mafks through the ftreets of Rome during the carnival of 1606, was the firft attempt at an opera, or fecular drama in mufic, which had been heard in that city." See OPERA, RECITATIVE, and PIETRO DELLA VALLE.

QUAGMIRE, in *Agriculture*, the name of a fort of foft miry fhaking or quaking bog, fwamp, or morafs, which is frequently and commonly met with in low hollow fituations, where there is none, or very little defcent, for the difcharge of the ftagnant water or wetnefs. They are formed in many different ways according to the nature of the circumftances which firft gave rife to them, and that of the places in which they are found. The author of the "Treatife on Landed Property" has remarked, that befides the common moory quagmires or bogs, there is a fpecies which is conftantly charged with moifture, yet does not accumulate a thick covering of moory earth, owing probably, it is fuppofed, to the want of fertility in the water by which it fed. Thefe forts of quagmires are, in his opinion, for the moft part, found in mountainous and hilly fituations. Other kinds are occafionally feen on large peat moffes, and hollow meadows, in fpots where the water is confined and kept up nearly to their upper parts, and where there is much decay of vegetable productions on their furfaces, and the reception of earthy materials from other places. Thefe quagmires occupy large fpots of ground in many different fituations, and are, of courfe, a great lofs to individuals and the public, as little or nothing of any ufe is ever produced by them. (See MORASS.) They are, for the moft part, capable of being readily drained by proper means, a fort of improvement which ought never to be neglected where it can be performed with any chance of fuccefs.

QUAHU, in *Geography*, a diftrict of Africa, on the Gold Coaft, in the kingdom of Acambou, or Aquamboe; which fee.

QUAHVITLA, in *Botany*, a name ufed by fome authors for the tree from which the refin commonly called gum copal is procured.

QUAICHA, in *Geography*, a town of Africa, in Sennaar; 38 miles E.S.E. of Gieffim.

QUAIL, COTURNIX, or Tetrao coturnix of Linnæus, in *Ornithology*, the leaft of all the birds of the gallinaceous kind. They have, however, the genius of the cock kind, and may be bred to fight like our game cocks.

This was an old cuftom among the Athenians, and is ftill kept up in fome parts of Italy, and in Afia.

Quails are birds of paffage, fome entirely quitting our ifland, others fhifting their quarters from one county to another, and fheltering themfelves among the weeds near the fea-fide; with us they frequent the corn-fields, and fometimes the meadows. They begin to fing in April, and make their nefts in the month of May, building on the ground, and feldom lay more than than fix or feven whitifh eggs, marked with ragged ruft-coloured fpots.

Quails are to be taken by means of the call during their whole wooing time, which lafts from April to Auguft. The proper times for ufing the call are at fun-rifing, at nine o'clock in the morning, at three in the afternoon, and at fun-fet; for thefe are the natural times of the quail's calling. The notes of the cock and hen-quail are very different, and the fportfman who expects to fucceed in the taking of them, muft be expert in both; for when the cock calls, the anfwer is to be made in the hen's note; and when the hen calls, the anfwer is to be made in the cock's. By this means they will come up to the perfon, fo that he may, with great eafe, throw the net over them, and take them. If a cock-quail be fingle, on hearing the hen's note he will immediately come; but if he have a hen already with him, he will not forfake her. Sometimes, though only one quail anfwers to the call, there will three or four come up;

and

and then it is beſt to have patience, and not run to take up the firſt, but ſtay till they are all entangled, as they will ſoon be.

The quail is a neat cleanly bird, and will not run much into dirty or wet places: in dewy mornings they will often fly inſtead of running to the call; and in this caſe, it is beſt to let them go over the net, if it ſo happens that they fly higher than its top, and the ſportſman then changing ſides, and calling again, the bird will come back, and then will probably be taken in the net.

The calls are to be made of a ſmall leather purſe, about two fingers wide, and four fingers long, and made in the ſhape of a pear; this is to be ſtuffed half full of horſe-hair, and at the end of it is to be placed a ſmall whiſtle, made of the bone of a rabbet's leg, or ſome other ſuch bone; this is to be about two inches long, and the end formed like a flageolet, with a little ſoft wax. This is to be the end faſtened into the purſe; the other is to be cloſed up with the ſame wax, only that a hole is to be opened with a pin, to make it give a diſtinct and clear ſound. To make this ſound, it is to be held full in the palm of the hand, with one of the fingers placed over the top of the wax: then the purſe is to be preſſed, and the finger is to ſhake over the middle of it, to modulate the ſound it gives into a ſort of ſhake. This is the moſt uſeful call; for it imitates the note of the hen-quail, and ſeldom fails to bring a cock to the net, if there be one near the place.

The call that imitates the note of the cock, and is uſed to bring the hen to him, is to be about four inches long, and above an inch thick; it is to be made of a piece of wire, turned round and curled, and covered with leather; and one end of it muſt be cloſed up with a piece of flat wood, about the middle of which there muſt be a ſmall thread or ſtrap of leather, and at the other end is to be placed the ſame ſort of pipe, made of bone, as is uſed in the other call. The noiſe is made by opening and cloſing the ſpiral, and gives the ſame ſound that the cock does when he gives the hen a ſignal that he is near her.

QUAKERS, in *Eccleſiaſtical Hiſtory*, the common denomination of a ſociety of Chriſtians, who appeared firſt in England about the middle of the ſeventeenth century, and who continue to be diſtinguiſhed from others by peculiar tenets and practices. They call themſelves *Friends*. They are remarkable for aſſerting the continuance, to the preſent time, of immediate revelation, or the communication of divine inſtruction to the mind, by the teſtimony of the ſpirit of God. This revelation they affirm to be neceſſary for the production of true faith, and that it neither does nor can contradict the outward teſtimony of the ſcriptures, or right and ſound reaſon. Their doctrine on this ſubject has been often miſunderſtood, even by theological writers; and they have in conſequence been ſubjected to much obloquy. It is, however, the principal feature in that peculiar view of Chriſtianity, which has occaſioned their ſeparation from other churches.

Origin and Hiſtory.—Before the period above mentioned, many ſerious perſons, ſatisfied with none of the modes of religion which the reformation brought forth, had withdrawn from the communion of every viſible church, to cultivate in retirement, impreſſions which they attributed to the operation of the ſpirit of Chriſt on their own minds: it is chiefly from ſuch, when brought to recognize each other by the miniſtry of an individual, that the Quakers conſider their ſociety to have been originally gathered. George Fox, the individual in queſtion, was born in 1624. He has left a journal of his own life, written with a ſimplicity of ſtyle, which proves that he has fairly laid open his own character. In this work, the peculiar principles of Quakeriſm may be ſatisfactorily explored in their early beginnings, which it may be worth while briefly to review. Fox's parents, who were pious members of the church of England, had intended him for the prieſthood, his character affording very early promiſe of fitneſs for religious ſervice; but others perſuading to the contrary, he was put under a maſter to a country buſineſs. Being engaged herein at a fair, when about the age of nineteen, a couſin of his, with another profeſſor of religion, attempted to engage him in drinking to intoxication. "The Lord had ſhewn me," ſays George, "that I might not eat or drink to make myſelf wanton, but for health, uſing the creatures in their ſervice, as ſervants in their places, to the glory of Him who created them."

Accordingly, on perceiving the deſign of his companions, he roſe up, paid for the refreſhment they had had, and departed, with emotions of virtuous indignation. Returning home, he paſſed a ſleepleſs night, walking up and down, and crying to the Lord; who, he affirms, ſaid unto him, "Thou ſeeſt how young people go together into vanity, and old people into the earth; thou muſt forſake all, young and old, keep out of all, and be as a ſtranger unto all." The reader will underſtand this, and generally all revelations profeſſed to have been received by Quakers, as conſiſting not in an outward voice, but in an internal communication to the mind. Taking the command literally, he detached himſelf from his connexions; and having ſome property of his own whereon to ſubſiſt, removed from place to place, obſerving the religion and profeſſors of the age, without engaging in cloſe fellowſhip with any. He devoted much of his time to faſting, ſolitary prayer, and reading the bible.

He became at length quite detached in his affections from the world, diſtreſſed at the ſpiritual condition of his fellow men, and in much anxiety, bordering on deſpair, about his own; yet was not without intervals of heavenly joy and comfort. Such a ſtate of mind naturally led him to ſeek for ſpiritual counſel from others, and he had conferences with many of the clergy, beginning with his own pariſh prieſt. In anſwer to a queſtion from the latter, we find him profeſſing faith in Chriſt, who, by his death as man, (for he died not as he was God,) became an offering for the ſins of the whole world. The general reſult of theſe conferences was, however, unſatisfactory to him; "for," he obſerves, "they could not reach my condition." Purſuing, therefore, his meditations on the ſubject as before, he came to be ſatisfied reſpecting ſeveral propoſitions which it involved, ſuch as the following:—that although it was ſaid that all Chriſtians are believers, both Proteſtants and Papiſts, yet that none were truly ſuch, but thoſe who were born of God, and who had paſſed from death unto life. Again, that to be bred at Oxford or Cambridge, was not enough to fit and qualify men to be miniſters of Chriſt. At this he wondered, becauſe it was the common belief that ſuch qualification was ſufficient. "At another time," he ſays, "it was opened in me, that God, who made the world, did not dwell in temples made with hands. This at firſt ſeemed ſtrange, becauſe both prieſts and people uſed to call their temples or churches dreadful places, holy ground, and the temples of God; but the Lord ſhewed me clearly that he did not dwell in thoſe temples, which men had commanded and ſet up, but in people's hearts." George Fox now ceaſed to attend the eſtabliſhed preachers; at which his relations being offended, he ſhewed them from the ſcriptures, "that there was an anointing within man to teach him, and that the Lord would teach his people himſelf."

Obſerving,

Obferving, as he thought, more of the fruits of this internal teaching among the "diffenting people," he went for a while among them; but, he continues, "as I had forfaken the priefts, fo I left the feparate preachers alfo, and thofe called the moft experienced people; for I faw there was none among them all that could fpeak to my condition. And when all my hopes in them, and in all men, were gone, fo that I had nothing outwardly to help me, nor could tell what to do, then, O then, I heard a voice, which faid, 'There is One, even Chrift Jefus, that can fpeak to thy condition.' When I heard it my heart did leap for joy. Then the Lord let me fee why there was none that could fpeak to my condition, namely, that I might give him all the glory. For all (he continues, alluding to Rom. xi. 32.) are concluded under fin, and fhut up in unbelief, as I had been, that Jefus Chrift might have the pre-eminence, who enlightens and gives grace, faith, and power."

The preceding is a fpecimen of Fox's own account of the manner in which the doctrine he afterwards preached arofe in his mind. The reader will perceive that he refers all his real edification to the means which have been already indicated, immediate revelation. He fays, "though I read the fcriptures, that fpoke of Chrift, and of God, yet I knew *Him* not but by revelation, as he who hath the key did open, and as the Father of life drew me to his Son by his Spirit." Yet that he was fenfible of the importance of the holy fcriptures, as the fource from whence, under this influence, Chriftian inftruction muft be drawn, is evident, both from his declaring that they were very precious to him, and from his having inceffantly ufed, and conftantly appealed to them, both before and after beginning to promulgate his fyftem.

Having at length attained to a view of Chriftianity in which he found peace of mind, he believed himfelf required and divinely commiffioned to become a teacher of it to others: and from the year 1647, the reader may conceive him always engaged in this office. He travelled as before, preaching firft to fmall companies of enquiring perfons, then to public congregations, fuch as upon his appearance among them were willing to hear him, and at length to large affemblies of people, convened on purpofe. This he did with the courage and perfeverance of a reformer; in the face of oppofition from the national and ftipendiary preachers, of frequent perfonal abufe from their hearers, and occafional fevere treatment by the magiftrates. In moft places where he came, he met with perfons who received his doctrines, a proportion of whom, after affociating with him for a time, became impreffed with the like apprehenfions of duty to propagate their principles; which they attempted by fimilar methods. Thus, although interrupted at different periods by imprifonment, he found himfelf, before many years had elapfed, in connection with a numerous band of fellow-labourers, and a widely diffufed and refpectable fociety of religious friends. No inconfiderable number of thefe quitted, for the fake of their principles, livings in the church, commiffions in the army, or feats as magiftrates.

When we confider that this happened in an age equally remarkable for religious zeal and political turbulence, it will appear that fome deviations from Chriftian propriety, fome fruits of the mixture of imagination with good intentions, could fcarcely fail to be exhibited among them. If the new fociety, from a regard to its principle of internal impulfes to particular duties, was flow to condemn thefe, it was careful, on the other hand, not to engraft them, by imitation on its practice. Individuals, therefore, were alone refponfible for fuch acts, and the general conduct of the members, from the period of their firft affociating together, was found in no mean degree conformable to the morality of the gofpel.

The moft ferious inftance of mifconduct occurred in the cafe of James Nayler and his followers. This fell out in 1656, and was magnified beyond its real importance by being fuffered to occupy for ten days the attention of parliament. Nayler had been an Independent, and a quarter-mafter of horfe under major-general Lambert. He was one of George Fox's earlieft converts, and for fome years an able preacher and difputant in the fame caufe. Coming to London, he found a fet of people who extolled him in his office above meafure. His friends, and George Fox among the reft, feeing his danger, gave him fuitable cautions; but flighting thefe, he became expofed to the flatteries of a train of followers, chiefly women, whom he fuffered, at length, from a delufive notion of its being done to *Chrift in him*, to addrefs him with the name and titles of the Saviour, and with acts amounting to worfhip. In particular, his entrance into Briftol was conducted, by thefe infatuated people, in imitation of the proceffion of Chrift into Jerufalem. The parties implicated in this tranfaction were committed to prifon; but Nayler alone was felected by parliament, after examination and long debates on his cafe, for punifhment as a blafphemer. Cromwell kept aloof from the proceedings, which, by their exceffive feverity, moved great commiferation in the public. The culprit was twice fcourged through the ftreets, twice pilloried, branded in the forehead, and bored through the tongue with a hot iron: all which he endured with furprifing patience and fortitude. His punifhment ended with two years' clofe imprifonment in Bridewell, during which he attained to repentance, and a founder mind. Having given proof of this by feveral public confeffions, the Quakers, who had difowned both him and his followers, received him back into their communion, in which he lived circumfpectly the fhort remainder of his life.

Quakerifm prevailed at firft chiefly in the northern counties; but many preachers having rifen up here, who travelled in different directions, it was not long in fpreading to the metropolis, and the remoter fouthern and weftern parts. Wherever its profeffors appeared, the ordeal of fuffering awaited them; for which their negative tenets commonly furnifhed the occafion. They refufed to the priefts every kind of payment, to the government military fervice, to the magiftrate oaths, and to all perfons the cuftomary, and at that time much looked for *worfhip*, of kneeling or bowing with the head uncovered. They adhered too, in every inftance, to their northern Englifh of *thou* and *thee*, judging the plural mode of addreffing one perfon to have originated, together with all empty titles, in a fpirit of flattery unbecoming Chriftians. Thefe peculiarities were a check to fuperficial converfions; fince an upright conformity to the profeffion was in moft cafes purchafed by the lofs of friends, contempt, and hardfhips. Even the privilege of meeting to worfhip, apart from the national congregations, was acquired only by perfevering in the practice, through almoft every kind and degree of coercive obftruction, down to the period of complete toleration, the revolution of 1688. Hence their hiftory confifts in great part of a detail of buffetings, imprifonments, and fpoiling of goods. So early as 1659 they ftated to parliament, that in the preceding fix years about two thoufand individuals had fuffered in perfon and eftate, for being Quakers: and this reprefentation was accompanied by one of the moft extraordinary public acts on record. One hundred and fixty-four Friends offered themfelves by name to the houfe, to be imprifoned in the places of an equal number, who from ficknefs or the hardſhips of their confinement, were conceived to be in danger of periſhing. The houſe, however, rejected this propoſal, and expreſſed ſome diſpleaſure at "the reflections on magiſtracy and miniſtry," ſaid to be contained in the memorial. It will be proper to give ſome particular inſtances of their ſufferings.

James Parnel, a youth of good parts and education, going to ſee George Fox in a dungeon at Carliſle, became a convert to his principles: and, preaching in Eſſex, was the means of raiſing many congregations of Quakers in that county. He was impriſoned in Colcheſter caſtle, and at the age of nineteen ſunk under the cruel treatment there inflicted on him. In 1656, two Quaker women arrived at Boſton, New England. They were apprehended 'ere they could land, committed to cloſe priſon, and ſearched in a brutal manner, by ſtripping them naked, leſt they might alſo be *witches;* an object to the coloniſts of equal and equally rational dread. Theſe two, with eight others who arrived afterwards, were forcibly ſent away: but the precaution was in vain, their principles entered the colony. An aged citizen, and church member of Boſton, was firſt found favourably inclined to them; he was fined, impriſoned, and baniſhed in the depth of winter. In Rhode iſland he was hoſpitably received by an Indian chief, who offered, if he would live with him, "to make him a warm houſe;" obſerving, "What a God have the Engliſh who deal ſo with one another about their God!" So far is intolerance from recommending the religion of thoſe who practiſe it. Penal laws againſt Quakeriſm ſoon followed the appearance of this people in New England. The ſcourge was firſt applied, without regard to age or ſex: mutilation, by cutting off the ears, followed: but theſe being found inſufficient, cruelty proceeded through another intermediate ſtep, baniſhment on pain of death, to its dreadful extreme; and four Quakers were hanged at Boſton. Their names were William Robinſon, Marmaduke Stevenſon, William Leddra, and Mary Dyar. Their caſes, as related by Sewel, in his "Hiſtory of the Quakers," form an intereſting piece of martyrology.

Charles II., on notice of theſe proceedings, granted a mandamus, which prevented further executions in the colonies; but he was not equally ready to reſtrain perſecution at home. The Quakers had ſeveral meeting houſes in London. When aſſembled at theſe, they were often diſperſed by ſoldiers, under the direction of the magiſtrates; theſe effected the purpoſe by ſevere beatings with their arms. One John Trowel being evidently mortally wounded in this way, a coroner's inqueſt was held, but the verdict of the jury was ſuppreſſed: and the king, on being informed of the facts, evaded interference, telling the complainants to proſecute the law againſt the ſoldiers! Similar proceedings took place at Colcheſter; where the congregation, being kept out of their houſe, met for many weeks in winter ſtanding in the ſtreet. Here they were aſſailed by ſoldiers on horſeback, who wounded many of them, and a man of ſeventy loſt his life in conſequence. On one of theſe occaſions a trooper's ſword, by violent uſing, came out of the hilt. The man he had been beating handed it up to him with theſe words, "I deſire the Lord may not lay this day's work to thy charge." In this inſtance, as in others, the patience of the ſufferers at length triumphed, and they were quietly allowed their right of meeting.

In 1665 a hundred and twenty Quakers were in Newgate, ſentenced to tranſportation, under an act recently made "to prevent and ſuppreſs ſeditious conventicles." The maſters of ſhips generally refuſing to carry them, an embargo was laid, and it was made a condition of ſailing to the Weſt Indies, that ſome Quakers ſhould be taken thither by every veſſel. A *mercenary wretch* being at length found for the ſervice, the Quakers, unwilling to be active in their own baniſhment, refuſed to walk on board, as did alſo the ſeamen to hoiſt them in. By the help of ſoldiers from the Tower, fifty-five of them were at length ſhipped. But the maſter was now in priſon for debt; and the ſhip, after ſeven months' detention, quitting the coaſt, was immediately taken by a Dutchman, and twenty-eight of the priſoners (the remainder having died of the plague) were liberated in Holland and ſent home. Other parties of Quakers were ſet on ſhore again from different veſſels, ſo that the number actually ſent to the Weſt Indies was ſmall.

The preceding inſtances may ſerve to ſhew the kind of perſecution which this ſociety endured for many years; it may be obſerved in concluſion, that the court (or rather the clergy) of Charles, in their eagerneſs to ſuppreſs the growing ſociety, actually deſcended to the meaſure of iſſuing a formal order of council for demoliſhing their meeting-houſe in Southwark, which was addreſſed to no leſs a perſon than Chriſtopher Wren, eſq. ſurveyor-general of his majeſty's works; but it was executed by the military, by whom the congregation, who had the courage to meet on the ruins, were dragooned as often as they aſſembled, for nearly three months together, without however overcoming their firmneſs.

Though the Quakers never ſent out miſſionaries, in the manner of ſome other ſocieties, we have ſeen that individuals went, under apprehenſions of religious duty, to diſtant parts. Several of theſe viſited Italy, where they did not conceal their diſlike of ſuperſtition; and one John Love, being detained at Rome on this account, died (as it ſeems a violent death) in the priſon of the inquiſition. Catharine Evans, and Sarah Cheevers, after three years' confinement, and many ſufferings in the inquiſition at Malta, were releaſed and returned to England. But the moſt extraordinary enterprize, in this way, was performed by Mary Fiſher, a maiden, and one of the two who had been ſo ill treated at Boſton. She, apprehending ſhe had a meſſage from God to ſultan Mahomet IV. actually made her way from England to his camp before Adrianople, where ſhe delivered, through his interpreters, what was on her mind, was treated with reſpect, and offered an eſcort to Conſtantinople, which ſhe declined, and returned, as ſhe had gone, alone and in perfect ſafety. A young man, named George Robinſon, went, through ſtill greater difficulties, to Jeruſalem, where, ſpeaking againſt the ſuperſtition of the pilgrimages, the friars procured him to be forced into a moſque, whence the Turks, on his refuſing to turn Mahometan, led him out to be put to death, as for wilfully violating the place: but a ſudden change taking place in their ſentiments concerning him, he alſo was permitted to return.

In 1660 the Quakers held their firſt general meeting, for the care of their poor and other concerns of the ſociety, at Skipton in Yorkſhire; within a few years after which, meetings for diſcipline were eſtabliſhed throughout England and Ireland, chiefly by the inceſſant perſonal labours and epiſtolary recommendations of George Fox. At this period the ſociety received a conſiderable acceſſion of reſpectability by the converſion of William Penn and Robert Barclay. The celebrated Apology of the latter gave the world an opportunity of fairly appreciating doctrines till then but partially known, and on this account the more decried: and the ſettlement of the Jerſeys, and ſubſequently, of Pennſylvania, under the auſpices of Penn, opened to the Quakers a new and promiſing field of increaſe, which they did not fail ſpeedily to occupy. Another perſon of confiderable learning, George Keith, after affociating with them for near thirty years, became the author of a fchifm, the circumftances of which it will be proper to notice. Keith was a native of Scotland, and educated at Aberdeen; he was imprifoned, as a Quaker, in 1664, and in 1675 affifted Barclay in a public difputation againft the ftudents at Aberdeen: he wrote much in defence of the principles of the Quakers, which he thoroughly underftood, and was employed in the education of their youth; but is thought by them to have indulged too much in curious and ufelefs fpeculations, which his brethren did not encourage. Being again repeatedly imprifoned, about 1684 he removed to America in difguft. Here, after fome previous general cenfure of his friends, he accufed feveral, in particular, of grofs error in doctrine; the pretext for which was, their holding (as he himfelf had done) that the knowledge and belief of the hiftory of Chrift is not neceffary for the falvation of thofe who have no poffible means of acquiring it. His complaints againft individuals leading to more general contention, the Friends in England interfered, and the parties were heard before the yearly meeting in London, which decided the caufe againft Keith, and he remained under the "difownment" pronounced againft him in America. He now fet up a feparate Quakers' meeting in London, attacked the principles he had formerly defended, (on which occafions the Quakers replied by quotations from his own works,) and finally entered into the church of England. He was foon after ordained prieft, and made a miffionary to America, to bring over his former brethren. But his efforts, though for a while troublefome to the Quakers, were attended with very little fuccefs: he returned to England, funk into obfcurity on a fmall living in Suffex, and his party gradually difappeared.

The jeopardy in which the Quakers almoft conftantly ftood on account of their principles, very early introduced them to an immediate intercourfe with the throne; and they thus acquired the privilege, which they ftill exercife, of prefenting public addreffes to the king, by a deputation from their body, in a manner which does not violate their confcientious fcruples. The acceffion of a new fovereign, the conclufion of a peace, or an impending war, have commonly drawn from them addreffes, in which fentiments not unworthy of their Chriftian profeffion, are conveyed in fimple but refpectful language. And very recently (1814), they availed themfelves of the prefence in this country of the emperor of Ruffia, and the king of Pruffia, to addrefs each of thefe monarchs in favour of a perfect toleration in their refpective dominions: in which they met with a favourable reception. Another great and interefting object, the abolition of the flave trade, has frequently brought them forward to government in this way. In the caufe of humanity, as it regards the oppreffed Africans, they have proved themfelves ftrenuous and indefatigable: the reproach, even of holding a fellow man in flavery, was wiped away from the members of this fociety many years before the abolition of the trade was decreed, either in England or America. This was effected by their difcipline; and it was made a part of this, in confequence of that view of Chriftianity, which regards every individual of the human race as a fit object of its benefits, and as entitled to the charitable regard which it inculcates. Much was done on the Negroes' behalf, in America, by Anthony Benezet, whofe character is well known to the world; and by John Woolman, a minifter of the fociety, whofe writings difcover a mind of uncommon purity, fimplicity, and tendernefs.

The Quakers as a body have been long relieved from actual perfecution: yet they are ftill involved by their principles in occafional trouble as individuals. The refufal to bear arms, or to pay military fines, fubjects them to legal diftraint on their goods, and if none of thefe be found, to imprifonment. Tithes and other ecclefiaftical claims, enforced upon them, likewife render diftraint a very common, and fometimes an oppreffive occurrence: and if the profecutor be more rigorous, they may be imprifoned for an indefinite time. In America they are exempt from ecclefiaftical but not from military feizures; by which, during the war for independence, many of them were impoverifhed. It is obvious that, refufing to fwear, they cannot fill any office of profit or truft under government. Except for thefe purpofes however, for ferving on juries, and in cafes of criminal profecution, their folemn affirmation before the magiftrate has the legal force of an oath.

The Quakers are difperfed over the united kingdom, and moft of the ftates of North America; from the fouthern ftates of the latter they have moftly emigrated of late to the Ohio. In America they are chiefly engaged in agriculture; and for a feries of years have been making judicious and fuccefsful efforts to introduce this, with the other arts, and the manners of civilized life, among the Indian natives. There are a few Quakers in Germany, and their principles are entertained by fome perfons in France.

In this country they are found chiefly in the middle clafs of citizens, and in trade or manufacture. Their general dereliction of agriculture feems to have refulted from the impediments offered by the tithing fyftem: a yoke which, under their fcruple, becomes doubly heavy on the farmer. There is a greater approach to equality in the civil condition of the Quakers, than obtains in almoft any other body: the children of fuch as become very rich are apt to quit the fociety, either by marrying perfons not in its communion, or for the fake of liberties which it prohibits: and the children of the poor commonly get a plain but folid education, fuperior to their condition, by means of which they rife in civil fociety to a higher level. They have feveral excellent eftablifhments for this purpofe: the principal of which, fituated at Ackworth in Yorkfhire, contains, of both fexes, three hundred children, and was founded in 1778, at the inftance of Dr. Fothergill. With provifion for mathematical and claffical learning, the Quakers, though they have fome good private fchools, are but flenderly furnifhed; and they have in confequence few accomplifhed men in thefe branches. They are by no means deficient in general information, and of late years many of them have cultivated natural philofophy with fuccefs. The fociety in its earlier ftage, including many men of regular fcholaftic education, who had joined it on principle, had of courfe the advantage, in point of theological knowledge, over the modern Friends, who chiefly inherit their profeffion, and whofe education has but of late begun to include fyftematic inftruction in the doctrines of Chriftianity at large.

In morals they are allowed to excel: their youth is watched over in this refpect with more than ordinary care; and when grown up, their difcipline prohibits, to all conditions, thofe amufements which offer to the mind the ready means of diffipating ferious impreffions. Habitual offenders againft their peculiar regulations forfeit their memberfhip, as well as thofe who violate the more obvious rules of juftice and morality: their moral character, and confiftency as a body, are thus kept up. But it is alleged, that they are not equally well guarded againft a money-getting fpirit; which is apt to grow upon thofe who intently profecute trade and commerce to the exclufion of all other purfuits. From the occafional tenor of the fociety's advices to its members, it fhould feem that this is in a certain degree true; and that it

behoves

behoves them to feek for an adequate remedy. They are not, however, chargeable with the love of money for its own fake; no clafs of men being more beneficent, or more prompt to contribute their time and fubftance to various public inftitutions, which the fpirit of the Chriftian religion has at length raifed up, for relieving the diftreffes, promoting the comforts, and improving the moral and religious condition of mankind.

As to the minuter features of their character, the Quakers are prudent and methodical in their bufinefs; generally good economifts of time and money. Their converfation has many peculiarities; fome of which flow from their principles, others merely from their affociating chiefly among themfelves. They were early thought to be habitually crafty ("the Quaker fly," fays Pope); but there feems no other ground for this, than the extreme caution with which they incur engagements, or make profeffions and promifes. Viewed at a diftance, they appear cold, formal, and referved in their manners; and have hence been unjuftly concluded void of domeftic cheerfulnefs, and incapable of the enjoyments arifing from focial converfe, and the intercourfe of cultivated minds. They are plain in their drefs; the peculiarities obfervable in which refult, not from any regulations on the fubject, but from an indifpofition to vary with the fafhion; they have, however, flowly followed changes which have proved general and permanent, and thus become lefs confpicuoufly fingular. Mourning habits they reject on principle: and with a people whofe ordinary drefs is fo grave, the moral reafon for them feems not to exift. They are averfe to fplendour in furniture and equipage: though the rich among them, in thefe articles, and moft of their females in drefs, have contrived, without ceafing to be known as Quakers, to refine confiderably upon abfolute fimplicity.

Doctrine.—A recent publication on behalf of the fociety, entitled, "A Summary of the Hiftory, Doctrine, and Difcipline of Friends," afcribed to one of the fociety, held in high eftimation, *viz.* Mr. J. G. Bevan, who died whilft this article was in the prefs, ftates their doctrine as follows:

"We agree with other profeffors of the Chriftian name, in the belief of one eternal God, the creator and preferver of the univerfe; and in Jefus Chrift his Son, the Meffiah, and mediator of the new covenant.

"When we fpeak of the gracious difplay of the love of God to mankind, in the miraculous conception, birth, life, miracles, death, refurrection, and afcenfion of our Saviour, we prefer the ufe of fuch terms as we find in fcripture; and contented with that knowledge, which divine wifdom hath feen meet to reveal, we attempt not to explain thofe myfteries which remain under the veil; neverthelefs we acknowledge and affert the divinity of Chrift, who is the wifdom and power of God unto falvation.

"To Chrift alone we give the title of the Word of God, and not to the fcriptures; although we highly efteem thefe facred writings, in fubordination to the Spirit from which they were given forth; and we hold with the apoftle Paul, that they are able to make wife unto falvation, through faith which is in Chrift Jefus.

"We revere thofe moft excellent precepts, which are recorded in fcripture to have been delivered by our great Lord, and we firmly believe that they are practicable and binding on every Chriftian; and that in the life to come every man will be rewarded according to his works. And further it is our belief, that, in order to enable mankind to put in practice thefe facred precepts, many of which are contradictory to the unregenerate will of man, every man coming into the world, is endued with a meafure of the light, grace, or good Spirit of Chrift; by which, as it is attended to, he is enabled to diftinguifh good from evil, and to correct the diforderly paffions and corrupt propenfities of his fallen nature, which mere reafon is altogether infufficient to overcome. For all that belongs to man is fallible, and within the reach of temptation; but this divine grace, which comes by Him, who hath overcome the world, is, to thofe who humbly and fincerely feek it, an all-fufficient and prefent help in time of need. By this, the fnares of the enemy are detected, his allurements avoided, and deliverance is experienced through faith in its effectual operation: whereby the foul is tranflated out of the kingdom of darknefs, and from under the power of Satan, into the marvellous light and kingdom of the Son of God.

"Being thus perfuaded that man, without the fpirit of Chrift inwardly revealed, can do nothing to the glory of God, or to effect his own falvation; we think this influence efpecially neceffary to the performance of the higheft act of which the human mind is capable; even the worfhip of the Father of lights and of fpirits, in fpirit and in truth: therefore we confider as obftructions to pure worfhip, all forms which divert the attention of the mind from the fecret influence of this unction from the Holy One. Yet, although true worfhip is not confined to time and place, we think it incumbent on Chriftians to meet often together, in teftimony of their dependence on the heavenly Father, and for a renewal of their fpiritual ftrength: thus, 'Each not only partakes of the particular refrefhment and ftrength which comes from the good in himfelf, but is a fharer of the whole body, as being a living member of the body, having a joint fellowfhip and communion with all.' Barclay.

"Neverthelefs, in the performance of worfhip, we dare not depend, for our acceptance, on a formal repetition of the words and experiences of others; but we believe it to be our duty to lay afide the activity of the imagination, and to wait in filence to have a true fight of our condition beftowed upon us; believing even a fingle figh, arifing from fuch a fenfe of our infirmities, and of the need we have of divine help, to be more acceptable to God, than any performances, however fpecious, which originate in the will of man. If any fhould object the difficulty of laying afide the activity of the imagination, let fuch confider the following ftatement—That it is our duty to maintain a watch over our thoughts, by endeavouring to preferve our attention from being carried away by fuch as manifeftly originate in our own natural will or habits, and to wait patiently for the arifing of the life of Chrift; which by bringing every thought into fubjection, produces a true inward filence, and therein affords a true fenfe of our condition.

"From what has been faid refpecting worfhip, it follows that the miniftry we approve muft have its origin from the fame fource; for that which is needful for a man's own direction, and for his acceptance with God, muft be eminently fo to enable him to be helpful to others. Accordingly we believe, that the renewed affiftance of the light and power of Chrift is indifpenfably neceffary for all true miniftry; and that this holy influence is not at our command, or to be procured by ftudy, but is the free gift of God to chofen and devoted fervants.—Hence arifes our teftimony againft preaching for hire, in contradiction to Chrift's pofitive command, 'Freely ye have received, freely give;' and hence our confcientious refufal to fupport fuch miniftry, by tithes or other means.

"As we dare not encourage any miniftry, but that which we believe to fpring from the influence of the Holy Spirit, fo neither dare we attempt to reftrain this miniftry to perfons of any condition in life, or to the male fex alone; but,

as

as male and female are one in Chrift, we hold it proper that fuch of the female fex as we believe to be endued with a right qualification for the miniftry, fhould exercife their gifts for the general edification of the church ; and this liberty we efteem a peculiar mark of the gofpel difpenfation, as foretold by the prophet Joel, and noticed by the apoftle Peter.

"Three are two ceremonies in ufe among moft profeffors of the Chriftian name, water-baptifm, and what is termed the Lord's fupper. The firft of thefe is generally efteemed the effential means of initiation into the church of Chrift ; and the latter, of maintaining communion with him. But as we have been convinced that nothing fhort of his redeeming power, inwardly revealed, can fet the foul free from the thraldom of fin ; by this power alone we believe falvation to be effected. We hold that as there is one Lord and one faith, fo his baptifm is one, in nature and operation ; that nothing fhort of it can make us living members of his myftical body ; and that the baptifm with water, adminiftered by his fore-runner John, belonged, as the latter confeffed, to an inferior and decreafing difpenfation.

"With refpect to the other rite, we believe that communion between Chrift and his church is not maintained by that, or by any other external performance, but only by a real participation of his divine nature through faith ; that this is the fupper alluded to in the Revelation, 'Behold I ftand at the door and knock : if any man hear my voice, and open the door, I will come in to him, and will fup with him, and he with me,' and that where the fubftance is attained, it is unneceffary to attend to the fhadow : which doth not confer grace, and concerning which, opinions fo different, and animofities fo violent, have arifen.

"Now, as we thus believe that the grace of God, which comes by Jefus Chrift, is alone fufficient for falvation, we can neither admit that it is conferred on a few only, whilft others are left without it ; nor, thus afferting its univerfality, can we limit its operation to a partial cleanfing of the foul from fin, even in this life. We entertain worthier notions both of the power and goodnefs of our heavenly Father, and believe that he doth vouchfafe to affift the obedient to experience a total furrender of the natural will, to the guidance of his pure unerring Spirit ; through whofe renewed affiftance they are enabled to bring forth fruits unto holinefs, and to ftand perfect in their prefent rank.

"There are not many of our tenets more generally known than our teftimony againft oaths, and againft war. With refpect to the former of thefe, we abide literally by Chrift's pofitive injunction, delivered in his fermon on the mount, 'Swear not at all.' From the fame facred collection of the moft excellent precepts of moral and religious duty, from the example of our Lord himfelf, and from the correfpondent convictions of his Spirit in our hearts, we are confirmed in the belief that wars and fightings are, in their origin and effects, utterly repugnant to the gofpel ; which ftill breathes peace and good-will to men. We alfo are clearly of the judgment, that if the benevolence of the gofpel were generally prevalent in the minds of men, it would effectually prevent them from oppreffing, much more from enflaving, their brethren (of whatever colour or complexion), for whom, as for themfelves, Chrift died ; and would even influence their conduct in their treatment of the brute creation, which would no longer groan, the victims of their avarice, or of their falfe ideas of pleafure.

"Some of our tenets have in former times, as hath been fhewn, fubjected our Friends to much fuffering from government, though to the falutary purpofes of government, our principles are a fecurity. They inculcate fubmiffion to the laws, in all cafes wherein confcience is not violated. But we hold, that as Chrift's kingdom is not of this world, it is not the bufinefs of the civil magiftrate to interfere in matters of religion, but to maintain the external peace and good order of the community. We therefore think perfecution, even in the fmalleft degree, unwarrantable. We are careful in requiring our members not to be concerned in illicit trade, nor in any manner to defraud the revenue.

"It is well known that the fociety, from its firft appearance, has difufed thofe names of the months and days, which having been given in honour of the heroes or falfe gods of the heathen, originated in their flattery or fuperftition ; and alfo the cuftom of fpeaking to a fingle perfon in the plural number, as having likewife arifen from motives of adulation. Compliments, fuperfluity of apparel, of furniture, and of provifion for the table, outward fhows of rejoicing and mourning, and the obfervation of days and times, we efteem to be incompatible with the fimplicity of a Chriftian life ; and public diverfions, gaming, and other vain amufements of the world, we cannot but condemn. They are a wafte of that time which is given us for nobler purpofes ; and divert the attention of the mind from the fober duties of life, and from the reproofs of inftruction, by which we are guided to an everlafting inheritance.

"To conclude, although we have exhibited the feveral tenets which diftinguifh our religious fociety, as objects of our belief ; yet we are fenfible that a true and living faith is not produced in the mind of man by his own effort ; but is the free gift of God in Chrift Jefus, nourifhed and increafed by the progreffive operation of his Spirit in our hearts, and our proportionate obedience. Therefore, although for the prefervation of the teftimonies given us to bear, and for the peace and good order of the fociety, we deem it neceffary that thofe who are admitted into memberfhip with us, fhould be previoufly convinced of thofe doctrines which we efteem effential ; yet we require no formal fubfcription to any articles, either as a condition of memberfhip, or a qualification for the fervice of the church. We prefer judging of men by their fruits, and depending on the aid of Him, who, by his prophet, hath promifed to be 'for a fpirit of judgment to him that fitteth in judgment.' Without this, there is a danger of receiving numbers into outward communion, without any addition to that fpiritual fheep-fold, whereof our bleffed Lord declared himfelf to be both the door and the fhepherd ; that is, fuch as know his voice, and follow him in the paths of obedience."

To this ftatement may be added the following extracts, the firft of which is from a declaration iffued on behalf of the fociety in 1693.

"We fincerely profefs faith in God by his only-begotten Son Jefus Chrift, as being our light and life, our only way to the Father, and alfo our only Mediator and Advocate with the Father ;—that God created all things, he made the worlds, by his Son Jefus Chrift, he being that powerful and living Word of God by whom all things were made ; and that the Father, the Word, and the Holy Spirit, are One, in divine Being infeparable ; One true, living, and eternal God bleffed for ever ;—yet that this Word or Son of God, in the fulnefs of time, took flefh, became perfect Man, according to the flefh defcended and came of the feed of Abraham and David, but was miraculoufly conceived by the Holy Ghoft, and born of the Virgin Mary, and alfo, farther, declared powerfully to be the Son of God, according to the Spirit of fanctification, by the refurrection from the dead ;—that, as Man, Chrift died for our fins, rofe again, and was received up into glory in the heavens ; he having, in his dying for all, been that one, great, univerfal offering and facrifice for peace, atonement, and reconciliation between God and man ; and he is the propitiation

tion not for our fins only, but for the fins of the whole world; we were reconciled by his death, but faved by his life;—that divine honour and worfhip is due to the Son of God; and that he is in true faith to be prayed unto, and the name of the Lord Jefus Chrift called upon, (as the primitive Chriftians did,) becaufe of the glorious union or onenefs of the Father and the Son." Sewel's Hiftory, p. 643.

"The doctrine of the refurrection of the dead is fo connected with the Chriftian religion, that it will be alfo proper to fay fomething on this fubject. In explaining our belief of this doctrine, we refer to the 15th chapter of the 1ft Epiftle to the Corinthians. In this chapter (verfes 40. 42. 44. 50.) is clearly laid down the refurrection of a body, though not of the fame body that dies. Here we reft our belief in this 'myftery,' without defiring to pry into it beyond what is revealed to us; remembering that 'fecret things belong unto the Lord our God, but thofe things which are revealed belong unto us and to our children.' Principles of Religion, as profeffed by the Quakers, by Henry Tuke.

Difcipline: from the "Summary," with fome abridgment.—"The purpofes which our difcipline hath chiefly in view, are, the relief of the poor, the maintenance of good order, the fupport of the teftimonies which we believe it is our duty to bear to the world, and the help and recovery of fuch as are overtaken in faults: in a few words, the promotion of piety and charity.

"In the practice of difcipline, we think it indifpenfable that the order recommended by Chrift himfelf be invariably obferved. 'If thy brother fhall trefpafs againft thee, go and tell him his fault between thee and him alone: if he fhall hear thee, thou haft gained thy brother; but if he will not hear thee, then take with thee one or two more, that in the mouth of two or three witneffes, every word may be eftablifhed; and if he fhall neglect to hear them, tell it unto the church.'

"To effect the falutary purpofes of difcipline, meetings were appointed, at an early period of the fociety, which, from the times of their being held, were called quarterly meetings. It was afterwards found expedient to divide the diftricts of thofe meetings, and to meet more frequently: from whence arofe monthly meetings, fubordinate to thofe held quarterly. At length, in 1669, a Yearly Meeting was eftablifhed, to fuperintend, affift, and provide rules for, the whole: previoufly to which, general meetings had been occafionally held.

"A monthly meeting is ufually compofed of feveral particular congregations, fituated within a convenient diftance from each other. Its bufinefs is to provide for the fubfiftence of the poor, and for the education of their offspring; to judge of the fincerity and fitnefs of perfons appearing to be convinced of the religious principles of the fociety, and defiring to be admitted into memberfhip; to excite due attention to the difcharge of religious and moral duty; and to deal with diforderly members. Monthly meetings alfo grant to fuch of their members as remove into other monthly meetings, certificates of their memberfhip and conduct; without which they cannot gain memberfhip in fuch meetings. Each monthly meeting is required to appoint certain perfons, under the name of overfeers, who are to take care that the rules of our difcipline be put in practice; and when any cafe of complaint, or diforderly conduct, comes to their knowledge, to fee that private admonition, agreeably to the gofpel rule before mentioned, be given, previoufly to its being laid before the monthly meeting.

"When a cafe is introduced, it is ufual for a fmall committee to be appointed, to vifit the offender, to endeavour to convince him of his error, and to induce him to forfake and condemn it. If they fucceed, the perfon is by minute declared to have made fatisfaction for the offence; if not, he is difowned as a member of the fociety.

"In difputes between individuals, it has long been the decided judgment of the fociety, that its members fhould not fue each other at law. It therefore enjoins all to end their differences by fpeedy and impartial arbitration, agreeably to rules laid down. If any refufe to adopt this mode, or, having adopted it, to fubmit to the award, it is the direction of the yearly meeting that fuch be difowned.

"To monthly meetings alfo belongs the allowing of marriages; for our fociety hath always fcrupled to acknowledge the exclufive authority of the priefts in the folemnization of marriage. Thofe who intend to marry, appear together, and propofe their intention to the monthly meeting; and if not attended by their parents or guardians, produce a written certificate of their confent, figned in the prefence of witneffes. The meeting then appoints a committee to inquire whether they be clear of other engagements refpecting marriage; and if, at a fubfequent meeting, no objections be reported, they have the meeting's confent to folemnize their intended marriage. This is done in a public meeting for worfhip, towards the clofe whereof the parties ftand up, and folemnly take each other for hufband and wife. A certificate of the proceedings is then publicly read, and figned by the parties, and afterwards by the relations, and others as witneffes. Of fuch marriages the monthly meeting keeps a record: as alfo of the births and burials of its members. A certificate of the date, of the name of the infant, and of its parents, figned by thofe prefent at the birth, is the fubject of one of thefe laft mentioned records; and an order for the interment, counterfigned by the grave-maker, of the other. The naming of children is without ceremony. Burials are alfo conducted in a fimple manner. The body, followed by the relations and friends, is fometimes, previoufly to interment, carried to a meeting; and at the grave a paufe is generally made; on both which occafions it frequently falls out, that one or more friends prefent have fomewhat to exprefs for the edification of thofe who attend; but no religious rite is confidered as an effential part of burial.

"Several monthly meetings compofe a quarterly meeting. At the quarterly meeting are produced written anfwers from the monthly meetings, to certain queries refpecting the conduct of their members, and the meeting's care over them. The accounts thus received, are digefted into one, which is fent, alfo in the form of anfwers to queries, by reprefentatives, to the yearly meeting. Appeals from the judgment of monthly meetings are brought to the quarterly meetings; whofe bufinefs alfo it is to affift in any difficult cafe, or where remiffnefs appears in the care of the monthly meetings over the individuals who compofe them.

"The yearly meeting has the general fuperintendence of the fociety in the country in which it is eftablifhed: and therefore, as the accounts which it receives difcover the ftate of inferior meetings, as particular exigencies require, or as the meeting is impreffed with a fenfe of duty, it gives forth its advice, makes fuch regulations as appear to be requifite, or excites to the obfervance of thofe already made; and fometimes appoints committees to vifit thofe quarterly meetings which appear to be in need of immediate advice. Appeals from the judgment of quarterly meetings are here finally determined, and a brotherly correfpondence, by epiftles, is maintained with other yearly meetings.

"There are eight yearly meetings, *viz.* 1. London, to which come reprefentatives from Ireland; 2. New England; 3. New York; 4. Pennfylvania and New Jerfey; 5. Maryland; 6. Virginia; 7. The Carolinas and Georgia; 8. Ohio.

"In

"In this place it is proper to add, that, as we believe women may be rightly called to the work of the miniſtry, we alſo think that to them belongs a ſhare in the ſupport of our Chriſtian diſcipline; and that ſome parts of it wherein their own ſex is concerned, devolve on them with peculiar propriety. Accordingly they have monthly, quarterly, and yearly meetings of their own ſex, held at the ſame time with thoſe of the men; but ſeparately, and without the power of making rules.

"In order that thoſe who are in the ſituation of miniſters may have the tender ſympathy and counſel of thoſe of either ſex, who, by their experience in the work of religion, are qualified for that ſervice, the monthly meetings are adviſed to ſelect ſuch, under the denomination of elders. Theſe, and miniſters approved by their monthly meetings, have meetings peculiar to themſelves, called meetings of miniſters and elders; in which they have an opportunity of exciting each other to a diſcharge of their ſeveral duties, and of extending advice to thoſe who may appear to be weak, without any needleſs expoſure. Such, it may be here obſerved, as believe themſelves required to ſpeak in meetings for worſhip, are not immediately acknowledged as miniſters by their monthly meetings; but time is taken for judgment, that the meeting may be ſatisfied of their call and qualification. It will alſo ſometimes happen, that ſuch as are not approved will obtrude themſelves as miniſters, to the grief of their brethren; but much forbearance is uſed towards theſe, before the diſapprobation of the meeting is publicly teſtified. Theſe meetings of miniſters and elders are generally held in the compaſs of each monthly, quarterly, and yearly meeting. They are conducted by rules preſcribed by the yearly meeting, and have no authority to make any alteration or addition to them. The members of them unite with their brethren in the meetings for diſcipline, and are equally accountable to the latter for their conduct.

"It is to a meeting of this kind in London, called the ſecond-day's morning meeting, that the reviſal of manuſcripts concerning our principles, previouſly to publication, is intruſted by the yearly meeting held in London: and alſo the granting, in the intervals of the yearly meeting, of certificates of approbation to ſuch miniſters as are concerned to travel in the work of the miniſtry in foreign parts; in addition to thoſe granted by their monthly and quarterly meetings.

"The yearly meeting of London, in the year 1675, appointed a meeting to be held in that city, for the purpoſe of adviſing and aſſiſting in caſes of ſuffering for conſcience-ſake, which hath continued with great uſe to the ſociety to this day. It is compoſed of friends under the name of correſpondents, choſen by the ſeveral quarterly meetings, and who reſide in or near the city. The ſame meetings alſo appoint members of their own in the country as correſpondents, who are to join their brethren in London on emergency. The names of all theſe correſpondents, previouſly to their being recorded, are ſubmitted to the approbation of the yearly meeting. Such men as are approved miniſters are alſo members of this meeting, which is called the Meeting for Sufferings; a name ariſing from its original purpoſe, and which is not yet become entirely obſolete.

"The yearly meeting has intruſted the meeting for ſufferings with the care of printing and diſtributing books, and with the management of its ſtock; and, conſidered as a ſtanding committee of the yearly meeting, it hath a general care of whatever may ariſe, during the intervals of that meeting, affecting the ſociety, and requiring immediate attention: particularly of thoſe circumſtances which may occaſion an application to government. The ſtock of the yearly meeting, juſt mentioned, is an occaſional voluntary contribution, expended in printing books,—ſalary of a clerk for keeping records,—the paſſage of miniſters who viſit their brethren beyond ſea,—and ſome ſmall incidental charges: but not, as has been falſely ſuppoſed, the reimburſement of thoſe who ſuffer diſtraint for tithes and other demands with which they ſcruple to comply." G. Fox's Journal. Sewel's Hiſtory of the Quakers. Gough's Hiſtory of the Quakers. Beſſe's Sufferings of the Quakers. Barclay's Apology. Clarkſon's Portraiture of Quakeriſm.

The editor is indebted for the hiſtorical part of the preceding article to a reſpectable member of the ſociety of Friends. Mr. Clarkſon's work, which was compoſed in conſequence of his intimate perſonal acquaintance with many of its leading members, produced by his labours for the abolition of the ſlave trade, may be conſulted for a more ample account of the manners, practices, and opinions of this ſociety.

QUAKER-TOWN, in *Geography*, a poſt-town of America, in Bucks county, Pennſylvania; 184 miles from Waſhington.

QUAKING-Bog, in *Agriculture*, a name uſually given to a ſort of ſoft pulpy, flexible, earthy depoſitions, which are formed in hollow moiſt ſituations, in conſequence of the ſtagnation of water in them in ſome manner or other. Bogs of this kind differ much in their nature, qualities, and properties, according to the difference of circumſtances and ſituations, but they have all a tremulous motion under the foot, when capable of being trodden upon. See Bog and Quagmire.

Draining is here equally neceſſary, as in all other caſes of a ſimilar kind, and may moſtly be carried into execution without any great difficulty.

Quaking-*Graſs*, in *Botany*, ſo called from the trembling of the little pendulous ſpikelets, occaſioned by their capillary zigzag ſtalks. See Briza.

Quaking-*Graſs*, in *Agriculture*, the common name of a ſort of graſs, which is ſaid to thrive and flouriſh well on moſt kinds of poor cold land, and which cattle eat in a greedy manner; but which is not much adopted for cultivation in graſs grounds, though it makes tolerably good hay. See Briza.

QUAKU, or Quaqua, in *Geography*, a diſtrict of Africa, on the Gold Coaſt.

QUALATCHE, a town of the ſtate of Georgia; 40 miles W.N.W. of Tugeloo.

QUALE Jus, in *Law*, was an ancient writ judicial, which lay where a religious perſon had judgment to recover land; before execution was made of the judgment.

This writ was iſſued forth to the eſcheator between judgment and execution, to enquire whether the religious perſon had right to recover, or whether the judgment were obtained by colluſion between the demandant and tenant; to the intent that the true lord might not be defrauded.

QUALEA, in *Botany*, a Caribbean name, uſed by Aublet, and inadvertently adopted by Schreber; poſſibly becauſe, as it appears, he ſuſpected the genus not to be ſufficiently diſtinct from *Vochy* of the ſame author, his own Cucullaria; ſee that article. Willdenow, however, has followed him; and thus one name more is added to dunghill, which ſome future botanical Hercules muſt ſweep away.—Aubl. Guian. v. 1. 5. Schreb. 7. Willd. Sp. Pl. v. 1. 18. Mart. Mill. Dict. v. 4. Juſſ. 424. Lamarck Illuſtr. t. 4.—Claſs and order, *Monandria Monogynia*. Nat. Ord. perhaps *Guttiferæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in four very deep ovate, coriaceous, concave, unequal ſegments; the two lowermoſt largeſt, ſpreading widely. *Cor.* Petals two, unequal, inſerted into the calyx; the uppermoſt erect, roundiſh, emarginate, terminating at the baſe behind, in a ſhort, obtuſe, horn-like nectary, projecting between the upper ſegments

ments of the calyx; lowermoſt largeſt, ſloping downward. *Stam.* Filament ſolitary, ſhort, aſcending, inſerted betwixt the lower petal and the germen; anther oblong, furrowed, recurved. *Piſt.* Germen ſuperior, globoſe; ſtyle thread-ſhaped, aſcending, the length of the ſtamen; ſtigma obtuſe. *Peric.* Berry? of one cell. *Seeds* numerous, imbedded in pulp.

Obſ. The corolla is, as it were, two-lipped. This genus is akin to *Cucullaria*. *Schreb.*

Eſſ. Ch. Calyx inferior, in four deep unequal ſegments. Petals two, unequal. Berry? with many ſeeds.

1. Q. *roſea*. Aubl. Guian. t. 1. Willd. n. 1.—Lower petal undivided. Leaves elongated at the point.—Native of the woods of Guiana, flowering in September. The inhabitants call this ſpecies *Laba-laba*. A *tree*, whoſe *trunk* is ſixty feet or more in height, terminating in large ſpreading *branches*. *Wood* red, compact. *Leaves* oppoſite, in pairs croſſing each other, on ſhortiſh ſtalks, elliptical, three or four inches long, entire, ſmooth, with an elongated blunt point; their tranſverſe veins very numerous, ſtraight and parallel. *Stipulas* deciduous. *Panicles* terminal. *Flowers* numerous, two inches long, powerfully and agreeably ſcented, white on the outſide, roſe-coloured, and finally yellowiſh, within.

2. Q. *cærulea*. Aubl. Guian. t. 2. Willd. n. 2.—Petals two-lobed. Leaves with a ſhort point.—Native of the Guiana foreſts. This ſpecies flowers in October, and is known by the name of Qualé. It differs from the former in having ſmaller *flowers*, of a grey or blueiſh colour, but fragrant like thoſe of *Q. roſea*. Their *petals* are emarginate, or almoſt obcordate. Points of the *leaves* leſs elongated.

QUALIFICATION for *killing game*, for *jurors*, *juſtices*, *members of parliament*, and *electors of members*. See Game, Jury, Justices, and Parliament.

Qualifications *for a complete muſician*, required by Zarlino. This venerable theoriſt had very exalted ideas of a perfect muſician, and tells us (Inſtit. vol. ii. part iv. p. 342, et ſeq.) that it is neceſſary he ſhould have a knowledge in arithmetic, for the calculation of muſical proportions; of geometry, to meaſure them; of the monochord and harpſichord, to try experiments and effects; that he ſhould be able to tune inſtruments, in order to accuſtom the ear to diſtinguiſh and judge of intervals; that he ſhould ſing with truth and taſte, and perfectly underſtand counterpoint; that he ſhould be a grammarian, in order to write correctly, and ſet words with propriety; that he ſhould read hiſtory, to know the progreſs of his art; be a maſter of logic, to reaſon upon, and inveſtigate the more abſtruſe parts of it; and of rhetoric, to expreſs his thoughts with preciſion; and, further, that he would do well to add to theſe ſciences ſome acquaintance with natural philoſophy, and the philoſophy of ſound; that his ears being perfectly exerciſed and purified, may not be eaſily deceived. And adds, that he who aſpires at the title of perfect muſician, has occaſion for all theſe qualifications, as a deficiency in any one of them will frequently render the reſt uſeleſs. An additional qualification is now become neceſſary to be added to thoſe enumerated by Zarlino, which is a perfect knowledge of the genius and powers of all the inſtruments for which a muſician writes; otherwiſe he will not only embarraſs a performer by uſeleſs and unmeaning difficulties, but loſe opportunities of producing effects by the bow of a violin, the *coup de langue* of flutes, and a ſelection of the pureſt and beſt tones on other wind inſtruments.

Qualifications *of Land-managers*, &c. the requiſite acquirements which are proper and eſſential to them in order to the due and full performance of all the different ſorts of buſineſs in which they may be engaged or employed. In this view, a conſiderable knowledge of the principles and practices of different ſorts of farming and farm-management, ſome acquaintance and experience in ſurveying land, in mechanics, in rural architecture, and in the buſineſs of planting, are indiſpenſibly neceſſary, as well as a notion of the various mineral and other ſubſtances contained in the bowels of the earth, and a ready facility in arranging the management of different ſorts of accounts.

They ſhould at the ſame time poſſeſs mild, conciliatory diſpoſitions, exact upright principles, and ſtrict moral characters. See Land-*Reeve*, Land-*Steward*, and Office *of Eſtate*.

The duties and uſes of theſe ſorts of managers, beſides thoſe of regulating and directing the huſbandry, management, and other matters, are, the preventing all ſorts of encroachments from taking place; the ſeeing that a proper and right method of ſtocking is purſued on the commonable lands; the guarding againſt the turf or ſoil being injured by being broken up or pared off; the looking after the public and private roads, lanes, and driftways, to ſee that the fences on the ſides of them are properly cut and pruned as occaſion may require, the travellable parts of them kept free from obſtructions, and in a ſuitable ſtate of repair, and that the farm-ways are well calculated to the uſes and intentions for which they were deſigned; the duly attending to the open drains, water courſes, and common ſewers, to take care that they are kept clear and free at all times, without doing injury to any one; the conſidering the ſtate of the natural ſtreams and running waters as fit for the purpoſes of watering live-ſtock at home or in other places, thoſe of irrigating land, the turning of mills, &c.; the examining the borders of rivers, brooks, &c. to ſee that they are not carried away, or their courſes altered in any injurious manner: the taking care of plantations, and all ſorts of woodlands, as well as timber-trees and young plants, by ſeeing that they are preſerved in a proper manner, and no damages committed by cutting them down, or in any other ways; the attending to the ſituation of the fences, gateways, &c. to ſee that the live hedges, with their banks, be duly cut, weeded, pruned, and kept up, as well as the gates, ſtiles, pales, and other dead fences properly preſerved and in repair; the keeping the home buildings, farm cottages, and garden grounds, belonging to them, in proper condition, with their tenants in a full ſtate of induſtry; and laſtly, the regulating the order of the different occupiers, by preventing improper meetings of all kinds, the repreſſing of bad houſes, and all ſorts of irregularities that have a tendency to leſſen induſtry and frugality.

Beſides theſe, there are many other duties which properly belong to them, but which need not be mentioned in this place. See Bailiff.

Qualifications *of Tenants*, the neceſſary properties and circumſtances which render them fit for holding lands as farms. The importance of having perſons perfectly qualified as tenants, is very great, in the ſuperintendance and management of all landed property, being, in a great meaſure, the baſis, or principal bearing, on which its uniform and laſting proſperity depends.

The proper qualifications of a good tenant, according to the author of the "Treatiſe on Landed Property," are the having capital, ſkill, induſtry, and character. And he contends, that without a ſufficient capital, the reſt are unavailing; but that, at the ſame time, an induſtrious, frugal, good farmer will ſtrive with difficulties, and get on with leſs money than a man of contrary qualifications. But if he has not ſufficient ſtrength to work his lands, nor a ſufficiency of live-ſtock to raiſe manure, or money wherewith to purchaſe it, he muſt, under ordinary circumſtances, live in a ſtate of poverty and hard labour; and, on the firſt attack of miſfortunes, or the firſt failing ſeaſon of crops, he will probably

ſink

fink under the weight of his accumulated burden, and be ruined.

Further, that in regard to the proper ratio or proportion between the rent and capital, it depends on the exifting ftate and circumftances of the farms, and the ftyle of management in which they are intended to be conducted; as well as on the number and ftrength of the occupiers' families, and their induftry and frugality. However, in order to afford fome general notions on the matter, it may be faid that, for farms of fize, as thofe of from one to five hundred pounds a year, the occupiers fhould have at their commands from five hundred to a thoufand pounds of capital, for every hundred pounds of rent which they may pay. Yet ftill, on the greater number of farms, the firft proportion is too fmall to manage them with full advantage and profit. And, if they be farmed with fpirit, and the higher order of improvements be attempted, particularly the introduction of the beft breeds of live-ftock adopted by modern farmers, the laft will not be found too large for the purpofe.

It may be remarked, that it is conftantly the beft way for tenants to farm fomewhat within their capitals, as a few pounds kept in their pockets enables them to embrace and take the advantage of every favourable opportunity that may offer, and to fell or buy with the greateft benefit. While fuch as are ftraightened for money, are forced to take the chance of markets, and liable to make bargains of a lofing and difadvantageous nature, as well as experience many other inconveniencies of different kinds.

Notwithftanding, where there is a want of fufficient experience and fkill in the art, and different branches of practical hufbandry, tenants cannot farm or manage their lands with the moft profit, either to themfelves, or the proprietors of them. Where, however, their capitals and exertions are great, they may, by obfervation and practice, acquire fkill; and by this means be enabled to perform the bufinefs in a tolerable manner, and in fome meafure do juftice to their farms, whatever they may do for their families in the way of getting money for their benefit. But where, with a want of fkill, fcanty capitals are joined, it is not all the exertion, induftry, and frugality in the power of man, that can fave or preferve the families or the farms from injury and inconvenience.

However, without induftry, capital and fkill may be faid to be thrown away. In the management of rural bufinefs, in which fo much depends on the nature of feafons and weather, idlenefs is a vice of the darkeft caft. Every inftance of negligence is not only injurious in itfelf, but operates as a dangerous and bad example; ferving as an apology or excufe for the half induftrious, with whom every farm or eftate is incumbered in a greater or lefs degree.

In confequence of the intimate connection which neceffarily fubfifts between the proprietors and the occupiers of land, and feeing how advantageous and profitable it is to preferve good order and regularity upon farm lands, as giving thereby full liberty and freedom to the exertions of their tenantry, it becomes a matter of fome importance, in the felection of farm-tenants, to make proper and neceffary inquiries into their characters for morality, and particularly as they relate to habits of fobriety or extravagance, as well as to a peacefulnefs or quarrelfomenefs of difpofition.

And it is farther to be remarked, in refpect to the proper felecting of tenants for farms, that nothing of intereft, or any other confideration whatever, that is not intimately connected with the above qualifications, can properly warrant the choice: unlefs in particular cafes and circumftances, as in providing for the widows and orphans of deceafed tenants, &c. A farm-manager fhould not fuffer himfelf to be influenced by any fort of family connection, favour, fee or reward. Superintendants of this kind, merely as fuch, cannot have any true interefts feparate and diftinct from thofe of the farms or lands they may overlook. It, therefore, becomes a difhoneft act in any agent of this fort, to put an inferior tenant into the poffeffion of a farm, through his own intereft, even at a fair rent for the fame.

Laftly, it may be noticed, that in a diftrict which ftands forward in a prominent manner in the ranks of rural improvements, merit fhould be looked for and encouraged near home. But to advance or bring up a farm or eftate which remains in the rear of modern practices, two or more tenants of the higher claffes fhould be fought for, at a diftance, in fuch diftricts as are of a kindred nature, but in which the more modern and profitable management of farming prevails, in order to lead and direct the native tenantry of the fituation.

Thefe are fome of the principal and leading qualifications which ought in all cafes to direct and regulate the choice of farm-tenants; there are, however, many others which fhould have an influence in certain circumftances, and particular methods of farm-management, otherwife the full interefts and advantages of the proprietors of the lands may be overlooked and neglected.

QUALIFICATOR, in the *Canon Law*, a divine appointed to qualify, or declare the quality of, a propofition brought before an ecclefiaftical tribunal; chiefly before the inquifition.

The qualificators of the office are not judges; they only give their fentiments on the propofitions prefented to them. They are the inquifitors that judge.

QUALITY, Qualitas, that affection of a thing, whence it is denominated fuch; or that which occafions a thing to affect our fenfes in this or that manner, and gives it this or that denomination. Accordingly quality is faid to be an attribute, from which no fubftance is exempt. See Mode.

Thus, that power in fire, whatever it be, by which it excites in us the fenfation of heat, fince it is that whence the fire is denominated hot, is called the quality of fire.

The word quality, *qualitas*, is faid to have been firft introduced into the Latin by Cicero: till his time the Romans ftudioufly avoided ufing a term which denoted an abftract; and in lieu of it only confidered concrete, fignified by *quale*. The like is obferved of the ancient Greeks, who did not ufe ποιοτης, but ποιον.

Quality, it is to be obferved, is an ambiguous term; and has been applied to fome things which ought rather to have been looked upon as ftates of matter, or affemblages of feveral qualities; as life, health, beauty, &c.

There are, alfo, other attributes, as fize, fhape, motion, and reft, ufually reckoned among qualities, which might more conveniently be ranked among the primary modes of the parts of matter; fince, from thefe fimple attributes, all the qualities are derived.

The ancient fchool-philofophers diftinguifh quality in the general, which they call *metaphyfical* and *predicamental* quality, into *effential* and *accidental*. The moderns more ufually divide it into *fpiritual* and *corporeal*.

Qualities, *Spiritual*, or *Qualities of the Soul*, are affections of the mind, confidered as in this or that habitude or difpofition. Of thefe they make two kinds; the one belonging to the underftanding, the other to the will: of the former kind are knowledge, opinion, certainty, doubting, &c. Of the latter are all the moral virtues and vices.

Qualities, *Corporeal* or *Phyſical*, are what we chiefly conſider under this denomination, and to which the definition above laid down is accommodated.

Philoſophers are divided as to the nature of theſe qualities, or what they are in the body. The general language of the Peripatetic ſchool is, that they are things diſtinct from the bodies themſelves; and are ſuperadded to them, or flow from their ſubſtantial forms: on which principle, they hold qualities to be real, and denominate them *accidents;* ſuppoſing them to be inherent in ſubſtances, though not in the relation of parts, but to be ſuſtained by them as in a ſubject, and incapable of ſubſiſting without them. In effect, the Thomiſts define qualities to be accidents following or ariſing from the form; in the ſame manner as quality is an accident following or ariſing from the ſubſtance.

The moderns abſolutely explode the notion of qualities diſtinct from the body; and inſiſt, that the powers by which bodies excite in us the ideas of ſuch qualities, are no other than the mechanical affections of the bodies themſelves, *viz.* the figure, magnitude, motion, &c. of the parts of which they conſiſt.

The principal conſiderations inſiſted on by the retainers to real qualities are, that theſe powers may be actually ſeparated from the ſubſtances they inhere in; as we ſee in light, heat, &c. That from theſe very qualities, conſidered as ſo many determinations, there ariſes a very great diverſity in bodies; and that bodies, according to the diverſity of their qualities, affect our ſenſes very differently.

The adherents to the experimental way, on the contrary, account for all the qualities of bodies from mechanical cauſes. Thus all the phenomena of a clock, the motion of its wheels, its hands, &c. by which it ſtrikes the hour, points the minute; day, moon's age, &c. do all evidently ariſe from the ſingle ſpring; which we never imagine to have any particular powers by which it ſhould be enabled to make ſuch diſcoveries; nor any other principle but that one of elaſticity. Why, then, may we not conceive, as to ſenſible qualities, that though, by virtue of a certain congruity or incongruity in point of figure, texture, or other mechanical properties, the portions of matter they modify are enabled to produce various effects, on account of which the bodies are ſaid to be endowed with qualities; yet theſe are not, in the bodies endowed with them, any real or diſtinct entities, or differing from the matter itſelf of ſuch a determinate bigneſs, ſhape, and other mechanical modifications? Thus, though the modern goldſmiths and refiners reckon it among the moſt diſtinguiſhed qualities of gold that it is diſſoluble in aqua regia, whilſt aqua fortis will not work upon it; yet theſe attributes are not in the gold any thing diſtinct from its peculiar texture; nor is the gold we have now of any other nature than it was in Pliny's time, when aqua fortis and aqua regia were unknown.

We all know that the ſun hath a power to harden clay, ſoften wax, melt butter, thaw ice, turn water into vapour, make air expand itſelf in weather-glaſſes, contribute to blanch linen, render the white ſkin of the face ſwarthy, and mowed graſs yellow, ripen fruit, hatch the eggs of ſilk-worms, caterpillars, &c. and perform many other things, ſome of which ſeem contrary to others; yet theſe are not diſtinct powers, or faculties in the ſun, but only the production of its heat, diverſified by the different textures of the body it chances to work on, and the condition of the other ſubſtances concerned in the operation. And, therefore, whether or not the ſun, in ſome caſes, has any influence at all diſtinct from its light and heat, we ſee that all the phenomena mentioned are producible by the heat of common fire, duly applied and regulated. Some of the ancients, and particularly the Peripatetics, have diſtinguiſhed qualities into *ſenſible* and *occult.*

Qualities, *Senſible,* or *Manifeſt,* are thoſe ariſing from certain modifications of matter, and which become immediately the objects of our ſenſes. Such are all thoſe above-mentioned.

Though, in ſtrictneſs, thoſe only are ſaid to be ſenſible qualities which affect ſome one ſenſe alone; as colour does the eye, ſound the ear, &c.

Theſe are ſometimes, alſo, called *tangible* qualities, becauſe they only produce their effect, *i. e.* excite their idea in us, when contiguous, or in contact with the organ.

Qualities, *Occult,* are certain latent powers ariſing from the ſpecific forms of things, of which no rational ſolution can be given on any principles of phyſics.

Senſible qualities are uſually ſubdivided into *primary* and *ſecondary.* See Ideas.

Qualities, *Primary,* or *General,* are ſuch as are found in all bodies; or which agree to all matter, conſidered as matter, and therefore to the elements themſelves. Such are extenſion, figure, motion, reſt, ſolidity, impenetrability, and number.

Qualities, *Secondary,* or *Particular,* are ſuch as reſult from a compoſition or mixture of elements, and do not agree to body as body, but as a mixt. Such are light, heat, cold, colour, ſound, taſte, ſmell, hardneſs, ſoftneſs, fluidity, firmneſs, roughneſs, ſmoothneſs, opacity, tranſparency, &c.

According to Ariſtotle, and the Peripatetics, the primary, or elementary qualities, are thoſe of the four elements themſelves; *viz.* heat, cold, moiſture, and dryneſs.

The ſecondary qualities, according to the ſame, are all the reſt; which are combinations or aſſemblages of the former elementary ones; as colour, odour, taſte, &c.

To give an idea of Ariſtotle's method of accounting for theſe ſecondary qualities from theſe primary ones, we ſhall inſtance in his account of colour. All colours, then, ſays he, are generated of a mixture of the four elementary qualities: white, *e. gr.* is produced when the humidity ſurmounts the heat, as in old men, whoſe hair grows grey; black is produced when the humidity dries off, as in walls, ciſterns, &c. red, &c.

Among the ſchool-philoſophers we meet with other diviſions of qualities; as *active,* and *paſſive; real,* and *intentional.*

Qualities, *Active,* are thoſe by virtue of which effects and operations are actually produced on other bodies duly diſpoſed with reſpect to them. Such are the heat of fire, the moiſture of water, &c.

Qualities, *Paſſive,* are thoſe by which bodies are diſpoſed to receive the action of others. Such are inflammability in oil, &c.

Qualities, *Real,* are thoſe which remain in the ſubject, and only act on things adjacent to it. As fire in a piece of iron not ignited, &c.

Qualities, *Intentional,* are thoſe which iſſue from the ſubject, and operate at a diſtance. Such is the light emitted from the ſun, &c.

But the moderns are agreed, that either all qualities are real, or all alike intentional. So that the diſtinction is impertinent. See on the ſubject of quality, its various ſpecies, and its different properties, Harris's Philoſophical Arrangements, chap. viii.

However ignorant we may be of the nature of qualities, or of the manner of their operation, yet we know the laws of their intention and remiſſion. Dr. Keil demonſtrates, that every quality which is propagated *in orbem,* ſuch as light,

light, heat, cold, odour, &c. has its efficacy increafed, or abated, in a duplicate ratio of the diftances from the centre of radiation, or exertion of the quality, reciprocally.

Thus, let A (*Plate* XII. *Geometry*, *fig.* 1.) be a centre from whence any quality exerts itfelf round about, according to the right lines, A *e*, A *f*, &c. The efficacy of the quality, be it heat, cold, odour, &c. will be (at equal diftances from A) as the fpiffitude or denfity of the rays, A *b*, A *c*, A *d*. But the rays within the inner circle, or rather fpherical fuperficies, *bcd* H, when they come to be extended to the other fpherical furface, *efg* K, will be much lefs clofe than they were before, and that in the reciprocal proportion of the fpaces they take up; that is, if the outer furface be the double of the inner, the rays there will be but half as thick; but fince fpherical fuperficies are as the fquares of their radii, therefore the efficacy of the quality in the inner furface will be to that of the outer, as A *e* fquare to A *b* fquare. *Q. E. D.*

Sir Ifaac Newton lays it down as one of the rules of philofophizing, that thofe qualities of bodies which are incapable of being intended and remitted, and which are found to obtain in all bodies in which the experiment could ever be tried, are to be efteemed univerfal qualities of all bodies. See PHILOSOPHIZING.

QUALITIES, *Cofmical.* See COSMICAL *Qualities.*

QUALITY is alfo ufed for a kind of title, or degree of eminence given to certain perfons, in regard of their territories, fignories, or other pretenfions.

Thus the king of Great Britain ufed to take the quality of king of France; the king of Poland that of king of Sweden; the king of Sardinia that of king of Cyprus and Jerufalem; the czars of Ruffia, and kings of Spain, have whole pages of qualities. The emperor of China affumes the quality of fon of the fun.

QUALITY *of Curvature*, in *Geometry*, is ufed to fignify its form, as it is more or lefs inequable, or as it is varied more or lefs in its progrefs through different parts of the curve. Newton's Meth. of Flux. and Inf. Ser. p. 75. Maclaur. Flux. art. 369. See CURVATURE.

QUALITIES *of Trees and Plants*, in *Agriculture* and *Gardening*, are the properties which are peculiar to them, in relation to their magnitude, modes of growth, textures or confiftences, forms, colours, taftes, fmells, means of propagation, culture, ufes, and values.

In regard to the firft, as foon as the fimple conftituent fibres of plants are evolved and increafed, as far as the nature of them and the arrangement of the primary nutrient fubftances will permit, they ceafe to receive any more for their farther increafe; the primary matters merely replacing the lofs which is occafioned by the performance of the natural functions of the plants; confequently they have each a particular prefcribed increafe or meafure of growth. Some are very large, others extremely fmall. The Indian fig, in confequence of ramifications being fent off, which concrete with the primitive trunk, by infenfible degrees acquires a very confiderable bulk or thicknefs, being frequently twenty, or even thirty cubic feet in its diametric fection. And there are accounts given of particular plants, which are fcarcely vifible to the naked eye; and of fome trees, which are fo large as to cover with their branches two hundred perfons, or more.

In this country, fome trees and fhrubs of the ornamental fort are either very high, or very low: of the former kind are the horfe-chefnut, larch, cornelian cherry, fnowdrop-tree, and many others; and of the latter, the mountain-afh, hemlock, fir, Scotch rofe, butchers' broom, and many more. There are fome trees which are very broad, in proportion to their height, as the oak, Spanifh chefnut, &c.; others which are very narrow, as the larch, fpruce fir, &c. And there are ftill fome others, in which there is a medium between thefe extremes, preferved and kept up, as in the afh-leaved maple, the evergreen oak, the Virginian rafpberry, the Guelder rofe, and a number of others.

The modes or habits of growth in trees and fhrubs are alfo extremely different: fome fending out their branches in a horizontal manner, as in the oak; in others they have an upward direction, as in the Huntingdon willow; while in a few they fall downwards, as in the lime, acacia, and others. Again, there are fome which have an oblique inclination, as may be feen in the Scotch fir; or they recline, and then rife up again, as in the larch kind; and there are ftill others, in which they hang directly downwards, as in the weeping afh, weeping willow, &c. There are likewife fome fhrubby plants, which creep along the furface of the ground, as the periwinkle; others which clafp themfelves to trees, as the paffion-flower; and a few which fix and attach themfelves to buildings, walls, &c. as the ivy. Farther, there are fome trees that, in whatever way they may be placed, cut, or pruned, conftantly affume and take on one principal ftem, from which all the different branches proceed or go off, as rays from a centre, as in the fir tribe; while in others, the trunks divide themfelves into arms, or large branches, which fend out boughs or fmaller branches in an irregular manner, as in the oak and others. Some kinds of fhrubs have merely one fingle ftem, as the althæa; while other forts invariably fpread and extend along the furface of the ground, throwing or fending up a greater number, as the hypericum, and fome others.

The texture or confiftence of plants of different kinds is likewife very different, as hard, foft, membranous, carneous, fmooth, downy, thorny, &c. which are moftly obvious to the feel. Plants of the young kind are commonly mucilaginous, becoming hard as they advance in growth; though many luxuriate in the ftate of continual foftnefs, as the tremella; yet fome are fo hard as to fink in water, as the iron wood of the ifland of Ceylon, &c. Thus among trees and fhrubs, fome have a foft fmooth appearance, as the lime, the fcorpion fenna, &c.; while others have a hard, rough, firm appearance, as the evergreen oak, the holly, &c. There are fome alfo which have a fmooth, filky appearance, as the tamarifk, &c.; while others have a downy, woolly appearance, as the hoary poplar, &c. And fome appear wholly befet and covered with thorns or prickles, as the furze, hedgehog holly, &c.; while others, again, appear wholly compofed of thready fhoots, as the Portugal broom, &c. Befides thefe, there are many other forts, which furnifh different appearances from any of thefe.

The forms in the different forts and varieties are ftill equally, if not more, various; fome being apparently folid and compact, from being thick fet with branches and foliage, as in the horfe-chefnut, the Englifh elm, the lilac, the fyringa, &c.; while others are of a more light, airy, elegant form, being thin of boughs, branches, and leaves, as the afh, the hoary poplar, the bird cherry, the Canadian mefpilus, &c.; and there is a middle degree between thefe extremes, in the broad-leaved euonymus, the afh-leaved maple, and fome others. They may alfo be further diftinguifhed into thofe whofe branches begin from nearly the furface of the ground, as in the fir tribe of trees, and moft fhrubs; and into thofe which fhoot up into a ftem before their branches are begun to be fent off, as in the mountain-afh, the althæa frutex, &c. It may likewife be noticed in refpect to thofe whofe branches begin from the ground, that fome of them rife in an elegant cone, as the larch, the

 holly,

holly, &c.; others in a cone, whofe bafe is very broad, as in the cedar; or whofe bafe is very fmall, as in the upright cyprefs. There are fome which fwell out in the middle of their growth, and diminifh or contract at both ends, as in the Weymouth pine, &c.; while others are broadeft at the top, as in the rafpberry, the alpine honeyfuckle, &c.; and fome few irregular and bufhy throughout, as in the evergreen oak, the fnowball tree, &c. Among thofe which fhoot up into a ftem before their branches are fent off, there are fome which are in the fhape of flender cones, as in the deciduous cyprefs; others in thofe of broad cones, as in the balfam poplar. Still others affume a globular form, as in the mountain-afh; while many are irregular throughout, as in the Scotch elm, the acacia, and feveral others.

As to colour, it appears to depend upon the colouring principle, the proportion of vital air and light which is contained, and is proper to different parts of the fame tree or plant: hence, when exhalation is prevented, and light intercepted, the green colour is changed into white. In trees and fhrubs it is either accidental or permanent: the latter including all the different fhades of green in the fummer months; the former, the different tints of red and yellow, which are peculiar to the autumnal and vernal feafons.

There are fome of the permanent kinds of colour, which are of a dark green, as thofe in the horfe-chefnut, the yew, &c.; while others are of a light green, as thofe in the afh, the common laurel, &c.; and others, again, which are of a blueifh-green, as thofe in the Scotch fir, the bladder fenna, &c. Some trees have a green tinged with brown, as the Virginian cedar; others a green tinged with white, as the abele and the Lapland willow. Alfo, in fome trees the greens are tinged with yellow, as in the afh-leaved maple, the Chinefe arbor vitæ, &c.; in others with red, as in the fcarlet maple, &c.; and in a few with purple, as in the purple beech. There are fome greens which are fpotted with white, yellow, and red, as that in the variegated holly, privet, fycamore, box, and various others. The colours which arife from accident are almoft infinite in number, each kind of which is liable to great variation: moftly, however, it will be found that in autumn the wild cherry affumes a bright red, the birch a deep red, the beech a brownifh-red, the fcarlet oak a deep fcarlet, the hornbeam a ruffet colour, the fugar maple a rich yellow, the common oak a reddifh-yellow, the lime and afh a ftraw colour, the balfam poplar a black, the fycamore a dark brown, and others different forts of other colours.

In regard to tafte and fmell, the former depends upon the different principles which compofe and conftitute the juices or humours of the different kinds, and varies as well in the different forts, as in the different parts of the fame fort of trees or plants. The latter depends on the volatile principle, or principles, which iffue or exhale from them, and differs in its nature, according to the kinds of plants, or the parts of them, in which it chiefly refides or is prefent. There are fome trees and fhrubs which have fcarcely any fmell, as the evergreen oak, platanus, &c.; others have a moft grateful rich fragrance, as the birch, fweet-briar, honeyfuckle, &c.; fome again have a lufcious, powerful fmell, as the mezereon, the fyringa, &c.; others a difagreeable naufeous fmell, as the elder, &c.; in fome the fmell is very fweet, as in the flowering lime; in others it is deleterious, as in thofe of the walnut, the artemifia, &c. There is alfo the greateft fragrance in fome while they are in bloffom, as in the hawthorn, and in fome it is folely confined to it, as in the lilac; while in others it is equally diffufed over or throughout the whole plant, as in the fweet-briar, and many others.

These may be confidered as fome of the moft general characteriftic qualities of trees and fhrubs; but various other peculiarities incident to them prefent themfelves, on a more minute inveftigation, which equally intereft and deferve the attention of the ornamental planter and gardener, as well as the cultivator of all forts of wood and timber; and which principally relate to differences in the barks, the buds, the leaves, the flowers, and the fruits. The appearance of the bark is very different in many different forts of trees and fhrubs, as red, white, black, brown, and green, as in the dogwood, birch, oak, Guelder rofe, and holly. It differs alfo in its properties, as in fome it is firm, in others fpongy, in fome thin, in others thick, brittle, glutinous, or thready, as in the oak, the cork-tree, the beech, the Scotch fir, the hornbeam, the holly, the lime, and the elm. It varies likewife in its duration, the outer bark or coat in fome trees being thrown off annually, as in the arbutus, the birch, &c.; while in others, for the moft part, it is conftantly retained or kept on. It differs equally in refpect to its properties of tafte, being in fome aftringent in its nature, in others fweet, bitter, refinous, &c., as in the oak and bramble, lime, abele, fir, &c. In regard to buds, fome trees have none at all, as the pine and evergreen forts; in fome they are very large, in others very fmall, as in the horfe-chefnut, and the willow. In fome they are coated over with a covering of glutinous or refinous matter, as in the horfe-chefnut, &c.; in others they are overfpread with a dry film or tegument, as in the beech, &c. There are likewife fome buds which are of a red colour; others which are yellow, black, brown, or red and greenifh; as thofe in the lime, the willow, the afh, the beech, and the common fycamore, in the order in which they occur.

The variety in the leaves is ftill much greater; fome being very broad, as thofe of the common laurel; others very narrow, as thofe of the larch. And there is a medium between thefe extremes, in thofe of the willow and the almond. In fome they are entire, as in the bay; in others ferrated, as in the cherry; and pinnatifid, as in the acacia, &c. In fome again they are covered with down, as in the fea buckthorn; in others with wool, as in the hoary poplar; with prickles, as in the holly; with a glutinous matter, as in the gum ciftus, &c. They are of all the different fhades of green in the fummer feafon; and of all the different tints of red and yellow, in the autumnal and vernal feafons.

There are fome which retain their leaves and colours during or throughout the whole year, as the pine tribe, &c.; others which lofe their green colour in the autumn; but retain their leaves all the winter, as the beech, hornbeam, &c. in particular circumftances. A great number of trees, among which are the elm and the afh, drop their leaves in the autumn, and are naked all the winter. In general, the leaves have the fame properties as the barks, but in a fainter and lefs perfect degree; which are of much importance in fome points of view. Thofe of the alder, the box, &c. are refufed by moft forts of cattle; thofe of the elm, the thorn, &c. greedily devoured by them; while thofe of the fir tribe are offenfive to many forts of infects, which are liable to infeft hot-houfes, and other fimilar places.

And the flowers are much lefs various than the leaves. Thofe of fome trees being large and fhowy, as of the rofe, the honeyfuckle, &c.; while thofe of others are fmall and obfcure, as of the alaternus, &c. In fome they cover the whole plant, and quickly fade away, as thofe of the hawthorn; while in others they are but thinly diftributed, yet continue a confiderable length of time, as thofe of the paffion-flower, &c. There are fome, which come into bloffom at an early period, as thofe of the mezereon, almond, &c.;

&c.; others that are very late, as those of the sweet chesnut, the althæa frutex, &c. And there are some trees and shrubs which cease flowering before their leaves expand, as the almond; and others in which the blossom makes its appearance only when the leaves fall off, as that of the hazel.

In the fruits or seeds of trees and plants the variety is likewise considerable. There are some, in which they are brilliantly coloured and showy in their appearance, as in the clustered berries of the mountain-ash; while in others, the seed is very much hidden and obscure, as in the willow. On some trees they remain two or more years, as the cones on the fir tribe; on others but a few weeks, as the capsules of the elm. The fruits and seeds of some are used for culinary purposes, and contribute to increase and enrich the deserts of the table, as the apple, pear, walnut, &c.; while others are appropriated to and have the properties of fattening the inferior sorts of animals, as the acorn, the beech mast, &c.; and others again are poisonous, as the berries of the deadly nightshade, and those of the mezereon, &c.

Further, along with their characteristic distinctions, some trees and plants combine and comprise what may be considered particular properties.

In the roots, they are as much varied underneath the ground, as the trunks, stems, and branches are above the surface of it. There are some which spread themselves in a horizontal manner, as those of the pine, and fir tribes; others which send down perpendicular roots to a great depth, as those of the oak, the chesnut, &c.; and there are those which form a medium between these extremes, as in those of the lime, the beech, &c.

In the modes or means of propagation in trees and plants there is equal or more variety. There are some which are raised from seeds, as the most part of forest-trees, such as the oak, elm, ash, larch, &c.; others from layers, as the lime, platanus, rose, and many sorts of shrubs; still others from suckers, as the abele, gale, spirea, &c. And some are propagated by ingrafting, as the weeping ash, apple, &c.; others by inoculation, as the double-blossomed almond, the weeping cherry, &c. And some kinds, again, by the roots, as the thorn, mezereon, and others.

In respect to culture they require different kinds of soils, situations, and management; some delight in a deep, strong soil, as the oak; some in a dry gravelly one, as the beech; some in a deep moist one, as the poplar; others in a soil of the peat-earthy kind, as the erica, and various other sorts; still others are natural to a rather moist soil, as the alder, &c. And there are some trees which will grow in a soil of almost any sort, as the Scotch fir tribe; while others will scarcely grow in any, but that of their natural one, as the rhododendron, the andromeda, &c. There are some again which hardly stand in need of the aid or assistance of any sort of soil, as the ivy, &c.; while others are of the parasite kind, as the misletoe, &c.

There is likewise much variety in the situations and exposures which trees and plants naturally affect. Some kinds will endure almost every sort of exposure, with the exception of that of strong powerful sea breezes, as the larch, the Scotch fir, the mountain-ash, &c.: while some again endure and withstand the sea breezes in a much better and far superior manner to others, as the sycamore, ash, service, elder, &c.; others will not prosper except in low, or sheltered situations, as the black spruce, most sorts of American plants, &c.; while others will rise and grow under the drip and shade of others, as the Scotch elm, the Norway maple, hemlock, spruce, dogwood, box, &c.; but others again die in such situations, as the larch, the pine, the willow, and many other sorts.

In their more young growths trees and plants not only demand soils, situations, and aspects suited to their particular natures and habits, but also such methods of culture as are adapted to them. Some kinds requiring the earth and mould about their roots to be repeatedly dug up and stirred, as the lime, the lilac, &c.; others advance with equal rapidity, where the ground on the surface is preserved free and clean from other injurious vegetable productions, as the oak, the chesnut, &c.; while others again succeed in the best manner, where the surface of the land is covered with mossy matter, as the rhododendron, the erica, &c.

In regard to cutting and pruning, there are some trees which will not bear the knife, as the cherry, &c.; the wood in others is many times hurt by it, as in the pine and the fir tribes. Some again are capable of bearing it to any extent, as the hawthorn, the crab-apple, &c. However, these peculiarities are mostly applicable to trees of considerable height; as most sorts when very young endure cutting in, and pruning very well, many kinds requiring these operations to train and bring them to single stems. For instance, the silver fir, while in the nursery state, requires the side shoots of it to be cut and shortened; and young oak plants, some time after they have been finally planted out, are often cut over just above the surface of the ground, and supposed to grow up stronger by it.

A great many sorts of trees and plants stand in need of being removed or transplanted the first or second year of their growth from the seed, while in the nursery ground; and to be set out from that situation into plantations of different kinds, while under the height of four feet, or in their more early growth. There are some sorts which are little or not at all hurt by such removals, as the elm; while others are liable to die after it, as the spruce fir, the Weymouth pine, &c.; some kinds are also apt to die on being transplanted, after they are eight, ten, or more feet in height, as the pine, the fir tribes, &c.; while other sorts may be safely transplanted at nearly double such ages and sizes, as the lime, the elm, the sycamore, and various other deciduous kinds; however, a year or more before their removal is to take place, they should have their roots cut in, and their tops thinned by the pruning knife, or other means, as such precautions are highly important and necessary, and should never be omitted, in removing trees of the latter of the above heights.

In respect to the uses of trees and shrubby plants, though the latter sort are commonly set out for the purpose of ornament, variety, &c., and the former for that of timber, as well as these and other uses; there are still some other ways in which they occasionally contribute, and become of utility and importance to the planter. There are different products of some of them, which are useful in different arts and professions. For instance, the bark of some is useful in chemistry, for the making of bird-lime, as that of the holly; that of others, as of the lime, the elm, &c. for the manufacturers of mats. The leaves of some, as those of the mulberry, for the growers and raisers of silk. The blossoms of others, as those of the rose, for the apothecary, and those of the syringa for the confectioner. Those parts of the seeds of the beech which are proper, are converted into bread. And the fruits of others, as those of the pear, apple, plum, &c. are of very general utility and value. Some kinds of wood are of particular use and value for particular purposes, as the oak to ship-builders; and others might be trained for this application, as the larch, by bending down the stem when about twenty feet in height, securing it in that position, and then re-bending it again some consider-

able

able time afterwards, leaving the bole or trunk in a differently crooked ſtate. The woody parts of the fir and pine are employed by houſe-carpenters, of the crab-tree by mill-wrights, of the aſh by plough-wrights, of the beech, the walnut, the cherry, the plum, the box, the holly, the yew, and others, by the cabinet-makers. The lime is particularly uſeful to the carver, the ſycamore to the turner, the box and holly to the mathematical inſtrument-maker, and the alder and the birch to the laſt and the heel-maker. Charcoal of any of the kinds is valuable for the iron-founders; that of the dog-wood, ſallow, alder, hazel, &c. for the gunpowder manufacturers. The larch, the ſilver fir, &c. afford the coarſe turpentine and its ſpirit; the ſpruce and pine tribes, reſin, tar, pitch, lamp-black, &c. Moſt woods, but eſpecially the beech, aſh, elm, &c. afford potaſh. The ſap-juice of ſome trees, as the birch, &c. yields a vinous liquor; and that of others, as of the ſugar-maple, &c. affords ſugar.

The value of wood as timber, and for other purpoſes, differs much according to local ſituation, and other circumſtances; when near a dry-dock or ſhip-yard, oak, elm, &c. ſuited to ſhip-building, are of much higher value than when at a great diſtance in the country. The undergrowths of ſeveral ſorts of trees, as dog-wood, ſallow, willow, alder, &c. are of the moſt value when near large manufactories of gunpowder, being of little utility, except as fuel, when at a diſtance. Some ſorts of wood, however, from the generality of their application and employment, are of great value in all ſituations, as thoſe of the oak, the elm, the aſh, the beech, and perhaps the larch has ſtill more value than any of them. Others, on account of their ſcarcity, are alſo valuable in all places, as the box, the holly, the yew, &c. All the lighter products of ſome ſorts of trees, as thoſe of bird-lime, potaſh, turpentine, tar, pitch, &c. may likewiſe be conſidered of equal value in all ſituations. But a tree which would be of the greateſt value in a particular ſituation or place, may not find in it that ſort of ſoil that is ſuitable to its nature or habits of growth; in which circumſtances that which will come to the moſt perfection in it, will commonly be found of the moſt value. Such woods as may not be valuable in conſequence of local circumſtances, may be rendered a great deal more high in their value, by having them manufactured in the places where they are met with, thus leſſening the expences of conveyance, &c. In conſequence of the great improvements in roads, canals, &c. and the general promotion of them, woods and plantations for timber, muſt, in almoſt all places, be valuable, and there can be few in which the other ſorts of products will not be of great importance. In the meaſuring of ſtandard trees for the purpoſe of aſcertaining their value, though many think themſelves fully qualified by being ſimply able to meaſure them; it is only by the perfect knowledge of the uſe and application of the different ſhapes, bends, and woods of them, that a correct eſtimate can be given; as a ſmall portion of wood may be of little conſequence in one ſort of buſineſs, while it is of much in another, which is a ſecret of great intereſt and importance to the purchaſers of timber of the ſtanding kind.

In addition to theſe qualities, almoſt every tree and plant is poſſeſſed of various others, which excite emotions that have a relation to them, and which give their characters or expreſſions. For inſtance, the cypreſs is of a regular, invariable ſhape, or form, and always, in colour, of a dark green, having a ſtill, ſolemn appearance; hence it has acquired the character of melancholy. A ſimilar, but ſomewhat fainter, train of emotions, is produced in the mind by the falling branches, drooping ſpray, and yellow greeniſh colour of the weeping willow; hence it ſuits with ſcenes of ſolitude, and induces meditation. In the light, airy form of the aſh, and the bright white of the variegated holly, there are ſome traits of certain degrees of the cheerful kind; in the feſtoons of the virgin's bower, eaſe and gracefulneſs; in the myrtle, delicacy and neatneſs; and in the ſweep of the ſtem, the curve of the branches, &c. of the larch, a peculiar elegance. In the oak and the cheſnut are forms which have long given the notions of grandeur and ſublimity. Both theſe and other trees are particularly expreſſive of peculiar known characters, ariſing, in ſome degree, from their own nature, and in part from aſſociations in the mind. Thoſe of the cypreſs and yew kinds have been planted in burying grounds, and other ſimilar places; the weeping willow, as the ſhade of urns; the laurel uſed as the crown of warriors; and the cheſnut introduced in landſcapes.

Some accidental characters and expreſſions of plants are produced by novelty and ſingularity either in their natures, forms, or appearances; hence exotics are at firſt diſtinguiſhed from thoſe of the indigenous kind, and called beautiful, elegant, fanciful, ſtrange, rare, &c. according to circumſtances. The creeping aſh, the ſtone pine, &c. derive and retain their characters from their comparative ſcarcity and unuſual ſhape; while others have that of elegance and novelty in a much leſs degree, as the cedar of Libanus and the cypreſs; the hemlock ſpruce, and the ſcarlet oak, &c. Some trees and plants are common, and thought nothing of in one diſtrict or country, while, in others, they are uncommon, and thought highly of; thus, the weeping willow, the narrow-leaved elm, the acacia, &c., which abound, and are little valued, in the ſouthern parts of the iſland; are ſcarce, highly eſteemed, and termed elegant in thoſe of the north; while the arbutus, the uva urſi, the erica alba, and even the mountain-aſh, which are plentiful, unnoticed, and common in the north, are held in eſtimation, and thought highly elegant in the ſouth.

Theſe are ſome of the more particular qualities of trees and plants, which are concerned in the claſſification and arrangement of them, as the materials by which the objects of planting and ornamental gardening are to be accompliſhed, but there are others which are peculiar to them in other points of view, that it is quite unneceſſary to notice in this place, as they are fully explained in ſpeaking of them individually under their proper heads.

More ample information on the above ſubject may, however, be obtained by conſulting Mr. Loudon's work "On Forming, Improving, and Managing Country Reſidences," in which will be ſeen their particular utility, and their moſt appropriate modes of application in the buſineſs of planting and ornamenting different kinds of pleaſure grounds, under all the various circumſtances which may occur in ſo far as their nature, ſituation, ſoil, and other ſimilar particulars are concerned, as well as the pictureſque effect which will be produced.

Qualities *of Seeds, Sets, and Produce*, the properties which are eſſential to them for the production of full and beneficial crops of the ſeveral different kinds, and the moſt perfect and advantageous ſtates of growth and maturation of ſuch crops, for their being conſumed, either as food or otherwiſe. In all ſorts of ſeeds of the grain kind, thoſe which are the moſt fully bodied, bright, thinneſt in the ſkin, and the moſt ſound, without being too long kept, are the moſt ſuitable for making uſe of as ſeed. Such as are ſmall, lean, ill fed, and ſhrunk in their ſkins, or which have been in any way heated in the mow or ſtack, are moſtly quite improper for this purpoſe. Some have, however, ſuppoſed the contrary to be the caſe, but they have hitherto adduced no proofs whatever, of the fact, while the former opinion is ſupported fupported by the daily experience of the beft farmers in the country. There is another circumftance which is of fome importance in this bufinefs, which is that of the grain for this ufe being conftantly newly threfhed out from the ftraw, as fuch, for the moft part, fprouts and grows more expeditioufly, and is lefs liable to rot and perifh in unfavourable feafons and fituations.

All forts of difeafed grain, and fuch as is not perfectly free from the mixture of the feeds of weeds with it, fhould always be, as much as poffible, avoided in this intention.

In regard to the fmaller forts of feeds for raifing all kinds of plant-crops in the field, as well as thofe of the grafs fort, both natural and artificial, the principal neceffary qualities, in each, are thofe of their being of a bright, lively, fhining colour, perfectly found, and frefh, or lately collected from the plants. Such as are old, or kept more than a few months, are moftly improper for this application. The beft forts commonly flide freely over each other, without fticking or being heavy in the hand, and have a brilliant bloomy appearance.

In gardening, moft forts of feeds alfo are the beft, and require to have thefe properties and qualities as much as poffible; but there are a few which are apt to grow too luxuriantly for fruiting well, as fome of the cucumber, melon, kidney-bean, and other kinds, which are better for being kept for fome length of time, as this property is thereby in fome meafure corrected and reftrained. Moft forts of nuts and ftones, when ufed as feed, fhould, however, be employed in as frefh a ftate as poffible.

Sets are different in their nature, being of the root or plant kinds. In the former, the fets or cuttings fhould have the eyes or buds in a perfect ftate, and be of a middling fize, as both thofe which are very large and very fmall are objectionable. This is the cafe with the potatoe and fome other forts. In the latter, the plants fhould not have too large growths, but be in a fine young ftate of vegetation, fo that they can be fet out with facility, and readily take root again, having their heads or upper parts, for the production of the produce, wholly in an uninjured condition. They fhould alfo be quite newly drawn up, cut or flipped from the ftalks of the old plants, without any fort of clubbing near the roots in thofe which are drawn. Such as have rifen the moft quickly from the feed, are, in general, the beft. They fhould none of them ever be kept any great length of time after being drawn, before they are re-planted. This is equally applicable to the field and garden kinds. See SEED, SET, and SOWING.

The produce in all the white or grain crops, which are employed either for the purpofe of mealing or malting, fhould conftantly be well ripened; but where the ftraw is to be made ufe of as cattle food, the crops are better to be cut before they have reached the ftate of full maturity, as this purpofe is thereby more completely anfwered. There is much lofs in the produce of moft forts of field plant-crops, by taking them before they have formed their bulbs or heads in a perfect manner. But many of fuch like products, in the garden, are the beft and moft advantageoufly taken in fuch imperfect ftates, being tough and coarfe when full grown, and without the neceffary tendernefs. Others require to be cut or drawn early in order to have the proper degrees of fweetnefs and flavour. The fruit kind of produce is taken both before and when nearly ripe, according to the ufes for which it is intended. Some forts of vegetable produce are ufed quite in their green ftate, as food; while others are beft in a fomewhat more advanced ftate: and others, again, in both thefe ftates. And there are thofe which require to be well ripened, and kept for fome length of time before they are ufed in this way.

All forts of produce of the grafs-kind, are cut and ufed to the moft benefit, when they are taken a little before they become perfectly ripe, as they go the fartheft, whether they are to be confumed in the green ftate, or in that of hay. This is equally the cafe with the more luxuriant artificial forts, as with thofe of lefs growth, of the natural kind. This is explained more fully in fpeaking of the different plants and crops individually, and in the article HAY; which fee.

QUALO, in *Geography*, a town on the N.E. coaft of Sumatra. N. lat. 2° 45′. E. long. 99° 40′.

QUALUGA, a town of Africa, in the country of Whidah; 18 miles N.W. of Sabi.

QUAM, a town of Norway, in the diocefe of Drontheim; 68 miles N. of Drontheim.

QUAM *diu fe bene gefferit*, a claufe frequent in letters patent, or grants of offices, to fecure them fo long as the perfon they are granted to fhall not be guilty of abufing the fame.

Thus, *e. gr.* we find it in thofe given to the barons of the exchequer: where it intimates, that they fhall hold the fame as long as they fhall behave themfelves well; which is to be reftrained to matters of their offices; and fignifies no more than the law would have implied, had the office been granted exprefsly for life. See JUDGE.

A grant therefore, with this claufe, is equivalent to a grant for life.

QUAMASH, in *Botany*, a name given, by the North American Indians, to a plant called *Phalangium Quamafh*, by Mr. Purfh, in his *Flora*, v. 1. 226; who neverthelefs mentions an irregularity in the petals, that might poffibly eftablifh it as a new genus. See PHALANGIUM.

This plant was obferved by governor Lewis, about the upper part of the Miffouri, near the Rocky-mountains, flowering in June. The *bulb* is roundifh, tunicated. *Stem* none. *Leaves* radical, few, long, and linear, half an inch broad, fmooth; keeled underneath. *Flower-ftalk* folitary, naked, erect, round, fmooth, unbranched, a foot or more in height, terminating in a *fpike*, or rather *clufter*, of large, pale-blue *flowers*, each accompanied by a linear, membranous, withering *bractea*, longer than the partial ftalk. *Petals* linear-lanceolate, nearly equal in length; five of them afcending; the fixth deflexed.

The bulbs are carefully collected by the natives, and cooked between heated ftones, when they affume the appearance of baked pears, and have an agreeable fweet tafte. They form a great part of the winter ftores of thefe Indians. Though governor Lewis's party found them a pleafant fort of food, they could not be eaten, in any quantity, without caufing bowel complaints.

QUAMOCLIT, an Indian name, retained by Plumier and Tournefort as generic; but by Linnæus ufed only as the fpecific appellation of a beautiful fpecies of IPOMÆA; fee that article.

QUAMPEAGAN FALLS, in *Geography*, falls in America at the head of the tide on Newichwanock river, which joins Pifcataqua river, 10 miles from the fea; fo called by the natives, becaufe fifh were there taken with nets. At thefe falls are a fet of faw-mills and others, and alfo a landing-place, where great quantities of lumber are rafted. Here the river has the Englifh name of Salmon Falls river, from the number of falmon caught there. On many places from Quampeagan to the pond, from which it iffues, there are mills for boards and corn.

QUAM-TOM, a town of China, of the third rank, in in the province of Yun-nan; 15 miles N.E. of Tchou-hiong.

QUAN, a town of China, of the third rank, in Chan-tong; 22 miles W. of Tong-tchang.

Quan, or *Guan*, in *Ornithology*. See Penelope *Criſtata*.

QUANAMORA, in *Geography*, a town of Africa, in Upper Guinea, on the banks of the Scherbro', ſaid to contain 5000 families. N. lat. 7° 45′. W. long. 10° 15′.

QUANDROS, a name given by writers of the middle ages to a ſtone to which they attribute great virtues, and which, they ſay, is found in the head of a vulture.

QUANG-LING, in *Geography*, a town of China, of the third rank, in Chan-ſi; 15 miles W.S.W. of Ouei.

QUANG-NING, a town of China, of the third rank, in Quang-tong; 35 miles N. of Tchao-king.

QUANG-PING, a city of China, of the firſt rank, ſituated in the northern part of the province of Pe-tche-li, between the provinces of Chang-tong and Ho-nan, which has nine towns of the third claſs dependent upon it. All its plains are well watered by rivers. Among its temples, one is dedicated to thoſe men, who, as the Chineſe pretend, diſcovered the ſecret of rendering themſelves immortal; 212 miles S.S.W. of Peking. N. lat. 36° 47′. E. long. 114° 29′.

QUANG-PUNG, a town of China, of the third rank, in Pe-tche-li; 17 miles N.W. of Tay-ming.

QUANG-SI, a province of China, ſituated between thoſe of Quang-tong, Hou-quang, Koei-tcheou, Yun-nan, and the kingdom of Tong-king; about 360 miles from E. to W., and 230 from N. to S. In commerce, as well as extent, it is not equal to that of the other provinces; and yet it ſo abounds with rice, as to ſupply, for ſix months in the year, the province of Quang-tong, without which the inhabitants of this province could not ſubſiſt. The mountains with which it is covered, abound with mines of gold, ſilver, copper, and tin, and in this province is a ſingular kind of tree, containing a ſoft pulp, which yields a ſort of flour, and of this flour they make a very good bread. Beſides parroquets, hedge-hogs, and the rhinoceros, wild animals, curious birds, and uncommon inſects are found here in great number. This province contains twelve towns of the firſt claſs, and eighty of the ſecond and third. Its capital is Quei-ling. Groſſier's China, vol. i.

The population of this province is eſtimated by ſir George Staunton at 10,000,000; its extent is ſaid to comprehend 78,250 ſquare miles, or 50,080,000 acres. The revenue transferred from it to the treaſury at Peking, compriſing land, ſalt, and taxes, is ſtated at 500,000 tahels, or ounces of ſilver.

QUANG-TCHANG, a town of China, of the third rank, in the province of Chan-ſi; 28 miles S. of Ouei.

QUANG-TCHEOU, or Quang-chou-fou, a city of China, of the firſt rank, in the province of *Quang-tong*, uſually called by the Europeans *Canton*; which ſee.

QUANG-TONG, the moſt conſiderable of the ſouthern provinces of China; bounded on the N.E. by Fokien, on the N. by Kiang-ſi, on the W. by Quang-ſi, and the kingdom of Tong-king; the reſt is waſhed by the ſea. The country is diverſified with plains and mountains, and the land is ſo fertile that it produces two crops every year. Trade and the fecundity of the ſoil ſupply this province with every thing that can contribute to the pleaſures of life; it furniſhes gold, precious ſtones, ſilk, pearls, eagle-wood, tin, quickſilver, ſugar, copper, iron, ſteel, ſaltpetre, ebony, and abundance of aromatic woods, which are much valued. Beſides European and Indian fruits, it produces ſeveral that are peculiar to itſelf. All the coaſts abound with fiſh, and furniſh great quantities of oyſters, crabs, and tortoiſes of an immenſe ſize: of the ſhells of theſe the Chineſe make ſeveral pretty toys. Tame ducks are reared in this province in great numbers: the Chineſe are induſtrious in breeding them, and they hatch their eggs in ovens or dunghills, though they do not ſeem to have derived this mode of breeding them from Egypt, where it is practiſed. They carry them on barks in large flocks to feed on the ſea-ſhore, where, at low water, they find ſhrimps, oyſters, and other kinds of ſhell-fiſh. At the approach of night they are collected together by only beating on a baſin, upon which they immediately form themſelves into different flocks, and each returns to the veſſel to which it belongs. The Chineſe have a method of ſalting their meat without injuring its flavour, and they ſalt their eggs by encloſing them in a coat of clay mixed with ſalt. Theſe ſalted eggs are ſaid to be very wholeſome, and even ſick perſons are permitted to eat them. Although the climate of this province is warm, the air is pure, and the people are robuſt and healthy. They are noted for their induſtry, and for a talent of imitation, which they poſſeſs in an eminent degree. As this province is at a great diſtance from court, its government is one of the moſt important, and it is alſo one of the moſt flouriſhing in the empire. Its viceroy has alſo the command of Quang-ſi, and reſides at Cheo-king, for the convenience of expediting his orders to either of theſe provinces. This governor always has a number of troops ready, properly poſted, to check the incurſions of robbers and pirates, who might otherwiſe interrupt and injure trade: for the ſame purpoſe, a great number of fortreſſes (moſt of them being cities provided with numerous garriſons) have been built along the coaſts and in the interior parts of the country. This province is divided into 10 diſtricts, which contain 10 cities of the firſt claſs, and 84 of the ſecond and third. Groſſier.

The number of inhabitants, according to ſir George Staunton's eſtimate, is 21,000,000; its area comprehends 79,456 ſquare miles, or 50,851,840 acres. The revenue remitted to the imperial treaſury at Peking, and raiſed from land, ſalt, and taxes, amounts to 1,340,000 tahels, or ounces of ſilver. The military force is ſaid to amount to 50,000 men. Its capital is *Canton*; which ſee.

QUANG-YANG, a town of China, of the third rank, in the province of Quang-ſi; 30 miles S. of Tſuen.

QUANG-YUEN, a town of China, of the third rank, in the province of Se-tchuen, ſeated on the Kialing; 50 miles N. of Pao-king.

QUANNEFIORD, a bay on the W. coaſt of Weſt Greenland. N. lat. 62° 10′. W. long. 48° 5′.

QUANO, a town of Japan, on the iſland of Niphon, on the S. coaſt, 70 miles E. of Meaco. N. lat. 35° 58′. E. long. 136° 14′.

QUANTALLA, an iſland of Africa, at the mouth of the Zaire, celebrated for a ſilver idol, to which the neighbouring kings ſend preſents and offer ſacrifices.

QUAN-TAO, a town of China, of the third rank, in Chan-tong; 25 miles W.N.W. of Tong-tchang.

QUAN-TCHANG, a town of China, in Chan-tong; 13 miles N. of Po.

QUANTITE′, Fr. This word in muſic, like proſody, does not fix the number of notes or of ſyllables, but their relative duration. Quantity produces the rhythm, as accent produces intonation. Rhythm and intonation generate melody. Rouſſeau. See Melody.

QUANTITY, Quantitas, any thing capable of eſtimation or menſuration; or, which being compared with another

other thing of the fame kind, may be faid to be greater or lefs than it; equal, or unequal, to it.

Mathematics is the fcience or doctrine of quantity.

Quantity is a general attribute, applied in a very different manner to things of very different nature; whence it is impoffible to give any univerfal definition of it.

Quantity is applied both to things and to modes; and this either fingularly to one; or plurally, to feveral. In the firft cafe it is called *magnitude*, in the latter *multitude*.

Quantity may be reduced to four claffes; *viz.*

Quantity, *Moral*, which depends on the manners of men, and the free determination of their wills. As the prices and value of things; degrees of dignity and power, good and evil, merit and demerit, rewards and punifhments, &c.

Quantity, *Notional*, arifing from the operation of the underftanding only. Such as the largenefs or narrownefs of the capacity of the mind, and its conceptions. In *Logic*, univerfals, predicaments, &c. In *Grammar*, the quantity or meafure of fyllables, accents, tones, &c.

Quantity, *Phyfical*, or *Natural*, which is of two kinds: 1. That which nature furnifhes us with in matter, and its extenfion. And, 2. In the powers and properties of natural bodies: as gravity, motion, light, heat, cold, rarity, denfity, &c.

Quantity, *Tranfcendental*, as duration, the continuation of any being, exiftence, time, &c.

Quantity is alfo popularly diftinguifhed into *continued* and *difcrete*.

Quantity, *Continued*, or *Continuous*, is when the parts are connected together, and is commonly called *magnitude*. This, again, is of two kinds; either *fucceffive*, or *improper*, as time.

Quantity, *Difcrete*, is when the parts of which it confifts exift diftinctly, and unconnected together; which makes what we call *number* or *multitude*.

The notion of continued quantity, and its difference from difcrete, appears to fome without foundation. Mr. Machin confiders all mathematical quantity, or that for which any fymbol is put, as nothing elfe but number, with regard to fome meafure, which is confidered as one; for that we cannot know precifely how much any thing is, but by means of number. The notion of continued quantity, without regard to any meafure, is indiftinct and confufed; and though fome fpecies of fuch quantity, confidered phyfically, may be defcribed by motion, as lines by the motion of points, and furfaces by the motion of lines; yet the magnitudes, or mathematical quantities, are not made by the motion, but by numbering according to a meafure. Vide Phil. Tranf. N° 447. p. 228.

Permanent quantity is farther diftinguifhable into length, breadth, and depth.

Wolfius feems to give us a more precife notion of mathematical quantity, and its two fpecies of difcrete and continued. hatever is referred to unity in the fame manner as one right line to another, is what we call quantity; or number in general.

If, now, the thing be referred to a given unit, as 3, it is called a determinate number: if to unity in the general, or at large, it is called a quantity; which, on this principle, is the fame with indeterminate number.

Thus, *e. gr.* the breadth of a river is accounted a quantity: if, then, it be enquired how great it is; to conceive its quantity, we take fome unit at pleafure, and fee the relation of the breadth to it; and according to the different unit affumed, we exprefs the breadth of the river in a different determinate number.

The breadth of the river, therefore, is quantity confidered as referred to a vague unit, or to unity at large; but the unit being determined, the thing is underftood by a determinate number.

In this fenfe, algebra is the arithmetic of quantities. See on the fubject of quantity, Harris's Philofophical Arrangements, chap. ix.

Quantity *of Action*. See Action.

Quantity, *Impoffible*, and *Imaginary*. See Root.

Quantity *of Curvature* at any point of a curve is determined by the circle of curvature at that point, and is reciprocally proportional to its radius. Newton's Meth. of Flux. and Inf. Series, p. 60. Maclaurin's Fluxions, b. i. c. xi. See Curvature and Evolute.

Quantity *of Motion*, in *Mechanics*, is of two kinds; *viz.* of momentary motion, and of entire motion.

Quantity *of entire motion*. The Cartefians define the entire motion as the momentary one, by the factum of the mafs, or quantity of matter, into the velocity; but fince motion is a fucceffive being, and has no parts co-exifting together, its quantity ought to be eftimated by the aggregate of the feveral parts exifting fucceffively; and is therefore equal to the factum of the momenta into the time.

Quantity *of momentary motion* is the factum of the velocity into the mafs; or it is a meafure arifing from the joint confideration of the quantity of matter, and the velocity of the motion of the body; the motion of any whole being the fum or aggregate of the motion in all its feveral parts.

Hence, in a body twice as great as another, moved with an equal velocity, the quantity of motion is double; if the velocity be double alfo, the quantity of the motion will be quadruple. Hence, the quantity of momentary motion coincides with what we call the momentum, or impetus of a moving body. See Force.

In the collifion of bodies, the quantity of momentary motion, which is found by taking the fum of motions tending the fame way, or their difference, if they tend towards contrary parts, is not at all changed by any actions of the bodies on one another. See Percussion.

Quantity *of Matter* in any body, is the product of the denfity into the bulk; or a quantity arifing from the joint confideration of its magnitude and denfity.

As, if a body be twice as denfe, and take up twice as much fpace as another, it will be four times as great.

This quantity of matter is the beft difcoverable by the abfolute weight of bodies. See Matter.

Quantity, *Infinite*. See Infinite *Quantity*.

Quantities, in *Algebra*, are indeterminate numbers, or things referred to unity in general. See Number.

Quantities are properly the fubject of algebra; which is wholly converfant in the computation of fuch quantities.

Given quantities are ufed to be noted by the firft letters of the alphabet a, b, c, d, &c. the quantities fought by the laft, z, y, x, &c. See Characters.

Algebraical quantities are chiefly of two kinds; *pofitive*, and *negative*.

Quantities, *Pofitive*, or *Affirmative*, are thofe which are greater than nothing, and which are affected with the fign + prefixed; or fuppofed to be fo.

Quantities, *Negative*, or *Privative*, are thofe lefs than nothing: which are affected with the fign − prefixed.

Hence, 1. Since + is the fign of addition, and − the fign of fubtraction; a pofitive quantity is produced by adding any real quantity to nothing: *e. gr.* $0 + 3 = + 3$; and $0 + a = + a$. And a privative quantity is produced by by fubtracting any real quantity out of nothing; *e. gr.* $0 - 3 = - 3$; and $0 - a = - a$.

For an illuftration. Suppofe when you are quite deftitute of money, fomebody gives you a hundred pieces; you have then a hundred pieces more than nothing; which pieces conftitute a pofitive quantity.

On the contrary, fuppofe you have no money, yet owe a hundred pieces; you have then a hundred pieces lefs than nothing; for you muft pay a hundred pieces to have juft nothing. This debt is a negative quantity.

Thus in local motion, progrefs may be called a pofitive quantity, and regrefs a negative one; becaufe the firft increafes, and the fecond diminifhes the fpace paffed over.

And in geometry, if a line drawn towards any part be accounted an affirmative quantity, another the contrary way will be a negative one.

Privative or negative quantities, therefore, are equally real with pofitive quantities, but oppofite to each other, fo as to take away each other's effect, in any operation, when they are equal as to quantity. Thus $3 - 3 = 0$, and $a - a = 0$. However, though $+ a$, and $- a$, are equal as to quantity, we do not fuppofe in algebra, that $+ a = - a$; becaufe to infer equality in this fcience, they muft not only be equal as to quantity, but of the fame quality, that in every operation the one may have the fame effect as the other. A negative quantity is faid to be lefs than nothing, becaufe it is oppofite to the pofitive, and diminifhes it when joined to it; whereas the addition of 0 has no effect. But a negative is to be confidered no lefs as a real quantity than a pofitive. Quantities that have no fign prefixed to them are underftood to be pofitive. See NEGATIVE *Sign*.

QUANTITIES, *commenfurable*, *compound*, *exponential*, *heterogeneous*, *like*, *rational*, *fimple*, *tranfcendental*, and *variable*. See the adjectives.

QUANTITIES, *Addition of*. 1. If the quantities denoted by the fame letter be affected with the fame fign, the numbers prefixed to them are added as in common arithmetic.

2. If they be affected with different figns, the addition is changed into fubtraction; and to the remainder is prefixed the fign of the greater.

3. Quantities denoted by different letters, are added by means of the fign $+$; as in the following example:

$$\begin{array}{lcr} 4a + 2b - 2c - 5d - g & \quad & a - b \\ 5a - 2b + 6c + 2d - 3g & & c \\ \hline 9a + 4c - 3d - 4g & & a - b + c \end{array}$$

See ADDITION.

QUANTITIES, *Subtraction of*. See SUBTRACTION.

QUANTITIES, *Multiplication and Divifion of*. See MULTIPLICATION, and DIVISION.

QUANTITIES, *Combination of*. See COMBINATION.

1. If a pofitive quantity be multiplied or divided by another pofitive quantity, the refult is alfo a pofitive quantity.

2. If a negative quantity be multiplied or divided by a pofitive, the refult is a negative.

3. If a negative quantity be multiplied or divided by another negative, the refult is a pofitive.

4. If a pofitive quantity be multiplied or divided by a negative, the refult is a negative quantity. See MULTIPLICATION, in *Algebra*.

QUANTITY *of a Degree*. See DEGREE.

QUANTITY *of an Eclipfe*. See ECLIPSE.

QUANTITIES *of Seed, Sets, and Plants*, in *Agriculture*, the proportions of each, which are neceffary for raifing good crops of the different kinds. The afcertaining of the moft ufeful and beneficial quantities, in the feveral cafes, depends, in a material degree, upon a number of different circumftances, fuch as thofe of the fituation, the nature and quality of the foil, the period of fowing, the ftate of the feafon, the manner of putting them into the earth, and feveral others.

A great deal more feed, fets, and plants, are requifite in late fituations or backward feafons, heavy, wet, ftiff lands, and late fowings; than where they are more forward, more light and dry, and put in early. And far lefs quantities made ufe of in the drill and dibble methods of putting in the crops, than in that of the broadcaft, or by the hand.

In moft forts of white, or grain crops, the quantities are from two to five bufhels *per* acre, being more in barley and oats, than in thofe of the other kinds, as from three to five in general.

In thofe of the pulfe kinds, ufually from fix or feven pecks, to two, three and a half, and four bufhels, being commonly the latter, or more, in fome forts of beans.

In thofe of the fmall feed defcription, as the buck-wheat and turnip forts, from one to two and three pounds; but in the cabbage kind, only from fix ounces to half a pound, and a quarter or half a peck.

In the tap-rooted crops, as the carrot, parfnip, mangle-wurzel, &c. from two to five pounds, and fometimes fix. In lettuce crops, in the field, from three to four pounds the acre.

In different forts of plantation crops, as thofe of hemp, flax, woad, weld, teafel, &c. from two to three up to five or fix bufhels, in the three firft; but only from two to four quarts, and from one to two pecks, in the two laft.

The fets in the hop, madder, liquorice, and lavender kinds, are from fix to feven hundred, and a thoufand or more, in the firft, and two laft; but in the madder from fifteen to twenty thoufand *per* acre. In the cabbage fort, from eight hundred to a thoufand and more plants or fets to the acre. And in the potatoe the quantity of fets vary from eight to twenty or more bufhels to the acre, according to the foil and manner of their being put into the ground.

The quantities of natural grafs feeds which are generally employed upon the acre, are from two to four bufhels and upwards. And thofe of the artificial grafs kinds, in the clovers from ten to eighteen pounds; in faintfoin from three to four bufhels; in lucern from fixteen to eighteen pounds; tares from two to three bufhels; trefoil, three pottles of cleaned feed, or two bufhels of the uncleaned fort. And in chicory from eight to twelve pounds. See SEED, SET, PLANT, and SOWING.

The fubject is more fully explained in fpeaking of the culture of the different forts of crops, and the moft fuitable quantities under different circumftances put down.

QUANTITY, in *Grammar*, denotes the meafure and magnitude of the fyllables; or that which determines them to be called long, or fhort; or, it is the meafure of time requifite for the diftinct pronunciation of a fyllable.

This quantity is the object of profody; and it is the regard to this that diftinguifhes verfe from profe.

The economy and arrangement of the quantities, *i. e.* the diftribution of long and fhort fyllables, make what we call the *number*.

The quantities are ufed to be diftinguifhed among grammarians by the characters fhort and long.

The proportion between the long and fhort fyllables may be generally fixed the fame as that between the crotchet and quaver in mufic; *viz.* as two to one. See TIME.

Syllables are long or fhort, either by their nature, or by accident; that is, on account of the place where they are put

put and the letters that follow them, which is called position.

In most languages, there are some syllables whose quantities vary, as the measure requires, which are called common; as in the English rĕcōrd and rĕcŏrd.

Some authors confound the quantity with the accent; but the difference is very evident; the former being the length or shortness of a syllable, the latter the raising or falling of the voice.

From two quantities, *viz.* long and short syllables, arise all the varieties of poetic feet, which are very great. Horace alone uses no less than twenty-eight. Yet the Greeks went vastly beyond the Romans in this respect. In effect, as many ways as two quantities may be varied by composition and transposition, from two to six syllables, so many different feet have the Greek poets contrived, and that under distinct names, to the number of 124. Though it is the opinion of some of the learned, that poetical numbers may be sufficiently explained from the feet of two or three syllables, into which the rest may be resolved.

The feet, formed by the ancients of the long and short syllables immediately, are the *spondee*, consisting of two long syllables; the *pyrrhic*, of two short ones; the *trochee*, of a long and short syllable; and the *iambic*, of a short and long syllable.

Those of three syllables are the *molossus*, consisting of three long syllables; the *tribrach*, of three short ones; the *dactyl*, of one long and two short syllables; and the *anapest*, of two short and one long syllable.

The English tongue admits of no feet above two syllables, though both the Latin and Greek allow of six.

Our heroic verses consist of five long and five short syllables intermixed alternately; though not so strictly but that the order may be dispensed with. Dryden varies them with admirable beauty; frequently his heroic verse begins with a long syllable followed by two short ones.

The truth is, the quantity of the syllables is but little fixed in the modern tongues; and there is still less regard had to it in the composition of modern verses. The want of feet, or rather the shortness and uniformity of our feet, makes great difference between the numbers of the ancient and modern verse. Our poets are fettered; and their fetters are so short, consisting of but two poor links, that it is no wonder they can make no extraordinary motions.

The ancients subsisted by their quantities alone; so well were they distinguished, and such a variety and harmony did they afford! Our quantities make such poor music, that we are forced to call in the Gothic aid of rhyme to distinguish our verse from prose.

Yet have attempts been made to settle our verse on the ancient and natural footing of quantities, in exclusion of rhyme, and with such success too (witness the immortal Paradise Lost) as seems to leave the practice of rhyming inexcusable. The French have likewise attempted the same in their tongue, particularly Jodelet, and after him Pasquier, Passerat, and Rapin; but they have all failed.

On Quantity in the Greek Language.

Rules for the determination of quantity in the Greek language, chiefly relate to the doubtful vowels α, ι, υ, since ε, ο, are, by *nature*, or not affected by *position*, short; and η, ω, are, by *nature*, or not affected by *position*, long.

Position.

1. A syllable in which a short or doubtful vowel precedes two consonants or a double letter, is long in every situation; as δεινὴ δὲ κλᾱγγὴ, αὐτᾱρ ἐμῑ Ζεὺς, κατᾱ φρένα, πᾱτρὸς, τέκνον. Hom.

1. Except that a *short* vowel before two consonants, whereof the *former* is a *mute* and the *latter* a *liquid*, is common; as

'Αλλ' ἐπιλἔκτρον ἰὼν, ἄκρον δἄκτυλον καταδάκνω. Hom. βατραχ. v. 45.

Μέτρα δὲ τεῦχε θεοῖσι, το γαρ μἔτρον εστιν αριστον. Phocyl. v. 92.

Note.—1. In pastoral, elegiac, and epigrammatic verse, the syllable is more frequently short.

2. In dramatic poetry we may observe, 1st, that a short vowel before a *short* or *aspirate* mute followed by a liquid, and before a *middle* mute followed by ρ, remains short. In tragedy the syllable, if not final, is often long. 2dly A short vowel before a *middle* mute followed by λ, μ, or ν, lengthens the syllable in all dramatic poetry.

3. When the syllable is lengthened before two consonants, the vowel in pronunciation assumes one of them; as δἔκ-λαγγὴ, ἱμἔσ-Διὸς, κατᾶφ-ρένα, πᾶτ-ρὸς, τἔκ-νον. Hom When the syllable remains short the vowel concludes it; as πᾰ-τρὸς, τἕ-κνον.

2. A short vowel is sometimes made long before a single consonant, particularly before a liquid, as πολλᾱ λισσομένη, Hom.; παρᾱ ῥηγμῖνι, Hom.

Note—It is generally long before ρ, which with its aspirate appears to have been doubled in pronunciation; as παρᾶῤῥηγμῖνι. This licence is not confined to a liquid; as ἔπειδὴ, ὄφιν &c. Hom.

3. A short syllable is often made long when the next word begins with a digammated vowel, as ὃς οἱ, for Ϝοι. Hom. Μέλανος οἴνοιο for Ϝοινοιο. Hom. 'Ουδὲ ους for Ϝους. Hom.

4. When three short syllables come together, it is necessary, on account of the measure in heroic verse, that one should be made long; as ᾱθάνατοι, Πρῑαμίδης.

Note.—This takes place even where the three syllables are in different words; as δῑα μὲν, Hom.; δρῠὸς ἔλυμα, Hes.

5. A vowel before another does not suffer elision, as in Latin, at the end of a word, unless an apostrophe is substituted.

Note.—The elision of diphthongs takes place in verbs only: real instances of this are to be found only in the fragments of the new comedy.

6. A long vowel, or a diphthong, is generally shortened at the end, and sometimes at the beginning, of a word, before a vowel; as οἴκω ἐν, Hom.; ποῖεῖ, Soph.; ἡ ζῶοι εἰμὲς, Theocr.

Note.—A long vowel, or a diphthong, may be considered as consisting of two short vowels. If the latter is supposed to suffer elision, the former will of course remain short; as οἴκὸ ἐν.

Crasis, or Contraction.

7. A contracted syllable is always long; as ὄφιες, ὄφῖς; ἱερὸς, ῑρός.

8. Two successive vowels, forming two syllables, even in different words, frequently coalesce in poetry; thus θεὸς becomes a monosyllable, χρυσέῳ a dissyllable, and in ἡ λάθετ', ἡ οὐκ ἐνόησεν, Hom.; ἡ ουκ are pronounced as one syllable.

Composition and Derivation.

9. Compound and derivative words follow the quantity of their primitives; as ἄτῑμος from τῑμὴ, φῠγη from ἔφῠγον; νῑκαω from νίκη.

Note.—Grammarians have sometimes complained that "non semper huic regulæ fidendum." But Dr. S. Clarke affirms;—"Derivata pro eo, a quâ parte fluant penultimam similiter vel perpetùo corripiunt, vel perpetùo producunt. Latini habent lĕgo, lēgi, quasi contractum ex lelĕgi. Similiter sĕdeo, sēdi, indeque sēdes, sēdile. Consimili quâdam ratione, apud Græcos fit. Verba nimirum innumera sunt, quæ in præsentibus et imperfectis omnibus et in aoristis primis, activis et mediis, semper producantur: in futuris autem et aoristis secundis omnibus, semper corripiantur; ut φαίνω, ἔφαινον, εφηνα; φᾰνῶ, ἐφᾰνον, ἐφᾰνόμην, indeque φᾰσις, φᾰνερὸς, &c. Κρῖνω, ἐκρῖνον, ἔκρῖνα; κρῖνω, indeque κρῖσις, κρῖτὸς, κρῖτης, &c.

According

According to the same analogy, μαρτῦρομαι, ἐμαρτῦρόμην, and ἐμαρτῦράμην, always lengthen the antepenultimate; as in Eurip. Med. 22. 619. 1410; Aristoph. Acharn 926. Nub 495, &c. though μαρτῦρουμαι, and its derivative μαρτῦρεω, shorten that syllable; as in Aristoph. Eccl. 557, Sophocl. Antigon. 525. In the same manner, κῦρω fut κῦρω, gives rise to κῦριος and κῦρεω, &c.

10. A, privative, is short, as ἄτιμος; but long in ἀθανατος.

11. Ἀρι, ἐρι, βρι, δυς, ζα, in composition, are short; as ζάθεος.

Of the Increments of Nouns and Adjectives.

12. The penultimate increase, A, of nouns and adjectives is short; as σώματος.

1. Except nouns in αν-ᾶνος; as τιταν, τιτᾶνος.

2. And the Doric genitive; as Ατρειδᾶο, μουσᾶν for μουσαων.

3. Also, κίςαν, κίςᾶνος; κρας, κρᾶτος; ψαρ, ψᾶρος; θώραξ, θώρᾶκος; ἱέραξ, ἱέρᾶκος; κορδαξ, κορδᾶκος; νέαξ, νέᾶκος; ῥάξ, ῥᾶγος; σύρφαξ, συρφᾶκος; Φαίαξ, Φαίᾶκος; φέναξ, φέναᾶκος, are long.

13. The penultimate increase, I, of nouns and adjectives, is short; as ἔρις, ἔριδος.

1. Except in words of two terminations; as δελφιν, δελφις, δελφῖνος.

2. And monosyllables; as θις, θῖνος; but Δις, Διὸς; θρὶξ, τρῖχος; στιξ, στῖχος; τις, τινὸς, are short.

3. Also nouns making ιδος or ιθος; as κνημις, κνημῖδος; ὄρνις, ὄρνιθος.

4. Nouns in ιξ, ιγος, or ικος; as μάστιξ, μαστῖγος; φοίνιξ, φοίνῖκος.

5. Monosyllables in ιψ, ιπος; as θριψ, θρῖπος.

14. The penultimate increase, Υ, of nouns and adjectives, is short; as πῦξ, πῦρός.

1. Except in words of two terminations; as φόρκυν and φόρκυς, with κήρυξ, κήρῦκος.

2. Γρυψ, γρυπὸς; γυψ, γυπὸς; βεβρυξ, βηβρυκος; are common.

Increment of Verbs.

15. The quantity of all tenses generally remains the same, as in the tense from which they are formed; as from κρῖνω are formed ἔκρῖνον, κρῖνομαι, ἐκρῖνόμην; from κρῖνῶ are formed κέκρῖκα, κέκρῖμαι, ἐκρῖθην.

16. The *perfect* follows the quantity of the first future; as φύω, φῦσω, πέφῦκα.

17. Verbs in πτω, except ῥίπτω, ῥίπτω, and those in υπτω, shorten the penultima of the perfect.

18. In the Attic reduplication the penultima is short; as ἐρίζω, ἤρικα, ἐρήρῖκα.

19. The *perfect middle* follows the quantity of the second aorist: as ἔτυπον, τέτῦπα; except βέβρῖθα, ἔρρῖγα, κέκρᾶγα, κέκρῖγα, μέμῦκα, πέπρᾶγα, πεφρῖκα, τέτρῖγα.

20. The doubtful vowels before σι are long; as τετύφᾶσι, δεικνῦσι.

21. In the *first aorist* participle, ασα is long.

22. In the *imperative* of verbs in μι, υ is short in polysyllables; as κέκλῦθι, but long in dissyllables, as κλῦθι.

23. In the *first future*, α, ι, and υ followed by σω, are short; as θαυμάζω, θαυμᾰσω; νομίζω, νομῐσω; κλύζω, κλῠσω.

24. But ασω is long before from verbs in αω preceeded by a vowel, or in ραω, as θεάω, θεᾶσω; δράω, δρᾶσω. Ισω and υσω are long from verbs in ω pure; as τιω, τῖσω; ἰσχύω, ἰσχῦσω.

The Quantity of doubtful Vowels in the First or Middle Syllables.

25. Α, ι, υ, before vowels, are generally short; as Ἡνίοχοι βεβάωτες, ἔφεσαν ὠκέας ἵππους. Hesiod.

1. Except Α, the penultimate of nouns in άων increasing by ο, and feminine proper names in αΐς, are long; as Μαχάων, Θαΐς. Also in ἀιξ, ἀηρ, κρᾶας, λᾶος, χᾶος, πᾶος: likewise the antepenultimate of ἄατος, ἀκρᾶαντος, ἀΐσσω, Ἀχᾶικος, Ἀΐονες, Ἀαρετις, βιάομαι, βαγίαος, &c.

2. Ι, the penultimate of nouns in ιων, ιος, is long, (except comparatives); as βραχίων, Ὠρίων. Also in κρῖος, κιάζω, ἰάομαι, ἰύζω, ἰωχμος, παλίωξις, πίειρ. But the penultimate of nouns in ια are accounted common; as σοφια, καλια. Likewise ι is said to be common in these: ἰαίνω, ἵεμαι, ἱερὸς, θριαι, θεῖον, λιαν, μνιον, ὀια, πιαινω, πιον.

3. Υ is long in ἐνῦα, θύας, ἰγνῦη, μύελος, μίωψ, πληκτύαζω, ὕετος, κυανεος.

26. Α, ι, υ, before final μα in neuter nouns, are long; as θεᾶμα, μνῆμα, χῦμα.

Except κλιμα, κριμα, ἔρυμα, πλυμα, which sometimes shorten the penultimate.

27. Α before β, γ, δ, θ, κ, λ, μ, ν, π, ρ, σ, τ, φ, χ, is mostly short; as ἀλλὰ κάκως ἀφίει, κρατερὸν δ' ἐπὶ μυθον ἔτελλε. Hom. Il. α. 25.

1. Except polysyllables in ατος, if ρ or a vowel goes before; as ἀνιᾶτος, Ἀρᾶτος, ἀπλᾶτος: except ἐρατος. Likewise nouns in ατης, whether gentiles proper, or the names of stones, are usually long; as Ἀσιᾶτης, ἀχᾶτης, Εὐφρᾶτης, Γαγᾶτης, &c. Also numerals in ακοσιος.

2. Α is also long in ἄβαλε, ἄγη, ἀδολεσχος, ἄκων, ἀκέσιος, Ἀκις, ἀλοσύνη, ἀμαρακος, Ἄπις, Ἄπυα, ἀτερος, ἀτη, κᾶδηξ, δᾶγυς, δᾶλος, Δᾶμοιτας, Δᾶμων, δᾶνος, διᾶκονος, διᾶμαλεισι, δρᾶπετης, θᾶτερος, Ἰᾶπυξ, Ἰᾶσων, Ἰθᾶγενης, κᾶναβινος, κᾶρις, κᾶρος, κλᾶδος, κοᾶλεμος, κοβᾶλος, κρᾶνιον, κρᾶνον, κρᾶτηρ, κυᾶκος, λᾶδων, λᾶρος, νᾶνος, ῥᾶπυ, ῥᾶπυια, Ὀμφᾶλη, πᾶνιζω, πετρᾶκης, ῥᾶδιξ, σᾶπερδης, σπᾶλιξ, Στυμφᾶλος, σφρᾶγις, τᾶλις, τιᾶρα, τρᾶνης, φᾶλαινα, φᾶνος, φλυᾶρος, ψᾶρος, ὑρᾶκιαω, ἀᾶτης, Ἀιᾶπος, Σαρδανᾶπαλος.

3. Α is common in ἀμαω, Ἄρης, χαραδρος, ἑανὸς, καλος, κραχυς. More frequently short in ἀλαὸς, ἀλίσκω, ἄριστον, prandium, ἀτάλλω, βαλσᾶμον, δᾶπεδον, Ζάκυνθος, ναυᾶγεω, ναυᾶγιον, τᾶφος, τᾶπης, ἀπάλαμνος: and more frequently long in ἀρᾶ, θᾶκος, φᾶρος.

4. In the nominative, α in Ἀπολλων is short; in other cases, common. Ἀνηρ in the nominative is common, in other cases long.

28. Ι before β, γ, δ, θ, κ, λ, μ, ν, π, σ, τ, φ, χ, is short. But ι before or after ρ is mostly long; as Βρῖθυ, μέγα, στιβαρὸν, τῷ δάμνησι στίχας ἀνδρῶν. Hom. Il. ε. 746.

1. Except nouns in ινη, ικη, ιτη, ιτης, ιτος, which generally have their penultimate long; as δῖνη, νῖκη, Ἀφροδῖτη, Θερσῖτης, ἀδηρῖτος.

2. Also ι is long in these: Ἀγχίσης, Αἰγῖνα, ἀγῖνεω, ἀκῖνάκης, ἀκόνιτον, ἀμνῖτος, ἀμφίσος, Δῖδω, δῖφαω, ἐνιπη, Ἐνιπευς, ἶσις, Ἴδη, Ἴδος, ἰθὺς, Ἴκαρος, ἴλη, ἴλιγξ, Ἴλιον, ἶλυς, Ἴλισσος, ἵμερος, ἰνίον, Ἰνω, Ἴναχος, Ἴφιτος, ἴφθιμος, ἰχὼρ, Καμῖνος, κῖκαμον, κῖκυς, κῖχρον, κλιβανος, κλῖμαξ, κλῖτες, κνίδη, κνῖπος, κονίσαλος, κονίλη, κοχλαμῖνος, κυμῖνον, λῖμος, μαρῖλα, Μισρίγανον, παρθενοπῖπης, πεδιλον, πῖδαξ, πῖδυω, πῖλεω, Πῖσα, σατῖνον, σελῖνον, σῖγη, Σῖδων, Σῖληνος, σῖσυμβριον, σίσυφος, σῖμος, σῖφων, σκῖπων, σμῖλη, σμῖλαξ, στιβη, στῖφος, τῖλυρος, τῖφυρις, τιθωνος, τῖμαω, τῖταν, τῖφυς, φῖμος, φῖνευς, φῖτυω, χαλῖνος, χελῖδων, χῖλιοι, χῖλος, χλῖδη, ψῖλος.

3. But ι in these is common: Αἰσχίνης, ἰθύνω, ἴκελος, ἰκέτης, ἱκάνω, ἱμὰς, κινεω, κοφινος, κοτινος, λιθος, μυρικη, πιναξ,

κῆρυξ, σίδη, φίλος; and sometimes in λίσας, θαμινος, λιπαρη, ὀπωρινός, ὀρθρινός.

4. Though ι before and after ρ is generally long, yet in the compounds and derivatives of τρις it is short, τρίνακρις excepted. It is also short in ξίφος, θρίδαξ, κρίνον, κρίσις, κρίτης, κριτος, τρίβος, θρίξ, τρίχος, with their compounds. And in materials in ινος; as κέδρινος, μύρρινος, &c.

29. Υ before β, δ, θ, κ, λ, ν, π, ρ, τ, φ, is short; but before γ, μ, σ, χ, mostly long: as Ὑμεῖς μάρτυροι ἐστε, φυλάσσετε δ' ὅρκια πιστά. Hom. Il. γ. 280.

1. Except verbals in υτηρ, υτης, υτος, υτωρ, are long; as λυτηρ, μηνυτης, κωκυτος, ῥυτωρ: except a few in υτος sometimes short. Dissyllables in υλη, υνη, υνος, are long; except μύλη, γύνη, πλῦνος. Adverbs in υδον are long; as βοτρυδον, πρυδον, except ῥυδον.

2. These also have υ long: Ἄβυδος, ἄγκυρα, ἁλιμυρης, ἀτρακτυλις, αὐτη, γεφυρα, Γερυνειος, γυρος, ζυθος, θυλακος, ισχυρος, κηρυκη, κελυφος, κινδυνος, κογχυλιον, κορκυρα, κοτυλη, κολυρα, κυριος, λαφυρον, λεπυρον, Λυδος, λυπη, μυλακομαι, μυραινα, μυρος, μυριοι, μυλιαω, ὄλυρα, διζυρος, ὀνογυρις, ορκυνος, πιτυρον, πλημμυρις, πυραμις, πυρος, ρυτη, σκυτος, συριγξ, σφυρα, τυδευς, τυρος, τρυπαω, υδος. χυλος, χελυνη.

3. But υ in these is common: βοθυνος, βυθος, κεκρυφαλος, παπυρος, ρυτις, σιβυνη, συλος, σφονδυλειος, τορυνη, τρυφαω, τυροεις, ὑγρος; and sometimes in γυλιος, κορυνη, λαγυνος, ξυλον, φυταω, φυταλια, φυταλμιος.

4. Though υ, before γ, μ, σ, χ, is generally long; yet it is short in the terminations υμος and υμων; as in ἡδυμος, διασυμων; and also in δυσις, ζυγος, Ἠλυσιος, θυμαλις, θυμον, κυμινον, λυγος, λυσις, μαρμαρυγη, μυχος, πυματος, τηυσιος, τρυγη, χυσις: and υ is often short in θυσανος, ὑμην, φυσις, and θυγατηρ.

Final Syllables.

30. Α, ι, υ, final are short: as μουσᾰ, τετυφᾰ, ινᾰ, ἱπποτᾰ; μελῐ, τιθημῐ, τυπτουσῐ, ιφῐ; σῠ, δακρῠ, γλυκῠ.

1. Except nouns in δα, θα, ρα, εα, ια, and polysyllables in αια; as κεραιᾱ; with ευλακᾱ. Διᾰ, ἴᾰ, μιᾰ, ποτνια, however, are short. So are ἄγκυρᾰ, ἄκανθᾰ, γέφυρᾰ, Κερκυρᾰ, ὄλυρᾰ, σκολοπενδρᾰ, σφυρᾰ, τανάγρᾰ; compounds of μετρᾰ, as γεωμετρᾰ; ρα preceded by a diphthong, as πειρᾰ; except αὐρᾱ, λαυρᾱ, πλευρᾱ, σαυρᾱ.

2. Duals of the first declension; as μουσᾱ.

3. Adjectives in α pure, and ρα from masculines in ος; as δικαια, ἡμετερα.

4. Nouns in εια from ευω; as δουλεια from δουλευω.

5. Oxytons of the first declension; as χαρα.

6. Accusatives in α from nouns in ευς, in the Attic dialect.

7. Vocatives from proper names in ας, as Αἰνεια, Παλλα.

8. The Doric α, as ἁ παγα for ἡ πηγη, βορεα for βορεου.

9. Adverbs in τι as usually long; in ιστι, short; as ἀνιδρωτῑ, Ἑλληνιστῐ.

10. Τυ Doric for συ is long; and adverbs in υ, as μεταξῡ: but αντικρυ is common.

11. The names of letters; as ξῖ, μῦ; to which add κρῖ, γρῦ.

12. The paragoge in pronouns and adverbs; as ουτοσι, νυνι; except the dative plural; as σοισι.

13. The Attic ι for α, ε, or ο; as ταυτι for ταυτα, ὁδὶ for ὅδε, τουτι for τουτο.

14. The imperfect and second aorist of verbs in υμι, as ἔφυ.

31. Αν, ιν, υν, final are short; as ἄν, ὦ Ἀιᾰν; παλῐν, εριν; συν.

1. Except that αν is long in circumflexed words, and in oxytons masculine; as πᾶν, Τιταν.

2. These adverbs, ἀγαν, ευαν, λιαν, περαν: and the accusative of the first declension, whose nominative is long; as Αἰνειαν, φιλιαν.

3. Ιν is long in words of two terminations; as δελφιν and δελφις.

4. Ἡμῖν and ὑμῖν when circumflexed: τιν Doric for σοι. Πριν is sometimes long in Homer.

5. Nouns in ιν, ινος, as ῥηγμιν, lengthen ιν final.

6. Υν is long in words of two terminations; as φορκυν and φορκυς.

7. Accusatives from υς long; as ὀφρυν, with νυν; though νυν the enclitic is short; as τοί νυν.

8. The imperfect and second aorist of verbs in υμι; as ἐδείκνυν, ἔφυν.

32. Αρ final is short, υρ final long; as Νεκταρ, αυταρ; ψιθυρ, πυρ.

Except that γαρ and αυταρ are sometimes long in Homer.

33. Ας, ις, υς, final are short; as λαμπᾰς, μεγᾰς, πολῐς, δῐς, βαθῠς.

1. Except that ας is long in the nominatives of participles; as τυψας: in all cases of the first declension; as Αἰνειας, ταμιας, φιλιας, μουσας, except the Doric accusative; as νυμφας; in plural accusatives in ας from the long α in the accusative singular of nouns; in ευς; and in nouns in ας-αντος; as Αἴας; with ταλας.

2. Also ις is long in words of two terminations; as δελφις and δελφιν; in nouns in ις increasing long; as κνημις, ὀρνις, κις, &c.

3. And υς is long in words of two terminations; as φορκυν and φορκυς; in monosyllables, as μυς, with κάμυς; oxytons making the genitive in ος pure; as πληθυς: ιχθυς is common. And in verbs in υμι; as ἐδείκνυς, &c.

On Quantity in the Latin Language.

As the prosody of the Latin language is considered to form an essential part of a classical education, we shall, therefore, devote the more peculiar attention to this part of the subject. In the course of which some rules will be given on the quantity of syllables usually said to be long or short by *authority*; which, we believe, have never yet been collected by any writer, ancient or modern. Perhaps, therefore, in particular for this, and for such other reasons as the candour of impartial discernment shall discover, we shall not incur the censure of having been too sanguine, should we have indulged the hope of being enabled to offer the most complete system on Latin prosody that has hitherto been presented to the public.

General Rules.

A Vowel before a Vowel.

1. One vowel preceding another, in the same word, is short; as pŭer, egregĭæ.

O Melibœe, Dĕus nobis hæc otĭa fecit. Virg.

2. The same happens, though an *h* intervene; as nĭhil, ăhenus, dĕhisco.

De nĭhilo nĭhil, in nĭhilum nil posse reverti. Pers.

Note.—H is generally considered only as a note of aspiration or breathing: though some ancient grammarians considered H as a consonant, and ranked it with the semi-vowels. See Terentianus Maurus, de syll. 511.

1. Except

1. Except the *i* of ſio is long, when it is not followed by *e* and *r*; as fīam, fīebam, fīat.

Omnia jam *fient*, *fīeri* quæ poſſe negabam.	Ovid.

2. The *e* of the genitive and dative of the fifth declenſion, when it comes between double *i*, is long; as faciēi; but it is ſhort in ſpĕi, and long and ſhort in rei and fidei.

Ventum erat ad Veſtæ quarta jam parte *diēi*.	Hor.
Extingue flammas; neve te diræ *ſpĕi*.	Seneca.
Ipſius rēi rationem reddere poſſis.	Lucret. *
Curtæ neſcio quid ſemper abeſt *rĕi*.	Hor.
Ille vir haud magna cum re, ſed plenu' *fidēi*.	Enn.
Unum pectus habent, *fidĕique* immobile vinclum.	Manil.

* Lucretius furniſhes five examples of rēi; Plautus two. Theſe caſes appear to have been anciently written both e-i and ei-i, which accounts for the variation in quantity.

3. Genitives in *ius* have the *i* long in proſe, though in poetry it is common: as unīus or unĭus, illīus or illĭus: except the *i* of alīus, which (formed by craſis from aliius) is always long, and the *i* of alterĭus, moſtly ſhort.

Navibus, infandum! amiſſis, unīus ob iram.	Virg.
Parſque meæ pœnæ totius inſtar erit.	Ovid.
Tu potes *alterīus* ſtudiis hærere Minervæ.	Claud.
Mox dum *alterīus* * obligurrias bona.	Enn.

* Alterīus is three times long in Terentianus; de ſyllab. 1072, de metr. 32; and 464.

4. The penultimate is long in auraï, aulaï, and other antique genitives of the firſt declenſion, and in ſuch vocatives as Pompeï, Caï; becauſe theſe were originally written with a double *i*; thus, Pompeii, Caii.

Æthereum ſenſum, atque aurāī ſimplicis ignem.	Virg.
Accipe Pompēī, deductum carmen ab illo.	Ovid.

5. In *ohe*, in *io* (whether interjection or proper name), and in Diana, the firſt ſyllable is common.

Ohe! jam ſatis eſt, *ŏhe*, libelle!	Mart.
Rurſus, *īo*, magnos clamat tibi Roma triumphos.	Mart.
Quâque ferebatur ductor Sidonius, *ĭo*.—Conclamant.	Sil. Ital.
Īo, verſa caput, primos mugiverat annos.	Propert.
Quæ tibi cauſa fugæ? quid *Io* freta longa pererras?	Ovid.
Experta eſt numen moriens utriuſque *Dianæ*.	Mart.
Juno, Veſta, Ceres, *Diana*, Minerva, Venus, Mars.	Enn.

6. Āër, Dīus, ēheu, have the firſt ſyllable long.

Proximus eſt *āër* illi levitate, locoque.	Ovid.
Italides: quas ipſa decus ſibi *dia* Camilla.	Virg.
Ēheu, quid volui miſero mihi? floribus Auſtrum, &c.	Virg.

7. In many Greek words a vowel is long, though immediately followed by another: as Achāia, Achelōus, Lāërtes, Lāodice, and other words compounded with λαος; Latōus, Enȳo, Panchāïa, Thrēïcius, Tāÿgetus, Trōas, Trōius, Galatīa, &c.

Erubuit Mavors, averſaque riſit *Enȳo*.	Claud.

8. Thoſe words which are written in Greek with the diphthong ει, and in Latin with a ſingle *e* or *i*, have that *e* or *i* long; as Ænēas, Muſēum, Darīus, Thalīa, Clīo, Elegīa, Orēades, &c.

Et *panacēa* potens, et Theſſala *centaurēa*.	Lucan.

9. Moſt adjectives in *eus*, formed from Greek proper names, have the *e* long; and it continues ſo, when reſolved into *ei*.

Oppida ſemoto Pelopēia marte vigerent.	Claud.

Note.—1. Thoſe which contain a choree (¯ ˘) in the two ſyllables immediately preceding the penultimate, were more frequently formed, for the convenience of furniſhing a dactyl, with the penultimate ſhort; as Hectorĕus, Neſtorĕus, Agenorĕus, Antenorĕus, &c.

2. In imitation of the Greeks, we ſee in Statius, the adjective Tiberēïus.

10. Names of towns, temples, or monuments in *ea*, *ia*, or *eum*, formed in the Greek manner, from the proper names of perſons, moſt commonly have the penultimate long; as Laodicēa, Apamēa, Cæſarēa, Alexandrīa, Antiochīa, Mauſolēum.

Terrarum mediis Apameæ mœnia clara.	Priſ.

11. Academia, Chorea, Platea, Malea, have the penultimate common.

In Latium ſpretis *Academīa* migrat Athenis.	Claud.
Atque *Academīa* celebratum nomine villam.	Laur. Tul.
Puræ ſunt *platĕæ*, nihil ut meditantibus obſtet.	Hor.
Aſpice! per bifidas plebs Romula funditur *platĕas*.	Prudent.

12. Greek genitives and accuſatives from nominatives in *eus* have the penultimate ſhort, according to the common dialect, long according to the Ionic.

Tydĕos illa dies: illum fugiuntque tremuntque.	Stat.
Ilionea petit dextrâ, levâque Sereſtum.	Virg.

Of Diphthongs.

3. A diphthong is long; as āurum, fœnus, āudio, ætas, pœnitet, Æneas, lāus, Graius, Cāius, Pompeius, Proculeius, &c.

Thesāuros, ignotum argenti pondus et *āuri*.	Virg.

1. Except præ, immediately before a vowel in a compound word, is generally ſhort.

Nec tota tamen ille prior *prăeunte* carina.	Virg.

Note.—Præ, originally being prai or prae, by the eliſion of the latter vowel before a following one, the words became pră'-uſtis, pra'-eunt, &c. Statius, however, (Theb. 6. 519.) and Sidonius Apollinarius (carm. 23.) preſerve the Æ long.

2. A diphthong is once ſhort in a line of Virgil, out of compoſition; thus,

Inſulæ̆ Ionio in magno, quas dira Celæno.	Virg.

3. The *eu* of Greek proper names in *eus* (genitive *eos*) becomes a diphthong.

Parvo dilexit ſpatio Minoïda *Thesēus*.	Propert.
Conditus Inarimes æternâ mole *Typhōeus*.	Lucan.

4. *Yi* is alſo a diphthong in Greek names, ſuch as Orithȳia, Ilithȳia, Harpyia, Agyieus, &c.

Orīthȳiān amans fulvis amplectitur alis.	Ovid.
Et patrio inſontes *Harpȳias* pellere regno.	Virg.

A Vowel before two Conſonants.

4. A vowel is long by *poſition*, when it immediately precedes two conſonants, one or both of which being in the ſame word with it; as ārma, Ērrabāt sīlvâ īn magna.

Pāſcere *opōrtet* oves, *dedūctum* dicere cārmen.	Virg.

5. Alſo, a vowel is long by *poſition*, when it immediately precedes a double conſonant (X or Z), or the letter J; as āxis, patrīzo, cūjus.

At nobis, *Pāx* alma, veni, ſpicamque teneto.	Tibul.
It Sthenelus, qualem Mavortia vidit *Amāzon*.	V. Flac.
Cauſa patrocinio non bona *pējor* erit.	Ovid.

Note.—In reality the J or I makes a diphthong with the preceding vowel; *viz.* major, pejor, are from māi-or, pēi-or:—and ſo in Māi-a, Māi-us, Bāi-æ, Troi-æ, Ai-ax, āi-unt, Cāi-eta, Cāi-us, and Grāi-us, diſſyllables. Hujus and cujus were, like illius, originally triſyllables, of which the firſt two, by ſynæreſis, coaleſced into one.

Except the compounds of jugum, which have the *i* ſhort before *j*; as bĭjugus, quadrĭjugus.

Martis equi *bĭjuges*, et magni currus Achillis.	Virg.

Note.—The word which in England we pronounce jugum, is in reality i-ugum or yu-gum, as the Germans at this day pronounce it. And in the meeting of two vowels, the former is tacitly elided, leaving the words bĭūgus, quadrĭūgus.

6. If

6. If the former of two words end in a ſhort vowel, and the next begin with two conſonants or a double letter, the vowel often remains ſhort.

Tu poteras viri es pennis *hebetarĕ ſmaragdos.* Ovid.
Jam medio apparet fluctu *nemorosă Zacynthus.* Virg.

Note.—Virgil, however, who has adopted ſuch licences as fultūs Hyacintho, and qui amant, has lengthened the ſhort ſyllable but in one line; ‘ Ferte citi ferrum, date *telā*, ſcandite muros.’ Many of theſe vowels, which at the end of a word are found long before two conſonants beginning a following word, are lengthened by the cæſura; as ‘ *Occultā* ſpolia, et plures de pace triumphos.’ Juven.

Of a Vowel before a Mute and a Liquid.

7. A vowel naturally ſhort, followed by a mute and a liquid, is common, though always pronounced ſhort in proſe: as ăgris, pharĕtra.

Natum ante ora *pātris, pătremque* obtroncat ad aras. Virg.
Nox *tenēbras* profert, Phœbus fugat inde *tenĕbras.* Ovid.

Note.—1. To produce this kind of poſition, three things are requiſite. 1. That the mute precede the liquid. 2. That the mute and the liquid be both in the following ſyllable; or otherwiſe this rule cannot take place; as in ab-luo, where the two conſonants cannot be founded in the latter ſyllable. 3. That the vowel preceding the mute and liquid be ſhort by nature. Hence the *a* in ācris and mātris is always long, becauſe the *a* in ācer and māter is always long.

2. In Latin words, *l* and *r* are the only liquids preceded by a vowel and a mute; in Greek words, *l*, *r*, and alſo *m*, *n*, have the ſame effect as Cyclopes, Tecmeſſa, Daphne.

3. H is not, neither in this, nor the foregoing rule, to be deemed a conſonant. Joined with any of the conſonants, it has not the power of lengthening a preceding ſhort vowel; not even with two conſonants (*i. e.* a mute and a liquid,) in the next ſyllable; as

Illic Pellæi proles *veſană* Philippi Lucan.
Cernitur egregius lapis hic, cui nomen *ăchates.* Priſ.
Hic *Păphius* myrtos, hic purpureas *amĕthyſtos.* Ovid.
Arbŏr habet frondes, pabula *ſempĕr* humus. Ovid.

Of Craſis, or Contraction.

8. Every ſyllable formed by the contraction of two ſyllables into one, is long; as cōgo for cŏ-ăgo, the genitive alīus for aliĭus.

Tityre *cōge* pecus, tu poſt carecta latebas. Virg.
Obſcuræ ſortis patres *ambāgibus* errant. Ovid.

Note.—This is a rule of very extenſive application. We are told that the ancients expreſſed a long ſyllable by a reduplication of the vowel; thus vēēnit for the perfect vēnit. And it will be found that in many words the long ſyllable ariſes from the contraction of two vowels. Thus we write tibīcen for tibiĭcen; ambāges for ambĕāges; bīgæ, trīgæ, for bijŭgæ, trijŭgæ; jūnior for jŭvĕnior; bōbus for bŏvibus; īt for iit; mī for mihi; and mālo for măgis vŏlo.

Of Derivatives.

9. Derivatives uſually follow the quantity of their primitives; as ănimus, ănima, ănimal, ănimalis, ănimoſus, ănimare: from lĕgo; lĕgebam, lĕgerem, lĕgam, &c.: but from lēgi; lēgeram, lēgerim, lēgero, &c. tōtalis from tōtus, and tōtus from tōt.

Nec *tōta* pars, homo terraï quota *tōtius* unus. Lucret.

1. Except deſiderative verbs in *urio*, which have the *u* ſhort, although formed from the participle in *urus*, that has *u* long; as nuptŭrio from nuptūrus.

2. Frequentative verbs, formed from the ſecond ſupine of the firſt conjugation, by changing *ātu* into *ĭto*, have the *i* ſhort; as clamĭto, volĭto.

Partŭriunt montes, naſcetur ridiculus mus. Hor.
Infelix ſua tecta ſuper *volĭtaverat* alis. Virg.

3. There are other long derivatives formed from ſhort primitives, and ſhort derivatives formed from long primitives.

Note.—1. Of the former, the following is nearly an accurate liſt: cōmo from cŏma; fōmes and fōmentum from fŏveo; hūmanus from hŏmo; jūcundus and jūmentum from jŭvo; mōbilis from mŏveo; tēgula from tĕgo; rēgula from rĕgo; trāgula from trăho; vōmer from vŏmo; vox-vōcis from vŏco; dēni from dĕcem; ſuſpīcio from ſuſpĭcor; ſēcius from ſĕcus; pēnuria from pĕnus; hūmor from hŭmus; jūgerum from jŭgum; mācero from măcer; plāco from plăceo.

2. Of the latter, the following are the principal; ărena, ăriſla from āreo; dĭcax from dīco; dĭſertus from dīſſero; dux-dŭcis from dūco; fĭdes from fīdo; frăgor and frăgilis from frango; lŭcerna from lūceo; dĭtio from dis-ditis; mĭco from mīca; năto from nātu; nŏto from nōtu; pronŭbus and pronŭba from nūbo; quăſillus from quālus; rŏſa from ros-rōris; ſtăbulis from ſtābam; ſŏpor from ſōpio; ſtĭpula and ſtĭpulor from ſtīpes; ſăgax from ſāgio; vădum from vādo; ăruſpex from āra; ambĭtus, ambĭtio, ambĭtioſus, from ambītu.

3. Some of theſe anomalies have, perhaps, ariſen from the influence of craſis and ſyncope. Thus mōbilis from mŏveo, may have been mŏvibilis; mōmentum, mŏvimentum; mōtum, mŏvitum; fōtum, fŏvitum from fŏveo; jūtum, jŭvātum; and jūmentum, jŭvamentum from jŭvo. Sometimes the derivative becomes ſhort by dropping one of the conſonants which rendered the word whence it is ſuppoſed to come, long by poſition; as dĭſertus from dīſſero; mămilla from mămma; vŏlutum from vōlvo; ſŏlutum from ſōlvo; tĭgillum from tīgnum; pŏtui from pōſſum. When the primitive is neceſſarily ſhort, by one vowel's preceding another, as in hyĕms, the derivative ſometimes becomes long, by the inſertion of a conſonant, as in hībērna, hīberno, hībernacula. Liquidus is ſuppoſed to have its firſt common (as it may be derived from the deponent liquor, or from the neuter liqueo,) on the following authority.

Craſſaque conveniunt *līquidis*, et *lĭquida* craſſis. Lucret.

Compound Words.

10. Compound words have the ſame quantity as the ſimple words from which they are formed; as perlĕgo from lĕgo; perlēgi from lēgi; imprŏbus from prŏbus; perjūrus from per and jus-jūris.

11. The quantity of the primitive word is generally preſerved in the compound, notwithſtanding the alteration of a vowel in the latter; thus accĭdo from cădo, accīdo from cædo, acquīro from quæro, inīquus, oblīquus, antīquus from æquus.

Multa renaſcentur, quæ jam *cecīdere*, *cădentque.* Hor.

Except 1. The following are ſhort compounds from long primitives; nihĭlum from hīlum; dejĕro and pejĕro from jūro; cauſidĭcus, fatidĭcus, malĕdĭcus, veridĭcus, from dīco; ſemiſŏpitus from ſōpitus; cognĭtum and agnĭtum from nōtum; hŏdie from hōc die.

2. Imbēcillus from băcillus has the ſecond ſyllable long: connūbium from nūbo has the *u* common.

Porto meis, nullo dextram ſubeunte *băcillo.* Juven.
Imbēcillus, iners, ſi quid vis? adde propino— Hor.
Connūbio jungam ſtabili, propriamque dicabo. Virg.
Hectoris Andromache! Pyrrhin' *connŭbia* ſervas. Virg.

12. Prepoſitions, in compoſition, have generally the ſame quantity as out of it; thus āmitto and dēduco have the firſt long, becauſe *ā* and *dē*, as *a* final and monoſyllabic *e* are long. Ăboleo and pĕrimo have the firſt ſhort, becauſe *ăb* and *pĕr*, as *b* and *r* final, are ſhort.

Expediam, primâ repetens *ăb* origine, famam. Virg.
Nec poterit ferrum, nec edax *ăbolere* vetuſtas. Ovid.

Note.—1. A prepoſition ending in a vowel, although out of compoſition it may be long, becomes ſhort by the firſt general rule, if followed by another vowel; as dĕoſculor, prŏhibeo. And if a ſhort prepoſition end in a conſonant, and be followed by another conſonant, it becomes long, by the ſecond general rule; as ādmitto, pērcello.

2. Sometimes the prepoſition, inſtead of becoming long by poſition, loſes its final conſonant, and remains ſhort; as ŏmitto, ŏperio.

Except 1. *Di* is ſhort in dĭrimo and dĭſertus: as

Hanc Deus et melior litem natura *dĭremit.* Ovid.
Cauſas, inquis, agam Cicerone *dĭſertius* ipſo. Mart.

2. *Rĕ*

12. *Rĕ* is ſhort; as rĕmitto, rĕpello, rĕfero. But *rē* (which here is ſuppoſed to be the ablative of *res*) is long in the imperſonal verb rēfert, it *concerns*.

Propellit Boreas; æſtus et unda *rĕfert*. Ovid.
Præterea nec jam mutari pabula *rēfert*. Virg.

13. *Pro*, when uſed as a Greek prepoſition for ante, is ſhort; as prŏpheta, prŏlogus, prŏpontis: but *pro*, a Latin prepoſition, is generally long; as prōdo, prōveho, prōmitto.

Miſit in has ſiquos longa *Prŏpontis* aquas. Ovid.
Quæ tam feſta dies, ut ceſſet *prōdere* furem. Juv.

Except prŏfundus, prŏfugio, prŏfugus, prŏnepos, prŏneptis, prŏfeſtus, prŏfari, prŏfiteor, prŏfanus, prŏfectò, prŏcella, prŏtervus, and prŏpago, ſignifying lineage; but prōpago, ſignifying a vine-ſtock, is long.

Note.—Notwithſtanding ſuch diſtinctions, propago, whoſe ſignification is always radically the ſame, may be conſidered among the doubtfuls; to which claſs procumbo is likewiſe added by ſome. But when the remarkable irregularity of *pro* is conſidered, without the ſlighteſt apparent reaſon to determine *why* it ſhould be *ſhort* in one word, *long* in another, and *common* in a third, it ſeems moſt probable, that it was in reality every where common, and that we ſhould, doubtleſs, find it ſo, had we enough of the ancient poetry extant. The word being evidently borrowed from the Greek, in which it was written with an *O-micron*, we might for that reaſon expect to find it invariably ſhort; but the Latin final *o* being in other caſes more generally long, we might, on this account, as naturally expect to find *pro* uſually made long, by thoſe at leaſt who were unacquainted with Greek. The poets ſeem to have availed themſelves of this convenient ambiguity by making *pro* long or ſhort, as proved moſt ſuitable to their purpoſe.

Of the final Vowels of firſt Words in Compoſition.

14. If the firſt member of a Latin compound word end in A, that vowel is long; as trādo, trāno, quāre, quāpropter, quātenus: but in Greek compounds the A is ſometimes ſhort; as ădipſos, ſometimes long, as Neāpolis.

Quāre agite ô proprios generatim diſcite cultus. Virg.
Extinguitque ſitim pomo, cui nomen *ădipſos*. Priſ.
Ambarum medio procera *Neāpolis* arcem. Avienus.

Except eădem, unleſs it be the ablative.

Non *eădem* arboribus pendet vindemia noſtris. Virg.

15. If the firſt member of a compound word terminate in *e*, that vowel is ſhort; as in the firſt ſyllables of nĕfas, nĕfandus, nĕque, trĕdecim, trĕcenti; in the ſecond of valĕdico, madĕfacio, ſtupĕfacio, tremĕfacio; and in the third of hujuſcĕmodi, ejuſcĕmodi.

Credebant hoc grande *nĕfas*, et morte piandum. Juven.

Except 1. The E is long in words compounded of *ſe* for *ſex* or for *ſemi*; as ſēdecim, ſēmeſtris, ſēmodius; (but in ſelibra it is ſhort.)

Sēmihominis Caci facies, quam dira tegebat. Virg.
Argenti libram mittebas: facta *sĕlibra* eſt. Mart.

2. It is long alſo in nēquis, nēquicquam, nēquam, nēquitia, nēquando, vidēlicet, and venēficus.

Nēquicquam ſeros exercet noctua cantus. Virg.

3. Liquefacio, tepefacio, and patefacio, have the *e* of the ſecond ſyllable chiefly ſhort, though ſometimes long; rarefacio and rarefio have the *e* generally long.

Sic mea perpetuis *liquĕfiunt* pectora curis. Ovid.
Tabe *liquĕfactis*, tendens ad ſidera palmas. Ovid.
Et *rarēfacit* calido miſcente vapore. Lucret.
Intremuit, motuque ſinus *patĕfecit* aquarum. Ovid.
Atque patēfecit, quas ante obſederat ater— Lucret.

Note.—Voſſius obſerves that Virgil ſhortens the e in ſuch words, and that Lucretius and Catullus lengthen it, the former without cæſura. Indeed it is probable that in theſe words it was generally conſidered common.

16. If the firſt member of a compound word terminate in *i*, that vowel is ſhort; as bĭvium, trĭvium, trĭceps, sĭquidem, fatĭdicus, agrĭcola, vatĭcinium, ſignĭfico, archĭtectus, dĭmeter, trĭmeter, Iphĭgenia, &c.

Jane *biceps!* anni tacite labentis origo. Ovid.

1. Except thoſe compounds in which the *i* is changed in declining; as quīdam, quīvis, quīlibet, quantīvis, quantīcunque, tantīdem, unīcuīque, eīdem, reīpublicæ, qualīqunque.

Jure mihi invideat *quivis*, ita te quoque amicum. Hor.

2. The final *i* is long in thoſe compounds which may be ſeparated without deſtroying the ſenſe; as ludīmagiſter, or ludī magiſter; parvīpendo, or parvī pendo; lucrīfacio, or lucrī facio; sīquis, or sī quis.

3. Thoſe words which in joining undergo a craſis or ſyncope, are long; as tibīcen for tibiicen; bigæ, trigæ, &c. for bĭjŭgæ, trĭjŭgæ, &c.; īlicet for īre licet; ſcīlicet for ſcīre licet; but tubĭcen, which has ſuffered neither, is ſhort by the general rule.

Īlicet ignis edax ſumma ad faſtigia vento. Virg.

4. Īdem maſculine is long; but in the neuter it is ſhort. Identidem has the penultimate ſhort.

Omnibus *īdem* animus, ſcelerata excedere terrâ. Virg.
Invitum qui ſervat, *idem* facit occidenti. Hor.
Qui ſedens adverſus *identĭdem* te. Catul.

5. The final *i* of the former compounding word, is long in nīmirum, ubīque, utrobīque, ibīdem.

Dixi equidem et dico. Captes aſtutus *ubīque*. Hor.

6. As the *i* is common in *ubi*; ſo it is in ubicunque and ubivis.

Clamat: io matres audite *ubīcunque* Latinæ. Virg.
Servor, *ubĭcunque* eſt: uni mea grudia ſervo? Ovid.

7. The compounds of *dies* have the final *i* of the firſt word long; as bīduum, trīduum, merīdies, prīdie, poſtrīdie.

Si ſolus tibi *trīduo* legatur. Mart.

Note.—1. Pridie and poſtridie are long by exception 3, being priori die, and poſteriori die.

2. Quotidie and quotidianus are ſaid to have the *i* ſometimes ſhort; but this is not ſatiſfactorily aſcertained, ſince the lines adduced in proof may, by the figure synizeſis, be differently meaſured: thus

Conjugis in culpa flagravit *quŏtĭdĭānā*.* Catul.

* Or quŏttīd-yā-nā. It muſt be confeſſed, however, that thus read the line is harſh, and is unneceſſarily rendered ſpondaic.

3. Trīginta, trīgeſimus, trīceſimus, and trīceni, are not conſidered as compound words, in which the *tri* is ſhort, as it is in all the real compounds of *tris*, *viz.* trĭceps, trĭplex, trĭformis, trĭcuſpis, tricenties, &c. &c. for triginta cannot with propriety be called a compound word, ſince *ginta* is only a termination. At all events the *tri* in triginta, &c. is ever long.

17. If the firſt member of a compound word terminate in *o*, it is ſhort; as Argŏnauta, Arctŏphylax, areŏpagus, bibliŏtheca, philŏſophus, ſacrŏſanctus, duŏdecim, hŏdie.

Non nautas puto vos, ſed *Argŏnautas*. Mart.
Non dices *hŏdie*, quorſum hæc tam putida tandem— Hor.

1. Except words compounded with *intro*, *retro*, *contro*, and *quando*; as intrōduco, intrōmitto, retrōcedo, contrōverſus, quandōque, &c.; but quandŏquidem has the *o* ſhort.

Ipſe *retrōverſus* ſqualentia protulit ora. Ovid.

2. Alſo aliōquin, utrōque, cæterōquin, utrōbique; and

and the compounds of *quō* ; as quōmodo, quōcunque, quōminus, quōcirca, quōvis, and quōque the adjective; but quŏque, the particle, has the *o* short.

Mendosa est natura, *aliōqui* recta, velut si. Hor.

3. Those words which in Greek are written with an *o-mega*, have the *o* long; as geōmetria, geōgraphia, minōtaurus, lagōpus.

Si meus aurită gaudet *lagōpode* Flaccus. Mart.

18. U and Y terminating the first member of a compound word, are short; as in Thrasўbulus, Eurўpylus, Polўpus, dŭcenti, dŭpondium, quadrŭpes, centŭplex, Trojŭgena, cornŭpeta, Polўdorus, Polўphemus, &c.

Nam fuit hoc vitiosus: in horâ sæpe *dŭcentos*— Hor.
Nam qualis quantusque cavo *Polўphemus* in antro. Virg.

Except jūdico, which in its first syllable is, by syncope, long.

Et sapit, et mecum facit, et Jove *jūdicat*, æquo. Hor.

Of the first Syllable of Dissyllabic Preterites.

19. Preterites of two syllables have the first long; as vēni, vīdi, vīci.

Vēnit summa dies, et ineluctabile tempus. Virg.

Except bĭbi, tŭli, dĕdi, stĕti, stĭti, scĭdi from scindo, (for abscīdi is long from abscido, and abscĭdi short from abscindo,) fĭdi from findo, (for fīdi and confīdi from fīdo are long.)

Aut *scĭdit*, et medias fecit sibi littora terras. Lucan.

Of the two first Syllables of Reduplicated Preterites.

20. Preterites doubling their first syllable, have that syllable and the following both short; as tĕtĭgi, pĕpŭli, pĕpĕri, dĭdĭci, tŭtŭdi, cĕcĭdi from cado.

Si *mĕmĭni* fuerant tibi quatuor, Ælia, dentes. Mart.
Littora, quæ cornu *pĕpŭlit* Saturnus equino. Val. Flac.

Except cecīdi from cædo has the second syllable long; and likewise those preterites, in which that syllable is followed by two consonants; as fĕfēlli, mŏmōrdi, spŏpōndi.

Ebrius et petulans, qui nullum forte *cecīdit*. Juven.
..... Vatum *spŏpōndit*: nulla propter me sacro. Senec.
Quæ Deus ipse viris intermina fortibus *spŏpōndit*. Prud.

Note.—From the authorities here quoted, it is evident that *spŏpondi* is the classic orthography, not *spospondi*, which would have the first syllable long by position, before *sp*, as we may invariably observe in compound words; as rĕspuo, rĕspicio, rĕspondeo, rĕspiro, rĕspergo, &c.

Of the first Syllable of Dissyllabic Supines.

21. Supines of two syllables, and the perfect participle formed from them, have the first syllable long; as vīsum, mōtum, ēsum, flētum, vīsus, mōtus, &c.

Terribiles *vīsu* formæ, letumque, laborque. Virg.
Quos ego — sed *mōtos* præstat componere fluctus. Virg.

1. Except the first syllable is short in dătum, rătum, sătum, ĭtum, lĭtum, quĭtum, sĭtum, rŭtum, and fŭtum, from the obsolete fuo, whence we have fŭturus.

Cui *dătus* hærebam custos, cursusque regebam. Virg.

2. Cĭtum from cieo of the second conjugation has the *i* short; but cītum from cio of the fourth conjugation has it long.

Corripuit sese, et tectis *cĭtus* extulit altis. Virg.
Unde ruunt toto *concīta* pericula mundo. Lucan.

3. Statum is common: hence we find stāturus, constāturus, obstāturus, stāmen, stātus-a-um, stātus-ûs, præstitum, stătio, stătuo, stăbilis, stăbulum, stător, stătim, &c.: the former of which are said to come from sto, the latter from sisto.

Hic *stātus* in cœlo multos permansit in annos. Ovid.
Damnavit multo *stāturum* sanguine Martem. Mart.
Instĭtor imperii, caupo famosus honorum. Claud.
Non *præstĭta* sibi præstat natura sed unus. Prop.
Constātura fuit Megalensis purpura centum. Mart.

Of the first Syllable of Polysyllabic Preterites and Supines.

22. Preterites and supines of more than two syllables have the same quantity in their first syllable as the present; thus vŏcavi and vŏcatum have the first short, because the first of vŏco is short: clāmavi and clāmatum have the first long, because the first of clāmo is long.

Si *vŏcat* officium turbâ cedente vehetur. Juven.
Induit, implevitque mero, divosque *vŏcavit*. Virg.

Except pŏsui, pŏsitum from pōno; gĕnui, gĕnitum from gīgno; pŏtui from possum; sŏlutum, vŏlutum from sōlvo and vōlvo.

Sæcula? qui tanti talem *gĕnuēre* parentes. Virg.

Of the Penultimate of Polysyllabic Supines.

23. Supines of more than two syllables, in *ātum*, *ētum*, and *ūtum*, lengthen the last syllable but one; as amātum, delētum, minūtum.

24. Supines in *itum*, from preterites in *ivi*, also have the penultimate long; as cupīvi, cupītum; petīvi, petītum; quæsīvi, quæsītum; polīvi, polītum; but the compounds of *eo*, ambio excepted, have the penultimate short.

25. Supines in *itum*, from any other preterites, shorten the penultimate; as cubui, cubĭtum; monui, monĭtum; abolevi, abolĭtum; agnovi, agnĭtum; credidi, credĭtum: recensītum of recenseo is long, on account of its origin from the obsolete censio, censivi.

Namque ferunt luctu Cycnum Phaëthontis *amāti*. Virg.
Delētas Volscorum acies, cecidisse Camillam. Virg.
Sustulit *exūtas* vinclis ad sidera palmas. Virg.
Sæpe *lacessītus* probris, gladiisque *petītus*. Claud.
Cedamus Phœbo, et *monĭti* meliora sequamur. Virg.
Prisca *recensītis* evolvite sæcula fastis. Claud.

Of the Penultimate of Participles in RUS.

26. Participles in *rus* always lengthen the last syllable but one; as amatūrus, habitūrus, lectūrus, auditūrus.

Tarda venit, seris *factūra* nepotibus umbram. Virg.

Increment of Nouns.

Note.—1. If the genitive case singular do not contain a greater number of syllables than the nominative, that noun has no increment, as penna, pennæ, caro, carnis. But if the genitive contains more syllables than the nominative, the penultimate of the genitive is the increment; and whether that syllable be long or short, it preserves the same quantity in all the oblique cases singular and plural. If bŏbus or būbus be an exception, we should recollect, it is so by syncope and crasis from bŏvibus. Ausonius, contrary to the practice of better authors, has an example of bŏbus short, as if it had been formed by simple syncope without crasis. See Auson. Epig. 62.

2. Nouns seldom have more than one increase in the singular: iter, jecur, (when its genitive is jecinoris,) supellex, and the compounds of caput, ending in *ps*, have two increments. The dative and ablative of the third declension have two; of the aforementioned words, three increments. They are reckoned in the retrograde order, beginning with the penultimate, for the last syllable is never considered as an increment.

i-ti-ne-ris, (1, 2)	i-ti-ne-ri-bus. (1, 2, 3)
je-ci-no-ris,	je-ci-no-ri-bus.
supel-lec-ti-lis,	supel-lec-ti-li-bus.
an-ci-pi-tis,	an-ci-pi-ti-bus.

Of the Increments of the Singular Number.

Of the first, second, fourth, and fifth Declensions.

27. In the first, fourth, and fifth declensions, there is no increment in the singular; except the antique increment of the first declension, by the resolution of the diphthong *æ* into *ai*, in which the *a* is long; as

Dives equûm, dives *pictāi* vestis et auri. Virg.

28. The increments of the second declension are short: as puĕri, vĭri, satŭri, tenĕri.

O *puĕri*! ne tanta animis assuescite bella. Virg.

Except Iber, Ibēri, and its compounds Celtiber, Celtibēri, which lengthen the penultimate; as

Quique feros movit Sertorius exul *Ibēros*. Lucan.
Vir *Celtibēris* non tacende gentibus. Mart.

Increments of the third Declension.

29. Nouns in A shorten the genitive penultimate; as dogma-ătis.

Non quivis videt immodulata *poēmăta* judex. Hor.

30. Nouns in I, compounds of meli, shorten the genitive penultimate; as hydromeli, hydromelĭtis.

31. Nouns in O, increasing in ĭnis, shorten the genitive penultimate; as cardo, cardĭnis; imago, imagĭnis.

32. Ēnis and ōnis, from *o*, are long; as anio, aniēnis; sermo, sermōnis.

1. Except gentiles in *o* generally shorten the increment; as Macedo, Macedŏnis; Saxo, Saxŏnis. To which add Lingŏnes, Seuŏnes, Tentŏnes, Vangiŏnes, Vascŏnes. Some lengthen the penultimate; as Sueſſiōnes, Vettōnes, Burgundiōnes, Eburōnes. Juvenal shortens Britones; Martial lengthens it.

2. Nouns in *on*, from the Greek *ων*, which sometimes drop the *n*, preserve in Latin the same quantity which they have in the original; as Agamemnon or Agamemno, Agamemnŏnis; Demiphon or Demipho, Demiphōnis.

Sanguine placâstis ventos, et *virgĭne* cæsâ. Virg.
Hæc tum multiplici populos *sermōne* replebat. Virg.
Non longinqua docent domito quod *Saxŏne* Tethys. Claud.
Qua nec terribiles Cimbri, nec *Britŏnes* unquam— Juven.
Quam veteres braccæ *Britōnes* pauperis et quam— Mart.
Quo ferus injusto petiit *Agamemnŏna* ferro— Ovid.

33. Nouns in EC lengthen the genitive penultimate; as halec-ēcis.

Halēcem sed quam protinus ipsa voret. Mart.

34. Nouns in D shorten the genitive penultimate; as David, Davĭdis.

Erecto indulget *Davĭdis* origine lumen. Juven.

Note.—Ecclesiastical writers often lengthen the penultimate of David.

35. Masculines in AL shorten the genitive penultimate; as Hannibal-ălis; sal-sălis (masculine or neuter).

36. Neuters in AL lengthen ālis; as animal-ālis.

Vela dabant læti, et spumas *sălis* ære ruebant. Virg.
Pronaque cum spectent *animālia* cætera terram. Ovid.

37. SOL lengthens sōlis: and also Hebrew nouns in EL lengthen the genitive penultimate; as Daniel-ēlis.

Regia *sōlis* erat sublimibus alta columnis. Ovid.

38. All other nouns in L shorten the genitive increment: as vigil-ĭlis, consul-ŭlis, exul-ŭlis.

Aut ursum, aut *pugĭles*, his nam plebecula gaudet. Hor.

39. Nouns in EN shorten the genitive penultimate; as crimen-ĭnis, flumen-ĭnis.

Quodque magis mirum est, auctorem *crimĭnis* hujus— Mart.

40. No certain rule can be given for the quantity of the increment of nouns ending in ON. Many lengthen the genitive penultimate; as Chiron, Demiphon, Agon, Helicon, Lacon, Sicyon, Solon, Simon: many shorten it; as Actæon, Agamemnon, Amazon, Jăson, Memnon, Philæmon, Orion, Sidon, Sindon: and Ægæon has the penultimate common.

Credit, et excludit sanos *Helicōne* poëtas. Hor.
Et velut absentem certatim *Actæŏna* clamant. Ovid.
Audierat duros laxantem *Ægæŏna* nexus. Stat.
Ægæōna suis immania terga lacertis. Ovid.

41. All other nouns in N lengthen the genitive penultimate; thus Titan-ānis, Siren-ēnis, delphin-īnis, Phorcyn-ȳnis.

Concitat iratus validos *Titānos* in arma. Ovid.
Orpheus in sylvis, inter *delphīnas* Arion Virg.

42. Neuter nouns in AR lengthen the genitive in āris; as calcar-āris.

Seu spumantis equi foderet *calcāribus* armos. Virg.

But these neuters shorten ăris; bacchar, jubar, nectar-ăris. To which add par-păris, and its compounds; as impar-impăris; dispar-dispăris, &c.; also hepar-ătis.

Pugnavere *păres*; succubuere *păres*. Mart.

43. But masculine nouns in AR shorten ăris; as Cæsar-ăris, Hamilcar-ăris, lar-lăris.

Ecce Dionæi processit *Cæsăris* astrum. Virg.

Except Car and Nar; as,

Laudibus immodicis *Cāres* in astra ferant. Mart.
Sulfureas posuit spiramina *Nāris* ad undas. Enn.

44. Greek nouns in TER lengthen the increment; as crater-ēris, character-ēris, spinther-ēris; except æther-ĕris.

Indulgent vino, et vertunt *cratēras* ahenos. Virg.
Quâcumque illa levem fugiens secat *æthĕra* pennis. Virg.

45. Nouns in OR lengthen ōris; as amor-ōris; timor-ōris.

1. Except neuter nouns; as marmor, æquor-ŏris.
2. Greek nouns in OR; as Hector, rhetor-ŏris.
3. Arbor-ŏris, and memor-memŏris.
4. Ador forms adŏris or adōris, whence adōreus in Virgil, Horace, and Claudian.

Inter spem curamque, *timōres* inter et iras. Hor.
Præterea fuit in tectis de *marmŏre* templum. Virg.
Ingemit et dulci frater cum *Castŏre* Pollux. Val. Flac.
Finiet, ante gravem quæ legerit *arbŏre* solem— Hor.
Mox ador, atque *adŏris* de polline pultificum far. Auson.
Emicat in nubes ardor *adōris*. Prif.

46. The following nouns lengthen the increment; fur-fūris, ver-vēris, Recimer-Recimēris, Byzer-Byzēris, Ser-Sēris, Iber-Ibēris, (as well as Iber of the second declension.)

Velleraque ut foliis depectant tenuia *Sēres*. Virg.

47. Other nouns in R, not mentioned, shorten the penultimate; as aer, aĕris; mulier, ĕris; cadaver-ĕris; iter, itĭneris; verber, verbĕris; vultur, ŭris; murmur, ŭris; femur, robur, jecur, ebur-ŏris; martyr-ȳris.

Si nigrum obscuro comprênderit *āĕra* cornu. Virg.
Aspice, ventosi ceciderunt *murmŭris* auræ. Virg.

48. Latin nouns in AS lengthen the increment; as pietas-ātis; Mæcenas-ātis; vas, vāsis, a vessel.

Insignem *pietāte* virum tot adire labores. Virg.

Except

Except anas, anătis; mas, măris; and vas, vădis, a ſecurity.

Tyrtæuſque *măres* animos in martia bella. Hor.

49. Greek nouns in AS ſhorten ădis, ătis, and ănis; as Pallas, lampas, ădis; artocreas, ătis; Melas, ănis.

Inſtar montis equum divina *Pallădis* arte. Virg.

50. Nouns in ES ſhorten the increment; as miles, milĭtis; ſeges, ſegĕtis; præſes, præsĭdis; obſes, obsĭdis; Ceres, Cerĕris; pes, pĕdis.

Metiri ſe quemque ſuo modulo ac *pĕde*, verum eſt. Hor.

Except locuples, quies, manſues, ētis; hæres, merces, ēdis: alſo Greek nouns which have ētis; as lebes, Thales, tapes, magnes, ētis.

Aſcanium ſurgentem, et ſpes *hærēdis* Iuli. Virg.
Viginti fulvos operoſo ex ære *lebētes*. Ovid.

51. Nouns in IS ſhorten the increment; as lapis, Phyllis, ĭdis; cinis, ĕris; ſanguis, ĭnis.

Immolat et pœnam ſcelerato ex *ſanguĭne* ſumit. Virg.

1. Except glis, glīris, and vīres the plural of vis, which lengthen the increment.

Somniculoſos ille porrigit *glīres*. Mart.
Sic fatus validis ingentem *vīribus* haſtam— Virg.

2. Latin nouns which have itis, as dis, dītis; lis, lītis; Quiris, Samnis, ītis; but Charis, a Greek noun, has Charĭtis ſhort.

Inſequeris tamen hunc, et *līte* moraris iniqua. Hor.
Tres fuerant *Charĭtes*, ſed dum mea Leſbia vixit— Auſon.

3. Crenis, Crenīdis; Neſis, Nesīdis; Pſophis, Pſophīdis, lengthen the penultimate; but Pſophis ſhortens it once in Statius.

Sylvaque, quæ fixam pelago *Nesīda* coronat. Stat.
Æpytios idem arbor agros, et *Pſophĭda* celſam. Stat.
Uſque ſub Orchomenon, *Pſophīdaque* Cylleneuque. Ovid.

4. Greek nouns in *is*, which have alſo the termination *in*; as Salamis, or Salamin-īnis.

Tiburis umbra tui, Teucer *Salamīna* patremque. Hor.

52. Nouns in OS lengthen the increment; as nepos, ōtis; flos, flōris; os, ōris; cuſtos, cuſtōdis; rhinoceros, ōtis; Tros, ōis; héros, ōis.

Qui legitis *flōres*, et humi naſcentia fraga. Virg.
Egreſſi optatâ potiuntur *Trōes* arenâ. Virg.

Except bos, bŏvis; compos, impos, ŏtis; which increaſe ſhort.

Perpetui tergo *bŏvis*, et luſtralibus extis. Virg.

53. Nouns in US ſhorten the increment; as lepus, corpus, ŏris; vellus, ĕris; tripus, ŏdis.

Ut canis in vacuo *lepŏrem* cum Gallicus arvo. Ovid.

1. Except thoſe nouns which have *udis*, *uris*, or *utis*; as incus, incūdis; tellus, tellūris; ſalus, ſalūtis. But theſe are ſhort; Ligŭris, from Ligur or Ligus; pecŭdis, from the obſolete pecus; and intercŭtis, from intercus.

In medio: ſacri *tripŏdes* viridesque coronæ— Virg.
Fas et *jūra* ſinunt: rivos deducere nulla— Virg.
Non ego te *Ligŭrum* ductor fortiſſime bello— Virg.

2. Comparatives in *us* lengthen the genitive penultimate; as melius, meliōris.

Perge, decet, forſan miſeros *meliōra* ſequentur. Virg.

54. Nouns in YS ſhorten the increment y̆dis and y̆dos, and lengthens ȳnis; as chlamys, y̆dis or y̆dos; Trachys, ȳnis.

In medio, *chlamy̆de*, et pictis conſpectus in armis. Virg.
Herculeâ *Trachȳne* jube, ſub imagine regis. Ovid.

55. Nouns in S, preceded by a conſonant, ſhorten their increment; as cœlebs, ĭbis; ſtips, ſtĭpis; Lælaps, ăpis; Cecrops, Dolops, ŏpis; auceps, cŭpis; hiems, ĕmis; alſo anceps, biceps, cĭpĭtis, and ſimilar compounds of caput, in which both increments are ſhort.

Ad matres primo *ancĭpĭtes*, oculiſque malignis— Virg.
Hic *Dolŏpum* manus, hic ſævus tendebat Achilles. Virg.

Except Cyclops, ōpis; ſeps, ſēpis; gryps, y̆phis; Cecrops, ōpis; plebs, plēbis; hydrops, ōpis; and genitives long by poſition; as excors, excordis; pars, partis.

Fortunam, et mores antiquæ *plēbis*, et idem— Hor.
Antiphatæ memores immanſuetique *Cyclōpis*. Ovid.

56. Nouns in T ſhorten the penultimate of *ĭtis*; as caput, ĭtis; ſinciput, ſincipĭtis; occiput, occipĭtis.

Magna fuit quondam *capĭtis* reverentia cani. Ovid.

57. A noun in X ſhortens the vowel before *gis*; as harpax, ăgis; grex, grĕgis; aquilex, lĕgis; biturix, ĭgis; Styx, y̆gis; Allobrox, ŏgis; conjux, ŭgis; Phryx, y̆gis.

Quinque *grĕges* illi balantum, quina redibant. Virg.
Ad *Sty̆ga* Tænariâ eſt auſus deſcendere portâ. Ovid.

Except lex, lēgis; illex, exlex, lēgis; rex, rēgis; coccyx, ȳgis; maſtix, īgis; and frūgis, from the obſolete frux.

Omnia ſub *lēges* mors vocat atra ſuas. Ovid.

58. A noun in EX ſhortens *ĭcis*; as vertex, ĭcis; pontifex, ĭcis: vibex (rather vibix), īcis excepted.

Qualem virgineo demeſſum *pollĭce* florem— Virg.

59. But EX having *ecis*, lengthens the increment; as vervex, ēcis.

Vervēcum in patria, craſſoque ſub aëre naſci. Juven.

Except nex, nĕcis, vĭcis, and prĕcis, wanting nominatives; alſo fœniſex; reſex, ĕcis; and ſupellex, ectĭlis.

Quam *nĕcis* artifices arte perire ſua. Ovid.

60. And all other nouns in X generally lengthen the increment; thus nouns in *ax*; as pax, pācis; fornax, ācis.

Except abax, ſmilax, Atrax, dropax, fax, Atax, climax, panax, opoponax, ſtyrax, colax; the compounds of phylax and corax; as Arctophylax, Nomophylax, nycticorax, phalacrocorax, ăcis.

Fraternaque fidem *pācis* petiitque deditque. Ovid.
Dicite *fēlices* animæ tuque, optime vates. Virg.

61. Thus words in IX; as radix, felix, cicatrix, nutrix, victrix, altrix, perdix, coturnix, pernix, lodix, icis.

1. Except appendix, chœnix, coxendix, cilix, calix, fornix, filix, hiſtrix, larix, pix, ſalix; varix, ĭcis, and ſtrix, ſtrigis.

2. Nix, nĭvis; maſtix, ĭchis, a gum.

Ecce *coturnīces* inter ſua prælia vivunt. Ovid.
Et *filĭcem* curvis inviſam paſcit aratris. Virg.
Et *ſtrĭgis* inventæ per buſta jacentia plumæ. Propert.
Jam fatis terris *nĭvis* atque diræ. Hor.
Contritumque ſimul cum *maſtĭche* confer anethum. Seren. Samon.

62. And

62. And words in OX; as vox, vōcis; velox, ōcis. Except Cappadox; præcox, ŏcis.

Condimus et magna fupremum *vōce* ciemus. Virg.
Mancip is locuples, eget æris *Cappadŏcum* rex. Hor.

63. In UX; as lux, lūcis; Pollux, lūcis. Except dux, crux, nux, trux-ŭcis.

Reftitit Æneas, claraque in *lūce* refulfit. Virg.
Confedere *dŭces*, et vulgi ftante corona. Ovid.

64. In YX; as bombyx, ȳcis. Except onyx, ўchis; Eryx, ўcis; calyx, ўcis; Naryx, ўcis. But Sandyx and Bebryx have the increment common.

Nec fiqua Arabio lucet *bombȳce* puella. Propert.
Illaque plebeio, vel fit *fandȳcis* amictu. Propert.
Interdum Libyco fucantur *fandȳce* pinnæ. Gratius.
Bebrȳcis et Scythici procul inclementia facri. Val. Flac

Of the Increments of the Plural Number.

65. The plural increments, A, E, O, are long; as musārum, ambābus, animābas; rērum, rēbus, hōrum, quōrum, regnōrum.

Tuque, *hārum* interpres *curārum*, et confcia, Juno. Virg.
Scilicet in nobis *rērum* natura novata eft. Ovid.
Rēbus in anguftis facile eft contemnere vitam. Mart.
Projicis? O Latio caput *hōrum* et caufa *malōrum*. Virg.

66. The plural increments I and U are fhort; as quĭbus, trĭbus, montĭbus, verŭbus, lacŭbus.

Except būbus or bōbus, which, on account of its contraction from bŏvĭbus, as already explained, is long.

Necte *trĭbus* nodis ternos, Amarylli, colores. Virg.
Non *opĭbus* mentes hominum curæque levantur. Tibul.
Pars in frufta fecant, *verŭbufque* trementia figunt. Virg.
Cum faber eduxit, *lacŭbus* demittit: at illud —— Ovid.
Et totum luftret curvatis *arcŭbus* orbem. Manil.
Et Tiberis noftris advena *būbus* erat. Propert.

Increment of Verbs.

Note.—1. When any part of a verb exceeds, in the number of fyllables, the fecond perfon fingular of the indicative prefent, active, the excefs is confidered as the increment. As in nouns, the laft fyllable is never reckoned the increment; fo alfo in verbs; and, therefore, when there is only one increafe, it muft be the penultimate.

2. Thus amat, amant, ama, amem, amans, containing, like amas, only two fyllables, have no increment. A-ma(1)-mus, a-ma(1)-tis, fle(1)-tis, fci(1)-res, da(1)-mus, have one increment, becaufe they exceed, by one fyllable, amas, fles, fcis, and das. A-ma(1)-ba(2)-mus, a-ma(1)-bi(2)-mus, have two increments, becaufe they exceed amas by two fyllables. A-ma(1)-ve(2)-ri(3)-tis has three increments. Au-di(1)-e(2)-ba(3)-mi(4)-ni has four, becaufe it has four fyllables more than audis. In determining the increments of deponent verbs, an active voice may be fuppofed; thus, co-na(1)-tur has one increment; co-na(1)-ba(2)-tur, two; cn-na(1)-re(2)-mi(3)-ni, three; becaufe conas of the fictitious active voice has but two fyllables. Or their increments may alfo be regulated by other verbs of the fame conjugation and number of fyllables, which have an active voice.

67. A is long in the increments of verbs; as flābam, ftāres, properāmus, docebāmur, audiebāmini.

Serius aut citius fedem *properāmus* ad unam. Ovid.
Pugnābant armis, quæ poft *fabricāverat* ufus. Hor.
Et *cantāre* pares, et refpondere *parāti*. Virg.
Contemplātor item, cum fe nux plurima filvis. Virg.

Except that *do*, and its compounds of the firft conjugation, have *a* fhort in their firft increment; as dămus, dăbunt, dăre; fo circundămus, venundăbo, &c. But in any other increment *do*, like its compounds of the third conjugation, is long; as dăbāmus, dederātis, circundăbāmus, credāmus.

Hic lacrymis vitam *dămus*, et miferefcimus ultro. Virg.
Taurino quantum poffent *circumdăre* tergo. Virg.
Nam quod confilium, aut quæ jam fortuna *dabātur*? Virg.

68. E is long in the increments of verbs; as flēbam, rēbar, amēris, docērem, legērunt, amēmus, amarēmus, amavifsētis, regēbat, audiēbar, &c.

Sic equidem *ducēbam* animo, *rēbarque* futurum. Virg.
Neu juvenes celebret multo fermone, *cavēto*. Tibul.

Except 1. E before R is fhort in the firft increment of all the prefent and imperfect tenfes of the third conjugation: as legĕres or legĕre, the indicative prefent paffive; legĕre, the infinitive prefent active, and imperative paffive; legĕrem and legĕrer, the imperfect fubjunctive active and paffive. But rēris and rēre are long; as amarēris, amarēre; docerēris, docerēre; regerēris, regerēre; audirēris, audirēre.

Parcĕre perfonis, *dicĕre* de vitiis. Mart.
Sic flendus Peleus, fi morerētur, erat. Ovid.
Cum confternatis *diripĕrēris* equis. Ovid.
Noftra, neque ad fedes victor *vehĕrēre*. Virg.

2. Bĕris and bĕre are every where fhort; as amabĕris, amabĕre; monebĕris, monebĕre: and among the ancients, largibĕris, experibĕre of the fourth. Excepting where the *b* belongs to the termination of the prefent; as fcribēris and fcribēre of the future paffive being long by the general rule.

Sanguine Trojano et Rutulo *dotabĕre*, virgo. Virg.
Scribēris Vario fortis, et hoftium— Hor.

3. E, before *ram*, *rim*, *ro*, and the perfons formed from them, is fhort; as amavĕram, amavĕrim, amavĕro; monuĕram, monuĕrim, monuĕro; rexĕram, rexĕrim, rexĕro; ĕram, fuĕram; potĕro, potuĕro, &c.

Vincere, nec duro *potĕris* convellere ferro. Virg.

4. By fyftole, the poets fometimes fhorten *e* before *runt*; as

Obftupui *ftetĕruntque* comæ, et vox faucibus hæfit. Virg.
Dî tibi divitias *dedĕrunt*, artemque fruendi. Hor.

69. In every increment, (whether the firft, fecond, third, or fourth,) I is fhort; as amabĭmus, docebĭmĭni, regĭtur, regĭmus, audĭmĭni, audĭebamĭni.

Mora tarda mente cedat: fimul ite; *fequĭmĭni*. Catul.
Venĭmus; et latos indagine *cinxĭmus* agros. Ovid.

Note.—In fuch verbs of the fourth conjugation as have in the firft perfon plural of their prefent and perfect indicative, the fame words, in regard to fpelling, there is a diftinction by the quantity; the penultimate of the former being long, as venīmus, reperīmus; and that of the latter fhort, as venĭmus, reperĭmus.

Except 1. Thefe have *i* long; sīmus, velīmus, nolīmus, with the other perfons coming from them and their compounds; as sītis, velītis, nolītis, nolīte, nolītote; malīmus, malītis; pofsīmus, pofsītis, &c.

Ne nimium *sīmus*, ftultorum more, molefti. Mart.

2. I before *vi* in preterites is always long; as petīvi, quæsīvi, audīvi, and in its derivative perfons; as petīvifti, quæsīvit, audīvimus, &c.

Ceffi et fublato montem genitore *petīvi*. Virg.

3. The firft increment of the fourth conjugation is long; as audīmus, audītis, audītur, audīto, audīrem, fcīmus, fcīre; and in audībam, as it is fometimes contracted;

tracted; and in ībam and ībo, from eo. But when a vowel follows, *i* is short by position, as audiēbam.

Nutrībat teneris immulgens ubera labris.	Virg.
Lenībunt tacito vulnera nostra sinu.	Propert.
Tu ne cede malis; sed contra audentior *ito*.	Virg.
Jungimus hospitio dextras, et tecta *subīmus*.	Virg.
Qui non edictis, sacturi *site* fabulis.	Plaut.

Note.—Imus in every preterite, and in that of the fourth conjugation also, is short; as juvimus, vidĭmus, fecimus, venĭmus, amavimus, adolevĭmus, pepercĭmus, munivĭmus.

4. Rĭmus and rĭtis in the subjunctive preterite are short.

Egerĭmus nosti; et nimium meminisse necesse est. Virg.

5. Rimus and rĭtis in the perfect future subjunctive are common.

Quas ob res, ubi *viderīmus* nil posse creari.	Lucret.
Nec mî aurum posco, nec mî pretium *dederītis*.	Enn.
Videritis stellas illic, ubi circulus axem.	Ovid.
Dein cum millia multa *fecerimus*.	Catul.
Oderīmus magis in culpam pœnasque creatos.	Manil.
Cum maris Ionii transieritis aquas.	Ovid.

Note—We have innumerable examples to prove that *rimis* and *ritis* in the perfect future subjunctive is common; but concerning the quantity of *rimus* and *ritis* in the preterite subjunctive, grammarians are not agreed. A difficulty in this investigation arises from the similarity of the two tenses; the latter having not unfrequently been mistaken for the former, and *vice versâ*: since "the perfect of the potential seems to be both past-perfect contingent, and future-perfect contingent. The perfect future has also so great an affinity to the preterperfect potential, that often a word may, consistently with the sense, be supposed to belong to either. As these tenses are usually interpreted in English, there is a great resemblance in their structure, as well as in the ideas which they express. Both are composed of verbs in present time, the one a verb of present liberty, or the like, the other of present intention or obligation; of an infinitive denoting subsequent or dependent possession; and a participle significant of the perfection of the action denoted by the verb: thus, *I may have written*, *I shall have written*." We find by A. Gellius, 18, 2, that it was a subject of dispute at Rome, whether the tense in *rim* ought to be considered as *past* or *future*, or both. Such disputes may, perhaps, have arisen from the accessory circumstances which are implied, besides the immediate action of the verb; in the same manner as, in English, two forms, precisely the same in their structure and reference, are characterised by certain grammarians under different times, *viz. I may write*, and *I shall write*, the former being named, from the accessory idea, a present, and the latter, from the depending action, a future, while, in reality, if we apply the same criterion to them, they are both present, or both future. Indeed it has been contended that the future had the termination *rim*, as well as *ro*; so that it is reckoned not improbable that both may originally have been but one tense, which had both a past and future reference. It is evident that this is a consideration by no means irrelevant, but indispensably necessary, before we can, with certainty, determine the quantity of *rimus* and *ritis* in the subjunctive preterite. In addition to the authorities for reckoning *rimus* and *ritis* common, there is likewise sufficient example from Horace, Martial, Ovid, Seneca, Tibullus, and Plautus, to consider *ris* of the future, at least as common; and this is an argument founded on the analogy of other tenses between the quantity of the final syllable of the second person singular, and the penultimate of the first and second persons plural, for considering the following *rimus* and *ritis* also common.—*Ris*, *rimus*, and *ritis*, are usually accounted short; but it is exceedingly probable that, whether referred to the preterite or perfect future, they still might be used as common.

70. O, in the increment of verbs, is always long; as amatōte, facitōte, itōte.

Cumquè loqui poterit, matrem *facitōte* salutet. Ovid.

71. U, in the increment of verbs, is short; as sŭmus, possŭmus, volŭmus, malŭmus.

Dicite, Pierides: non omnia *possŭmus* omnes. Virg.

Note.—For U in the penultimate of the future in *rus*, see the rule.

Section II.—*On the quantity of the penultimate and antepenultimate syllables, and on the quantity of such as are usually said to be long or short by authority.*

Note.—It is very well known that the prosodial rules, hitherto extant, determine not the quantity of every syllable of the Latin language; but of such only as are more commonly ascertained from the circumstances of *position*, *derivation*, *preterites*, *supines*, *increment*, and *final syllables*. Consequently, in the greater number of instances, the inquiries of the student are at a stand until he can appeal to that *observation*, which would be more happily employed in confirming his previous acquisitions. And thus with but partial instead of complete information, he arrives at but mere intimation, the first stage of his progress, at the time when he unquestionably might achieve the second, the satisfactory and practical illustration of his previous attainments. If we depend on practice for the *first principles* of our knowledge, we lose its best and happiest effect. Practice will always evince its most prevalent efficacy, when its office is alone to rear the superstructure on the basis of regular system and theory, and not to attempt the casual and fortuitous task of laying a transitory foundation, and that too on a vacuum, the baseless texture of ignorance, not admitting that analogy and arrangement, that reciprocal and corroborative illustration, which so essentially aid the intellectual faculty with effectual and permanent impression. The part which follows is an attempt to supply this *desideratum*. It was obtained by four consecutive analyses of the language, in which every word and syllable passed under minute and decisive consideration. This investigation was undertaken in consequence of its being suspected, that since it is a general rule in the prosody of the Latin language, that a vowel before two consonants, &c. is long, that a law exists, directly the reverse of this, and of not less extensive influence; *viz.* that a vowel before a single consonant is short: though each of these general and very extensive rules, may have, in special cases, their exceptions. The result justified the expectation, and proved, that principally with the addition of another general rule, the prosodial system might become so comprehensive, as to include and provide for the whole language; and consequently, for all those syllables usually said to be long or short only by authority. The exceptions to this general principle are chiefly included in the rules for the penultimate and antepenultimate syllables. And though some of these have appeared in former treatises, yet from their enlargement, the addition of others, the general rule, and its more special exceptions, which have arisen from the repeated analysis we have undertaken, it will be easy to perceive, that we have in this part some claim to originality. In the preceding rules, and in such as shall follow on final syllables, in justice to the subject and our readers, we have felt it indispensably incumbent on us to avail ourselves of the valuable researches of preceding and contemporary prosodians. And the originality of this section places us under the obligation of devoting peculiar attention, especially to the demonstrative part, that every rule and exception, which we now first offer, might not appear to rest on our bare assertion, but on the only legitimate warrant, poetic sanction. And thus, perhaps, we have now the opportunity, for the first time, of offering the only complete collection or system which determines the quantity of every syllable, at least of pure and Augustan Latin, that has hitherto been presented to the public.

1. Masculine patronymics in *ades* or *ides* usually shorten the penultimate; as Priamĭdes, Atlantiădes.

Atque hîc *priamĭdem* laniatum corpore toto. Virg. Æn. 6. 494.

1. Except those formed from nouns in *eus*; as [1] Pelīdes.

2. Also [2] Amphiaraīdes, [3] Belīdes, [4] Japetionīdes, [5] Lycurgīdes.

1. Par sibi Pelīdes: nec inania Tartara sentit.	Ovid. Met. 12. 619.
2. *Amphiaraīdes* Naupactoo Acheloo.	Ovid. Fas. 2. 43.
3. *Belīdæ* nomen Palamedis et inclyta fama.	Virg. Æn. 2. 82.
4. *Japetionīdes* Atlas fuit. Ultima tellus.	Ovid. Met. 4. 632.
5. Quique *Lycurgīden* lethavit, et arbore natum.	Ovid. in Ib. 505.

2. Patronymics and similar words in *ais*, *eis*, and *ois*, lengthen the penultimate; as Achāis, Ptolemais, Chrysēis, Ænēis, Minōis, and Latōis.

Protinus Ægides, raptâ *Minōĭde*, Dian. Ovid. Met. 8. 174.

Except [1] Thebāis and [2] Phocāis: [3] Nerēis is common.

1. The-

1. *Thebaides* juſſis tua tempora frondibus ornant. Ovid. Met. 6. 163.
2. *Phocăis* effundit vaſtos baliſta molares. Silius Ital. 1. 334.
3. Et tibi præ invidia *Nerĭdes* increpitarent. Prop. 1. 26. 15.
4. *Nerēi*, te vereor; tua fulmine ſævior ira eſt. Ovid. Met 13.858.

3. Words ending in *acus*, *icus*, and *idus*, ſhorten the penultimate; as [1]Ægyptiăcus, [3]aromatĭcus, [4]callĭdus.

1. Quos *Ægyptiăcos* ſemper renuiſtis ab ævo— Cole.
2. Idaliæ lucos, ubi mollis *amarăcus* illum— Virg. Æn. 1. 693.
3. Vatis *fatidĭcæ*, cecinit quæ prima futuros. Virg. Æn. 8. 340.
4. Utque ſuum laqueis, quos *callĭdus* abdidit anceps. Ovid.

1. Except [1]Merācus, [2]opācus, [3]amīcus, [4]aprīcus, [5]antīcus, [6]fīcus, [7]mendīcus, [8]poſtīcus, [9]pudīcus, [10]umbilīcus, [11]vīcus.

2. Alſo [12]nīdus, [13]sīdus; [14]fīdus, infīdus: but [15]perfīdus (from *per* and *fides*), follows the general rule.

1. Ah! pereat quicunque *merācas* repperit uvas. Prop. 2. 3. 27.
2. Continui montes, niſi diſſocientur *opāca*. Hor. Epiſt. 1. 16.
3. Eſſe tibi magnus, Theleſine, videris *amīcus*— Mart. 3. 40. 3.
4. Duceret *aprīcis* in collibus uva colorem. Virg. Ecl. 9. 49.
5. Et ſuper *antīcos* in frontis imagine crines— Mill.
6. Cum me *fīcus* alit, cum paſcar dulcibus uvis. Mart. 13. 49.
7. Nec *mendīca* ferat barbati prandia nudi— Mart. 14. 81.
8. Occipiti cæco, *poſtīcæ* occurrite ſannæ. Perſ. 1. 62.
9. Perduci poterit tam frugi tamque *pudīca*. Hor. b. 2. s. 5. 77.
10. Nec *umbilīcis* quod decorus et cedro. Mart. 8. 61.
11. Et tua patricius culmina *vīcus* habet. Mart. 7. 72.
12. Ore ferunt, dulcem *nīdis* immitibus eſcam. Virg. G. 4. 17.
13. Hoc metuens, cœli menſes et *sīdera* ſerva. Virg. G. 1. 335.
14. Fortunata domus, modò ſit tibi *fīdus amīcus*. Prop. 3. 20. 9.
15. Diſſimulare etiam ſperaſti, *perfĭde* tantum. Virg. Æn. 4. 305.

4. Words ending in [1]*imus* or [2]*ymus*, ſhorten the penultimate; as finitĭmus, maxĭmus, thўmus, fortiſsĭmus.

Thus anĭmus, decĭmus, fĭmus, ocĭmum, anonўmus, callionўmus, and all adjectives and ſuperlatives in *imus* ſhorten the penultimate.

1. Entelle heroum quondam *fortiſsĭme* fruſtra. Virg. Æn. 5. 389.
2. Fervet opus, redolentque *thўmo* fragrantia mella. Virg. G. 4. 169.

1. Except [1]bīmus, [2]līmus, [3]mīmus, [4]opīmus, [5]quadrīmus, [6]sīmus, [7]trīmus.

2. And two ſuperlatives, īmus and prīmus.

1. Tum vitulos, *bīmâ* curvans, jam cornua fronte. Virg. Georg.
2. *Līmus* ut hic dureſcit, et hæc ut cera liqueſcit. Virg. Ecl. 8. 80.
3. Scribere ſi fas eſt imitantes turpia *mīmos*— Ovid. Triſt. 2. 515.
4. Aut ſpoliis ego jam raptis laudabor *opīmis*. Virg. Æn. 10. 449.
5. Deprome *quadrīmum* Sabinâ. Hor. b. 1. od. 9. 7.
6. Dum tenera attondent *sīmæ* virgulta capellæ. Virg. Ecl. 10. 7.
7. Quæ, velut latis equa *trīma* campis— Hor. b. 3. od. 11. v. 9.

Note.—The quantity of the penultimate of patrimus and matrimus is undetermined: Facciolatus, the Italian lexicographer, ſays "lis eſt inter grammaticos de quantitate eorum penultimæ, quæ adhuc eſt ſub judice, quia nihil certi afferri adhuc potuit."

5. Other vowels before final *mus* or *mum* are long; as rāmus, rēmus, pōmum, dūmus.

So amōmum, cāmus, cardamōmum, cinnamōmum, dēmum, extrēmus, fūmus, grūmus, hāmus, poſtrēmus, prōmus, racēmus, ſuprēmus, volēmum.

Sylveſtris raris ſparſit labruſca *racēmis*. Virg.

1. Except [1]atŏmus, [2]balsămum, [3]cinnămum, [4]dŏmus, [5]glŏmus, [6]hŭmus, [7]poſtŭmus, [8]thalămus, [9]tŏmus.

2. And words ending in *dromus*, from the Greek δρόμος; as epidrŏmus, hemerodrŏmus.

1. Parvarum ſerie conſtant connexa *atŏmorum*. An.
2. & 3. *Balsăma* qui ſemper, *cinnăma* ſemper olet. Mart.
4. Non unquam gravis ære *dŏmum* mihi dextra redibat. Virg.
5. Ut vinoſa *glŏmos* furtivæ Pyrrhia lanæ— Hor.
6. Spargite *hŭmum* foliis, inducite fontibus umbras. Virg.
7. Silvius, Albanum nomen, tua *poſtŭma* proles. Virg.

8. Poſt ubi jam *thalămis* ſe compoſuere, ſiletur. Virg.
9. Scriptura quanti conſiet, et *tŏmus* vilis. Mart.

6. A vowel before final [1]*le*, [2]*lis*, or [3]*les*, is long; as monīle, annālis, mōles.

So ancīle, bovīle, būle, caprīle, crināle, focāle, fœnīle, īle, incīle, mantēle, mantīle, ovīle.

And āles, anīlis, aprīlis, civīlis, carduēlis, curūlis, crudelis, conjugālis, dotalis, exīlis, fidēlis, herīlis, mīles, patruēlis, prōles, quinctīlis, ſubtīlis, ſextīlis, &c. with many others.

1. Et opportuno ſe *bovīli* condidit. Phædr.
2. At qui umbrata gerunt *civīli* tempora quercu. Virg.
3. Tota cohors. Rarus venit in cænacula *mīles*. Juven.

1. Except [1]verbal nouns or adjectives; as agĭlis, amabĭlis, facĭlis, insĭle, miſsĭlis, miſsĭle, utĭlis.

2. And all adjectives in [2]*atĭlis*; as aquatĭlis, fluviatĭlis, plicatĭlis, volatĭlis.

3. Alſo dapsĭlis, dactўlis, [5]gracĭlis, [6]humĭlis, [7]indŏles, [8]parĭlis, [9]simĭlis, [10]ſterĭlis, [11]ſubŏles.

1. Nec tibi deliciæ *facĭles*, vulgataque tantum. Ovid.
2. Paſtor agens telis, liquitque *volatĭle* ferrum. Virg.
3. *Dapsĭlis* excepit dictis, Cereremque ferentes. Faliſc.
4. Hinc pedem ſi cœperimus, edere iterum *dactўlum*. Terent.
5. Et *gracĭlis* ſtructos effugit umbra rogos. Ovid.
6. Atque *humĭles* habitare caſas, et figere cervos. Virg.
7. Quid pius Æneas tanta dabit *indŏle* dignum? Virg.
8. —— Et noctes *parĭles* agitare diebus. Lucret.
9. Stes capite obſtipo, multùm *simĭlis* metuenti. Hor.
10. Hic, *ſterĭlem* exiguus ne deſerat humor arenam. Virg.
11. Denſior hinc *ſubŏles*, hinc largi copia lactis. Virg.

7. Adjectives in *inus* derived from nouns ſignifying [1]trees, [2]plants, and ſtones; alſo from [3]adverbs of time, or from ſubſtantives ſignifying the four ſeaſons of the year, ſhorten the penultimate; as fagĭnus, hyacinthĭnus, adamantĭnus, craſtĭnus, diutĭnus, perendĭnus, chimerĭnus, annotĭnus, hornotĭnus: to which add bombycĭnus, elephantĭnus, which ſeem rather to refer to the ſilk and ivory, than to the animals themſelves.

1. Truditur e ſicco radix *oleagĭna* ligno. Virg.
2. Grandia tolluntur *cryſtallĭna*, maxima rurſus. Juven.
3. *Myrrhĭna*, deinde adamas notiſſimus. Juven.
4. Et lux cum primum terris ſe *craſtĭna* reddet. Virg.
5. Delicias et panniculus *bombycĭnus* urit. Juven.

Except [1]repentīnus, [2]matutīnus, [3]veſpertīnus.

1. Inque *repentīnos* convivia verſa tumultus. Ovid.
2. *Matutīna* parùm cautos jam frigora mordent. Hor.
3. Nec *veſpertīnus* circumgemit urſus ovile. Hor.

Note.—The penultimate of malinus, Ainſworth, as well as every Engliſh lexicographer, has, without any poetic authority, marked long. Facciolatus, however, gives it that quantity, which, as derived from malus, a tree, it certainly ſhould have.

8. All other adjectives and words ending in *īnus* lengthen the penultimate; as canīnus, bīnus, trīnus, feſtīnus, Latīnus, mediaſtīnus.

Vix primos *inopīna* quies laxaverat artus. Virg.

Except [1]asĭnus, [2]comĭnùs, [3]domĭnus, [4]emĭnùs, [5]facĭnus, [6]sĭnus, [7]termĭnus.

1. Suadebat *Asĭno* fugere, ne poſſet capi. Phædr.
2. & 4. *Comĭnus* enſe ferit; jaculo cadit *emĭnùs* ipſe. Ovid.
3. Tum caput ipſi aufert *domĭno*, truncumque relinquit. Virg.
5. Nondum Juſtitiam *facĭnus* mortale fugarat. Ovid.
6. Nunc tantum *sĭnus*, et ſtatio maleſida carinis. Virg.
7. Quicunque mundi *termĭnus* obſtitit. Hor.

9. Other vowels before final *nus* and *num* are long; as urbānus, plēnus, dōnum, mūnus.

So ahēnus, fānum, prōnus, prūnus, ſerēnus, venēnum,

num, vānus, and many others; for the nouns and adjectives compriſed by this rule are numerous.

Aut *montāna* ſedet circum caſtella ſub armis. Virg.

Except galbănus, [2]mănus, [3]oceănus, [4]platănus, [5]tympănum; [6]ebĕnus, [7]gĕnus, [8]tĕnus, [9]Vĕnus; [10]bŏnus, [11]ŏnus, [12]sŏnus, [13]tŏnus.

1. Fuſcos colores, *Galbănos* habet mores. Mart.
2. Et *mănus* in gremio languida facta jacet. Ovid.
3. Quid tantùm *oceăno* properent ſe tingere ſoles. Virg.
4. Non ſine natanti *platăno*, lentaque ſorore. Catul.
5. Hinc radios trivere rotis, hinc *tympăna* plauſtris. Virg.
6. Fert *ebĕnum*, ſolis eſt thurea virga Sabæis. Virg.
7. Idne eſt verum? Imò, id *gĕnus* eſt hominum peſſimum. Ter.
8. Eſt quōdam prodire *tĕnùs*, ſi non datur ultrà. Hor.
9. Sic *Vĕnus*; at *Vĕneris* contrà ſic filius ortus. Virg.
10. At *bŏna* pars procerum tacitâ libabit acerrâ. Perſius.
11. Tu pueris curre, Parmeno obviàm, atque his *ŏnera* adjuta. Ter.
12. Omnibus auditur. *Sŏnus* eſt, qui vivit in illâ. Ovid.
13. Tædia dulcisŏnis auferat illa *tŏnis*. Cato.

10. Words ending in *ino* or *inor* ſhorten the penultimate; as lĭno, fulmĭno, termĭno.

So sĭno, inquĭno, coinquĭno, circĭno, femĭno, grandĭno, germĭno, emĭnor, procraſtĭno, comperendĭno; the compounds of căno, as concĭno, and many others.

Nunc *sĭnite*, et placitum læti componite fœdus. Virg.

Except [1]divīno, [2]omnīno, [3]propīno, [4]ſupīno; alſo [5]clīno, and its [6]compounds, as acclīno, inclīno, proclīno, reclīno.

1. Hâc *divīnavi*, notitiamque tuli. Ovid.
2. Non impulit me, hæc nunc *omnīnò* ut crederem. Terence.
3. Nemo *propīnabit*, Calliodore, tibi. Mart.
4. Gramen, et erecto currum temone *ſupīnant*. Stat.
5. Quare etiam, atque etiam paulum *clīnare* neceſſe. Lucret.
6. *Inclīnat* curſus; et eaſdem *circĭnat* auras. Ovid.

11. Other vowels before final *no* or *nor* are long; as māno, exarēno, pōno, Jūno.

So plāno, trāno, ferēno, dōno, cōnor, and ſeveral others.

Hâc te nos fragili *dōnabimus* ante cicutâ. Virg.

Except [1]căno, [2]rĕno, [3]hŏnor, [4]sŏno, and [5]tŏno.

1. Sicelides Muſæ, paullo majora *cănamus*. Virg.
2. Sed juremus in hæc; ſimul imis ſaxa *rĕnarint*. Hor.
3. Sed cum ſummus *hŏnor* finito computet anno. Juven.
4. Te lyra pulſa manu, te carmina noſtra *sŏnabunt*. Ovid.
5. Cum *tŏnat*, exanimes primo quoque murmure cœli— Juven.

12. A vowel before final *na* is long; as lāna, vēna, ſpīna, nōna, Lūna, rāna, arēna, arvīna, carīna.

Hîc *regīna* gravem gemmis auroque popoſcit. Virg.

Except [1]advĕna, [2]buccĭna, [3]domĭna, [4]gĕna, [5]fiſcĭna, [6]fœmĭna, [7]machĭna, [8]pagĭna, [9]farcĭna, [10]tibicĭna, [11]trutĭna.

1. Non tamen hoſpes eris, nec jam potes *advĕna* dici. Mart.
2. Sed qui ſermones? Quæ fœdæ *buccĭna* famæ? Juven.
3. Concurrunt trepidæ comites, *domĭnamque* recentem— Virg.
4. Pendenteſque *gĕnas*, et tales aſpice rugas. Juven.
5. Preſſaque flammeola rumpatur *fiſcĭna* caltha. Col.
6. *Fœmĭna* palantes agit, atque hæc agmina vertit? Virg.
7. Aut hæc in noſtros fabricata eſt *machĭna* muros. Virg.
8. Quam ſibi quæ Vari præſcripſit *pagĭna* nomen. Virg.
9. Muli gravati *farcĭnis* ibant duo. Phædr.
10. Ebria nos madidis rumpit *tibicĭna* buccis. Mart.
11. Si volet, hac lege in *trutĭna* ponetur eadem. Hor.

13. A vowel before final [1]*ne*, [2]*ni*, [3]*nes*, [4]*nis*, is long; as mānè, sēni, mānes, fīnis.

So bulbīne, anemōne, confīne, pēne; bīni, lucāni, antepilāni, quīni, ſeptēni, octōni, novēni, dēni, vicēni, ducēni, and other numerals in *ēni*; ſo fūnis, acclīnis, inclīnis, inānis, commūnis, immūnis, commūnis, immūnis, &c.

1. Et quæ *mānè* refert, et quæ ſurgentibus aſtris. Virg.
2. Bis *dēnas* Italo texamus robore naves. Virg.
3. Quòd vivis: *cĭnis*, et *mānes* et fabula fies. Perſ.
4. O curas hominum! O quantum eſt in rebus *ināne*! Perſ.

Except bĕne, [2]sĭne, [3]pĕnes, [4]cănis, [5]cĭnis, [6]juvĕnis; and [7]nouns derived from μαίνομαι, as hippomănes, trichomănes.

1. Vivitur parvo *bĕne*, cui paternum— Hor.
2. Mollia cum duris, *sĭne* pondere habentia pondus. Ovid.
3. Me *pĕnes* eſt unum vaſti cuſtodia mundi. Ovid.
4. Sic *cănibus* catulos ſimiles, ſic matribus hædos. Virg.
5. For *cĭnis*, ſee verſe 3. under the above rule.
6. Clamoſus *juvĕnem* pater excitat; accipe ceras. Juven.
7. *Hippomănes*, quod ſæpè malæ legêre novercæ. Virg.

14. A vowel before final [1]*nea*, [2]*neo*, [3]*nia*, [4]*nio*, [5]*nius*, and [6]*nium*, is long; as līnea, cāneo, mūnia, pūnio, favōnius, ſcrīnium.

So arānea, gāneo, declīneo, delīneo, līneo, cicōnia, insānia, Irōnia, colōnia, alcedōnia, lacīnia, querimōnia, delēnio, exinānio, fīnio, insānio, mūnio, confīnium, patrimōnium, vadimōnium, and many others.

1. In foribus laxos ſuſpendit *arānea* caſſes. Virg.
2. Carpamus: dum manè novum, dum gramina *cānent*. Virg.
3. Sævit amor ferri, et ſcelerata *insānia* belli. Virg.
4. Oppida cœperunt *mūnire*, et ponere leges. Hor.
5. Primo reſtituent vere *Favōnii*. Hor.
6. Pullati proceres, differt *vadimōnia* prætor. Juven.

1. Except [1]caſtănea, [2]tĭnea, [3]măneo, [4]mĭneo, [5]mŏneo, [6]tĕneo.

2. Alſo [7]ignomĭnia, [8]vĕnia, [9]lĭnio, [10]lănio, [11]vĕnio.

1. *Caſtăneæ* molles, et preſſi copia lactis. Virg.
2. Aut *tĭneas* paſces taciturnus inertes. Hor.
3. Quæ finis? Aut quod me *mănet* ſtipendium. Hor.
4. Inclinata *mĭnent* in eandem prodita partem. Lucret.
5. Aliquid *mŏneat*, ut illa, quæ te ſcire credas, neſcias. Ter.
6. Utque viam *tĕneas*, nulloque errore traharis. Ovid.
7. Multa gemens, *ignomĭnium*, plagaſque ſuperbi. Virg.
8. Orantes *vĕniam*, et templum clamore petebant. Virg.
9. Neve tua Medæ *lĭniantur* cæde ſagittæ. Propert.
10. Quin *lănient* mundum; tanta eſt diſcordia fratrum. Ovid.
11. Momento cita mors *vĕnit*, aut victoria læta. Hor.

15. A vowel before final *do* is long; as vādo, cēdo, formīdo, rōdo, teſtūdo.

So rādo, crēdo, alcēdo, dulcēdo, cupīdo, crepīdo, nōdo, cūdo, lūdo, altitūdo, beatitūdo, and many others; for the nouns and verbs compriſed by this rule are very numerous.

Poſſe putes illos ſicco freta *rādere* paſſu. Ovid.

Except [1]cădo, [2]dīvĭdo, [3]trepĭdo; and [4]rŭdo[5], which is common; and [6]ĕdo, to eat; ēdo, to declare, publiſh, &c. (the prepoſition *ē* being long,) follows the above rule.

1. Multa renaſcentur, quæ jam cecidere, *cădentque*. Hor.
2. *Dividimus* muros, et mænia pandimus urbis. Virg.
3. Cùm ſubitò *trepĭdare* intus præcordia ſenſi. Ovid.
4. Findor: ut Arcadiæ pecuaria *rŭdere* credas. Perſ.
5. Incluſumque cavo ſaxo, atque inſueta *rūdentum*. Virg.
6. Ut verò eſt expulſa quies; furit ardor *ĕdendi*. Ovid.

16. E before final *rus*, *ra*, *rum*, is ſhort; as mĕrus, hedĕra, cætĕrum.

The nouns and adjectives compriſed by this rule are numerous.

Ite domum ſaturæ, venit *Heſpĕrus*, ite capellæ. Virg.
Certum eſt, in ſylvis, inter ſpelæa *fĕrarum*. Virg.

1. Except

1. Except [1]austērus, [2]galērus, [3]plērufque, [4]sērus, [5]fevērus, [6]vērus; [7]pēra, [8]cēra, and [9]fincērus, from fine cērâ.

2. And though of anthēra, œnothēra, ftatēra, there is no poetic fanction, they are long by derivation from ἀνθηρα, θηρεια, and ϛατηρα, fo panthēra (Virg. Æn. 8. 460.) from θηρ.

1. Qui volet *auftēros* arte ferire viros. Prop.
2. Bina manu, fulvofque lupi de pelle *galēros*. Virg.
3. *Plēraque* differat, et præfens in tempus omittat. Hor.
4. *Sērus* in offenfam rettuleritque pedem. Tibul.
5. Cum fit trifte habitu, vultuque et vefte *fevērum*. Juven.
6. *Vērùm*, quid facias? Ut homo eft, ita morem geras. Ter.
7. *Pēras* impofuit Jupiter nobis duas. Phædr.
8. Limus ut hîc durefcit, et hæc ut *cēra* liquefcit. Virg.
9. Enfe recidendum; ne pars *fincēra* trahatur. Ovid.

17. Other vowels before final [1]*rus*, [2]*ra*, [3]*rum*, are long; as cārus, mīrus, mōrus, mūrus; hāra, fpīra, ōra, natūra, lōrum, &c.

So āra, tiāra, īra, līra, hōra, aurōra, lōra, manticōra, prōra, captūra, figūra, cenfūra; alfo the nouns, adjectives, and participles in *rus*, &c. are very numerous.

1. Exultans rorem latè difpergit *amārum*. Virg.
2. Vela legunt focii, et *prōras* ad littora torquent. Virg.
3. Puniceo tingit pendentia *mōra* colore. Ovid.

1. Except [1]barbărus, [2]cammărus, [3]camŭrus, [4]canthărus, [5]chŏrus, [6]hellebŏrus, [7]nŭrus, [8]opipărus, [9]ovipărus, [10]fpărus, [11]Tartărus, [12]tŏrus.

2. Alfo [13]anchŏra, [14]cithăra, [15]mŏra, [16]purpŭra, [17]philўra.

3. And the following in *rum*; [18]fŏrum, [19]fuppărum, [20]gărum, [21]părùm.

4. Alfo the [22]compounds of *vŏro*, as carnivŏrus, omnivŏrus; thofe ending in [23]*phŏrus* and *phŏra*, from φερω, as amphŏra, canephŏra, echphŏra, phofphŏrus, ciftophŏrus, &c.; and the derivatives of ἄργυρος, as hydrargўrum, lithargўrus.

1. *Barbărus* hîc ego fum, quia non intelligor ulli. Ovid.
2. Sed tibi dimidio conftrictus *Cammărus* ovo. Juven.
3. Pes etiam et *camŭris* hirtæ fub cornibus aures. Virg.
4. Et gravis attritâ pendebat *canthărus* anfâ. Virg.
5. Doctus et Phœbi *chŏrus*, et Dianæ. Hor.
6. Scillamque, *hellebŏrofque* graves, nigrumque bitumen. Virg.
7. Si qua tibi *nŭrus* eft, fi qua eft tibi filia, voces. Ovid.
8. Vino ornamentis *opipărifque* opfoniis. Plaut.
9. Præpinguis teres, *ovipăra* congeftior alvo. Aufon.
10. Agreftifque manus armat *fpărus*: vertitur ipfe. Virg.
11. *Tartăra* Panthoiden iterum Orco— Hor.
12. Proximus ut viridante *tŏro* confederat herbæ. Virg.
13. *Anchŏra* jam noftram non tenet ulla ratem. Ovid.
14. Non ftudio *cithăræ*, nec Mufæ deditus ulli. Hor.
15. Troja cadet; fed erit noftri *mŏra* longa laboris. Ovid.
16. Per hoc inane *purpŭræ* decus precor. Hor.
17. Difplicent nexæ *philўrâ* coronæ. Hor.
18. Infanumque *fŏrum*, aut populi tabularia vidit. Virg.
19. *Suppăra* nudatos cingunt angufta lacertos. Lucret.
20. Preffit cella, *găro* de fuccis pifcis Iberi. Hor.
21. Matutina *părùm* cautos jam frigora mordent. Hor.
22. Mittere *carnivŏris* præberi pabula mandat. An.
23. *Phofphŏre* redde diem; quid gaudia noftra moraris? Mart.
24. *Amphŏra* non meruit tam pretiofa mori. Mart.

18. E before final *ro* or *ror* is fhort; as fĕro, gĕro, tĕro.

So tempĕro, afpĕro, blatĕro, cætĕrò, capĕro, celĕro, confidĕro, defidĕro, fcelĕro, propĕro, sĕro (to fow), quĕror, &c.

Verùm, quid facias? ut homo eft, ita morem *gĕras*. Ter.

Except [1]fpēro; [2]affevēro and [3]perfevēro from fevērus, and the adverb [4]sēro from sērus; for sĕro, to fow, is fhort.

1. *Spēret* idem, fudet multùm fruftràque laboret. Hor.
2. Profitebitur, jurabit, *affevērabit*. Scaz
3. Poft manes tumulumque *perfevēret*. Mart.
4. Verùm. Age modò hodie: *sērò* ac nequidquam voles. Ter.

19. Other vowels before final *ro* or *ror* are long; as vāro, fpīro, ōro, ūro.

So līro, tīro, inquīro, acquīro, conquīro, plōro, labōro, auctōro, ignōro, cūro, figūro, lūror, dūro, and many others.

Delicias et panniculus bombycinus *ūrit*. Juven.

1. Except [1]ăro, [2]căro, [3]fŭro, [4]hilăro, [5]infŏro, [6]mŏror, [7]păro, [8]fatŭro, [9]vŏro.

2. Alfo the [10]derivatives from genitives increafing fhort in *ŏris* or *ŭris*; as decŏro, murmŭro, from decus-ŏris, murmur-ŭris.

So memŏro from memor-ŏris; corpŏror from corpus-ŏris; robŏro from robus-ŏris; exaugŭro from augur-ŭris; fulgŭro from fulgur-ŭris; expectŏro from pectus-ŏris.

1. Littus *ărant*, Rutulofque exercent vomere colles. Virg.
2. Sed malè viva *căro* eft. Lambendo mater in artus— Ovid.
3. Quid *fŭris*? Aut quonam noftri tibi cura receffit. Virg.
4. Hos ubi facundo tua vox *hilăraverat* ore. Ovid.
5. Licetne *infŏrare*, fi incomitiare non licet? Plaut.
6. Quid vitam *mŏror* invifam, Pallante perempto. Virg.
7. Umbras, et cœlo diffundere figna *părabat*. Hor.
8. Qua *fatŭrat* Calabris culta Galefis aquis? Mart.
9. Optima fylvarum interea, pelagique *vŏrabit*. Juven.
10. Et validas auget vires, et *robŏrat* ictum. Lucret.

20. Words ending in [1]*atus*, [2]*etus*, [3]*otus*, [4]*utus*, lengthen the penultimate; as probātus, cētus, tōtus, tūtus.

So grātus, facētus, bolētus, pōtus, agrōtus, argūtus, aftūtus, brūtus, hirfūtus, mūtus, and many others; alfo participles in *ātus*, *ētus*, *ōtus*, and *ūtus*, as mandātus, decrētus, nōtus, minūtus, metūtus, conftitūtus, volūtus, &c.

1. O *fortunātos* nimium, fua fi bona norint! Virg.
2. Tu rem impeditam et perditam reftituas? hem! quo *frētus* fum. Ter.
3. Facilè omnes, cum valemus, recta confilia, *ægrotis* damus. Ter.
4. *Tūta* manent; mediis Tanaïs fumavit in undis. Ovid.

1. Except [1]cătus, [2]lătus-ĕris, [3]ftătus-ûs; [4]impĕtus, [5]mĕtus, [6]vĕtus; and [7]antidŏtus.

2. [8]Venĕtus is fhort by derivation from Venĕtiæ; [9]quŏtus from quŏt; [10]tŏtus (fo great), from tŏt, for tōtus is long; and [11]arbŭtus from arbor-arbŏris.

3. Of dicrŏtum, and automătus from automăton, there is no poetic authority.

4. Except alfo the plural genitives of nouns ending in ma-mătis; as poemătum.

5. And the participles dătus, rătus, sătus, ftătus; for which fee the rule concerning diffyllabic fupines.

1. Me plus fapere quàm vos, dederim vobis confilium *cătum*. Plaut.
2. Impulit in *lătus*, et venti, velut agmine facto— Virg.
3. Et enim verò quoniam formam cepi hujus in me et *ftătum*. Plaut.
4. Æquora; fic illam fert *impĕtus* ipfe volantem. Virg.
5. Necdum eft ille dolor, fed jam *mĕtus* incubat amens. Lucan.
6. Et *vĕtera* oblitis jura referre foris. Propert.
7. Et venditaret falfo *antidŏtum* nomine. Phædr.
8. Sic *Venĕtus* ftagnante Pado, fufóque Britannus— Lucan.
9. & 10. Nec *tŏta* pars homo terrai, *quŏta tŏtius* unus. Lucret.
11. Inferitur verò ex fœtu nucis *arbŭtus* horrida. Virg.

21. Words ending in *itus* lengthen the penultimate; as aurītus, crinītus, invītus, perītus.

Fac jam tu, præco, nunc omnem *aurītum* populum. Plaut.

1. Except

1. Except [1]anhelītus, [2]ſervītus, [3]ſpirĭtus, and [4]ſuſpirĭtus.

2. Alſo [5]all adverbs in *itùs;* as humanĭtùs, penĭtùs.

3. [6]Blĭtum is not derived from the termination *itus*, but from βλιτον, and therefore ſhortens the penultimate.

4. Alſo polyſyllabic participles in *itus*, not derived from preterites in *īvi;* as habĭtus, exercĭtus-a-um, and nouns derived from them; as habĭtus-ûs, and exercĭtus-ûs.

5. And the participles from the verb eo, and its compounds; as transĭtus-a-um, and their derivatives; as transĭtus-ûs; the participle ambītus is, however, long, and the noun ambĭtus-ûs ſhort.

1. & 4. Simul enunciato *ſuſpirĭtûs.* Vix ſuffero, hercle, *anhelĭtum.* — Plaut.
2. Apud me juſta et clemens fuerit *ſervĭtus.* — Ter.
3. Dum memor ipſe mei, dum *ſpirĭtus* hos reget artus. — Virg.
5. Inſequor, et cauſas *penĭtùs* tentare latentes. — Virg.
6. Apponunt rumicem, braſſicam, betam, *blĭtum.* — Plaut.

For the 4th and 5th exceptions, ſee the rules for polyſyllabic ſupines.

22. A vowel before final [1]*men*, [2]*mens*, [3]*mentum*, is long; as levāmen, clēmens, āmentum.

So acūmen, crīmen, flāmen, flūmen, grāmen, jurgāmen, volūmen, argūmentum, jūmentum, atrāmentum, and many others; the nouns compriſed by this rule being numerous.

1. *Flūminibus* ſalices, craſſique paludibus alni. — Virg.
2. Ego hanc *clēmentem* vitam, urbanum, atque otium. — Ter.
3. *Strāmenta* deſunt. Tollere hæc aranea. — Phædr.

1. Except [1]tămen, [2]colŭmen, [3]hўmen, [4]elĕmentum.

2. Alſo [5]alĭmentum, [6]docŭmen or docŭmentum, [7]emolŭmentum, [8]monĭmentum or monŭmentum, [9]regĭmen, [10]ſpecĭmen, [11]tegĭmen or tegŭmen and integŭmentum.

3. And ſuch verbs as frĕmo, gĕmo, &c. will naturally ſhorten the penultimate of frĕmens, gĕmens, &c.

Note.—The irregularity of ſuch words as monĭmentum, docŭmentum, &c. has been conſidered as ariſing from the ſupine of the ſecond or third conjugation; which originally, before the effect of ſyncope, is ſuppoſed to have generally been in *it m;* as moneo, monĭtum, monĭmentum; doceo, or dokeo, dokitum, and by ſyncope dok'-tum or doctum; whence dokĭmentum or docŭmentum, &c. But if theſe verbal nouns were primitively deducible from their ſupines, many of them muſt have ſubſequently aſſumed the characteriſtic of the infinitive preſent, as the *g* of regimen and tegimen will teſtify. See Salmon's Stemmata Latinitatis on the terminations *men* and *mentum*.

1. Sed *tămen* iidem olim curru ſuccedere ſueti. — Virg.
2. Bone cuſtos, ſalve; *colŭmen* verò familiæ. — Ter.
3. Vulgus *Hўmen Hўmenæe* vocat, fugit ille vocantes. — Ovid.
4. Doctores, *elĕmenta* velint ut diſcere prima. — Hor.
5. Atque ipſæ vitiis ſunt *alĭmenta* vices. — Ovid.
6. Et *docŭmenta* damus, qua ſimus origine nati. — Ovid.
7. Nullus in urbe locus, nulla *emolŭmenta* laborum. — Juven.
8. Hic dabat, hæredes *monĭmentum* ne ſequeretur. — Hor.
9. In quo conſilium vitæ, *regĭmenque* locatum eſt. — Lucret.
10. Hocc' etiam in primis *ſpecĭmen* verum eſſe videtur. — Lucret.
11. Iſtæc ego mihi ſemper habui ætati *tegŭmentum* meæ. — Plaut.

23. A vowel before final [1]*ma*, [2]*mes*, [3]*mis*, is long; as hāma, līmes, ſublīmis.

So agēma, dāma, fāma, plūma, poēma, rīma, rūma, sīma, ſquāma, ſpūma, ſtrūma, fōmes, trāmes, illīmis, cōmis, ſēmis, deplūmis, decirēmis, quadrirēmis, quinquerēmis, infāmis, and many others in each of theſe terminations.

1. Cum canibus timidæ venient ad pocula *dāmæ.* — Virg.
2. Excitat invalidas admoto *fōmite* flammas. — Lucan.
3. *Sublīmes* in equis redeunt, pacemque reportant. — Virg.

1. Except [1]cŏma, [2]cŏmes, [3]cucŭmis, [4]făme[s], [5]incolŭmis, [6]lacrўma, [7]nĭmis, [8]pyrămis.

2. Alſo the [9]derivatives[10] of anĭmus and decĭmus; as anĭma, exanĭmis, decĭma or decŭma.

3. [11]Dynămis and [12]endrŏmis have their penultimate regulated by the Greek ſhort α and ο; as δύναμις, ἐνδρομὶς.

1. *Cŏmuntur* noſtræ, matre jubente, *cŏmæ.* — Ovid.
2. Jamque *cŏmes* ſemper magnorum prima malorum. — Lucan.
4. Sæva *fămes* aderat: nulloque obſeſſus ab hoſte. — Lucan.
3. Cæruleus *cucŭmis*, tumidoque cucurbita ventre. — Propert.
5. Fecit; et *incolŭmis* lætor quòd vivit in urbe. — Hor.
6. Cogat et invitam *lacrўmas* ſiccare cadentes. — Propert.
7. Fortuna multis dat *nĭmis*, ſatis nulli. — Mart.
8. Non mihi *pyrămidum* tumulis evulſus Amaſis. — Lucan.
9. Tantùm *anĭmas*, nobis *anĭmum* quoque; mutuus ut nos. — Juven.
10. Tibi propino *decŭma* fonte: tibi tutè unde, ſi ſapis. — Plaut.
11. *Dynămin* domi habent maxumam. — Plaut.
12. Dona peregrinam mittimus *endrŏmida.* — Mart.

Note.—Ainſworth refers to Plaut. Trinum. 3. 3. 15. for colŭmis. Taubmanni edit. anno 1621, has "Columen te ſiſtere illi, et detraxe autument." The editions of Lambinus and Camerarius have alſo colŭmen, according to the moſt ancient MSS. and editions. Facciolatus conſiders colŭmis to be of doubtful authority: it cannot, therefore, be admitted as an exception to this rule. For columen, ſee rule 22, No. 2.

24. I or Y, or a vowel derived from the ſhort increment of the genitive, before final *mo* or *mor*, is ſhort; as anĭmo, æſtĭmo, decĭmo, lacrўmo, and hiĕmo from hiems-ĕmis.

Quo redit ad faſtos, et virtutem *æſtĭmet* annis. — Hor.

Except [1]līmo and [2]rīmor.

1. *Līmat* non odio obſcuro morſuque venenant. — Hor.
2. Dulcibus in ſtagnis *rīmantur* prata Caÿſtri. — Virg.

25. Other vowels before final *mo* or *mor* are long; as clāmo, nēmo, prōmo, sūmo.

So fāmo, ſquāmo, tēmo, dēmo, poſtrēmo, fūmo, irrūmo, ſpūmo, rūmor, &c.

Excutit et longe lapſum *tēmone* relinquit. — Virg.

Except [1]ămo, [2]autŭmo, [3]crĕmo, [4]dŏmo, [5]ĕmo, [6]frĕmo, [7]gĕmo, [8]hŏmo, [9]prĕmo, [10]trĕmo, [11]tŭmor, [12]vŏmo.

1. Votum in *ămante* novum; vellem, quod *ămamus* abeſſet. — Ovid.
2. Neque ſe id pigere, et deinde facturum *autŭmat.* — Ter.
3. Atque omnem ornatum, flammâ crepitante, *crĕmari.* — Virg.
4. Non anni *dŏmuere* decem, non mille carinæ. — Virg.
5. Si quis *ĕmat* citharas, emptas comportet in unum. — Hor.
6. Poſt tergum nodis, *frĕmit* horridus ore cruento. — Virg.
7. Parte flagellari *gĕmuit* ſua robora caudæ. — Ovid.
8. *Hŏmo* ſum; humani nihil à me alienum puto. — Ter.
9. Ignoſci; *prĕmit* ille graves interritus iras. — Lucan.
10. Tempeſtas concuſſa *trĕmit*, *frĕmituſque* moventur. — Lucret.
11. Cuſtodum et nullo ſepta *tŭmore*, placet. — Propert.
12. Mane ſalutantum totis *vŏmit* ædibus undam. — Virg.

Note.—Comō-ĕre follows the general rule; but cŏmo-āre, a verb *ſeldom* uſed, ſhortens the penultimate: both are derived from cŏma.

26. A vowel before final *lo* or *lor* is long; as cālo, cēlo, pīlo, sōlo.

So hālo, mālo, vēlo, sīlo, nōlo, pālor, sōlor, pecūlor, and ſeveral others.

Excipit, ac feſſos opibus *ſōlatur* amicis. — Virg.

1. Except [1]ălo, [2]călor, [3]cŏlor, dŏlo ([4]noun or [5]verb), [6]dŏlor, [7]mŏlo, [8]ventĭlo, [9]vŏlo, and [10]cŏlo-ĕre, to cultivate, but [11]cōlo-are, to filter, follows the general rule.

2. Alſo the penultimate of [12]conſŭlo is ſhort, from conſul-ŭlis; ſo [13]gĕlo from gĕlu, and [14]aſſimĭlo from ſimĭlis.

3. Except

3. Except alſo [15]verbs in *ulo* or *ulor*, which are generally derived from diminutives in *ulus*; as circŭlo, circŭlor, from circŭlus.

1. Tutius et geminos anxia mater *ălit*. Propert.
2. Et *cŏlor* extremus primo cum frigore mixtus. Lucret.
3. Mille trahens varios adverſo Sole *cŏlores*. Virg.
4. Pila manu, ſævoſque gerunt in bella *dŏlones*. Virg.
5. Materiemque *dŏlare*, levare ac radere tigna. Lucret.
6. Nulla fides damnis, veriſque *dŏloribus* adſit. Hor.
7. *Mŏlendum* uſque in piſtrino; vapulandum; habendæ compedes. Ter.
8. *Ventĭlet* æſtivum digitis ſudantibus aurum. Juven.
9. Cæpere: alternos Muſæ meminiſſe *vŏlebant*. Virg.
10. Ignem Trojanum, et Veſtam *cŏlit* Alba minorem. Juven.
11. Et *cōlare* vagos inductis retibus amnes. Manil.
12. Utrique; id oro te, in commune ut *consŭlas*. Ter.
13. Nec Pallas ſpectare poteſt: vultuſque *gĕlaſſent*. Lucan.
14. Grandia ſi parvis *aſſimĭlare* licet. Ovid.
15. Licèt ſuperbus *ambŭles* pecuniâ. Hor.

Note.—Ainſworth has bombīlo, which ſhould be bombito. See Facciolatus.

27. A vowel before final [1]*bes* and [2]*ges* is long; as nūbes, ambāges.

So lābes, tābes, pūbes, compāges, impāges, ſtrāges, frūges, &c.

1. Sub pedibus videt *nūbes* et ſidera Daphnis. Virg.
2. Jam catervatim dat *ſtrūgem* atque aggerat ipſis. Virg.

Except [1]hĕbes, [2]indĭges, [3]lĕbes, [4]sĕges, and [5]tĕges.

1. Utque *hĕbeti* pectus tantummodo contudit ictu. Ovid.
2. Dii patrii *indĭgetes* et Romule Veſtaque mater. Virg.
3. Tertia dona facit geminos ex ære *lĕbetes*. Virg.
4. Illa *sĕges* demum votis reſpondet avari. Virg.
5. Inſtitor hybernæ *tĕgetis*, niveique cadurci. Juven.

28. A vowel before final [1]*des* and [2]*pes* is ſhort; as fĭdes, tăpes.

So analectĭdes, anterĭdes, hyădes, pleiădes, sŭdes, and all maſculine patronymics, according to the firſt rule; ſo alſo ăpes, dăpes, trăpes, and the following compounds of pes, bĭpes, trĭpes, quadrŭpes, centĭpes, antipŏdes, celerĭpes, gracilĭpes, alĭpes, levĭpes, ſonĭpes, cornĭpes, ignĭpes, longĭpes, lorĭpes, palmĭpes, ſolidĭpes, caprĭpes, &c.

1. Mens bona, fama, *fĭdes*, hæc clarè, et ut audiat hoſpes. Perſ.
2. Inſtratos oſtro *alĭpedes* pictiſque *tăpetis*. Virg.

1. Except [1]clādes, [2]sēdes, [3]rūpes, [4]sēpes, and [5]ſtīpes.

2. And though we are without poetic authority for carcinōdes, caulōdes, horminōdes, yet their penultimate is evidently long from the Greek ω; ſo epōdes; as καρκινώδες, καυλώδης, ὁρμινῶδης, ἐπῳδής.

1. *Clādibus* irruimus nocituraque poſcimus arma. Lucan.
2. Ducit ad infernas per multa ſilentia *sēdes*. Ovid.
3. Ille, velut pelagi *rūpes* immota reſiſtit. Virg.
4. Texendæ *sēpes* etiam, et pecus omne tenendum eſt. Virg.
5. *Stīpitibus* duris agitur *sŭdibuſque* præuſtis. Virg.

Note.—The claſſical exiſtence of trūdes ſeems not to be ſatisfactorily proved: Ainſworth and Facciolatus cite only one authority, Tacit. Ann. 3. 46, where commentators propoſe sŭdes, as a better reading.

29. A vowel before final [1]*dex*, [2]*dix*, [3]*lex*, [4]*mex*, [5]*nix*, or [6]*rex*, is long; as cōdex, rādix, īlex, cīmex, jūnix, cārex.

So jūdex, lōdix, ſpādix, hālex, pūlex, pūmex, rāmex, tōmex, rēmex, mūrex, sōrex, &c.

1. Inde porrò ad puteum, atque ad robuſtum *cōdicem*. Plaut.
2. Pronus ab arboreâ cecidit *rādice* retentus. Ovid.
3. Procumbunt piceæ, ſonat icta ſecuribus *īlex*. Virg.
4. Cui domus et dulces latebroſo in *pūmice* nidi. Virg.
5. Quàm mox horſum ad ſtabulum *jūnix* recipiat ſe e pabulo. Plaut.
6. Et Calabrûm coxit vitiato *mūrice* vellus. Perſ.

Except [1]cŭlex, [2]sĭlex, and [3]rŭmex.

1. Tota abit hora. Mali *cŭlices*, ranæque paluſtres. Hor.
2. Spem gregis, ah! *sĭlice* in nudâ connixa reliquit. Virg.
3. Apponunt *rŭmicem*, braſſicam, betam, blitum. Plaut.

Note.—Alex, in the beſt authors and editions, is read alec, and is therefore no exception to this rule.

30. A vowel before final [1]*per* and [2]*ter* is ſhort; as sŭper, arbĭter.

So ăper, căper, ĭter, lăter, accipĭter, diamĕter, păter, Jupĭter, Dieſpĭter, and all adverbs in *ter*; as alĭter, amplĭter, acrĭter, celerĭter, and many others.

1. Dum juga montis *ăper*, fluvios dum piſcis, amabit. Virg.
2. Non locus effuſi latè maris *arbĭter*, auſert. Hor.

1. Except [1]nūper, [2]āter, [3]frāter, [4]māter, [5]crāter, [6]dēter, [7]tēter.

2. Uter-tra-trum follows the general rule; but [8]ūter-tris, a bag, lengthens the penultimate.

3. Alſo [9]sōter from σωτηρ, of which the poets give no example, except through its derivative sōteria.

1. Nunc huc remiſit *nūper* ad me epiſtolam. Plaut.
2. Calculus immitem dimittitur *āter* in urnam. Ovid.
3. Cui volet, importunus ebur; *frāter*, *pāter*, adde. Hor.
4. Cui *māter* mediâ ſeſe tulit obvia ſylvâ. Virg.
5. Tum *pāter* Anchiſes magnum *crātera* coronâ. Virg.
6. Nam *dēteriores* omnes ſumus licentiâ. Ter.
7. *Tēter* ut immundæ carnis abiret odor. Mart.
8. Mollibus in pratis unctos ſalire per *ūtres*. Virg.
9. Nam quoties ſurgis, *sōteria* poſcis amicos. Mart.

31. A vowel before final [1]*ba*, [2]*bo*, [3]*pa*, [4]*po*, is ſhort; as făba, bĭbo, săpa, nuncŭpo.

So jŭba, ſyllăba, cĭbo, prŏbo, glŏbo, cŭbo, arrhăbo, ſcăbo, nĕpa, lŭpa, pŏpa, upŭpa, alăpa, crĭpa, legicrĕpa, metŏpa, crĕpo, ſtrĕpo, căpo, occŭpo, emancĭpo, partĭcĭpo, antĭcĭpo, &c.

1. Denſa *jŭba*, et dextro jactata recumbit in armo. Virg.
2. Non auro, myrrhaque *bĭbunt*: ſed gurgite puro. Lucan.
3. Et Laletanæ nigra lagena *săpæ*. Mart.
4. Adſidet, et totum prope ſlucibus *obcŭpat* amnem. Lucret.

Except [1]glēba, [2]ſcrība, [3]ſcrībo, [4]lībo, [5]nūbo, [6]būbo, [7]cēpa, [8]rāpa, [9]ſcōpa, [10]clēpo, [11]ſtīpo.

1. Liquitur, et Zephyro putris ſe *glēba* reſolvit. Virg.
2. Linquimus, inſani ridentes præmia *ſcrībæ*. Hor.
3. Sumite materiam veſtris, qui *ſcrībitis* æquam. Hor.
4. Purpureoſque metunt flores, et flumina *lībant*. Virg.
5. Iis *nūbant*, et illos ducere eadem hæc lex jubet. Ter.
6. Solaque culminibus ferali carmine *būbo*. Virg.
7. Cædenda eſt hortis eruta *cēpa* meis. Ovid.
8. Hæc tibi brumali gaudentia frigore *rāpa*. Mart.
9. Vilibus in *ſcōpis*, in mappis, in ſcobe, quantus. Hor.
10. Qui hæc habent conſilia; ubi data occaſio eſt, rape, *clēpe*, tene, harpaga. Plaut.
11. *Stīpant*, et liquido diſtendunt nectare cellas. Virg.

Note.—Cūpa, ſtūpa, and pūpa, are ſometimes more properly ſpelled cuppa, ſtuppa, puppa; ſince this latter orthography deſignates their quantity, and is more conſiſtent with their derivation from κυββα, (French couppe,) στυππη, &c. Cōpa and cōpo ſeem corrupted readings for caupo, which the more accurate editions ſubſtitute.

32. A vowel before final *ga* is long; as ſtēga.

So aurīga, bīga, quadrīga, collēga, sāga, pȳga, rūga, ſanguiſūga, folipūga, &c.

At Novius *collēga* gradu poſt me ſedet uno. Hor.

Except [1]calĭga, [2]oſſifrăga, tŏga, and the [4]derivatives of fŭgo, as fŭga, perfŭga, lucifŭga, lucrifŭga.

1. Caſar cognomen *calīgæ* cui caſtra dederunt. Auſon.
2. Adcipitres, atque *oſſifrāgæ*, mergeique, marinis. Lucret.
3. Lis numquam, *tŏga* rara, mens quieta. Mart.
4. Quâ venti incubuere, *fŭgam* dant nubila cœlo. Virg.

33. A vowel before final *go* is long; as imāgo, orīgo, inſtīgo.

So ærūgo, rūgo, aurīgo, fulīgo, compāgo, cartilāgo, conſilīgo, calīgo, fīgo, mīgo, heſperūgo, sūgo, ſuffrāgo, &c.

Adſpirate meis, primâque ab *origine* mundi. Ovid.

1. Except [1]ĕgo, [2]fŭgo, [3]harpăgo, lĭgo ([4]noun or [5]verb), [6]rĕgo, [7]rĭgo, [8]rŏgo, [9]ſtrĭgo, [10]tĕgo.

2. Alſo [11]congrĕgo is ſhort, from grex-grĕgis; and [12]jŭgo, from jŭgum.

3. [13]Lĕgo-ere of the third conjugation ſhortens the penultimate; but [14]lēgo-are, of the firſt, lengthens it.

4. Except alſo [15]ăgo, and its [16]compounds; as nĕgo, navĭgo, litĭgo, mitĭgo, &c. It is to be obſerved, however, that when the [17]compound has been formed by ſyncope or craſis, the penultimate, according to the rule for contracted ſyllables, becomes long; as fatīgo, from fatum or affatim and ago; indāgo, from inde and ago; farrāgo, from farre and ago; vertīgo, from vertendo and ago; caſtīgo, from caſtum and ago; dēgo, from de and ago, &c.

1. & 12. Quas ĕgo non gentes, quas non face corda *jŭgavi*. Stat.
2. Trans pontum *fŭgat*, et terris immitit apricis. Virg.
3. Conſulit blandiloquentulus, *harpăgo*, mendax, cuppes, avarus. Plaut.
4. Longis purgare *lĭgonibus* arva. Ovid.
5. Diſſociata locis concordi pace *lĭgavit*. Ovid.
6. Pacatumque *rĕget* patriis virtutibus orbem. Virg.
7. Prata *rĭget* fons interdum, campiſque redundet. Lucret.
8. Sacerdos, id faciam; atque aquam hinc de proximo *rŏgabo*. Plaut.
9. Namque ubi *ſtrĭgandum* eſt, et ubi currendum, ſcio. Phædr.
10. Superba jactas, *tĕgere* quod debet pudor. Phædr.
11. Inde ea comprendunt inter ſe, conque *grĕgantur*. Lucret.
13. Qui *lĕgitis* flores, et humi naſcentia fraga. Virg.
14. Quin potiùs, quod *lēgatum* eſt tibi negotium. Plaut.
15. Et potum, paſtas *ăge*, Tityre, et inter *ăgendum*. Virg.
16. Hoc etiam ſævas paulatim *mitĭgat* iras. Ovid.
17. Conſiliis animum *fatīgas*? Hor.

34. A vowel before final [1]*gus*, [2]*gum*, or [3]*gium*, is ſhort; as pelăgus, jŭgum, navĭgium.

So aſparăgus, catalŏgus, confrăgus, naufrăgus, oſſifrăgus, dialŏgus, epilŏgus, etholŏgus, elĕgus, lucifŭgus, indĭgus, noctivăgus, măgus, rŏgus, the noun săgus or săgum; conjŭgium, elŏgium, fortilĕgium, naufrăgium, prodĭgium, diffŭgium, perfŭgium, horolŏgium, remĭgium, ſacrilĕgium, aquilĕgium, confŭgium, &c.

1. Materiæ tanto in *pelăgo*, turbâque alienâ? Lucret.
2. Robuſtus quoque jam tauris *jŭga* ſolvet arator. Virg.
3. Excipe *naufrăgium* non duro littore noſtrum. Ovid.

1. Except fāgus, [2]frāgum, [3]frīgus, [4]pāgus, and the adjective [5]sāgus.

2. Alſo [6]contāgium, [7]faſtīgium, [8]ſuffrāgium, [9]veſtīgium.

3. And [10]chorāgus, [11]chorāgium from χορηγος, χορηγιον; and [12]pædagogus from ἄγω.

1. Tityre, tu patulæ recubans ſub tegmine *fāgi*. Virg.
2. Arbuteos fœtus, montanaque *frāga* legebant. Ovid.
3. Ante focum, ſi *frīgus* erit, ſi meſſis in umbrâ. Virg.
4. Quàm ſi me toto laudet vicinia *pāgo*. Juven.
5. Ipſe nihil certum *sāgis* clangoribus æther. Stat.
6. Nec mala vicini pecoris *contāgia* lædent. Virg.
7. Ambages; ſed ſumma ſequar *faſtīgia* rerum. Virg.
8. Libera ſi dentur populo *ſuffrāgia*, quis tam, &c. Juven.
9. Pauca tamen ſuberunt priſcæ *veſtīgia* fraudis. Virg.
10. Ipſe ornamenta a *Chorāgo* hæc ſumpſit ſuo periculo. Plaut.
11. Nam hoc pœne iniquum eſt Comico *chorāgio*. Plaut.
12. Mihi *pædagōgus* fuerat, quaſi uti mihi foret. Plaut.

35. A vowel before final [1]*va*, [2]*ve*, [3]*ves*, [4]*vis*, [5]*vo*, [6]*vus*, is long; as clāva, proclīve, dīves, cīvis, pāvo, rīvus.

So cēva, convīva, dīva, gingīva, pāva, prærogatīva, ūva, æſtīva, olīva, conclāve, nēve, clāvis, ſuāvis, nāvis, rāvis, acclīvis, declīvis, proclīvis, vīvo, prāvo, rīvo, nāvo, prīvo, æſtīvo, flāvus, ignāvus, æſtīvus, dīvum, ōvum, prāvus, and all adjectives ending in *īvus*, which are numerous.

1. Duceret apricis in collibus *ūva* colorem. Virg.
2. Currere per totum pavidi *conclāve* magiſque. Hor.
3. *Dīves* agris, *dīves* poſitis in fœnere nummis. Hor.
4. Nec prohibent *clāves*, et canis ipſe tacet. Tib.
5. Ulceris os; alitur vitium, *vīvitque* tegendo. Virg.
6. Tam ficti *prāvique* tenax, quàm nuncia veri. Virg.

1. Except [1]ăvis, [2]brĕvis, [3]grăvis, [4]lĕvis, [5]ŏvis.

2. Alſo [6]căvo, [7]grăvo, [8]jŭvo, [9]lăvo, [10]lĕvo, [11]nŏvo, [12]ŏvo.

3. And [13]ăvus, [14]căvus, [15]făvus, [16]nŏvus.

1. Fiet aper, modò *ăvis*, modò ſaxum, et, cum volet, arbor. Hor.
2. Vitæ ſumma *brĕvis* ſpem nos vetat inchoare longam. Hor.
3. Reddit, ubi Æoliden ſaxum *grăve* Siſyphon urget. Ovid.
4. Ante *lĕves* ergo paſcentur in æthere cervi. Virg.
5. Inſtituit, Pan curat *ŏves*, *ŏviumque* magiſtros. Virg.
6. Dura tamen molli ſaxa *căvantur* aquâ. Ovid.
7. Unde *grăvet* pennas; ſi celſior ignis adurat. Ovid.
8. Temperie cœli, corpuſque, animuſque *jŭvantur*. Ovid.
9. Prandeo, poto, cano, ludo, *lăvo*, cœno, quieſco. Mart.
10. Cantantes ut eamus, ego hoc te faſce *lĕvabo*. Virg.
11. Nec remorantur ibei: ſic rerum ſumma *nŏvatur*. Lucret.
12. Quo nunc Turnus *ŏvat*, ſpolio gaudetque potitus. Virg.
13. Stat fortuna domus et *ăvi*, numerantur *ăvorum*. Virg.
14. Sed tùm fortè *căvâ* dum perſonat æquora conchâ. Virg.
15. Mella *făvis*, illi tiliæ atque uberrima pinus. Virg.
16. Pura *nŏvum* vati laurea mollit iter. Propert.

36. A vowel before final *ca* is long; as ſpīca, formīca, feſtūca.

So antīca, apīca, cloāca, carrūca, currūca, erīca, mīca, myrīca, lactūca, lectīca, noctilūca, rīca, rubrīca, lorīca, pīca, paſtināca, phōca, ſambūca, ſīca, urtīca, veſtīca, &c.; and ſeveral ending in *theca*, from θήκη, as apothēca, bibliothēca, oporothēca, &c.

Parvula nam exemplo eſt, magni *formīca* laboris. Hor.

Except [1]alĭca, [2]braſsĭca, [3]fulĭca, [4]mantĭca, [5]pertĭca, [6]tunĭca, [7]falarĭca or phalarĭca, [8]dĭca.

1. Nos *alĭcam*, multum poterit tibi mittere dives. Mart.
2. Me notat, et junco *braſsĭca* vincta levi. Propert.
3. In ſicco ludunt *fulĭcæ*, notaſque paludes. Virg.
4. *Mantĭca* cui lumbos onere ulceret, atque eques armos. Hor.
5. *Pertĭca* dat plenis immitia vulnere ramis. Ovid.
6. Sufficiunt *tunĭcæ* ſummis Ædilibus albæ. Juven.
7. Sed magnum ſtridens contorta *falarĭca* venit. Virg.
8. Cedò dum, en unquam injuriarum audiſti mî ſcriptam *dĭcam*. Ter.

Note.—1. Aphăca is rather aphăce-es from ἀφάκη, and therefore does not relate to this rule.

2. And ſince adjectives in *icus* ſhorten the penultimate; wherever the termination *ica* is derivable from an adjective in *icus*, though the adjective itſelf be not in uſe, the penultimate is ſhort by derivation; as,

Piratĭca from piraticus; *i. e.* ars piratæ piratĭca.
Fabrĭca from fabricus; *i. e.* officina fabri fabrĭca.
Flaminĭca from flaminicus; *i. e.* fœmina flaminis flaminĭca.
Manĭca from manus; *i. e.* veſtis manûs manĭca.
Pedĭca from pedicus; *i. e.* catena pedis pedĭca.
Lucanĭca from Lucanicus; *i. e.* eſca Lucanorum lucanĭca.
Bucolĭca from bucolicus; *i. e.* carmina βουκολιαστῶν bucolĭca.
Baſilĭca from baſilicus; *i. e.* aula βασιλέως βασιλικὴ vel baſilica.
Arithmetĭca from arithmeticus; *i. e.* τέχνη ἀριθμῶν arithmetica.
Mnemonĭca from μνημονικὸς; *i. e.* τέχνη μνήμης μνημονικὴ.

37. Words

37. Words ending in [1]*aris* or [2]*are* lengthen the penultimate; as alāris, altāre.

So agricolāris, peculiāris, nāris, alveāre, capillāre, plantāre, quāre, and many others.

1. Sufpiciens, patulis captavit *nāribus* auras. Virg.
2. Sufpicit exigui lætum *plantāribus* horti. Juv.

Except [1]hilăris, [2]bimăris, [3]canthăris, [4]cappăris, [5]măre, and [6]dăre.

1. Oderunt *hilărem* triftes, triftemque jocofi. Hor.
2. Aut Ephefum *bimărifve* Corinthi. Hor.
3. *Canthăridum* fuccos, dante parente, bibas. Ovid.
4. *Cappărin*, et putri cepas alece natantes. Mart.
5. Ante *măre* et tellus, et quod tegit omnia cœlum. Ovid.
6. See, for *dăre*, the verbal increment in *a*.

38. Words ending in [1]*elis*, [2]*elus*, [3]*ela*, [4]*elum*, [5]*osus*, [6]*udus*, [7]*ator*, *utor*, lengthen the penultimate; as fidēlis, phasēlus, fuadēla, prēlum, fumōfus, sūdus, orātor, ūtor.

So crudēlis, carduēlis, patruēlis, candēla, loquēla, querēla, corruptēla, cicindēla, clientēla, muftēla, nitēla, Philomēla, parallēlus, polymēlus, arenōfus, formōfus, luctuōfus, perniciōfus, nūdus, crūdus, lūdus, ūdus, and many others.

1. Nunquam eft *fidēlis* cum potente focietas. Phædr.
2. Et circum pictis vehitur fua rura *phasēlis*. Virg.
3. Qualis populeâ mærens *Philomēla* fub umbrâ. Virg.
4. & 5. Colaque *prēlorum fumōfis* deripe tectis. Virg.
6. Quid Nero tam fævâ, *crudāque* tyrannide fecit? Juven.
7. Hinc altâ fub rupe canet *frondātor* ad auras. Virg.
8. Nec foleas fecit; *sūtor* tamen eft fapiens. Qui?— Hor.

39. Words ending in [1]*ober*, [2]*uber*, or [3]*aver*, lengthen the penultimate; as Octōber, falūber, papāver.

So fūber, tūber, ūber, hūber, pūber, cadāver, &c.

1. Te taceo, *Octōber* fœnere ditat agros. Aufon.
2. Quique frequens herbis et fertilis *ūbere* campus. Virg.
3. Lilia purpureis mifta *papāveribus*. Prop.

Except [1]colŭber and [2]rŭber.

1. Inque pruinofo *colŭber* diftenditur arvo. Lucan.
2. Crine *rŭber*, niger ore, brevis pede, lumine læfus. Mart.

40. Adverbs in [1]*tim* lengthen the penultimate; as oppidātim, virītim, tribūtim: except [2]ftătim.

1. Et velut abfentem *certātim* Actæona clamant. Ovid.
2. Nec fpernat auris, nec tamen credat *ftătim*. Phædr.

Note.—"Noftra Lexica, Gradufque ad Parnas. Pænultimam adverbii, *affātim*, longâ apice fignant. Nec eo inficias, quin poetæ degeneris Latinitatis eam produxerint." Vide tamen Lexicon Facciolati, ubi hanc obfervationem invenies, "Annianus poeta, apud Gell. l. 7. c. 7. ita difputat de quantitate penultimæ, ut ftatuat eam effe corripiendam: innuat, autem, olim etiam productam fuiffe: quod et ab Aratore factum eft. L. 2. in Ac. Apoftol. v. 326. Verùm non eft hoc fatis, ut contra communem ufum produci poffet."

41. Words ending in final *quus* are compounded with *æquus*, and therefore lengthen the penultimate; as antīquus, inīquus, oblīquus.

Terra *antīqua*, potens armis atque ubere glebæ. Virg.

Except relĭquus, which is not derived from æquus, and is therefore excepted.

Texantur *relĭqua* tecta palude tibi. Mart.

Note.—Though the real caufe of the penultimate of inīquus, antīquus, &c. being long, is the contraction of the *æ*, of æquus, from which they are derived, into *ī*, which is therefore long, according to the rule we have given for contraction: yet fince the above may be a more obvious diftinction than a latent caufe, we have not thought it improper to add it. And fince this remark is applicable to fome other terminations and examples, noticed in this analyfis, it is fufficient here, once for all, to give this general anfwer.

42. Words ending in *pōla*, or *pōlium*, being derived from πωλέω, lengthen the vowel before *l*; as bibliopōla, œnopōlium.

So myropōla, myropōlium, propōla, pharmacopōla, &c.

1. Sed qui me vendit *Bibliopōla* putat. Plaut.
2. Nam omneis plateas perreptavi, gymnafia et *myropōlia*. Plaut.

43. Words ending in [1]*areo*, [2]*arius*, [3]*erium*, [4]*orius*, lengthen the antepenultimate; as pāreo, cibārius, acrotērium, mefsōrius.

So āreo, clāreo, hordeārius, fextārius, librārius, mercenārius, herbārius, capiftērium, dictērium, ecclefiaftērium, nicetērium, fphæriftērium, adulatōrius, cenfōrius, and many others.

1. Vim geminam fentit, *pāretque* incerta duobus. Ovid.
2. In hunc diem jam tuus fum *mercenārius*. Plaut.
3. Omnibus arrides, *dictēria* dicis in omnes. Mart.
4. Quem *censōria* cum meo fevero. Mart.

1. Except [1]căreo, [2]vărius, and [3]nectăreus, from nectar-ăris.

2. Alfo [4]defidĕrium, from defidĕro; [5]magiftĕrium, from magiftĕr; and [6]miniftĕrium, from miniftĕr.

3. And the [7]derivatives of genitives increafing in fhort *ŏris*; as æquŏreus, arbŏreus, caftŏreus, corpŏreus, ebŏreus, marmŏreus, ftercŏreus, robŏreus, from æquor-ŏris, arbor-ŏris, caftor-ŏris, corpus-ŏris, ebur-ŏris, marmor-ŏris, ftercus-ŏris, robur-ŏris.

4. Except alfo fome [8]derivatives from o (omicron), as bŏreus, antibŏreus, hyperbŏreus, from βορέας.

1. Scilicet et morbis et debilitate *cărebis*. Juven.
2. Et *vărias* ufus meditando extunderat artes. Virg.
3. Attica *nectăreum* turbatis mella falernum— Mart.
4. Roma, domufque fubit, *defidĕriumque* locorum. Ovid.
5. Virtute, id factum, tuâ, et *magiftĕrio* tuo. Plaut.
6. Feffa *miniftĕriis* mulces, reparafque labori. Ovid.
7. *Arbŏreæ* frondes auro radiante nitentes. Ovid.
8. Vita procul patria peragenda fub axe *Bŏrea*. Ovid.

44. Words ending in [1]*aceus*, [2]*aseus*, [3]*aneus*, [4]*eneus*, [5]*oneus*, lengthen the antepenultimate; as teftāceus, cāfeus, fubitāneus, ahēneus, idōneus.

So arenāceus, hederāceus, hordeāceus, refināceus, cretāceus, arāneus, conditāneus, rejectāneus, collectāneus, bipedāneus, and many others.

1. Herbas utiliores *argillācea* terra. Var.
2. Pinguis et ingratæ premeretur *cāfeus* urbi. Virg.
3. Nec nebulam noctu, neque *arānei* tenuia fila— Lucret.
4. Si rectè facies: hic murus *ahēneus* efto. Hor.
5. Opportunus ita eft fi forte et *idōneus* aër— Lucret.

1. Except caftăneus, from caftănea.

*Caftăneæ*que nuces, mea quas Amaryllis amabat. Virg.

45. Words ending in *icius*, *icium*, or *itius*, fhorten the antepenultimate; as patrĭcius, ædifĭcium, ædilĭtius.

Patrĭcios omnes opibus cùm provocet unus. Juven.

So gentilĭcius, tribunĭcius, adventĭtius, factĭtius, aufpĭcium, judĭcium, artifĭcium, arufpĭcium, malefĭcium, benefĭcium, opifĭcium, extifpĭcium, harrufpĭcium, facrifĭcium, indĭcium, offĭcium, panefĭcium, and many others.

1. Except [1]novīcius, or novītius; and thofe which come from long fupines; as effutītius, from effutio, īre, īvi, ītum.

2. Alfo [2]convīcium, [3]līcium, and [4]nutrīcium, from nutrix-īcis.

1. Jam fedet in ripa tetrumque *novīcius* horret. Juv.
2. Neve in me ftolidæ *convīcia* funnere linguæ. Ovid.
3. Et prenfos domitare boves, et *līcia* telæ. Virg.
4. Omniaque infantum mixta *nutrītia* turba— Manil.

46. Words

46. Words ending in [1] *aticus*, [2] *atilis*, [3] *etudo*, [4] *atio*, [5] *utio*, lengthen the antepenultimate; as aquāticus, aquātilis, valētudo, feſtinātio, locūtio.

So pluviātilis, plicātilis, deſuētudo, cremātio, balbūtio, and many others.

1. Calcavêre pedis, nec ſolvit *aquāticus* Auſter. — Ovid.
2. Labitur occultè, fallitque *volātilis* ætas. — Ovid.
3. Gratia, fama, *valētudo* contingat abunde. — Hor.
4. Sceleſtæ hæ ſunt ædes, impia eſt *habitātio*. — Plaut.
5. *Balbūtit* ſcaurum, pravis fultum malè talis. — Hor.

Except ſome ending in *măticus*, from neuters in *ma-ătis;* as aromăticus, from aroma-ătis; rheumăticus, from ῥεῦμα-ατος; grammăticus, from γράμμα-ατος; and hepăticus, from hepar-ătis.

Grammăticas ambire tribus, et pulpita dignor. — Hor.

47. Abilis lengthens the antepenultimate; ſo does ibilis, when from long preterites in īvi; otherwiſe it ſhortens it, as amăbilis; expetībilis, from expeto, īvi, ītum; terrĭbilis, from terreo, ŭi, ĭtum.

Accipiam, cunctiſque meum *lætābile* factum. — Ovid.
Terrĭbili ſqualore Charon; cui plurima mento— — Virg.

48. [1] Abulum, [2] aculum, [3] ecula, lengthen the antepenultimate; [4] iculum, [5] icula, ſhorten it; as pābulum, gubernāculum, apēcula, ridĭculus, aurĭcula.

1. *Pābula* parva legens, nidiſque loquacibus eſcas. — Virg.
2. Omnia transformat ſeſe in *mirācula* rerum. — Virg.
3. Aut urſum, aut pugiles; his nam *plebēcula* gaudet. — Hor.
4. Quàm ex hoc *fontĭculo* tantundem ſumere. Eò fit. — Hor.
5. Humanum genus eſt avidum nimis *aurĭcularum*. — Lucret.

Except [1] perīculum, and [2] ſome long by derivation; as hædīculus, from hædīle; redimīculum, from redimio, īvi, &c.; lorīcula, from lorīca; poſtīculum, from poſtīcus; nutrīcula, from nutrix-īcis.

1. Sed tibi vexatæ per multa *pericula* vitæ. — Prop.
2. Et tunicæ manicas et habent *redimīcula* mitræ. — Virg.

49. Words ending in [1] *ācium*, [2] *ēlia*, [3] *fāriām*, lengthen the antepenultimate; as mendācium, pittācium, contumēlia, multifāriām.

1. Impercepta pia *mendācia* fraude latebant. — Ovid.
2. Quod quum inquinâſſent omni *contumēlia*. — Phædr.
3. Ut diſpartirem obſonium hic *bifāriam*. — Plaut.

50. Numerals ending in [1] *ni*, lengthen the penultimate; in [2] *ginti*, [3] *ginta*, [4] *gies*, and [5] *ēſimus*, the antepenultimate; as bīni, sēni, vicēni, ducēni, vīginti, octōginta, nonāgies, octōgies, vigēſimus, multēſimus.

So quīni, ſeptēni, octōni, novēni, undēni, duodēni, tredēni, &c.; quadrāginta, quinquāginta, &c.; quadrāgies, quinquāgies, &c.; trigēſimus, quadragēſimus, &c.

1. Bis *dēnas* Italo texamus robore naves. — Virg.
2. *Vīginti* tauros magnorum horrentia centum. — Virg.
3. *Trīginta* magnos volvendis menſibus orbes. — Virg.
4. Phœbus *nonāgies* illuceſcet polum utrumque. — Hipponac.
5. Bis jam pene tibi conſul *trigēſimus* inſtat. — Mart.

51. Words ending in [1] *ates*, [2] *itis*, [3] *otis*, [4] *ota*, and [5] *eta*, lengthen the penultimate; as vātes, vītis, caryōtis, diōta, mēta.

So crātes, penātes, mītis, chalcītis, pleurītis, ampelītis, arthrītis, caprītis, mephītis, caryōta, ceſtrōta, bēta, crēta, coſmēta, comēta, poēta, sēta, &c.

1. Cælicolæ, clarique ſuos poſuêre *penātes*. — Ovid.
2. Contuderit *vites*, ſeamve momorderit æſtas. — Hor.
3. Et notas *caryōtidas* theatris— — Mart.
4. O Thaliarche merum *diōtā*— — Hor.
5. Quorſum abeant ſani? *crētâ* an carbone notandi?— — Hor.

Except [1] pŏtis, [2] sĭtis, [3] nŏta, [4] rŏta, [5] drapĕta.

1. Quis *pŏtis* eſt, niſi vis animæ, quæ membra gubernat. — Lucret.
2. Depoſitura *sĭtim* vicini fontis in undâ. — Ovid.
3. A quo repulſus triſtem ſuſtinuit *nŏtam*. — Phædr.
4. Hîc neque tum ſolis *rŏta* cerni, lumine largo. — Lucret.
5. Conſtant, conferunt ſermones inter ſeſe *drapĕtæ*. — Plaut.

52. Laſtly; the following final ſyllables lengthen the preceding vowel, [1] *nar*, [2] *cal*, [3] *gal*, [4] *nal*, and [5] *tal;* as lacūnar, pulvīnar, cervīcal, vectīgal, Bacchānal, minūtal, and ſome others.

1. Meâ renidet in domo *lacūnar*. — Hor.
2. Tinge caput nardi folio, *cervīcal* olebit. — Mart.
3. Jurgatur verbis: ego *vectīgalia* magna. — Hor.
4. *Bacchānal* te exercuiſſe, quom qui ſis, alium rogites? — Plaut.
5. Heſternum ſolitus medio ſervare *minūtal*. — Juven.

53. Alſo, whatever terminations are naturally derivable from any of the preceding final ſyllables, lengthen or ſhorten, according to their primitive termination, their penultimate, or antepenultimate ſyllable; as maſculines ending in *ārius*, may form feminines in *āria*, and neuters in *ārium;* ſo *ōrius*, *ōria*, *ōrium;* *ētus*, *ēta*, *ētum*, &c. as ærārius, belonging to copper or braſs; ærāria, a copper mine; ærārium, a treaſury; hence roſārium, pomārium, muſcārium, meritōrium, quercētum, roſētum, palmētum, &c.

Note.—1. And it ſhould be recollected, that ſince compounds and derivatives follow the quantity of their primitives, the compounds and derivatives of ſuch words as form exceptions to any of theſe rules, will follow the general rule for the quantity of derivative words.

2. And it may be here neceſſary, finally, to remind the young proſodiah of the ſame rule, ſince the quantity of many vowels is explicable ſolely by this law, and requires no other direction; as ædilitius from ædilis; aliēnigena from aliēnus; contrādico from contrā; aliquātenus from aliquā, &c. Hence adjectives ending in *ax-ācis* form derivatives in *ăcia*, *ăcitas;* as capax-ācis, capăcitas, audax-ācis, audăcia: in the ſame manner genitives increaſing ſhort, ſhorten the correſponding vowel of the derivative; as cartilago-gĭnis, cartilagĭneus, cartilagĭnoſus. Thus preterites and ſupines having their penultimate long, lengthen accordingly the derivative vowel; as dormīto from dormio-īvi-ītum; condītio, condītitius from condio-īvi-ītum; ſo condĭtio, condĭtus, condĭtor from condo-dĭdi-dĭtum: hence arrīſio, arrīſor, audītio, definītio, are from arrideo-riſi-rīſum, &c. Thus words ending in *ālis* may form derivatives in *ālia*, *ālitas*, *āliter*, *ālitius*, *ālicutus;* hence cereālia, æquālitas, artificiāliter, canālitius, canāliculus, ariſe from the primitive termination *ālis:* and thus nouns in *ātio* have their derivatives in *ātiuncula;* as ædificātio, ædificātiuncula, &c.

54. I [1] before or [2] after *r*, is long; as īra, ſcrīnium.

1. *Īra* furor brevis eſt. Animum rege, qui niſi paret— — Hor.
2. Mixtaque *rīdenti* colocaſia fundet acantho. — Virg.

1. Except [1] hĭrudo, [2] hĭrundo, [3] rĭgo, [4] rĭgeo, [5] trĭbus, [6] vĭreo.

2. Alſo, *ri* followed by [7] *c* is ſhort; as frĭco, Afrĭcus, fabrĭco, lubrĭco, currĭculum; yet [8] lumbrīcus, [9] rubrīca, [10] trīcæ, and its derivative [11] extrīco, and [12] rīca, follow the general rule.

3. And *ri* followed by a vowel, is ſhort by the rule "a vowel before another," &c. as penurĭa.

1. Qualis volo, vetulos duo; jam ego me convortam in *hĭrudinem*— — Plaut.
2. Pervolat, et pennis alta atria luſtrat *hĭrundo*. — Virg.
3. Omnia quæ maria, ac terras, ſparguntque, *rĭgantque*. — Lucret.
4. Sanguine et igne micant oculi, *rĭget* horrida cervix. — Ovid.
5. Et ditant Latias tertia dona *trĭbus*. — Mart.
6. Quo ſeges in campo, quo *vĭret* uva jugo. — Prop.
7. *Afrĭcus* in glaciem frigore nectit aquas. — Prop.
8. Foras, foras, *lumbrīce*, qui ſub terrâ erepſiſti modò. — Plaut.
9. Non ſecùs ac ſi oculo *rubrīcam* dirigat uno. — Perſ.
10. Litibus, neque *trīcis:* quam ob rem ego argentum numerem foras? — Plaut.
11. Mercedem aut nummos unde unde *extrīcat*, amaras— — Hor.
12. Supparum, aut ſubminiam, *rīcam*, baſilicum, aut exoticum. — Plaut.

55. Y

55. Y before or after R, is long; as Butȳrum, collȳrium, papȳrus.

1. *Collȳræ* facite ut madeant et colliphia. Plaut.
2. Succinctus patriâ quondam Crifpine *papȳro*. Juven.

1. Except [1]lachrȳma, [2]lȳra, [3]corȳlus, [4]philȳra, [5]pȳrus, [6]fatȳra, [7]zephȳrus.

2. And the derivatives of ἄϱγυϱος; as hydrargȳros, lithargȳros.

3. See the 3d exception to the laft rule.

1. Et *lacrȳmis* fpargunt rorantibus ora genafque. Lucret.
2. Sit tibi Mufa *lȳræ* folers, et cantor Apollo. Hor.
3. Neve inter vites *corȳlum* fere; neve flagella. Virg.
4. Ebrius incinctis *philȳrâ* conviva capillis. Ovid.
5. Infere nunc, Melibœe, *pȳros*, pone ordine vites. Virg.
6. Sunt quibus in *Satȳrâ* videar nimis acer, et ultra. Hor.
7. At verò *Zephȳris* cum læta vocantibus æftas— Virg.

56. U [1]before or [2]after R, is long; as lūridus, ūro, rūmor.

1. Neglectis *ūrenda* filix innafcitur agris. Hor.
2. Quæ vos ad cœlum effertis *rūmore* fecundo. Hor.

1. Except [1]cŭrulis, [2]cærŭlus, [3]fŭro and fŭror, [4]frŭtex, [5]lemŭres, [6]nŭrus, [7]querŭlus, [8]rŭdis, [9]rŭdens, [10]rŭbeo, [11]rŭtilus, [12]rŭmex, [13]tugŭrium, [14]fatŭr-ŭra-ŭrum.

2. Except alfo *ri* in [15]genitives, increafing fhort in *ŭcis* or *ŭris*, and their derivatives; as crux-crŭcis, trux-trŭcis, augur-ŭris, murmur-ŭris, fulphur-ŭris, which give crŭcio, trŭcido, murmŭro, augŭrium, fulphŭreus, and the like.

3. Alfo, [16]meditatives in *ŭrio* and *luxŭrio*; as esŭrio: [17]other verbs in *urio* follow the general rule; as ligūrio, featūrio.

4. U before final *r*, and *ru* followed by a vowel, are regulated by the rules for thofe circumftances; as augŭr, fatŭr, rŭino.

1. Prætor adeft vacuæque loco ceffere *cŭrules*. Lucan.
2. Adnixi torquent fpumas, et *cærŭla* verrunt. Virg.
3. Quid *fŭris*? Aut quonam noftri tibi cura receffit? Virg.
4. Contexit illum *frŭtice*, et admonuit fimul. Phædr.
5. Nocturnos *lemŭres* portentaque Theffala rides? Hor.
6. Cinctaque adeft virgo matrum *nŭruumque* catervâ. Ovid.
7. Et nunquam *querŭli* caufa doloris abeft. Ovid.
8. Quem dixêre Chaos; *rŭdis* indigeftaque moles. Ovid.
9. Infequitur clamorque virûm, ftridorque *rŭdentum*. Virg.
10. Purpureis invecta rotis Aurora *rŭbebat*. Virg.
11. Robora complexus *rŭtilo* curvata metallo. Lucan.
12. Apponunt *rŭmicem*, braflicam, betam, blitum. Plaut.
13. Pauperis et *tugŭri* congeftum cefpite culmen. Virg.
14. Aut intus claufos *fatŭra* ad præfepia fervant. Virg.
15. Vultus in unum me *trŭces*. Hor.
16. Græculus *esŭriens*, in cœlum jufferis, ibit. Juven.
17. Tractavit calicem manibus, dum furta *ligūrit*. Hor.

57. [1]O and [2]U, before *m* are long; as vōmer, būmaftus.

1. Ingemere, et fulco attritus fplendefcere *vōmer*. Virg.
2. Quale folet fylvis *brūmali* frigore vifcum. Virg.

1. Except, to *o* before *m*, [1]cŏmeta, [2]cŏmedo, [3]ŏmitto, [4]tŏmaclum.

2. Alfo atŏmus, dŏmus, glŏmus, tŏmus (for which fee fect. 2, rule 5); cŏma, cŏmes (for which fee fect. 2, rule 23); dŏmo, hŏmo, and vomo; (for which fee fect. 2, rule 25.)

1. Non fecus ac liquida fi quando nocte *cŏmetæ*. Virg.
2. Ut libet: hæc porcis hodie *cŏmedenda* relinques. Hor.
3. Pleraque differat, et præfens in tempus *ŏmittat*. Hor.
4. Quod fumantia qui *tŏmacla* raucus. Mart.

3. Except, to *u* before *m*, [1]crŭmena, [2]cŭmulus, [3]hŭmerus, [4]nŭmella, [5]nŭmerus, [6]sŭmus, [7]tŭmeo.

4. Alfo, colŭmen, docŭmentum, emolŭmentum, tegŭmen (for which fee fect. 2, rule 22); hŭmus, poftŭmus (for which fee fect. 2, rule 5); cucŭmis (for which fee fect. 2, rule 23); and autŭmo; (for which fee fect. 2, rule 25.)

5. For circŭmeo and circŭmago, fee the rule for *m* final.

1. Quid eum velit, homo, *crŭmenam* fibi de collo detraxit. Plaut.
2. Exhauftum in *cŭmulos* omnifque in fluctibus unda eft. Lucan
3. Ipfe fubibo *hŭmeris*: nec me labor ifte gravabit. Virg.
4. Nervos, catenas, carceres, *nŭmellas*, pedicas boias. Plaut.
5. Rari quippe boni, *nŭmero* vix funt totidem, quot— Juv.
6. Alii fimul delinquunt, cenfores *sŭmus*. Phædr.
7. Igne micant oculi, corpus *tŭmet* omne veneno. Ovid.

58. U before *c* is long; as būcula, dūco, cadūcus.

Vidi ego labentes acies, et tela *cadūca*. Prop.

1. Except [1]lŭcellum, [2]lucerna, [3]nŭcleus, [4]volŭcer.

2. And in [5]genitives increafing fhort in *ŭcis*, and their derivatives; as dux-ŭcis, crux-ŭcis, trux-ŭcis; hence crŭcio, trŭcido, &c.

1. Quid purè tranquillet; honos, an dulce *lŭcellum*— Hor.
2. Hæc ego non credam Venufina digna *lŭcernâ*. Juv.
3. Mella dari, *nŭcleo*fque jubet, dulcefque placentas. Mart.
4. Interea *volŭcer* motis conterrita pennis. Petron.
5. Abftraxitque hominem in maximam malam *crŭcem*. Plaut.

59. Syllables indifferently fpelled with one or two confonants are long; as lītteræ or litteræ, lītus or littus, cūpa or cuppa, pūpa or puppa, ftūpa or ftuppa, fcīroma or fcirroma, ftlōpus or ftloppus or fcloppus, cōliphium or colliphium, which fhould invariably retain the double confonant, fince it is by pofition alone that they are long, by the confonant, and not by the vowel, reduplication.

60. Syllables indifferently fpelled with a fingle vowel, or a diphthong, are long; as tēda or tæda, prēlum or prælum, which latter orthography, the moft expreffive of the vowel quantity, it is better to retain.

61. Vowels derived from η, ω, ει, ου, are long, as hērōus, Sīrius, mūfa, from ἥϱως, σείϱιος, μοῦσα.

Note.—Many of thefe are already comprifed under the preceding rules; the principal words referrible *alone* to this rule, are cōlon, cratēra, hēpar, hēros, lēcythus, lēthum, lichen, ōde, rhētor, fpēlæum, fpēlunca, thēfauros, thōrax, theōria. To thefe we may add near 200 words of very rare occurrence, chiefly fignifying plants, herbs, ftones, minerals, &c. &c. as anthēdon, afclēpias, afplēnon, &c. Of thefe we would here infert our manufcript lift, but fince they are principally confined to fuch authors as Pliny, Celfus, Vitruvius, and Frontinus, they are matter rather of occafional reference, than of any grammatical rule.

62. Some words alike in orthography, differ in quantity *only* according to their fignification; as

1. . . . . Pōpulus arbor
2. . . . . Eft; notat et pŏpulus
3. . . . . . . Plebem. Sic mālos eft pro
4. . . . . . . Pravo; gignit item mălum.
5. . . . . . Navis mālus; mālina mālus,
6. . . Stirpe unâ produci poffint. Māla genam vult;
7. . . . . Māla poma. Et pālus
8. . . . . . Faciens păludis; eft ferè
9. . . . . Stagnum lacufve; at non tamen fic
10. . . . . Pālus notans sūdem. Nītor, nītenfque,
11. . . . . Nĭten; creatque nĭtor et nitens sĕcŭs.
12. . . . Pro tellure sŏlum; non ita sōlus aut
13. . . . Ab eo sōlùm. Plāga notione
14. . . . Retis vel oræ corripitur; licet
15. . . . Verberis aut vice vulneris, tu
16. . . Extendas ita plāgam. Pila fic in globuli lŏco
17. . . . . . . Contrahiturque: mole
18. . . Denotata, porrige pīlam: notat atque pilus
19. . . . . . . Aciei feriem miffileque;
20. . . . . Ea pīlum quoque, mallāmque terit. Sin
21. . . . . Vice crinis pilus eft; atque pīlo dat: pĭlo
22. . . . Significat fūrāri, non fŭrĕre. Et notat cōmāre
23. . . . Cæfariem gerere; fed cŏmĕre ornare eft cŏmam.
24. . . . Cōlāre aquam nos dicimus; || fed cŏlere arva, fons.

Note.

Note.—The above verſes not only furniſh the words relating to rule 62, but alſo, to unite two objects in one, they at the ſame time afford a ſpecimen of all the Horatian metre, which, to the claſſical ſtudent, may prove a uſeful compendium. It is, probably, only the ſecond production of the kind in print. The firſt is quoted by the two editors of Horace, Cruquius and Baxter, and, had its ſubject been as eligible as the deſign, the preſent would have been ſuperſeded. For a definition of the Horatian metres compoſing this ſpecimen, the reader may conſult Lyne's Latin Primer, (edit. 4th) page 246, or VERSIFICATION, in the ſequel of this work. The following, however, are the Horatian metres, as exemplified in the above lines: 1. An Adonic; 2. A dactylic penthemimer; 3. A Pherecratian tripodia; 4. A Glyconic choriambic; 5. Dactylic tetrameter; 6. An hexameter; 7. Iambic dimeter acephalous; 8. Iambic dimeter; 9 Iambic dimeter hypercatalectic; 10. Iambic trimeter catalectic; 11. Iambic trimeter; 12. An aſclepiad; 13. A Sapphic hendecaſyllabic; 14. A great Alcaic; 15. A ſmall Alcaic; 16. Alcaic choriambic; 17. Choriambic dimeter; 18. Epichoriambic tetrameter; 19. Ionic à minori trimeter; 20. Sapphic Ionic; 21. Ionic à minori tetrameter; 22. Dactylic heptameter; 23. Firſt elegiambic Archilochian; 24. Second elegiambic Archilochian. The remaining words alluded to by rule 62, are compriſed by the following hexameters.

25. Ad mediam noctem *sērum* producere poſſis;
26. Datque *sĕrum* tibi lac. *Sōpire* facit *sŏpor* omnes.
27. Ac ſoboles *pernĭcis*, uti *pernīciter*, eandem
28. Deductam vocalem extendunt. Perque *nĕcare*
29. *Pernĭciem* proleſque tibi dant. *Ācer* acutum
30. Denotat; arborem *ăcer* vult; atqui corripiuntur
31. Amborum ſoboles. *Prŏcĕres*, faciens *prŏcĕrum*, ſit
32. Pro magnatibus; et celſo *prōcērus*. Et *lābor*
33. *Lābi*; ſed *lăbi* *facta* *lăbore*; *lăboro*, *lăbare*.
34. Rurſus, *litteræ* uti *lĭqueant* tibi, diſcere poſſis
35. Ut liceat proferre, metalla *lĭquare*, *lĭquorem*,
36. *Līqui*. *Lūteum* et in *lŭteo* *lŭto* oleſcere *lūtum*.
37. *Īdem* *ĕădem*, necnon *ĭdem*, et in ſexto fit *eādem*.
38. *Līberi* uti ſint verò *lĭberi*, iis nihil extat
39. Utilius, quàm ut ſanctus *lĭber* hiſce *lĕgendus*
40. Sit, tunc his *lĭbertatem* *lēgalis*: ibīdem
41. Ut *mōres* *mŏni* poſſint ſolŭmque ſalutem
42. Æternamque *mŏrari*; quâ, *mŏrā* pernicioſa
43. Valde eſt; utque ita *mōri* *mŏrenturque* revera,
44. Diſcent. *Dēnique* hæc, *dīco*, mentique *dĭcanda*.

General Rule.

63. A vowel before a ſingle conſonant, not affected by any preceding or following rule, is ſhort; as săpio, sĭlĭqua, grăcĭlĭtas.

1. Attamen excipias hæc paucula, ceu, crocodīlus,
2. Ālea, fūlīgo, pīrāta, abſtēmius, ōlim,
3. Ārea, sōlenniſque vēnēficus, īlicet, īco,
4. Hībernus mācūtīnuſque fălārica, nōdus,
5. Clītellæ, bālœnaque, cōram, līlia, gluten,
6. Māturus, līmax, capitōlium, anōnymus, īlia,
7. Adduntur nīdor, vendēmia, flāgito, vēlox
8. Tībia, tībīcenque acadēmia, fībula, pāla,
9. Grādīvus, Māvors, Sāturnus, Jūpiter, Īris,
10. Pȳthon, Īdōla ethnica, vel crepitacula. Rurſus
11. Āla, repāgula, sēmi, sēmis, cōpia, fīlum,
12. Vīburnum, contāmino et āles crāpula, tālus,
13. Vītupero, mausōleum, māgālia, rāpum,
14. Cālīgo, sūgillo, mūlus, mūtuus, īdus,
15. Mētīri, bālīſtaque, fēlix, dēnuo, quālus,
16. Sōlicito, prīdem, ſic prīdie, et sīmia, sēpes,
17. Lāmina, tēmētum, irrītare, monēdula, mūgil,
18. Rhīnoceros, dūdum, nāſus, prævārĭcor, adde
19. Vārĭcor; invīto ceu vīto, sōlea, dōnec,
20. Jūniperuſque. Nec ōtia dantque nĕgōtia; sōlers
21. Eurīpus, grātus, pēnūria, pōcula, rhēda,
22. Ocius Īliadem, fīli perdiſce Hŏmēri;
23. Cūleus, et vībex, imbēcilliſque. Dat hīlum,
24. Progeniemque nīhil. Quàm ſæpe, heu! ducere poſſint
25. Nūgaces, nūgas, tricaſque. Cānōpus, asīlus,
26. Glūtīre ac vēcors, sōcors, exōticus, āēr,
27. Āēris ac āio quoque āio; vīpera, crēber,
28. Vāpulo; et audīre atque ōb, obēdīre efficiuntque
29. Adduntur gnōmon, vāgīre, bonāſus, ōmāſum,
30. Dīvidere, ac idiōta, ſināpis, trāgula, jūgis;
31. Corripiunturque hæc măceo, măcer; exprime prolem
32. Mācero: et adde vōco, quod vōcem, vōciferoque
33. Vōcalem variat, formatque vocabula. Plāco;
34. Plācatus plăceo plăcidus, plācabilis, unà
35. No nāvi nātum nāto, uti nōtum nōta, vādo
36. Atque vādum, nūbo unà pronŭba ſunt varianda.
37. Sic oblīviſcor et pecūlia, sīlus, aēdon,
38. Faſtīdire hālec, marsūpia, fābula, phrāſis,
39. Sībilo anīcetum ſquālere et ephēbus, iūlus,
40. Glōcire, ōceanus, pīpire, facētia, tūber,
41. Et cōlum, lībum, conchȳlia, ſtrāgula, tābum
42. Faux dat præſōeo, ſic veſpertīlio, pūpus,
43. Sēculum et adduntur sūſes et sēria rāſis
44. Rāvire ac ūdus mūgire et bālia, nāpus
45. Brāchia fēriæ anētha et anōdyna glōria thōrax
46. *Sīdera* cœlorum *consīdera*, opes meliores
47. Terrenis necnon *desīdera*, omitte minora.

Note—1. To confine the preceding rules to limits as ſhort as poſſible, 1ſt, the preceding rules and their exceptions relate only to words of pure or Auguſtan Latin. 2. Some terms of very rare occurrence, chiefly the names of plants, herbs, ſtones, foſſils, &c. near 300 in number, are omitted, as matters of occaſional reference, rather than of conſtant attention or grammatical rule.

2. We have now, after four conſecutive analyſes of the language, for the more complete information of the ſtudent, accompliſhed a taſk, perhaps never achieved before, nor, ſo far as we are acquainted, offered to the public, in any proſodial ſyſtem. And we can venture to affirm, that any perſon well acquainted with common proſody, and the rules of this ſection, will not, within the precincts of Auguſtan Latin, find a ſingle word, except the few of rare and unfrequent occurrence mentioned above, whoſe quantity is not regulated or accounted for by the rules now given. Thus, for the firſt time, we have reduced that, the majority of Latin quantity, by all preceding proſodians referred to a courſe of obſervation and practice alone, to a regular claſſification and ſyſtem. Would our limits permit, we would here, for the ſake of exemplification, take the words compriſed by any letter of the alphabet, and account for the quantity of each by the principles and criteria we have here conſidered.

3. It is almoſt neceſſary here to add, that the quantities of ſyllables are marked with very frequent inaccuracy in moſt of our common dictionaries. The poets are the only ſatisfactory teſt.

SECTION III.—*On final Syllables.*

1. A final, in words declined by caſes, is ſhort; as famă, regnă, lampadă.

Anchoră de prora jacitur: ſtant littore puppes. — Virg.

1. Except the ablative ſingular of the firſt declenſion; as hâc muſā, hoc Æneā.

2. The vocative ſingular from Greek nouns in *as*; as O Pallā, O Atlā.

1. Proſpiciens, *ſummā* placidum caput extulit *undā*. — Virg.
2. Non hæc, O *Pallā*, dederas promiſſa parenti. — Virg.

2. A final, in words not declined by caſes, is long; as amā, ultrā, prætereā.

1. Littus *amā* et lævas ſtringat ſine palmula cautes. — Virg.
2. *Intereā* magno miſceri murmure pontum. — Virg.

1. Except ită and ejă ſhort, and poſtea common.

2. Quia is generally ſhort, but ſince Phædrus lengthens it, we may pronounce it to be common.

3. Some proſodians quote puta, with the *a* ſhort, from Perſius, 4. 9. But the beſt editions have puto, a reading evidently preferable, in point both of ſenſe and grammar.

4. Though numerals in *ginta* are ſometimes found ſhort, approved authors lengthen the *a*; yet it may be well to recollect, that the Greek termination KONTA, whence the Latin *ginta* is evidently borrowed, has the final vowel ſhort; as

Τοις δ' ἁμα τεσσαρα KONTA μελαιναι νηες ἑποντο. — Hom.
[See many other inſtances in Iliad B.]

1. . . . Ferret ad aurigeræ caput arboris, *ejă*, per ipſum. — Val. Flac.
2. Tum ſic affatur regem, atque *ită* turbidus infit. — Virg.
3. Si auctoritatem *poſteā* defugeris. — Plaut.
4. *Poſteă* mirabar, cur non ſine litibus eſſet. — Ovid.
5. Haud, (equidem credo,) *quiă* ſit divinitus illis. — Virg.
6. Ego primam tollo, nominor *quiā* leo. — Phædr.
7. *Sexagintă* teras cum limina mane ſenator. — Mart.
8. *Trigintā* toto mala ſunt epigrammata libro. — Mart.

3. E

3. E final is ſhort; as natĕ, patrĕ, currĕ, nempĕ, antĕ.

Incipĕ, parvĕ puer, riſu *cognoſcerĕ* matrem. — Virg.

1. Except that ſinal E in all caſes of the [1] firſt and [2] fifth declenſion, is long; as Calliopē, Tydidē, Anchiſē, fidē; alſo [2] famē, originally of the fifth. Thus alſo, *rē, diē,* and their [3] compounds quarē, hodiē, pridiē, poſtridiē, quotidiē.

2. Alſo in [4] all nouns wanting the ſingular; as cetē, melē, tempē, pelagē, Greek neuters plural.

3. The ſecond perſon ſingular of the imperative of the [5] ſecond conjugation, has the E long; as docē, monē; but [5] cave, [6] vale, [9] vide [10], [7] reſponde [8], and [11] ſalve [12], have *e* common.

4. [13] Monoſyllables ending in E are long; as *ē, mē, tē, ſē, nē* (leſt or not) except [13] enclitics and ſyllabic adjectives; as *quĕ, nĕ, vĕ, ptĕ, cĕ, tĕ;* as nequĕ, quoquĕ, ſuaptĕ, hujuſcĕ, tutĕ, &c.

5. [14] Adverbs in *e* coming from nouns of the ſecond declenſion are long; as placidē, pulchrē, valdē or validē, &c. Except [15] benĕ, malĕ, [16] ſupernĕ, [16] infernĕ, magĕ.

6. [17] Fermē, [18] ferē, and [19] ohē, have *e* long.

1. Hanc tua *Penelopē* lento tibi mittit, Ulyſſe. — Ovid.
2. Et quamquam ſævit pariter *rabiēque, famēque.* — Ovid.
3. Quæ mens eſt *hodiē*, cur eadem non puero fuit? — Hor.
4. At *pelagē* multa, et late ſuſtrata videmus. — Lucret.
5. Vade, *valē*, *cavĕ* ne titubes, mandataque frangas. — Hor.
6. Idque, quod ignoti faciunt, *valĕ* dicere ſaltem. — Ovid.
7. *Reſpondē*, quibus amiſſas reparare queam res. — Hor.
8. Si quando veniet? dicet; *reſpondĕ*, poëta. — Mart.
9. Quid ſis nata *vidē*, niſi te quoque decipis ipſam. — Ovid.
10. *Vidĕ*, ne dolone collum compungam tibi. — Phædr.
[See alſo Perſ. 1. 108.]
11. Lector *ſalvē*. Taces, diſſimulaſque? Vale. — Mart.
12. *Salvĕ*, Pæoniæ largitor nobilis undæ. — Claud.
13. Vera, inquit; *nequĕ* me Argolica *dē* gente negabo. — Virg.
14. *Præcipuē*, cum jam hic trabibus contextus acernis. — Virg.
15. Nil *benĕ* cum facias, facis attamen omnia belle. — Mart.
16. Tecta *ſupernē* timent: metuunt *infernē* cavernas. — Lucret.
17. Mobilis et varia eſt *fermē* natura malorum. — Juven.
18. Jamque *ferē* ſicco, ſubductæ littore puppes. — Virg.
19. Importunus amat laudari? donec *ohē!* jam. — Hor.

4. I final is long; as dominī, claſsī, fierī, docerī, audī, ī, filī.

Ollī reſpondit rex *Albāī Longāī.* — Enn.

1. Except the *i* of Greek vocatives; as Alexĭ, Amaryllĭ, Thetĭ, Parĭ, Daphnĭ; but Simŏī, or ſuch as belong to nouns having *entos* in the genitive, are long.

2. Greek datives ſingular of the third declenſion, from nouns increaſing, are varied. Minoidĭ and Tethyĭ in Catullus, and Palladĭ in Statius, are ſhort.* Thetidī in Catullus, and Paridī and Tyndaridī in Propertius, are long; but Greek datives formed by contraction are always long; as Demoſthenī, metamorphoſī; alſo thoſe which come from the firſt declenſion in Greek; as Oreſtī, Euripidī.

3. Neuters in *i* are alſo ſhort; as gummĭ, melĭ, ſinapĭ.

4. Datives and ablatives plural of Greek nouns in *ſi* (*ſin* before a vowel) are ſhort; as heroiſĭ, Troaſĭ.

5. Mihi, tibi, ſibi are common. Alſo ibi, niſi, ubi and quaſi; but theſe laſt are more frequently ſhort.

* *Note.*—Theſe may be long by poetic licence, or by poſition; for the *i* of Greek caſes is naturally ſhort. Orphēī may be conſidered as a dactyl in Virgil. Ecl. 4. 57; and by ſynæreſis it is a ſpondee in the Georgics, 4. 535 and 553.

1. O crudelis *Alexī*, nihil mea carmina curas. — Virg.
2. *Palladī* littoreæ celebrabat Scyros honorem. — Stat.
3. *Troaſĭn* invideo, quæ ſi lacrymoſa ſuorum. — Ovid.
4. Non unquam gravis ære domum *mihī* dextra redibat. — Virg.
5. Extremum hunc, Arethuſa, *mihi* concede laborem. — Virg.

5. O final is common; as quando, Cato, leo, ambo, octo, amo, doceto.

1. Arma amens *capiō*, nec ſat rationis in armis. — Virg.
2. Non *amŏ* te, Sabidi; nec poſſum dicere quare. — Mart.

1. Except [1] monoſyllables, which are long; as ō, prō, dō, ſtō, and prōh, *h* not being accounted as a letter.

2. [2] Greek feminines ending in *o* are long; as Didō, Sapphō, Cliō.

3. O final in [3] datives and ablatives of the ſecond declenſion, is long; as ſomnō; to which add another ablative, as ergō, for the ſake of, ergo therefore belonging to the rule.

4. Alſo [3] Greek caſes, written in the original with omega; as Androgeō, Athō.

5. [4] Adverbs formed from nouns have the final *o* long; as ſubitō, meritō, multō; [5] and illō, quō, eō, and their compounds. Alſo citrō, intrō, retrō, ultrō. But the [6] following are ſometimes found ſhort, denuŏ, idcircŏ, ſerŏ, profectŏ, [9] poſtremŏ, the conjunction [10] verŏ, [11] porrŏ, to which ſome add ſedulŏ, crebrŏ, and mutuŏ. [12] Modŏ (uſed adverbially,) and its compounds are ſhort; as quomodŏ, dummodŏ, poſtmodŏ.

6. Though the final *o* of verbs, occaſionally by writers of a [7] ſecondary claſs, and more rarely by thoſe of the [5] Auguſtan age, has been made ſometimes ſhort, yet its derivation from the Greek omega, and the more general practice of the principal poets, make it long: the *o* of ſcio, [6] neſcio, puto, cito, and of the imperative cedo, only, are generally ſhort.

7. The gerund in *do*, in reality, being nothing elſe than the dative or ablative of the ſecond declenſion, is, accordingly, by all authors of the Auguſtan age, made long: the [17] exceptions to this rule are very few, and only by writers of an inferior claſs.

8. [18] Ambo, duo, imo, illico, ego, generally ſhorten *o* final.

1. *Prō* molli violâ, *prō purpureō* narciſſo. — Virg.
2. *Cliōque*, et Beroë ſoror, oceanides ambæ. — Virg.
3. In foribus letum *Androgeō*: tum pendere pœnas. — Virg.
4. Adde, quod iſte tuus, tam *rarō* prælia paſſus. — Ovid.
5. Uſque *a leōne* times, quem tu facis ipſe timendum? — Lucret.
6. *Idcircŏ* gemellum vocitarunt choriambon. — Terent.
7. *Idcircō* certis dimenſum partibus orbem. — Virg.
8. Imperium tibi *ſerŏ* datum: victoria velox. — Claud.
9. Et Scauros, et Fabricios; *poſtremŏ* ſeveros. — Juven.
10. Quod petimus: ſin *verŏ* preces et dicta ſuperbus. — Val. Flac.
11. Veſter *porrŏ* labor fæcundior hiſtoriarum. — Juven.
12. Hic inter denſas corylos *modŏ* namque gemellos. — Virg.
13. Horrida Romuleum certamina *pangŏ* duellum. — Enn.
14. *Prandeŏ, potŏ*, cano, ludo, *lavŏ, cœnŏ*, quieſco. — Mart.
15. *Dixerŏ* quid ſi forte jocoſius, hoc mihi juris. — Hor.
16. Sic ubi *neſciŏ* quis Lycia de gente virorum. — Ovid.
17. Quæ noſti, *meditandŏ* velis inoleſcere menti. — Auſon.
18. Præterea *duŏ* nec tutâ mihi valle reperti. — Virg.

6. U final is long; as vultū, cornū, Panthū, dictū, diū.

Quo res ſumma loco, *Panthū?* quam prendimus arcem. — Virg.

1. Except [1] indŭ for in, and [2] nenŭ for non, both uſed by Lucretius, the former likewiſe by others, in compoſition, as indŭperator, have the *u* ſhort.

2. Alſo the *ŭ* before the elided *s*; as nunciŭ, plenŭ, for nuncius, plenus.

1. *Indū*

1. *Indŭ* manu validas potis eſt moderanter habenas. Lucret.
2. *Nenŭ* queunt rapidi contra conſtare leones. Lucret.
3. Vicimus O ſocii, et magnam *pugnavimŭ* pugnam. Enn.

7. Y final is ſhort; as Moly̆, Tiphy̆, Chely̆, Tethy̆.

Moly̆ vocant ſuperi. Ovid.

Except when *y* is a contraction, as in Tethy, inſtead of Tethyi, the dative, it is long by the general rule for craſis.

Quam *Tethȳ* longinqua dies, Glaucoque repoſtâm. Val. Flac.

8. Latin words ending in B ſhorten the preceding vowel; foreign words lengthen it, as ăb, ŏb, Jōb, Jacōb.[1]

Magnus *ăb* integro ſec'lorum naſcitur ordo. Virg.

9. Final C lengthens the preceding vowel; as āc, sīc, hīc, (adverb), dūc, illūc, &c.

Sīc oculos, *sīc* ille manus, *sīc* ora ferebat. Virg.

1. Except that nec and donec are ſhort, as alſo the imperative fac.*
2. Hic and hoc of the nominative and accuſative, are common.

* Two paſſages quoted from incorrect copies of Ovid, to prove *fac* long, in better editions appear *facito* and *face*; ſo that, according to the opinion of Alvarez, it is ſafer to conſider *fac* as ſhort.

1. Parve, *nĕc* invideo, ſine me, liber ibis in urbem. Ovid.
2. *Donĕc* eris felix, multos numerabis *amīcos*. Ovid.
3. Signa rarius, aut ſemel *făc* illud. Mart.
4. Hic vir, *hĭc* eſt, tibi quem promitti ſæpius audis. Virg.
5. Hic gladio fidens, *hīc* acer et arduus haſta. Virg.

10. Final D, in Latin words, ſhortens the preceding vowel; in foreign words it lengthens it; as quĭd, ăd, apŭd, illŭd, sĕd, Davīd.

Ipſe docet *quĭd* agam. Fas eſt et *ăb* hoſte doceri. Ovid.

11. Final L ſhortens the preceding vowel: as mĕl, fĕl, pŏl, ſimŭl, ſemĕl, nihĭl, conſŭl.

Innocui veniant: *procŭl* hinc, *procŭl* impius eſto. Ovid.

1. Except that Hebrew words are generally long; as Daniēl, Nabāl, Saūl.
2. Sāl, ſōl, and nīl, are long.

1. Non *sāl*, oxyporumve caſeuſve. Stat.
2. Omnia ſub pedibus, quâ *sōl* utrumque recurrens. Virg.
3. *Nīl* opis externæ cupiens, *nīl* indiga laudis. Claud.

12. Final M was, anciently, ſhort, and was not, as now, elided when followed by a vowel.

Inſignita ferè tum millia *militŭm* octo. Enn.

It is ſhort in *circŭm*, in compoſition with words beginning with a vowel, as [1] circŭmeo, [2] circŭmago.

1. Cujus non hederæ *circŭmiere* caput. Propert.
2. Quo te *circŭmagas?* quæ prima aut ultima ponas? Juven.

13. Final N lengthens the preceding vowel; as ēn, ſplēn, quīn, nōn, sīn, rēn, Pān, Salamīn, Oriōn, Titān.

Merſit et ardentes *Oriōn* aureus ignes. Manil.

1. Except nouns ending in [1] *en*, which have *ĭnis*, ſhort, in the genitive; as carmĕn-ĭnis, tegmĕn-ĭnis.
2. Alſo nouns in [2] *on* of the ſingular number, from the Greek *o* (omicron), and which, in Latin, are of the ſecond declenſion; as Iliŏn, Pylŏn.
3. N is ſhort in the accuſatives of Greek nouns, having the final ſyllable of their nominative ſhort; as Majăn, Æginăn, Orpheŏn, Alexĭn, Ibĭn, Chely̆n, Ity̆n.

4. Alſo ăn, ĭn, forsăn, forſităn, tamĕn, attamĕn, veruntamĕn, vidĕn', ſatĭn', have *n* ſhort.

1. Addunt et titulum; titulus breve *carmĕn* habebat. Ovid.
2. Laudabunt alii claram *Rhodŏn*, aut Mitylenen. Hor.
3. Tantaque nox animi eſt, *ităn* huc arceſſite, dixit. Ovid.
4. Mittite; *forsăn* et hæc olim meminiſſe juvabit. Virg.
5. *Forſităn* et, Priami fuerint quæ fata, requiras. Virg.
6. Educet. *Vidĕn'* ut geminæ ſtent vertice criſtæ. Virg.

14. Final R ſhortens the preceding vowel; as vĭr, puĕr, tĕr, timŏr, calcăr, Hamilcăr, amamŭr, audiuntŭr.

Tum *patĕr* omnipotens miſſo perfregit Olympum. Ovid.

1. Except [1] Greek nouns, and [2] ſuch as have *ēris*, long, in the genitive; as cratēr, ſtatēr, vēr, Recimēr, [3] Iber-ēris; but [4] Celtiber[5], the compound of Iber, has the penultimate common.
2. Alſo [6] aēr and æthēr, though they increaſe ſhort in the genitive.
3. And [7] fār, [8] lār, [9] nār, [10] cūr, [11] fūr, and [12] pār, with its [12] compounds, compār, impār, diſpār.

1. *Cratēr* auratis ſurgit cælatus ab aſtris. Manil.
2. *Vēr* erat æternum, placidique tepentibus auris. Ovid.
3. Si tibi durus *Ibēr*, aut ſi tibi terga dediſſet. Lucan.
4. Nunc *Celtibēr* in *Celtibēria* terrâ. Catul.
5. Ducit ad auriferas quod me ſalo *Celtibĕr* oras. Mart.
6. Inde mare, inde *aēr*, inde *æthēr* ignifer ipſe. Lucret.
7. *Fār* erat, et puri lucida mica ſalis. Ovid.
8. Exagitant et *Lār*, et turba Diania fures. Ovid.
9. Sulfureâ *Nār* albus aquâ, fonteſque Velini. Virg.
10. Multa quidem dixi, *cūr* excuſatus abirem. Hor.
11. Callidus effracta nummos *fūr* auferet urcâ. Mart.
12. Ludere *pār*, *impār*, equitare in arundine longa. Hor.

Note.—*Cor* long is attributed to Ovid, but the line in which it is ſaid to be thus found, is read differently in corrected editions; the ſame remark is applicable to *vir*; as

1. Molle meum levibuſque *cŏr* eſt violabile telis. Ovid.
2. De grege nunc tibi *vir*, nunc de grege natus habendus. Ovid.

Thus corrected, *vir* is long merely by poſition.

15. Words ending in AS, lengthen the final ſyllable; as mās, vās, crās, fās, amās, farās, pietās, Thomās, Muſas.

Hās autem *terrās*, Italique hanc littoris oram— Virg.

1. Greek nouns in *as* are ſhort, which make the genitive in *ados* or *adis*, as Arcas, Pallas, Lampas, Ilias: to which add the noun Anăs, and Latin nouns in *as*, formed after the manner of Greek patronymics; as Appiăs.
2. Alſo the final *as* of Greek accuſatives plural of the third declenſion is ſhort; as craterăs, lampadăs, Troăs, Cyclopăs, herŏas, heroidăs, Hectorăs, &c.

1. Bellica *Pallăs* adeſt, et protegit ægide fratrem. Ovid.
2. Et pictis *anăs* enovata pennis. Petron.
3. *Appiăs* expreſſis aëra pultat aquis. Ovid.
4. *Naidăs* his venam, quæ nunquam areſcere poſſet— Ovid.

16. Words ending in ES lengthen that ſyllable; as rēs, ſpēs, vulpēs, quiēs, hærēs, eſsēs, Anchisēs, totiēs, locuplēs.

Vulpēs ad cœnam dicitur ciconiam. Phædr.

1. [1] The nouns and vocatives plural of Greek nouns increaſing (not in εος) ſhort in the ſingular, are ſhort; as Amazonĕs, Arcadĕs, Delphinĕs, Naiadĕs, Gryphĕs, Phrygĕs.
2. To which may be added Greek vocatives ſingular in *es*, coming from nominatives in *es*, not formed from *eus* of the Doric dialect, and having their genitive in *eos*; as Demoſthenĕs, Socratĕs.

3. * *Es*, in the present tense of *sum*, and its [3] compounds, is short; as adĕs, abĕs, prodĕs, potĕs, &c.; and in the preposition penĕs.

4. [2] Latin nouns of the third declension, in *es*, increasing short in the genitive, are short in the final syllable; as hebĕs, alĕs, pedĕs, limĕs, obsĕs. [5] But *es* is long in these following; Cerēs, pariēs, ariēs, abiēs, pēs, and its [8] compounds, as bipēs, tripēs, alipēs, sonipēs; to which some add præpēs, a derivative of præpeto.

1.	*Troadĕs*; et patriæ fumantia tecta reliquunt.	Ovid.
2.	Quisquis ĕs, amissos hinc jam obliviscere Graios.	Virg.
3.	Nunc *adĕs* O cœptis, flava Minerva, meis.	Ovid.
4.	Vivitur ex rapto; non *hospĕs* ab hospite tutus.	Ovid.
5.	Flava *Cerēs* alto nequicquam spectat Olympo.	Virg.
6.	Creditur: ipse *ariēs* etiam nunc vellera siccat.	Virg.
7.	Desuper Aurigæ dexter *pēs* imminet astro.	Manil.
8.	Stat *sonipēs*, et fræna ferox spumantia mandit.	Virg.

**Note.*—1. Though *es*, in the present tense of *sum* and its compounds is short, it is not in any other tense, nor in the final syllable of *essēs*, (as has been asserted,) as

Possēs in tanto vivere flagitio?	Propert.
Essēs Ionii facta puella maris.	Propert.

2. Whenever paries, aries, and abies are found long, there happens to be a cæsura; and perhaps Ceres and pes are long by diastole: Ausonius shortens bipes and triges; and Probus observes that alipes and sonipes are likewise short: though the contrary appears in Virgil, Lucan, and Horace, yet some of the above-mentioned words could not be introduced into heroic verse without the influence of a figure to lengthen their final syllable. Præpes, which comes not from *pes*, but from πϱοπετής, is short in Virgil. (Æn. 5. 254.) Tigrēs, ascribed to Ovid, is, by the best critics, rejected.

17. IS final is short; as bĭs, ĭs, quĭs, cĭs, magĭs, turrĭs, militĭs, creditĭs, Thetĭs.

Tum *bĭs* ad occasum, bis se convertit ad ortum.	Ovid.

1. Except plural cases in *is*; as nobīs, vobīs, ([2] quīs for quibus), musīs; the plural accusatives [3] omnīs, [4] urbīs, &c.

2. The nominative in *is* is long, when the [5] genitive ends in *ītis*, *īnis*, or *ēntis* long; as līs, Samnīs, Salamīs, Simoīs.

3. *Is* is long in the adverbs [9] gratīs and forīs; in the noun glīs, and in vīs, whether noun or [8] verb.

4. All [6] second persons singular in *is* are long; when the second persons plural have *ītis* long; as cīs, fīs, sīs, īs, abīs, audīs, velīs, nolīs, possīs, &c.

5. [10] *Ris* of the perfect is commonly considered short, of the [11] future [2], common; so are the penultimates of ausĭs and faxĭs: ris and ritis of [13] ero and potero are more frequently short.

1.	Inducenda rota est: das *nōbīs* utile munus	Mart.
2.	*Quīs* ante ora patrum Trojæ sub mœnibus altis.	Virg.
3.	Non *omnīs* arbusta juvant, humilesque myricæ.	Virg.
4.	Adde tot egregias *urbīs*, operumque laborem.	Virg.
5.	Sed *līs* est mihi de tribus capellis.	Mart.
6.	*Nescīs*, heu! nescis dominæ fastidia Romæ.	Mart.
7.	Ignea convexi *vīs* et sine pondere cœli.	Ovid.
8.	Si *vīs* esse aliquis. Probitas laudatur et alget.	Juven.
9.	*Gratīs* anhelans, multa agendo, nil agens.	Phædr.
10.	*Dixerīs* egregie notum si callida verbum.	Hor.
11.	Quas gentes Italum, aut quas non *oraverĭs* urbes.	Virg.
12.	Da mihi te placidum; *dederĭs* in carmine vires.	Ovid.
13.	Fortunate puer, tu nunc *ĕris* alter ab illo.	Virg.

18. OS final is long; as rōs, vōs, nōs, mōs, flōs, trōs, arbōs, honōs, custōs, nepōs.

Ōs homini sublime dedit, cœlumque tueri.	Ovid.

1. Except [1] Greek genitives in *os*; as Arcadŏs, Tethyŏs, Tereŏs, Orpheŏs.

2. Also [2] compŏs, impŏs, and [3] ŏs-ossis, with its compounds exŏs, have the final syllable short.

3. [4] Greek nominatives and vocatives of the second declension have *os* short; as Clarŏs, Tenedŏs, Lesbŏs, Atropŏs. But those nouns of the Attic dialect, having their genitives in omega, are long, as Androgeōs, Athōs: also nouns of the same dialect, which have changed *laŏs* (λαὸς) into *leos* (λεὼς), as Peneleōs, Meneleōs.

4. Greek neuters in *os* are short; as Argŏs, epŏs, chaŏs, melŏs.

1.	Alta jacet vasti super ora *Typhoëŏs* Ætna.	Ovid.
2.	Insequere, et voti postmodo *compŏs* eris.	Ovid.
3.	*Exŏs* et exsanguis tumidos perfluctuat artus.	Lucret.
4.	Tum, cum tristis erat, defensa est *Iliŏs* armis.	Ovid.
5.	Quantus *Athōs*, aut quantus Eryx, aut ipse caruscis.	Virg.
6.	Et *Chaŏs* et Phlegethon, loca nocte silentia late—	Virg.

19. US final is short; as tenŭs, littŭs, penitŭs, intŭs, Ambobŭs, Montibŭs, Amamŭs.

Incipe: pascentes servabit *Tityrŭs* hædos.	Virg.

1. Except [1] monosyllables in *us*; as grūs, plūs, rūs, thūs, jūs.

2. Also the [2] genitives of feminine nouns in *o*; as Cliūs, Sapphūs, Mantūs.

3. Genitives singular, and nominatives, accusatives, and vocatives plural of the fourth declension, (all being contracted,) have *us* long; as fructūs, manūs.

4. Also nouns increasing long in the genitive; as palūs-ūdis, virtūs-ūtis, tellūs-ūris, Opūs-ūntis.

5. *Us* is long in the [5] compounds of πους, (forming the genitive in podis or podos,) as Tripūs, Melampūs, Œdipūs, Polypūs.

6. Also [6] those nouns which have *u* in their vocative; as Panthūs, O Panthu.

7. Finally, [7] Ιησους has the final syllable long.

1.	Romæ *rūs* optas, absentem rusticus urbem.	Hor.
2.	*Didūs* atque suum misceri sanguine sanguen.	Varro.
3.	Pars secreta *domūs* ebore et testudine cultus—	Ovid.
4.	Ridet ager; neque adhuc *virtūs* in frondibus ulla est.	Ovid.
5.	Hic *Œdipūs* Ægea tranabit freta.	Seneca.
6.	*Panthūs* Othryades, arcis Phœbique sacerdos.	Virg.
7.	Et cœlo et terris venerandum nomen *Jēsus*.	

20. YS final is short; as Capy̆s, chely̆s, chlamy̆s.

At *Capy̆s*, et quorum melior sententia menti.	Virg.

Except nouns which form the nominative in *yn* also; as Gortȳs, Phorcȳs. To these add contracted plurals; as Erynnȳs, for Erinnyēs, or Erinnyās.

21. Final T shortens the preceding vowel; as capŭt, amăt.

Verum hæc tantum alias inter; *capŭt extulĭt* urbes.	Virg.

Except when final *t* is long by crasis: as redit for rediit or redivit.

Magnus civis *obīt* et formidatus Othoni.	Juven.

22. The last syllable of every verse is considered common; that is, if the syllable be naturally long, it may be accounted short; or, if it suit the verse, *vice versâ*.

Gens inimica mihi Tyrrhenum navigat *æquŏr*.	Virg.
Crescit occulto velut arbor *ævŏ*.	Hor.

Note.—1. In the first of these examples, *ŏr*, naturally short, forms the second syllable of a spondee; in the last, a Sapphic verse, the word *ævŏ*, which is naturally a spondee, forms a trochee.

2. "The grammarians that displease Dr. Clarke, (see Clarke's Homer, Iliad A. v. 54.) by saying that the last syllable of a verse is common, only mean, that the *local* quantity supersedes the natural quantity of the syllable."

For the last principal head of prosody; see VERSIFICATION.

QUAN-TSOM, in *Geography*, a town of China, of the third rank, in Pe-tche-li; 32 miles S. of Chunte.

QUANTUM Meruit, called alfo an *affumpfit*, in *Law*, an action upon the cafe, grounded upon a neceffity to pay a ma for doing any thing fo much as it deferves or merits.

This valuation of his trouble is fubmitted to the determination of a jury; who will affefs fuch a fum in damages as they think he really merited.

Quantum *Valebat*, or an implied affumpfit, is where goods and wares fold, are delivered by a tradefman at no certain price, or to be paid for them as much as they are worth in general; then *quantum valebat*, or an action on the cafe, lies, and the plaintiff is to aver them to be worth fo much; fo where the law obliges one to furnifh another with goods or provifions, as an inn-keeper his guefts, &c.

QUANTZ, John Joachim, in *Biography*, chamber mufician to Frederic II. king of Pruffia, to whom he had been flute-mafter before his acceffion to the crown. Quantz was born at Oberfcheden, a village in the electorate of Hanover, in 1697. His father, who was a blackfmith, obliged him to work at the anvil before he was nine years old; which muft have afforded him an early opportunity of making the famous Pythagorean experiment, mentioned by Jamblichus (de Vit. Pythag.), and by all the mufical writers of antiquity. Indeed, the ear of our young Ardalus had been already formed, in his excurfions with his brother, a village mufician, who ufed to play about the country on holydays and feftivals, whom he accompanied upon thefe occafions, on the bafe-viol, when but eight years old, and without knowing a note of mufic; but this performance, bad as it was, pleafed him fo much, that he determined to choofe mufic for his profeffion; though his father, who died when he was only ten years of age, recommended to him, on his death-bed, to continue in the honourable profeffion of his anceftors.

Quantz, after lofing his father, had no other friends to depend upon for counfel and protection, than two uncles, who lived at Merfeburg in Saxony; and thefe, fending for him, gave him the choice of their feveral profeffions, the one being a taylor, and the other a *kunftpfeifer*, or town-wait.

Upon this occafion, the paffion for mufic in the young Quantz overpowered all other confiderations, and, prefering the fiddle-ftick to the anvil or fhears, he bound himfelf apprentice to his uncle, the mufician, for five years; but this uncle dying three months after, he was transferred to his fon-in-law, Fleifchhack, who was of the fame profeffion; and it was under him that he firft practifed the violin, an inftrument to which his inclination at this time impelled him, preferably to any other.

Soon after this, however, he practifed the hautbois, and the trumpet, with which inftruments, and the violin, he chiefly filled up the term of his apprenticefhip; but as a true town mufician, in Germany, is expected to play upon all kinds of inftruments, he had been obliged, occafionally, to apply himfelf, during this period, to the fackbut, cornet, bafe-viol, French horn, common flute, baffoon, viol da gamba, and the lord knows how many more. Thefe were in the way of bufinefs, but for pleafure, he now and then took leffons on the harpfichord, of the organift Kiefewetter, who was likewife his relation; by which he laid the firft foundation of his knowledge in harmony, and love for compofition.

Luckily for Quantz, his mafter, Fleifchhack, was not, like other country muficians, fond only of old, dry, ftiff, and taftelefs compofitions, but had fufficient difcernment to choofe his pieces out of the neweft and beft productions of the times, by Telemann, Melchoir, Hofmann, and Heinechen, which were publifhed at Leipfic; from the perufal, and practice of which, our young performer derived great advantage.

The duke of Merfeburg's band not being very numerous, the town-waits, at this time, were often called in, to affift at the mufical performances, both of court and chapel. Here Quantz frequently heard foreigners play and fing, in a manner far fuperior to any profeffors whom he had hitherto met with, which excited in him a ftrong defire to travel. Drefden and Berlin were at this time the moft renowned cities in Germany, for the cultivation of mufic, and the number of able muficians. He eagerly wifhed to vifit one of thofe cities, but was deftitute of the means. However, he now began to feel his ftrength, and trufting to his feet and his fiddle, he boldly fet off for Drefden.

It was in the year 1714 that he arrived in that city. His firft entrance was not aufpicious, being wholly unable to procure employment: on this account, he made an excurfion to Radeburg, where a journeyman fiddler being wanting, he entered into the fervice of the town mufician, Knoll; but alas! he was foon driven from this poft, by the fatal accident of the town being burnt down by lightning. Again reduced to the ftate of a fugitive, and a wanderer, he levied contributions round the country by the power of his violin, which was now his principal inftrument, till he reached Pirna.

Here, deftined ftill to be *fervus fervorum*, he could procure no other means of exercifing his profeffion, than by accepting the office of deputy to a fick journeyman mufician of the town. It was during this time, that he firft faw Vivaldi's concertos for the violin, which were fo congenial to his own feelings and ideas of perfection, that he made them his model as long as he continued to practife that inftrument.

Still regarding Drefden as his centre, he eagerly accepted an offer that was made to him, of being temporary affiftant there, to one of the town-waits, who was then ill; an employment which he preferred, for the opportunities it afforded him of hearing good mufic and good muficians, to the more honourable poft of being the beft of bad muficians at Berenburg, where he might have been appointed firft violin, with a good falary.

His fecond arrival at Drefden was in the year 1716, where he foon difcovered that it was not fufficient for a mufician to be able to execute the mere notes which a compofer had fet on paper; and it was now that he firft began to be fenfible of the exiftence of tafte and expreffion.

Auguftus II. was at this time king of Poland, and elector of Saxony, and the orcheftra of this prince at Drefden was in a flourifhing condition; however, the ftyle which had been introduced there, by the concert-mafter Volumier, was French; but Pifendel, who fucceeded him, introduced a mixed tafte, partly French, and partly Italian, which he afterwards brought to fuch perfection, that Quantz declares, he never heard a better band in all his future travels.

No orcheftra in Europe could now boaft of fo many able profeffors, as that of the elector of Saxony, among whom, were Pifendel and Veracini, on the violin; Pantaleone Hebenftreit, on the pantaleone; Weifs, on the lute; Richter, on the hautbois; and Buffardin, on the German flute; not to mention feveral excellent performers on the violoncello, baffoon, French horn, and double-bafe.

Upon hearing thefe great performers, Quantz was filled with fuch wonder, and poffeffed of fuch a rage for improvement, that he laboured inceffantly to render himfelf worthy of a place among fuch honourable affociates.

For, however prejudiced he may have been in favour of his own reputable calling of kunftpfeifer, he began now juft to think it poffible for him to be prevailed upon, to relinquifh that part of it, at leaft, which required him to play country dances, though in itfelf fo jovial, pleafant, and feftal an employment.

He continued, however, to be the kunftpfeifer's delegate in this city, till the death of Auguftus II.'s mother, in 1717, at which time, the general mourning profcribing the ufe of every fpecies of convivial mufic, he again, in his ufual manner, commenced traveller, and fiddled his way through Silefia, Moravia, and Auftria, to Vienna; and in the month of October, of the fame year, returned through Prague to Drefden; which journey, he thinks, contributed more to his knowledge, in practical geography, than in any other art.

The jubilee of the reformation, brought about by Dr. Luther, happening to be celebrated foon after his return, he was called upon, among others, to perform a part upon the trumpet, at church, where the chapel-mafter Schmidt having heard him, offered to prevail on the king to have him regularly taught that inftrument, in order to qualify him for the place of court trumpeter; but Quantz, however ardently he might have wifhed for an office at court, declined the acceptance of this, well knowing that the good tafte to which he afpired, was not to be learned upon that inftrument, at leaft as it was then played in Drefden.

In 1718, the Polifh or royal chapel was inftituted; it was to confift of twelve performers, eleven were already chofen, and a hautbois player, only, was now wanting, to complete the number. After undergoing the feveral trials, and giving the requifite proofs of his abilities, he had the happinefs to be invefted with that employment, by the director, baron Seyfertitz, with a falary of 150 dollars, and a lodging.

This was an important period in his life, and in the exercife of his profeffion. The violin, which had hitherto been his principal inftrument, was now laid afide for the hautbois, upon which, however, he was prevented from diftinguifhing himfelf, by the feniority of his brethren. Mortified at this circumftance, he applied himfelf ferioufly to the German flute, upon which he had formerly made fome progrefs without a mafter; but his motive now for refuming it, was the certainty of his having no rival, in the king's band, as M. Friefe, the firft flute, had no great paffion for mufic, and readily relinquifhed to him his place.

In order to work upon fure ground, Quantz took leffons at this time of the famous Buffardin, with whom, however, he only played quick movements, in which this celebrated flute-player chiefly excelled. The fcarcity of pieces, compofed exprefsly for the German flute, was fuch, at this period, that the performers upon that inftrument were obliged to adopt thofe of the hautbois, or violin, and by altering or tranfpofing, accommodate them to their purpofe, as well as they could.

This ftimulated Quantz to compofe for himfelf; he had not as yet ever received any regular inftructions in counterpoint, fo that, after he had committed his thoughts to paper, he was obliged to have recourfe to others to correct them. Schmidt, the chapel-mafter, had promifed to teach him compofition, but delayed keeping his word from time to time, and Quantz was afraid of applying to Heinichen, his colleague, for fear of offending Schmidt, as thefe mafters were upon bad terms together. In the mean time, for want of other affiftance, he diligently ftudied the fcores of great mafters, and without ftealing from them, endeavoured to imitate their manner of putting parts together, in trios, and concertos.

About this time he had the good fortune to commence a friendfhip with Pifendel, now appointed concert-mafter, in the room of Volumier. Quantz is very warm in his praifes of Pifendel, whom he calls a profound theorift, a great performer, and a truly honeft man. It was from this worthy concert-mafter that he learned to perform an adagio, and to compofe in many parts. Pifendel had in his youth been taught to fing by the famous Piftocchi, and had received inftructions, on the violin, from Torelli; however, having travelled through France and Italy, where he had acquired the peculiarities in the tafte of both countries, he fo blended them together as to form a third genus, or mixed ftyle of writing and playing, which was half French and half Italian. Influenced by his example, Quantz declares, that he always preferred this compound ftyle, to that of Italy, France, or the national ftyle of his own country.

At the marriage of the prince royal of Poland, in 1719, feveral Italian operas were performed at Drefden. Lotti, the famous Venetian maeftro di capella, together with the moft celebrated fingers of Italy, male and female, were called thither upon this occafion; thefe were the firft Italian operas which Quantz had heard, and he confeffes, that the performance of them gave him a very favourable idea of the genuine and found Italian mufic, from which he thinks later times have too much deviated.

After defcribing the talents of the fingers who will have their place in our alphabet, he informs us that this famous opera at Drefden, was broken up by a quarrel between Heinichen, the king of Poland's chapel-mafter, and Senefino, who this fame year, 1719, went to England for the firft time.

Nothing very interefting occurs in the life of Quantz from this period, till 1723, when he took a journey with Weifs, the famous lutenift, and Graun, the compofer, to Prague.

Quantz, not long after the coronation of Charles VI. at Prague, went to Italy in the fuite of count Lagnafco, with the confent of his royal mafter, the king of Poland. He left Drefden in May 1724, and, when he arrived at Rome, he found that Vivoldi had juft introduced the Lombard ftyle in that city, with which the citizens were fo captivated, that they would hear no other.

During his refidence at Rome, he took leffons in compofition of the famous Gafparini, who was at that time feventy-two years of age; and after ftudying counterpoint with him, which he calls mufic for the eye, he went to work for the ear, and compofed folos, duets, trios, and concertos; however, he confeffes, that counterpoint had its ufe in writing pieces of many parts; though he was obliged to unlearn many things, in practice, which theory had taught him, in order to avoid that dry, and ftiff ftyle, which too clofe an adherence to rules is apt to produce; upon this occafion, he very judicioufly obferves, that invention is the firft requifite in a compofer, and that it behoves him to preferve a friendfhip between harmony and melody.

In 1725 he went to Naples, where he met with his countryman Haffe, who then ftudied under Alef. Scarlatti. Haffe had not, as yet, diftinguifhed himfelf by any compofitions for the ftage; however, it was at this time, that a confiderable Neapolitan banker employed him to fet a ferenata for two voices, which he did in the prefence of Quantz; the fingers who performed in it, were Farinelli and Tefi. Haffe gained fo much reputation by this production, that it paved the way to his future fuccefs, and he was foon after appointed compofer of the great opera at the theatre royal.

Quantz intreated Haffe to introduce him to his mafter, Scarlatti, to which he readily confented; but upon mentioning him to the old compofer, he faid, "my fon, you know I hate wind inftruments, they are never in tune." However, Haffe did not ceafe importuning him, till he had obtained the permiffion he required.

In

In the vifit which he made to Scarlatti, M. Quantz fays, that he had an opportunity of hearing him play on the harpfichord, which he did in a very learned manner; but obferves, that his abilities on that inftrument were not equal to thofe of his fon.

Before his departure from Naples, M. Quantz frequently heard concerts at the duke of Lichtenftein's, in which Haffe, Farinelli, Tefi, and Francifchello, were employed.

In 1726 he was at Venice, during the performance of two rival operas, "Siface," compofed by Porpora, and "Siroe," by Vinci; the latter was moft applauded. The Cav. Nicolini, a contralto, La Romanina, a deep foprano, and the famous tenor, Paita, were the principal fingers in thefe dramas.

San Martini, the celebrated performer on the hautbois, who afterwards eftablifhed himfelf in London, was now at Venice, as was Vivaldi.

At Turin he met with Somis, under whom, Le Claire was at that time a fcholar on the violin.

From Turin he went to Paris, which, with refpect to mufic, was going from one extreme to another.

His character of French finging in the former part of the laft century, is very juft and characteriftic.

"I was difpleafed with the French tafte now," fays M. Quantz, "though I had heard it formerly with patience. The old, worn-out, fecond-hand thoughts, and paffages ill-expreffed, difgufted me now, as much as a ftale difh warmed again. The refemblance between recitative and air, with the affected and unnatural howling of the fingers, particularly the women, fhocked my ears."

M. Quantz was the firft who applied an additional key to the German flute, in order to correct its imperfections; and it was in the courfe of this year, 1726, that he made the difcovery.

In 1727 he arrived in London, where he found the opera in a very flourifhing ftate, under the direction of Handel. The drama of "Admetus" was now in run, of which, he fays, the mufic was grand and pompous. Senefino performed the firft male part, and Cuzzoni and Fauftina were the principal women.

He then gives a character of the fingers, ftate of the opera, and of mufic in general in London, very correctly.

Upon his return to Drefden, he was eftablifhed in the king's chapel, with an addition to his former falary of 250 dollars a-year. He now entirely quitted the hautbois, fuppofing it hurtful to the embouchure of the flute, which, from this time, he made his fole ftudy.

In 1728 he went to Berlin, with baron Seyfertiz, in the fuite of the king of Poland; where he was obliged, at the command of the queen of Pruffia, but with the permiffion of his royal mafter, to remain for fome months. Pifendel, Weifs, and Buffardin, were, by the fame order, called thither. After he had had the honour of playing before the queen two or three times, he was offered a place and penfion of 800 dollars a-year. He was very willing to accept of them, but the king his mafter would not grant his confent: however, this prince gave him a general permiffion to go to Berlin as often as he was defired.

This year, 1728, the prince royal of Pruffia determined to learn the German flute, and M. Quantz had the honour to teach him. On this account, he was obliged to go twice a year to Berlin, Ruppin, or Reinfberg, the feveral refidences of his royal fcholar.

After the death of the king of Poland, in 1733, his fon, Auguftus III. not choofing to difmifs M. Quantz, raifed his appointment to 800 dollars, and confirmed the permiffion which had been granted by his royal father, for his going occafionally to Berlin.

In 1734 he publifhed his firft folos; but he does not acknowledge the fonatas, which were printed under his name, in Holland, about that time.

In 1739, M. Quantz finding a great fcarcity of German flutes, undertook to bore them himfelf for the ufe of his pupils; an enterprife which, afterwards, he found to be very lucrative.

In 1741 he was again invited to Berlin, in order to enter into the fervice of his royal fcholar, then king of Pruffia, with offers of an annual penfion of 2000 dollars for life; a feparate payment for compofitions; 100 ducats for every flute he fhould deliver; and an exemption from playing in the orcheftra, or any where elfe, but in the king's chamber, as well as from dependance on any other commands than thofe of his majefty; which terms, as the king of Poland was too gracious longer to refufe his difmiffion, M. Quantz was unable to refift.

In 1752 he publifhed his "Art of Playing the German Flute;" and it was this year that he invented the new joint for the upper-piece of the flute, by which means, without drawing out the middle piece, and without hurting the tone, the inftrument may be raifed or lowered half a note.

And now, having traced our induftrious mufician through the troublefome mazes by which he arrived at the temple of fortune, we had hopes that we fhould have left him to the enjoyment of that reputable eafe, that *otium cum dignitate*, to which every artift in years afpires; but alas! this eminent mufician and worthy man died at Potzdam in lefs than a year after we had feen, heard, and converfed with him in that fummer refidence of his royal difciple and patron! A complete lift of his works is given in Gerber.

QUANUSE, in *Geography*, a town of America, in the Tenneffee government. N. lat. 35° 12′. W. long. 84° 28′.

QUAPA, a town of Louifiana, at the conflux of the Akanfas with the Miffifippi. N. lat. 33° 48′. W. long. 91° 23′.

QUAPACTOTOTL, in *Ornithology*, a name under which Nieremberg has defcribed a bird, which, he fays, imitates the human laugh. He fays its body is eight inches long, and the tail as many; the beak of a blueifh-black, and bent and crooked; the breaft grey, and the belly black; the tail of a brownifh-black; and the wings, neck, and head, of a yellowifh-brown.

This is the Cuculus ridibundus of Gmelin, the Cuculus Mexicanus of Briffon, and the Laughing cuckow of Latham. It is found in New Spain.

QUAPIZOTL, in *Zoology*, the name given by Hernandez to the Tajaçu of Marcgrave, the Pecari of Buffon, and the Mexican hog of Pennant. See Sus *Tajaffu*.

QUAPOYA, in *Botany*, Aubl. Guian. v. 2. 897. t. 343, 344, a barbarous Caribbean name. See XANTHE.

QUAR, in *Agriculture*, a term occafionally employed, in a provincial manner, to fignify a fmall fort of quarry of any kind, but more efpecially of the lime-ftone, free-ftone, flag-ftone, or flate-ftone nature. It is much ufed in fome of the more northern diftricts of the country. See QUARRY.

QUARANTAIN, in old *Law Books*, written *Quarentine*, and *Quarentena*, denotes the fpace of forty days.

"Quatuor carucatas terræ arabilis, continentes in longitudine 8 quarentenas, & 8 quarentenas in latitudine." Chart. Withlafii Reg. Merc. apud Ingulf.

"Quarentena in London. ponetur pro refpectu habend. 40 dies poft fummonitionem per breve regis, ut confulant, &c. fi fibi viderint expedire." MS. de Temp. Ed. III.

The

The term is borrowed from the French *quarentain;* and is ſometimes uſed for the time of Lent.

QUARANTAIN *of the King*, in France, denotes a truce of forty days appointed by St. Louis, during which time it was expreſsly forbidden to take any revenge of the relations or friends of people who had fought, wounded, or affronted each other in words.

QUARANTAIN, or *Quarentine*, is more particularly uſed for the term of forty days, which veſſels, coming from places ſuſpected of contagion, are obliged to wait in certain places appointed to air themſelves before they come into port.

By the ſtat. 26 Geo. II. cap. 6. explained and amended by 29 Geo. II. cap. 8. the method of performing quarentine, or forty days probation, by ſhips coming from foreign countries, is put in a much more regular and effectual order than formerly; and maſters of ſhips coming from infected places, and diſobeying the directions there given, or having the plague on board, and concealing it, are guilty of felony without benefit of clergy. The ſame penalty alſo attends perſons eſcaping from the lazarettos, and officers and watchmen neglecting their duty, and perſons conveying goods or letters from ſhips performing quarantine. Se PLAGUE.

In caſes of inſurance, before the riſk on a ſhip can be ſaid to be completely ended, ſhe muſt not only have been 24 hours moored at anchor in her port of deſtination, but ſhe muſt have been during that time in *good ſafety*, in the fulleſt ſenſe of thoſe words. If, therefore, the ſhip be obliged to perform quarantine, this does not end the voyage. The voyage only ends when the ſhip is arrived at her port of deſtination, and is there moored 24 hours in good ſafety. Accordingly, if the ſhip, before the 24 hours are expired, be ordered to the proper place for performing quarantine, the riſk continues, though ſhe do not leave her moorings till long after the 24 hours are expired. See RISK.

QUARANTAIN alſo denotes certain duties impoſed upon ſhips, for the purpoſes of quarantine.

QUARANTAIN, *Quarantine*, or *Quarentine*, *Quarentena*, in *Law*, denotes a benefit allowed by the laws of England to the widow of a man dying ſeiſed of land; by which ſhe may challenge to continue in his capital meſſuage, or chief manſion-houſe (ſo it be not a caſtle), for the ſpace of 40 days after his deceaſe; during which time her dower ſhall be aſſigned. The particular lands to be held in dower muſt be aſſigned by the heir of the huſband, or his guardian. Co. Litt. 34, 35.

If the heir, or any other perſon, attempt to eject her, ſhe may have the writ *de quarantena habenda;* which lies for a widow to enjoy her quarantain.

QUARANTAIN is alſo uſed for a meaſure or extent of land, containing 40 perches.

QUARANTARIA, in *Geography*, a high mountain between Jeruſalem and Jericho; which, as tradition ſays, is the mountain to which our bleſſed Saviour was taken by the devil, when he tempted him with the viſionary ſcene of all the kingdoms and glories of the world. This is, as St. Matthew ſtyles it, an exceeding high mountain, and not only difficult, but dangerous, of aſcent. It has a ſmall chapel at the top, and another about half-way of its aſcent, founded upon a prominent part of the rock. Near this latter are ſeveral caves and holes in the ſide of the mountain, made uſe of anciently by hermits, and by ſome in later times, for places in which they kept their Lent; in imitation of that of our bleſſed Saviour. In moſt of theſe grots Maundrell found certain Arabs quartered with fire-arms, who obſtructed his aſcent, demanding 200 dollars for leave to go up the mountain. He and his companions, ſays the traveller, departed without farther trouble, not a little glad to have ſo good an excuſe for not climbing ſo dangerous a precipice. Maundrell's Journey, &c. p. 80.

QUARANTIA, in the Venetian *Polity*, a court of judicature compoſed of forty judges.

The Venetians have an old civil quarantia, a new civil quarantia, and a criminal quarantia.

The criminal quarantia takes cognizance of all crimes except thoſe againſt the ſtate, which belongs to the council of ten. The new civil quarantia judges of appeals made from ſentences made by judges out of the city. The old civil quarantia takes cognizance of appeals from ſentences of ſubaltern judges in that city.

QUARARIBEA, in *Botany*. See MYRODIA.

QUARE *clauſum fregit*, in *Law*. See CLAUSUM *fregit*.

QUARE *ejecit infra terminum*, a writ which lieth, by the ancient law, where the wrongdoer or ejector is not himſelf in poſſeſſion of the lands, but another who claims under him. As where a man leaſeth lands to another for years, and, after, the leſſor or reverſioner entereth, and maketh a feoffment in fee, or for life, of the ſame lands to a ſtranger: now the leſſee cannot bring a writ of *ejectione firmæ*, or ejectment, againſt the feoffee; becauſe he did not eject him, but the reverſioner: neither can he have any ſuch action to recover his term againſt the reverſioner, who did ouſt him; becauſe he is not now in poſſeſſion. And upon that account this writ was deviſed, upon the equity of the ſtatute Weſtm. 2. c. 24. as in a caſe where no adequate remedy was already provided. And the action is brought againſt the feoffee for deforcing, or keeping out, the original leſſee during the continuance of his term: and herein, as in the ejectment, the plaintiff ſhall recover ſo much of the term as remains; and alſo ſhall have actual damages for that portion of it, whereof he has been unjuſtly deprived. But ſince the introduction of fictitious ouſters, whereby the title may be tried againſt any tenant in poſſeſſion, (by what means ſoever he acquired it,) and the ſubſequent recovery of damages by action of treſpaſs for meſne profits, this action is fallen into diſuſe. See EJECTIONE *Firmæ*.

QUARE *impedit*, a writ which lies for him who has purchaſed an advowſon, againſt him that diſturbs him in the right of it, by preſenting a clerk to it when the church is void.

It differs from the aſſize of darrein preſentment, *ultimæ præſentationis*, which lies where a man, or his anceſtors, formerly preſented; this other lying for him who is the purchaſer himſelf. Where a man may have the aſſiſe, he may have this writ; but not contrariwiſe.

In conteſted preſentations, upon the firſt delay or refuſal of the biſhop to admit his clerk, the patron uſually brings his writ of *quare impedit* againſt the biſhop, for the temporal injury done to his property, in diſturbing him in his preſentation. And if the delay ariſes from the biſhop alone, as upon pretence of incapacity, or the like, then he only is named in the writ; but if there be another preſentation ſet up, then the pretended patron and his clerk are alſo joined in the action; or it may be brought againſt the patron and clerk, leaving out the biſhop; or againſt the patron only. But it is moſt adviſeable to bring it againſt all three: for if the biſhop be left out, and the ſuit be not determined till the ſix months are paſt, the biſhop is entitled to preſent by lapſe; for he is not party to the ſuit: but, if he be named, no lapſe can poſſibly accrue till the right is determined. If the patron be left out, and the writ be brought only againſt the biſhop and the clerk, the ſuit is of no effect, and the writ ſhall abate; for the right of the patron is the principal queſtion in the cauſe. If the clerk be left out, and has received

ceived inftitution before the action brought, (as is fometimes the cafe,) the patron by this fuit may recover his right of patronage, but not the prefent turn; for he cannot have judgment to remove the clerk, unlefs he be made a defendant, and party to the fuit, to hear what he can allege againft it. For which reafon it is the fafer way to infert all three in the writ.

The writ of *quare impedit* commands the difturbers, the bifhop, the pfeudo-patron, and his clerk, to permit the plaintiff to prefent a proper perfon (without fpecifying the particular clerk) to fuch a vacant church, which pertains to his patronage; and which the defendants, as he alleges, do obftruct; and unlefs they fo do, then that they appear in court to fhew the reafon why they hinder him.

Immediately on the fuing out of the *quare impedit*, if the plaintiff fufpects that the bifhop will admit the defendant's or any other clerk, pending the fuit, he may have a prohibitory writ, called a *ne admittas;* which recites the contention begun in the king's courts, and forbids the bifhop to admit any clerk whatfoever till fuch contention be determined. And if the bifhop doth, after the receipt of this writ, admit any perfon, even though the patron's right may have been found in a *jure patronatus*, then the plaintiff, after he has obtained judgment in the *quare impedit*, may remove the incumbent, if the clerk of a ftranger, by writ of *fcire facias:* and fhall have a fpecial action againft the bifhop, called a *quare incumbravit;* to recover the prefentation, and alfo fatisfaction in damages for the injury done him by incumbering the church with a clerk, pending the fuit, and after the *ne admittas* received. But if the bifhop has incumbered the church by inftituting the clerk, before the *ne admittas* iffued, no *quare incumbravit* lies; for the bifhop hath no legal notice, till the writ of *ne admittas* is ferved upon him. The patron is, therefore, left to his *quare impedit* merely; which now lies (fince the ftatute of Weftm. 2.) as well upon a recent ufurpation within fix months paft, as upon a difturbance without any ufurpation had.

In the proceedings upon a *quare impedit*, the plaintiff muft fet out his title at length, and prove at leaft one prefentation in himfelf, his anceftors, or thofe under whom he claims; for he muft recover by the ftrength of his own right, and not by the weaknefs of the defendant's: and he muft alfo fhew a difturbance before the action brought. Upon this the bifhop and the clerk ufually difclaim all title: fave only, the one as ordinary, to admit and inftitute; and the other as prefentee of the patron, who is left to defend his own right. And, upon failure of the plaintiff in making out his own title, the defendant is put upon the proof of his, in order to obtain judgment for himfelf, if needful. But if the right be found for the plaintiff, on the trial, three farther points are alfo to be inquired: 1. If the church be full; and, if full, then of whofe prefentation: for if it be of the defendant's prefentation, then the clerk is removeable by writ brought in due time. 2. Of what value the living is: and this in order to affefs the damages which are directed to be given by the ftatute of Weftm. 2. 3. In cafe of plenarty upon an ufurpation, whether fix calendar months have paffed between the avoidance and the time of bringing the action: for then it would not be within the ftatute, which permits an ufurpation to be divefted by a *quare impedit*, brought *infra tempus femeftre*. So that plenarty is ftill a fufficient bar in an action of *quare impedit*, brought above fix months after the vacancy happens; as it was univerfally by the common law, however early the action was commenced.

If it be found that the plaintiff hath the right, and hath commenced his action in due time, then he fhall have judgment to recover the prefentation; and, if the church be full by inftitution of any clerk, to remove him: unlefs it were filled *pendente lite* by lapfe to the ordinary, he not being party to the fuit; in which cafe the plaintiff lofes his prefentation *pro hac vice*, but fhall recover two years' full value of the church from the defendant, the pretended patron, as a fatisfaction for the turn loft by his difturbance: or, in cafe of infolvency, the defendant fhall be imprifoned for two years. But if the church remains ftill void at the end of the fuit, then whichever party the prefentation is found to belong to, whether plaintiff or defendant, fhall have a writ directed to the bifhop *ad admittendum clericum*, reciting the judgment of the court, and ordering him to admit and inftitute the clerk of the prevailing party; and, if upon this order he does not admit him, the patron may fue the bifhop in a writ of *quare non admifit*, and recover ample fatisfaction in damages.

Befides thefe poffeffory actions, there may be alfo had a writ of *right of advowfon*, which refembles other writs of right: the only diftinguifhing advantage now attending it being, that it is more conclufive than a *quare impedit;* fince to an action of *quare impedit* a recovery had in a writ of right may be pleaded in bar.

There is no limitation with regard to the time within which any actions touching advowfons are to be brought; at leaft none later than the times of Richard I. and Henry III.: for by ftatute 1 Mar. ft. 2. c. 5. the ftatute of limitations, 32 Hen. VIII. c. 2. is declared not to extend to any writ of right of advowfon, *quare impedit*, or affife of *darrein prefentment*, or *jus patronatus*.

In a writ of *quare impedit*, which is almoft the only real action that remains in common ufe, and alfo in the affife of *darrein prefentment*, and writ of right, the patron only, and not the clerk, is allowed to fue the difturber. But, by virtue of feveral acts of parliament, there is one fpecies of prefentations, in which a remedy, to be fued in the temporal courts, is put into the hands of the clerks prefented, as well as of the owners of the advowfon. We mean the prefentation to fuch benefices, as belong to Roman Catholic patrons; which, according to their feveral counties, are vefted in and fecured to the two univerfities of this kingdom. And particularly by the ftatute of 12 Ann. ft. 2. c. 14. § 4. a new method of proceeding is provided; *viz.* that, befides the writs of *quare impedit*, which the univerfities as patrons are entitled to bring, they, or their clerks, may be at liberty to file a bill in equity againft any perfon prefenting to fuch livings, and difturbing their right of patronage, or his *ceftuy que truft*, or any other perfon whom they have caufe to fufpect; in order to compel a difcovery of any fecret trufts, for the benefit of Papifts, in evafion of thofe laws whereby this right of advowfon is vefted in thofe learned bodies: and alfo (by the ftatute 11 Geo. II. c. 17.) to compel a difcovery whether any grant or conveyance, faid to be made of fuch advowfon, were made *bona fide* to a Proteftant purchafer, for the benefit of Proteftants, and for a full confideration; without which requifites, every fuch grant and conveyance of any advowfon or avoidance is abfolutely null and void. Blackft. Com. b. iii.

Quare *incumbravit*, a writ which lies againft the bifhop, who, within fix months after the vacancy of a benefice, confers it on the clerk of any one, while two perfons are contending at law for the right of prefenting. This writ lies always depending the plea. See the preceding article, Presentation, Assise *of darrein prefentment*, &c.

Quare *non admisit*, a writ which lies against the bishop, for refusing to admit his clerk, who has recovered in a plea of advowson, on pretence of lapse, &c. See Quare *impedit*.

Quare *non permittit*, is a writ that lies for one who has a right to present for a turn against the proprietary.

Quare *obstruxit*, a writ that lies for him, who, having right to pass through his neighbour's grounds, cannot enjoy the same, because the owner has fenced it up.

QUARENTINE. See Quarantain.

QUARERA, or Quaratia. See Quarry.

QUARITZ, in *Geography*, a town of Silesia, in the principality of Glogau; 8 miles W. of Gros-Glogau.

QUARKEN, or Querken, a cluster of small islands, in the gulf of Bothnia, near the east coast. N. lat. 63° 16′. E. long. 21°.

QUARLES, Francis, in *Biography*, an English poet, born in 1592, near Rumford, in Essex, was son of James Quarles, esq. who held an office at the navy board in the reign of queen Elizabeth. The subject of this article was educated at Christ's college in Cambridge, and was afterwards entered a student in Lincoln's Inn. He obtained the place of cup-bearer to the queen of Bohemia, daughter to James I.; and upon his return, he was appointed secretary to archbishop Usher in Ireland, from which country he made his escape, on the breaking out of the rebellion in 1641, after the loss of his property. He had before distinguished himself by some works, chiefly on religious subjects, in consideration of which he had a pension from Charles I. About this time he had the post of chronologer to the city of London. On the commencement of the civil wars, he gave great offence to the parliament by a work, entitled "The Loyal Convert;" and when he actually joined the king at Oxford, he was plundered of his estates, his books, and manuscripts. These losses he did not long survive. He died at the age of 52, in 1644. Of his numerous writings, as well in prose as in verse, the most celebrated, and indeed that by which he is almost entirely known, is his "Emblems," a set of designs exhibited in prints, and elucidated by some lines attached to each. A considerable part of the work is borrowed from the "Emblems" of Hermannus Hugo, but his verses are his own. For a considerable time they excited a large portion of public admiration in the religious world. They then fell into contempt; but we believe a new edition has of late years been given to the world. Quarles is thus characterized by an able critic: "He is by no means without his beauties; and his verses, which are generally smooth, afford occasional bursts of fancy, and strokes of pathos, which shew real genius, though overrun with false taste. Mr. Jackson of Exeter, in his "Letters on various Subjects," endeavoured to recall the public attention to this neglected poet, and pointed out with much feeling some of his brilliant passages; but though curiosity may be amused by hunting for his scattered beauties, he can never regain a place among the English classical poets."

QUARLESVILLE, in *Geography*, a post-town of America, in Brunswick county, Virginia; 204 miles from Washington.

QUARNAMELA, a town of Sweden, in the province of Smaland; 23 miles S. of Wexio.

QUARNERO, or Cornero, *Gulf of*, a part of the Adriatic, between Istria and Morlachia, anciently called "Sinus Flanaticus." It is subject to sudden storms and hurricanes, which render its navigation dangerous.

QUARRE′, Fr. In old French music, B quarré was the term for B ♮. See Quadro.

Quarré *les Tombes*, in *Geography*, a town of France, in the department of the Yonne, and chief place of a canton, in the district of Avallon; 6 miles S. of Avallon. The place contains 2007, and the canton 7287 inhabitants, on a territory of 192½ kiliometres, and 9 communes.

QUARRE′E, in the old French time-table, implied a breve, or square note, equal to two semi-breves. See Time-table.

QUARREL, Querela, in *Law*. See Querela.

Quarrel seems properly to relate to personal actions, or at most to mixed ones, wherein the plaintiff is called *querens*; and in all declarations of trespass, it is said, *queritur*.

Yet if a man release all quarrels or querels, (a man's own deed being taken most strongly against himself,) quarrel includes all actions; and accordingly all actions, both real and personal, are hereby released.

Quarrels or affrays in a church or church-yard are esteemed very heinous offences, as being indignities to him to whose service those places are consecrated; therefore mere quarrelsome words, which are neither an affray nor an offence in any other place, are penal here. See Affray.

Quarrel between the French and Italian singers at Rome, in the time of Charlemagne; for which we refer to our article Charlemagne. See also Rousseau's Dict.

Quarrel, in *Armoury*, a bolt, or square-headed arrow, to shoot out of an arbalist, or cross-bow.

Quarrel *of Glass*. See Quarry.

The word is formed, by diminution, from the Latin *quadratum*, or the French *quarré*, *square*; or, perhaps, immediately from the Italian *quadrello*, *little square*.

QUARRY, in *Agriculture*, the common name of an opening, pit, drift, or shaft, which is dug into the earth or ground, and from which are to be raised ores of various kinds, different sorts of stones, slates, and other materials of similar natures. It is remarked by the writer of the work on "Landed Property," that the more useful and advantageous materials and substances that have at different times been dug and raised out of quarries in this country, are chiefly those of the iron ore kind, lime-stone, and other calcareous matters, materials for building, such as slates, flags, stones, and substances of other sorts, matters for the constructing and repairing of roads, as sand, gravel, and others of the same nature, earthy substances for the purposes of different manufactures, such as clays, &c. moulds and vegetable earthy matters, and coals, with other articles for use as fuel. There are, however, occasionally raised from openings of this nature, a few other kinds of substances, such as will be noticed below.

It has been farther supposed by the above writer, that the substances which he has here mentioned, may with truth be said to be of more real use and value to mankind than all the mines of precious metals in the world; and that the eyes of the managers of landed estates should constantly be turned towards and fixed upon the discovery of the hidden valuable treasures and productions of this nature, wherever there is a probability or likelihood of their being to be met with. It is also suggested, that it would be highly beneficial and advantageous if mineralogists, and those who are acquainted with such substances, were to turn their attention towards the appearances or accompaniments which point out such useful concealed matters; as it might greatly facilitate the search for them, and frequently lead fortuitously to their discovery. The methods which are practised in searching for and ascertaining the presence of different sorts of materials

rials of this nature, are principally thofe of boring, by means of an auger or borer made for the purpofe, into the earth, and digging into it in other ways. In fearching for moft forts of mineral fubftances, coals, and fome other matters, the ufe of the borer is conftantly firft had recourfe to, and not that of finking a fhaft, however favourable the appearances of the place may be for the purpofe, and the fuccefs of the undertaking. The ground is firft tried by this means, and a certainty of fuccefs or failure gained, as well as that of the moft proper fituation for finking the fhaft or making the opening or pit, without much expence being incurred, in cafe of the former. In trying for ochres, marles, and other fimilar articles, the fame implement is alfo in common ufe. But in raifing and providing lime-ftone, free-ftone, flags, and flates, &c. in fome cafes, digging down into and opening the ground, by fpades and other tools, is the mode employed in the firft inftance, in confequence of fuch fubftances being obvioufly prefent in fufficient quantities to be wrought with advantage. See Borer, Boring, and Auger.

The common methods of working and managing different forts of quarries, are in general, in moft places, tolerably well underftood and regulated, by fuch quarrymen as are conftantly employed in the bufinefs; but a circumftance which they commonly neglect very much, or are in a great degree inattentive to, in many cafes, is that of making good the ground below, by means of the turf or foil which is caft off from the top, or upper parts; and that of keeping the mouths of the openings fufficiently clear and free. Another common difficulty incident to them, is that of draining, and freeing their bottom parts from injurious water. This may be effected in various ways, as by the ufe of different forts of machinery worked by wind, water, and fteam, and by fome other means. See Quarries, *Pits*, &c. *Draining of.*

In many of the more fouthern diftricts of the kingdom, and ftill more in thofe towards the north, and in Wales, there are quarries, from which fubftances of fome of the following kinds are raifed and ufed in their neighbourhoods, or fent away to a diftance, in a very extenfive manner; fuch, for inftance, as thofe of the ftony kind, as iron-ftone or ore, lime-ftone, marble, chalk, granite, free-ftone, grit-ftone, flag-ftone, white, grey, purple, and blue flate-ftone, fand-ftone, fand, gravel, clay-ftone, fcythe-ftones, tile-ftones, &c.; different ochres, plumbago or black lead, calamine, gypfum, marle, pipe-clay, alum-earth, fuller's-earth, peat-earth, culm, coal, cannel, falt-rock, &c. Thefe quarries and pits are wrought, and the materials got up from them, in feveral different ways, according to circumftances and convenience, as well as the particular nature, kinds, qualities, &c. of the different articles themfelves; all of which are moftly well known, and capable of being performed by the workmen of their refpective neighbourhoods, who are commonly employed in them, and very expert in their management.

Stony fubftances which bear a great variety of different names, and which poffefs equal variety in their qualities and ufeful properties, are met with, and dug up from quarries and pits, in many different diftricts and fituations, in almoft all parts of this ifland, in order to be converted to purpofes of improvement and utility in a variety of different ways and intentions. Iron-ftones and ores abound more in the northern parts, though they are occafionally found in fome of the fouthern ones. A confiderable quantity of highly rich iron-ftone is got up and fent annually from the vicinity of Combemartin in Devonfhire, to the iron-works of Mr. Raby at Llenethy in South Wales. A large portion of it is alfo found on the borders of the Orchment river, and difperfed throughout the whole diftrict, as well as in other parts of the fame county. Iron-ftone is likewife met with in Suffex in large quantities, imbedded with lime-ftone and fand-ftone, that which rifes near to the furface being the beft, the other having a coarfer and more dull appearance, working heavier in the furnace. The very beft is frequently interfected with thin ftripes of foft marly matter. Iron-ftone, to a great extent, exifts on the eftates of lord Dudley, and many others in Staffordfhire, and contributes much to the employment and profperity of the inhabitants. But, in the northern part of Lancafhire, in the diftrict of Low Furnefs, ftone and ore of this fort are perhaps found in the largeft quantity, of the beft kind, and in the moft general manner, of any where in the kingdom. There are numbers of fhafts, quarries, and pits for raifing them from, on Lindal Moor, Whittrig Moor, and Crofs Gates, in the vicinity of Dalton, as well as in fome other places. In the former, the working is ufually effected at the depth of from twenty to forty-five feet, but it has been done at lefs as well as greater depths. The whole of their cavities are chambered with wood, and coft from a guinea to twenty-five fhillings in finking each fathom, without the wood. The ore runs in veins or feams between the rocks on the north and fouth, being in breadth from about forty to fixty yards. And it conftantly dips towards the fouth-eaft at the rate of about a foot in five or fix. The beft ore is that which has the moft greafy appearance, and it is raifed with lefs difficulty, working lefs hard, requiring lefs flux, and forming a more foft iron. It is raifed from the fhafts or pits by machinery of the gin or windlafs kind, the men employing picks, punches, and hammers in digging it up. It was formerly got, in fome places, by driving levels into the fides of the hills, and conveying it out on railways, in fmall waggons; but now the other way is moftly employed. Four men get about fourteen tons in the day, in fome fituations; but in others, double the number are required for getting the fame quantity. It is wheeled to diftant heaps, from which much of it is fent in fmall carts to the port of Old Barrow, from whence it is fhipped to different parts of England, Wales, and Scotland, at the expence of from fourteen to thirty fhillings in freight; and the reft converted into pig-iron by the furnaces in the neighbourhood. Iron-ftones and ores are alfo met with in fome other counties more to the north of the kingdom, where there are pits and quarries for raifing them from.

Lime-ftone is a very general fort of ftone raifed from quarries and pits in many different parts of this country, as in Devonfhire, Suffex, Kent, &c. towards the fouth, where it lies in vaft beds, from which it is dug for ufe; in the more midland counties, as in Gloucefterfhire, Shropfhire, Derbyfhire, Staffordfhire, and others, where it exifts and is employed to a ftill greater extent; but by far the moft extenfively in thofe farther to the north, as Lancafhire, Weftmoreland, Yorkfhire, Cumberland, and fome diftricts of Scotland. In many parts of the county of Lancafter it is dug and raifed from quarries, where it lies in a ftratified manner at no great depth from the furface, being got up without much difficulty or trouble; while in other places it is forced from the folid rock, with great labour and expence. This is likewife the cafe in many other diftricts. Wherever it is met with, it is almoft conftantly a quarry material of great value, and which affords much employment to labourers.

In the county of Kent, the banks of fome of the large rivers are fcooped out into ftone quarries in a remarkable manner, fome of them worn out and difufed, others in the ftate of being wrought. It has been obferved, that this is the neareft ftone country into which water-carriage can penetrate from the metropolis; and that the original London

was

was built, as well as the modern one chiefly paved, by materials from this diftrict, fuch as the rag-ftone, and the large pebbles gathered on the fea-fhores, before the Scotch granite came into ufe. In the neighbourhood of Maidftone there are the appearances of many abandoned and neglected quarries of this nature; but the moft confiderable ones, which were lately wrought in that vicinity, are thofe of Farleigh and Fant. In each of thefe, blocks of ftones, of different kinds, and of every form and fize, are met with, being feparated by feams, and large irregular maffes of earth of various qualities: among the reft, brick-earth of the beft quality. In fome places, the ftones are buried feveral feet under thefe earthy materials; in others, the rock rifes to the furface. After this, the quarrymen worm their way; following it, with irregular windings, leaving behind them refufe in greater quantity than the ufeful materials which they raife.

The ftony fubftances which are principally met with in them, are of two very diftinct kinds: the one hard, and of a ftrong contexture, provincially denominated *rag*, or Kentifh rag; the other of a foft crumbly nature, provincially termed *haffock*. The quarrymen are in the practice of dividing the firft fort into two kinds; what they call the *common rag*, and the *cork-ftone*, the latter being their principal object in thefe immenfe works. It has in its general appearance much refemblance to the ftrong grey lime-ftones which are found in different parts of this country; but when minutely examined by means of a glafs, its fracture and contexture have the characters of the Devonfhire marbles; except that the grain of this fort of ftone is fomewhat coarfer. In colour, too, it differs from thefe marbles, having a greater refemblance to the Yorkfhire lime-ftones. It is ufed for different purpofes; much of it is fent to the neighbourhood of London, where it is burnt into lime, for the ufe of the fugar-bakers; who, for fome reafon or other, chiefly employ lime, burnt from this material, or ftone, inftead of that of chalk. It is likewife made ufe of as a building material; and, particularly in pedeftals, for the pofts of cattle-fheds and other farm-offices. It is hewn with ftone-mafons' axes, working with tolerable freedom.

It is very durable, as fome part of the bafement of Weftminfter Abbey appears to have been built with the ftone from thefe quarries. In this cafe, it feems to have been dreffed fmooth; and the furface ftill remains with little alteration; having withftood the attacks of time with great firmnefs; it being even now difficult to detect a loofened fplinter in the work.

The common rag-ftone comprehends all the different kinds which are met with in thefe quarries, except that of the above, and that which is of the haffocky nature; though the true unmixed rag is a diftinct fort, having characters different from any of the others. In the colour, it inclines more to the red or liver colour, than that of the cork-ftone, but otherwife refembles it confiderably. Viewed with a glafs, its grain is finer, and the fracture flint-like.

Its ufes are, however, but few. Some of the beft and moft regularly-faced ftones are fometimes laid afide for paving materials; but the large pieces are moftly referved, in order to be fent by water to the diftrict of Romney Marfh, for the purpofe of forming the hard materials of the embankments and jetties, which are there made againft the fea. The fmaller forts are, in general, converted to ufe as a road material.

The haffocky ftone appears to the naked eye to be of a foft, white, fandy quality; and its fracture is the fame But under the glafs, its grain is fine, its contexture uniform, and fo thickly interfperfed with fmall feed-like granules, of a dark or black colour, as to give it a grey appearance. Sometimes bearing evident impreffions of fhells. Its texture is loofe and brittle; crumbling eafily between the fingers into a coarfe fand-like powder. It will not burn into good lime, although it is almoft wholly calcareous.

Its principal ufe is that of forming a loofe friable fort of rubbly fub-foil, in fome places, which is admirably fuited to the growth of faintfoin, and fome other crops of the plant as well as the fruit-tree kinds.

The quarries in feveral other counties contain ftony materials of thefe different kinds, which are wrought and applied to a variety of different ufes in thefe and other ways.

Quarries of marble are wrought in feveral diftricts in different parts of the country, and afford great advantages in various ways. In Suffex they have a marble, which, when cut into flabs, is ufed for ornamenting chimney-pieces, and many other purpofes. It is equal in quality and beauty to moft forts when highly polifhed. For fquare building and paving it is alfo a material fcarcely to be exceeded. By burning, it likewife affords a very valuable manure, equal, and by fome thought fuperior, to chalk, being cheaper to thofe who are near the places from which it is dug. It is found the moft perfect about Kirdford, at the depth of from ten to twenty feet underground, in flakes nine or ten inches in thicknefs, and called the Petworth marble. It was much employed in building the cathedral at Canterbury, the pillars, monuments, vaults, pavement, &c. being formed of it. And the archbifhop's chair is one entire piece of it. Marble is gotten in fome of the counties in the middle of the ifland, as Derbyfhire, Nottinghamfhire, &c. At Beacon-hill, near Newark, a blue ftone for hearths is got, which approaches to marble, and is capable of burning into lime. And in the county of Derby much good marble is raifed in different places. In Lancafhire there are quarries of fine black marble, and of ftones, which approach to, and take on the polifh of marbles. In many of the weftern and northern parts of Yorkfhire, marble of various kinds is found, fome much refembling, and others fuperior, in clofenefs of texture and diftinctnefs of colours, to that which is wrought in Derbyfhire. Alfo a ftone, which greatly refembles the marble of that county, and which is capable of receiving much fuch a polifh, and is nearly of the fame colour, mixture, and appearance. On the fide of the river Kent, near Kendall, a vein of beautiful marble has been lately difcovered in the property of D. Wilfon, efq. of Dallam-Tower; and a main quarry opened upon it. Marble has alfo been met with on the oppofite bank.

In the county of Invernefs, likewife, marble of the greateft variety of colours, and of the moft beautiful fhades, has been met with in Benevis, on the property of Mr. Camerton; and inexhauftible quarries of it lie untouched in the iflands which belong to it.

Befides, this fort of material exifts in immenfe quantities, in quarries, in many other parts of the kingdom.

Chalk is a material which is raifed from quarries and pits, moftly in the fouthern parts of the country, as in Suffex, Surrey, Kent, Effex, Berkfhire, Hertfordfhire, &c. It exifts in vaft ranges and tracts in moft of thefe diftricts, whence it is dug up from quarries, at different depths, according to circumftances, expofed in fheds to dry, when wet, and then converted into lime for various ufes, by means of fire, or employed in its broken and powdery ftate, without undergoing the above proceffes, by merely digging it out of fuch places. In fome parts, as in Kent, and the neighbouring diftricts, it is often dug and raifed from confiderable depths, from beds of very great thickneffes. And near Reading, in Berkfhire, there is a ftratum of this fubftance,

ftance, which is thirty feet in thicknefs. It is there ufed and dug out for manure, and occafionally as a building material, for the latter of which purpofes it is very durable. The remains of the abbey of Hurley, and of the ancient chapel, now the parifh church, built wholly of chalk, in the reign of William the Conqueror, are, it is remarked by the writer of the corrected Agricultural Survey of the diftrict, ftill as frefh and found as if they had been the works of the laft century. Chalk, when once indurated by the air, has a remarkable property in refifting the action of the weather.

Granite is a ftony fubftance, which is found to exift in fome of the fouthern parts of the country, as well as in thofe of the north, but it abounds much more in the latter.

In the weftern parts of Cornwall it is in great plenty in the diftricts of Penwith and Kirrier, prefenting itfelf in large flabs on all the rocky hills or tors, as well as in the wafte moors and vallies; and appearing in detached fpots, even in the fhelfy flaty tracts. It is of different colours and textures, being adapted to a great variety of ufes and purpofes, as thofe of building, and being wrought into columnar maffes, eight or ten feet in length, for fupporters to fheds, out-houfes, &c.; and as gate-pofts, and bridges over brooks, rivulets, &c.; as well as in the forming of rollers, malting, falting, and pig troughs. It is alfo an article of commerce to different parts. It is fuppofed to be exactly of the fame nature with the original granite; and there are five forts of it, which are diftinguifhed by their colours, the white, the dufky, or dove-coloured, the yellow, the red, and the black, moft of which are charged with a brown and bright filvery matter.

The county of Invernefs has a great deal of this fort of ftone, and there are numerous quarries in it for raifing and working of it. The common granite abounds in all the different diftricts of it. In many places the whole rocks are compofed of this kind, which is uncommonly ufeful for all ordinary purpofes. By natural fiffures, which run in ftraight lines, and generally at right angles, it is formed into all fized portions and fhapes, having uniformly a plain furface. And, by means of cutters or tranfverfe lines, thefe ftones are eafily quarried, and found in the greateft plenty every where. They are remarkably beautiful, being almoft as fmooth and regular as hewn ftone, and of courfe well fuited for various forts of building work. The beft buildings of the county-town are of a dark kind of granite, which is very hard and durable, but which has few or no fiffures. It is generally found in large blocks, and in many of thefe parts, there is no other material for building or adding ornament with. The manner of giving it the polifh it admits of at the quarries, is by means of fmall picks, or pick-axes, which are, in fact, hammers with fharp points at each end, in the manner of thofe employed by millers in preparing their grinding ftones. It is a very heavy, compact ftone. There is a mixed fort, denominated peafy granite, which confifts of white, black, and grey fpots, that fparkle beautifully in the fun, and is very ornamental, as well as much ufed for different purpofes, as ftairs, doors, and windows. Though this is very folid, and almoft without natural fiffures, it fplits very ftraight, by means of iron wedges, fet in a line, and ftruck alternately, with a hammer of great power.

A great deal of this kind of ftone is imported into the metropolis and other large towns, for paving the ftreets, &c. It is on the whole a very advantageous fort of quarry material in various parts of the kingdom.

Quarries of free-ftone are wrought in a great number of different places. In the more fouthern parts is found the Portland ftone, which is fo famous and ufeful in building. A fort of this kind of ftone, which much approaches to it in quality, is alfo met with in Cornwall. Some likewife exifts in Devonfhire and Gloucefterfhire. The Cotfwold quarries in the latter, afford free-ftone of an excellent quality, particularly thofe at Painfwick, Lodbury, Lockhampton-hill, &c. It abounds more, however, in Chefhire, Lancafhire, Weftmoreland, Cumberland, and fome of the ftill more northern diftricts. Several excellent quarries of free-ftone are carried on in the firft of thefe, as thofe at Runcorn, Manley, &c. where much valuable ftone of this nature is raifed. The fecond county alfo affords equally valuable quarries in many different places, from which vaft quantities of the ftone are raifed, and employed, or fent away to a diftance. Thofe about Ormfkirk, Up-Holland, and Wigan, as well as thofe on all the eaftern fide, are in general of a very good quality. And in the vicinity of Lancafter there are fome excellent ones; that on the moor or common, clofe to the town, is very extenfive, and affords a free-ftone that admits of a fine polifh. In this diftrict, this fort of ftone is met with of a whitifh-brown, yellowifh, and reddifh caft, but the firft is by much the moft efteemed. In the eaftern parts of Weftmoreland, as about Hutton Roofe, and fome other places, a good fort of free-ftone is dug up from pits and quarries formed for raifing it. This fort of ftone exifts and is quarried almoft all over the counties of Cumberland and Northumberland; and prevails occafionally in others, where it is wrought to advantage. A grit-ftone, fomewhat of this nature, is met with in fome diftricts, as in Shropfhire, &c. which is raifed from quarries, and ufed as a building material. And a fand-ftone exifts to confiderable extent in others, as in Suffex, &c. that is fometimes dug up, and made ufe of for common buildings, &c. In Chefhire, on the hills near Macclesfield, about Kerridge, a fort of fand-ftone is met with, which is particularly well fuited to the making of flags, and whetting tools, as well as fometimes to the forming of flates, for which it was formerly much employed. Near Pott-Shrigley, alfo, a fine fand-ftone is found, that admits of a good polifh. The quarry has not, however, been wrought for fome late years, as from the extreme hardnefs of the ftone, the expence of getting it is very confiderable. There are feveral other quarries of excellent free-ftone wrought in the fame neighbourhood.

There has been great abundance of free-ftone wrought, time immemorial, in the low parts of the county of Perth, and quarries of a greater or fmaller grained ftone of this fort appear almoft in every place, with the exception of the carfes. In the lowlands, and near to the eaftern fea, the pores and grain of it are greater; but as the mountains are approached, the pores are lefs, and the grain finer, by which thefe ftones admit a fmoother polifh. The quarry of Tullyalan parifh, called Long-annat, affords a ftone of a very excellent quality. It has a white colour, admits of a fmooth polifh, and refifts the influence of the weather. Some of the principal houfes in that part of the country, as well as fome of the moft magnificent public buildings in the capital of Edinburgh, as thofe of the Exchange, the Infirmary, and the Regifter-office, confift partly of this ftone, and thofe found at hand. And farther, in fome inftances it has been carried to the continent. But the quarry of Kingoodie, in the carfe of Gowrie, belonging to Mr. Mylne, of Mylnfield, is unqueftionably the fineft of this kind of any in the county. Aftonifhing blocks in great number are raifed there, fifty feet in length, fixteen feet in breadth, and three feet in thicknefs. Such is the demand for this ftone, both at home and abroad, that four veffels are employed in exporting it from this quarry. The work is, however, on the de-

 cline,

cline, occaſioned by the act of 1794, which impoſed a duty on ſtones, which, although trifling in itſelf, cauſes much grievance, vexation, delay, and trouble, in procuring coaſt-diſpatches, &c.

Flag-ſtones and quarries for the working and preparing of all ſorts of flags, are met with in all thoſe ſituations where free-ſtone is found, and where it exiſts in rather thick ſtrata, or layers of ſome depth, which are capable of being ſeparated by hammers, wedges, or other means. In many places in the ſouthern parts of the iſland, the flags raiſed from ſuch free-ſtone quarries are of an extremely good quality, being uſed in very large quantities for many different purpoſes. Thoſe of Cornwall and Devonſhire alſo, in many caſes, afford a good ſort of flags. The ſand-ſtone quarries of Shropſhire, as at Grinſell, near Shrewſbury, about Bridgnorth, and at Corndon-hill, near Biſhop's-caſtle, as well as in the Swinney mountain, &c. where alternate beds of fine white and red ſtone of this kind, of very ſuperior quality and thickneſs, exiſt; that in the firſt of theſe ſituations, being twenty yards thick, affords flags likewiſe, which are of a very uſeful nature. Free-ſtone flags too, of uſeful ſorts, are met with in the quarries of ſome of the midland counties. And they abound much in many of the free-ſtone quarries of Lancaſhire, Yorkſhire, and ſome of the other more northern diſtricts of the country.

The quarries of this kind become ſlate-ſtone, and furniſh the white, grey, and brown ſlate, wherever the ſtone lies in thin layers, or ſtrata, which are able to be raiſed and ſeparated from each other with convenience and facility. They exiſt in moſt of the above tracts, and are plentiful in ſome of them, eſpecially thoſe towards the north. The Lancaſhire and Yorkſhire quarries, in many places, ſupply the white and grey ſorts in great abundance, and of good qualities. Thoſe of Weſtmoreland, Cumberland, and Northumberland, alſo afford them in many inſtances of a valuable nature. And they are equally good in the ſtill more northern diſtricts. There are numerous quarries of different colours of them in Clydeſdale, Perthſhire, Argyleſhire, and the county of Inverneſs, from which vaſt ſupplies are conſtantly raiſed for home and other uſe. This ſort of ſlate has, however, moſtly the diſadvantages of being very porous, heavy, leſs durable, and of requiring more and ſtronger timber to ſupport it, than ſome other kinds; being only fit for expoſed climates and ſituations.

The quarries of the lighter and thinner kinds of ſlate, of the blue, green, purple, and other colours, formed from other ſorts of ſtone, only exiſt in ſome particular diſtricts, as thoſe of Wales, the northern part of Lancaſhire, and the adjoining counties, and in a few places in Scotland. The ſlate quarries of the Welſh diſtricts ſupply ſeveral kinds and colours in large quantities, and of good qualities, but the dark and lighter purples are the moſt prevalent ſorts in moſt of them. In Lancaſhire the quarries of this kind are very numerous in the part to the north of the ſands, as about Gothwaite-common, Kirby-moor, Coniſtone-hills, and Tilberthwaite-fells, &c.; and from which very large ſupplies of the blue, green, and the dark purple ſorts of ſlate are raiſed, and ſent away for exportation, or conſumed at home for different purpoſes. They are wrought, and the ſlate prepared in ſomewhat different manners in different places. The Gothwaite quarries have the ſlate dug out from the ſide of the hill, and carried away. But in ſome on Kirby-moor, a level is driven through the ground from below, the metal being conveyed away by ſmall four-wheeled waggons on iron rail-ways. Thoſe about Coniſtone are moſtly worked into the hills, and the metal raiſed and carried out from them. Some of the Tilberthwaite quarries are wrought by blaſting the ſlate-ſtone, and collecting and carrying it out of them on ſlanting roads, in ſmall carts or trucks conſtructed for the purpoſe, the levels being below the hills, but not nearly ſo low as the bottoms of the quarries. Others are wrought by draught roads from the bottoms of them. One man will raiſe eighteen or twenty hundred weight of ſlate in one day, where the metal riſes well, but leſs in other caſes. In ſome it is dug out by one ſet of men, ſplit by another, and formed into ſlates by a third, for which purpoſes, flat crow-bars, ſlate-knives, and axes are employed. The ſlate is divided and diſtinguiſhed into three ſorts, as firſts, ſeconds, and thirds, or London, country, and toms. In the firſt, or Gothwaite quarries, the ſlate has a darkiſh purple, or black caſt, and is worth from forty to forty-four ſhillings the ton. In the Coniſtone quarries it has a fine blue and green appearance, and is much thinner and lighter than the other ſort. The Tilberthwaite ſlate, in ſome inſtances, ſplits very fine, thin, and light, but does not cover ſo far as thoſe of the Gothwaite and Kirby quarries. This ſort is worth from forty-eight to fifty ſhillings the ton. In ſome quarries a ſort of rent is paid *per* ton, on the ſlate which is raiſed, as ten ſhillings for the beſt, eight ſhillings for the ſeconds, and ſixpence for the thirds. In others a certain rent only is paid for the liberty of the royalty, and not a tonnage duty. Theſe rents or duties on the workers of theſe quarries, are probably higher than they will bear, and have enabled the Welſh ſlate dealers to underſell thoſe of this county.

Weſtmoreland and Cumberland, in ſome inſtances, afford good blue and green ſlates. In the latter, ſome of an excellent quality are gotten in the quarries of Borrowdale, and inferior ſorts in ſome of the neighbouring mountains.

The county of Argyle, in Scotland, in ſome parts abounds with ſlate-quarries, as the tracts about Eſdale, from which five millions of ſlates have for ſome time been annually ſold at the rate of twenty-five ſhillings the thouſand. Quarries of the ſame kind are alſo wrought in many other parts, with great benefit to the inhabitants.

Slate-quarries are formed in many parts of the highlands of the county of Perth, but none in the low. The ſlates in ſome are of a purple colour, in others of an azure blue, and in a few of a muddy, ſandy, brown complexion along the cutters. It is well known where the different ſorts are quarried. The veins of ſlate-rock ſeem to run from Drumlane, in the pariſh of Aberfoil, in a north-eaſt direction to Dunkeld; and may be traced beyond the limits of the county both ways. The azure coloured are the beſt metal, and riſe of a greater ſize than any of the other kinds. Many of the buildings in different places are ſlated with this beautiful covering. Into the lower diſtricts of the county, ſlates are imported from Eſdale, and the other quarries on the weſt coaſt of the county of Argyle.

Quarries of grey ſlate exiſt in many different parts of the county of Inverneſs, in which the quality is very good, and well ſuited to the climate. In ſome places theſe ſlates are much preferred to blue ones, as the latter are more expenſive in procuring, and though nailed on the roofs ever ſo firmly, are apt to be looſened by high winds, unleſs bedded in lime, which circumſtance renders repairs difficult.

There are numerous quarries of ſand and gravel to be met with in almoſt every diſtrict of the kingdom, which are wrought either for the purpoſe of ſupplying domeſtic uſes, or thoſe of repairing roads, &c. Thoſe of the former ſort, which contain the fine white, red, and yellow ſands, are by far the moſt valuable, and wrought to the greateſt extent, the materials being moſtly dug out from the ſides of banks and other places, and but rarely got by ſinking the

the quarries into the more level parts of the ground, though this method is fometimes practifed. The matters are commonly raifed fimply by digging and fpades; and thrown into the carts, in many cafes, from the quarries and pits themfelves. Numerous quarries and pits of this nature exift and are wrought to a very great extent in the neighbourhoods of the metropolis, and moft other large towns, all over the kingdom, for the purpofe of fale for various domeftic ufes.

In the gravelly kinds, thofe quarries which abound with the fharp, coarfe, flinty, and pebbly forts, are the moft proper and beneficial for the making and repairing of all forts of roads and carriage-ways. They are occafionally formed by working into banks and fteep places, but more frequently by openings in the plain furface. Their depth is fometimes confiderable, the materials being raifed after being fcreened, the work, of courfe, very laborious and troublefome. In other cafes, the carts are filled from the quarries or pits without much difficulty or trouble.

Quarries of clay-ftone, ftone-tiles, fcythe-ftones, and fome other forts, are found of good qualities in different diftricts. In Gloucefterfhire they have quarries of blue clay-ftone at different depths, lying in beds of the fame coloured clay, difpofed in layers of from four to ten inches in thicknefs. The ftone in new quarries is eftimated by the effects which the atmofphere has upon it from fome expofure. The beft fort is a very ufeful material for feveral purpofes. Quarries of ftone-tiles principally exift, and thofe articles are raifed from them, in different part of the Cotfwolds. The beft are prepared about Miferdine, Beverftone, Charlton, and Hampton-field, the colour of which are yellow or grey; but another fort, which is red grit, is dug up about Iron Acton, and fome other places, but which is lefs valuable.

There are quarries of fcythe-ftones in many parts of Lancafhire, but the beft are obtained from thofe about Rainford, where they are well wrought and prepared for ufe. In feveral other diftricts, quarries of different kinds of whetting-ftones likewife exift, and are wrought to advantage.

Ochres of different kinds are met with in different places in quarries formed for the purpofe of raifing them. In the county of Devon, formerly large quantities of various fhades between red and yellow, were raifed and manufactured in thofe about Eaft-down. Umber, in the parifh of Combemartin, exifts in a pretty large body. The working and preparing of thefe are, however, now much lefs attended to than heretofore.

In Suffex there are quarries of red ochre about Graffham, and in various places contiguous to the fea, as near Chidham, &c. where much is raifed, prepared, and fent to London. Ochre quarries alfo exift in many counties more to the middle and north of the kingdom, from which great quantities of this fubftance are procured and prepared for ufe in different forts of arts and manufactures.

Quarries of plumbago, or black lead, are likewife occafionally found and wrought, in different fituations, in different diftricts of the country. This fubftance has been met with and raifed near the borders of the Bovey river, in Devonfhire, in fome quantity, and prepared to be fent to Exeter for fale. Quarries of black lead are alfo found and wrought in Borrowdale, in Cumberland, near to the town of Kefwick, to fome advantage. And they exift in fome of the middle tracts of the ifland, affording great benefit to the proprietors of them. In the county of Invernefs, there are fome appearances of black or pencil lead about Glengary, but they have not yet been turned to any ufeful account.

In fome diftricts, in the middle parts of the country, quarries of calamine, or *lapis calaminaris*, are met with, and much of this fubftance raifed from them to great profit. It abounds in the Mendip-hills, in Somerfetfhire, about Rowbarrow, Shipham, Winfcomb, and on Broadfield-down, &c. It is fometimes found within a yard of the furface, and feldom wrought deeper than thirty fathoms. In fome places its quality is excellent. It is prefent in other neighbouring mountainous tracts, and raifed with equal advantage.

Quarries of gypfum prefent themfelves in many different parts, and are wrought in fome with confiderable benefit. In the county of Devon, it lies between ftrata of red ftone, marle, and chalk rubble, about Salcombe, Branfcombe, and Beer, being ufeful for various purpofes. Gloucefterfhire and Derbyfhire have quarries of this nature, where there are fine beds of it. Thofe of Auft Cliff in the former, have it not fo good, however, as that which is met with in the latter county. In Nottinghamfhire it is of an excellent quality, efpecially that got near Newark and at Redhill. Chefhire has fome, but not turned to much account. Weftmoreland and Cumberland have good quarries of it, in fome places, where a great deal is gotten up, and made ufe of. And it abounds in different parts of the county of York, where it is raifed to advantage.

Marle is an article that is met with in pits and quarries in a variety of different fituations, and of feveral different kinds and qualities. It is found and dug up for ufe in many places in Suffex, and the counties more to the centre of the country; but it prevails in the greateft plenty in the county of Lancafter and fome others, in which it is raifed or worked out from large openings on the fides of hills, high banks, or in the plain furface, and fet thickly upon the land. The getting or digging of the material out of fuch places, is ufually performed by means of ftrong iron mattocks, crows, fpades, and wooden fpiles; large pieces being in fome cafes forced down, not without danger to the workmen, by driving in the fpiles or piles from above. This method is called *falling*. The work is extremely fevere, and commonly done by the rod. The large clods thus forced down, break into fmall pieces, and are then filled into carts for the purpofe.

Shell-marle, though it is not much attended to in any part of England, is frequently met with and dug up from various parts of Scotland, and employed on the land in great quantities, with much fuccefs. The pits and quarries of this fort are commonly wrought with much more facility than thofe of the others.

Pipe, and other kinds of fine clays, are dug and raifed from a fort of pits or quarries, in large quantities, in many different counties. Near Wear Giffard, in Devonfhire, much of the firft fort is dug and fent coaftways, though not in fuch quantities as formerly. Brown potter's-clay is alfo raifed and fent away in great abundance from the neighbourhood of Fremington. Thefe forts of clays are likewife found in much abundance in Berkfhire, and ftill more fully in fome of the midland diftricts, where the pits of them are wrought to a vaft extent. They are articles of great importance and utility in feveral forts of manufactures, and for which there is great demand in many inftances.

Alum earth is a kind of ftratified matter, which is met with and raifed from pits and quarries in a number of different fituations, and various parts of the kingdom. In fome they are wrought to very confiderable extents and advantages, but in others in far lefs degrees, and with much lefs fuccefs.

The ftrata of this earth are dug and got up in different manners

manners under different circumſtances, but moſtly by means of ſtrong crows, picks, and other tools of a ſimilar kind, being wrought in ſomewhat the ſame method as in the caſes of marle. The buſineſs is uſually executed by common labourers.

Fuller's-earth is another material of this nature, which is dug out of the ground from pits and quarries at different depths in ſeveral parts of the country. In ſome it is very abundant, and of a rich good quality, as in thoſe of the middle and more northern parts of the iſland, forming an article of great uſe and demand in ſeveral branches of buſineſs. In others it is of a much leſs valuable nature, being far leſs in requeſt. That which is found about Tillington, in Suſſex, is conſumed in the neighbouring fulling mills. The mills of this ſort in Yorkſhire, and other parts alſo, conſume immenſe quantities. The material is raiſed from the places in which it is found in much the ſame way as many other earthy ſubſtances, but it ſeldom requires ſo much digging, as it is a far leſs hard matter.

Fuller's-earth was formerly got up from pits and quarries in the neighbourhood of Maidſtone, in Kent, and much ground wrought over; but the beds of ſand by which it is covered are of ſuch depths, as to render the works of little value or importance.

Quarries and pits of mineral peat-earth are found in ſome diſtricts, and much of the material dug up from them, and made uſe of when prepared upon land. The vale of Kennet, in Berkſhire, contains vaſt quantities of it, as well as ſome other parts. It is a ſtratified ſubſtance which is dug from under the ſurface at the depth of from one to ſix feet, laying below ſtrata of ſmall ſhells and calcareous matter. In raiſing it, a peculiar kind of ſpade is made uſe of, which cuts it in long pains, ſomething like ſoap, which, when dry, are burnt into aſhes and laid on the land. This ſubſtance is found to contain the oxyd of iron, gypſum, and the muriates of ſulphur and potaſh, in the proportions of forty-eight, thirty-two, and twenty parts to that of one hundred.

It is ſuggeſted by the writer of the work on "Landed Property," that in moſt mountainous diſtricts, and many low fenny counties, immenſe collections of vegetable mould or peat-earth lie in a ſtate of neglect; even in places where they might be converted to valuable purpoſes; not only as ſources of fuel merely, but as manure, either uſing the vegetable matter in its raw ſtate, or after being reduced to aſhes. In all theſe ſituations it might be readily dug up from different places, and applied to different uſes in each of theſe ways, the pits or other ſpots containing it working in a very eaſy manner. The aſhes of it are only employed on any large ſcale in the above county.

Culm, coal, and cannel, are articles of the fuel kind, which are found in a vaſt number of places, all over the kingdom in pits, mines, or quarries, and which are of the greateſt importance in many of them. Speaking of coals, the author of the work on "Landed Property," conſiders them as riſing in the minds of moſt men, far ſuperior to moſt other productions and ſubterraneous matters, whether they are held in the light of agriculture, manufactures, or national defence. It is aſked, if it were not for the collieries of this country, how many hundred thouſand acres of its land, which are now appropriated to cultivation, would be required for the production of fuel? How many manufactories, eſpecially thoſe of iron, which are ſo very valuable to civilized ſociety, would be cramped, retarded, and ſtopped, in their progreſs and operations? And how many hardy ſeamen would be wanting to its navy? Surely, in his opinion, an indigenous production and material, on which the proſperity of the country ſo greatly depends, is entitled to the guardian care of its government; to aſcertain the preſent expenditure, and the probable ſtock which is remaining. Let us not, it is remarked, play the ſpendthrift, and, by the follies of a day, entail centuries of want on generations to come, and the curſes of millions on the memory of the preſent times.

In endeavouring to find theſe ſorts of ſubſtances in parts where pits of them have not yet been wrought, the ſearching, it is ſuppoſed by the ſame writer, ſhould, in general, be done by the land proprietors of the particular places, in a conjoint manner. There are, however, certain inſtances, in which individuals may proſecute the ſearch with propriety, and in the moſt beneficial manner. In doing which, the principal things to be guarded againſt are thoſe of misjudgment and impoſition. Hence the neceſſary prudence of endeavouring to procure perſons of ſkill and integrity for making ſuch ſearches; which are, in the firſt place, to be attempted by a cloſe inveſtigation of ſuperficial appearances, and then where thoſe are favourable in their nature, by the uſe of the boring rod or tool. It is ſuppoſed that, at preſent, there are none who are equal to ſuch undertakings, except thoſe who have been long converſant with the buſineſs of coal-works; men who have an intereſt in the exiſting collieries or works of that kind. On this account it is thought to become a matter of common prudence, in a given ſituation, to endeavour to procure an undertaker or overlooker from a diſtant work; or ſuch a one as can have no counter-intereſt to that of his employer; and then, cloſely to connect and bind them in one common intereſt. After having had different occaſions for conſidering the ſubject, and for beſtowing no ſmall thought upon it, the writer is of opinion that the moſt eligible plan of proceeding, in ſuch caſes, is that of agreeing with an overlooker, or undertaker, to pay him reaſonably, but not extravagantly, for his time, and for his actual expences in proſecuting the neceſſary ſearches; and, further, to agree to give him, in the event of ſucceſs, a reward ſufficient to call forth his beſt exertions; ſuch reward to be payable, not on finding coal, but whenever the work, to be eſtabliſhed in conſequence of the diſcovery, ſhall have cleared the amount. In this way the proprietor will feel himſelf ſecure, while the perſon employed has the moſt powerful ſtimulus to induſtry, attention, and the accompliſhment of the object of the undertaking.

Culm and coal have been met with and wrought in ſome degree, in Devonſhire, Suſſex, and ſome other of the ſouthern parts of the iſland; but they exiſt much more plentifully in the midland and more northern diſtricts, as well as in ſome places in Wales and Scotland. In Glouceſterſhire, coal abounds in moſt parts of the foreſt of Dean, and its vicinities, and probably to within a ſmall diſtance of the county-town, as at Newent and Pauntley, where pits are eſtabliſhed. Thoſe of the foreſt tracts are very numerous, but not fully wrought for want of ſufficient draining. Pits of this kind alſo exiſt in many places, in the lower vale part of the county. In this diſtrict, however, the coals are no where of the beſt quality.

In the counties of Salop and Somerſet, coals alſo prevail very much, various pits of them in both, being wrought to conſiderable extent. Thoſe in the northern part of the latter diſtrict, have ſtrata of them which form an inclination of the plane of about nine inches in the yard; and are nineteen in number. They are ſeldom wrought where leſs than fifteen inches in thickneſs, but they vary from ten inches to upwards of three feet. The working is performed at conſiderable depths, eſpecially ſince the eſtabliſhment of improved machinery, and other means for raiſing them. The coal

coal is of the firſt quality, being pure and durable in burning, and from its firmneſs, largeneſs, and ſtrength of grain, capable of being conveyed to any diſtance without injury. At preſent the quantity raiſed in theſe pits, is from fifteen hundred to two thouſand tons weekly, but much greater ſupplies could be afforded, if they were wanted. The works are twenty-ſix in number, ſome of which afford a good profit.

The pits in the ſouthern part are upon a more limited ſcale of work. In them the ſtrata of coal form an inclination of the plane of from eighteen to thirty inches in the yard; but in ſome it is deſtroyed, and they deſcend in a perpendicular manner. There are, in number, twenty-five, which are in thickneſs from ſix inches to ſeven feet, being rarely wrought under eighteen inches. The depth of working is middling, but will be increaſed. The quality of the coal not the beſt, but tolerably good. The quantity now raiſed from theſe pits is from eight hundred to a thouſand tons in the week, which might be eaſily extended. The working profits are by no means great. There are pits in other parts, but they are not many, or much wrought.

Againſt the apprehenſion of pits of this nature being exhauſted or worn out in theſe places, it is contended that more than treble the preſent quantity is capable of being raiſed from the works already carried on, and that this increaſed quantity might be ſupplied for ſeveral hundred years to come.

The works and quantities of coals contained in the counties of Stafford, Derby, and Nottingham, are likewiſe very great, and moſtly of good kinds; pits of them being carried on in many places to vaſt extent.

Cheſhire, too, is a coal diſtrict, in which a great variety of works for raiſing it are eſtabliſhed in different parts, and much of it, which is of a very good quality, gotten up. The ſtrata of coal here in many caſes are ſeveral feet in thickneſs; about Wirrall the ſeam is five or ſix feet thick, and the works extenſive under the channel of the Dee. In ſome works the beds of coal lie at the depth of from ſeventy to one hundred yards below the ſurface of the ground, and are of different thickneſſes to ten feet or more.

In Lancaſhire, coal of good ſorts is moſt abundant. The beds of it run acroſs the county in ſomewhat three different parts, as towards the ſouth, nearly in the middle, and on the north-eaſt part. Thoſe in the two firſt are of conſiderable breadths and thickneſſes in different parts, but the third is much leſs broad and very thin in many places. They all run, in ſome degree, from the north-eaſt to the ſouth-weſt, conſtantly keeping ſomewhat the ſame direction, though occaſionally branching out in a lateral manner to ſome extent. The works on each of theſe different lines of coal ſtrata, eſpecially the two moſt towards the ſouth, are very numerous, and, in different inſtances, of very conſiderable extent. There are ſome alſo eſtabliſhed on the northern line, but they are of a far more limited nature. The layers or ſtrata of the coals are of various widths, from a few yards to a very great diſtance, and their depths or thickneſſes from a few inches to ſix or ſeven feet. They lie at very different depths from the ſurface of the earth, according to circumſtances and ſituation; on the eaſtern ſide of the county they ſometimes nearly appear on the top of the ground, while in the middle, and towards the ſouth-weſt, they are often a conſiderable number of yards deep. All about moſt of the large towns in the ſouthern parts of the diſtrict very extenſive works are eſtabliſhed, where immenſe quantities of coals are raiſed for home uſe, as well as being ſent coaſtways, and, in ſome caſes, for exportation. They are a ſort of material which is of vaſt importance to the manufacturing ſtate of the county, and which contributes greatly to its proſperity. The quantity is ſo great, when conſidered as a whole, that they would ſeem to be almoſt inexhauſtible.

The cannel coal, which is a ſort that has ſome reſemblance to fine black marble, is principally found and raiſed in the tract about Haigh, near Wigan, which is not more than a few miles ſquare. It lies in pretty thick ſtrata, at the depth of from five to ſeven or eight yards from the ſurface. It is of a very fine, hard, inflammable quality, being got up by ſharp picks, often with conſiderable labour, and for which there is much demand, for domeſtic uſe, in the neighbourhood.

Coals alſo abound in the neighbouring counties of Cumberland and Northumberland, being found in many parts of the eaſtern mountains, and, with not many exceptions, all along the tract, which extends in different degrees of breadth, from Sebergham to Whitehaven, and along the coaſt to Maryport, forming and comprehending a diſtrict of about one hundred ſquare miles, in the former. And they are met with in great plenty throughout the greateſt part of the latter county, particularly in the lower diſtrict of it; being of the beſt quality, and the moſt numerous, and thickeſt ſeams, in the ſouth-eaſt quarter; whence thoſe vaſt quantities are exported which ſupply the great conſumption of the London market, as well as the coaſting and foreign trade. A trade which is the foundation of the commerce of the country, and the principal ſource of its wealth, as well as a never failing nurſery for ſome of the beſt ſeamen of the Britiſh navy. The former county has likewiſe works which ſupply prodigious quantities, both for home conſumption and the coaſtways and export trade. Cannel coal is alſo raiſed in this diſtrict in pretty large ſupplies in the neighbourhoods of Caldbeck and Bolton.

Large portions of this article are likewiſe raiſed from the works in the county of Durham, which in ſome parts are carried on with much ſpirit and enterprize.

Coals are found, and raiſed in full ſupplies, in many places, in moſt of the counties of Scotland, ſo far as Perthſhire; but they have not been met with any farther towards the north in any ſufficient quantities. Where they exiſt, to any extent, in theſe ſituations, they are generally of good kinds, and capable of being got up without any great difficulty, ſeldom lying at any very great depth below the ſurface.

It has been contended by ſome, that the coals in the pits and other places, in this country, are inexhauſtible, while others maintain the contrary to be the caſe; as the matter relates to the county of Northumberland, we have the following calculations, on the authority of the writers of the Agricultural Report of that diſtrict. And they may perhaps equally apply to others. It is ſuppoſed, that towards elucidating this point, it may be of ſome uſe to eſtimate what number of acres are wrought yearly in the county to ſupply the neceſſary conſumption. In order to accompliſh this object, the thickneſs and number of workable ſeams of coal muſt be firſt aſcertained; for which purpoſe they have been favoured with ſections, exhibiting the thickneſs and depth of the various ſtrata, in ſome of the deepeſt pits in the county, one of which has a depth of two hundred and ſeven yards, with ſixteen ſeams of coals; the other a depth of two hundred and forty yards, with fifteen ſeams; conſequently, if the medium be taken betwixt the two, it will be nearly ſix yards thick of workable coal; from which may be formed, it is thought, a calculation of the quantity of coal in an acre of ground, ſuppoſing the aggregate thickneſs of the various ſeams amount to ſix yards.

An

An acre of ground contains - 4840 fquare yards,
which, multiplied by the thicknefs 6 yards,

gives - - - 29040 cubic yards in an acre.
From which deduct ⅓ for wafte and the parts or pillars neceffary to be left in working - - 9680

there remains 19360 cubic yards to be wrought.

And as three cubic yards of coal, when wrought, afford a Newcaftle chaldron, therefore

19360 = gives 6453 Newcaftle chaldrons *per* acre,
divided by 3

The coals exported yearly from the rivers Tyne and Wear, with Hartley and Blyth, amount to about 825,000 chaldrons, which, with the home-confumption of the two counties of Northumberland and Durham, will make the quantity of coals raifed yearly about 1,000,000 chaldrons.

And the chaldrons raifed yearly divided by the chaldrons *per* acre 1,000,000 / 6453 = gives 155 acres nearly *per* year, cleared of coal fix yards thick.

And by eftimating the breadth occupied by the caking coals to be on the average eight miles broad, and twenty-five miles long in the two counties, it is found that there will be about two hundred fquare miles, or 128,000 acres of coal proper for exportation.

From Newcaftle 510,000 chaldrons.
—— Sunderland 315,000 ditto.

In all 825,000

Then the whole area divided by the yearly confumption - 128,000 / 155 = 825 years. The time before this fpace will be wrought out.

It is, however, fuggefted, that there are fome reafons to fuppofe that a thicknefs of feam equal to fix yards will not be obtained all over an extent of two hundred fquare miles, probably not more, on an average, than four yards; in which cafe the coal will be exhaufted in five hundred and fifty years. And if the aggregate thicknefs of the feams to be obtained fhould prove only three yards, then little more than four hundred will be the term of continuance; but it is probable, it is thought, that before the half of that time be elapfed, the price to the confumer will be confiderably increafed from the increafed expence of obtaining them, and the increafed length of carriage from the pits to the rivers; this laft, it is prefumed, may be reduced in fome fituations, by adopting canals inftead of waggon-ways, which, it has often been wondered at, have never yet been attempted. From this inveftigation, it is fuggefted, that the apprehenfions of exhauftion are not fo chimerical as they have been fuppofed and reprefented to be by fome perfons. When, however, the vaft extent of the working and unwrought tracts, in the different parts of the country, are confidered, there cannot be any grounds for fear, in this refpect, for a vaft length of time yet to come.

Pits, fome what of the quarry kind, are wrought in one diftrict of this country, that of Chefhire, for the raifing of rock falt, in fome of which large quantities of this material are procured, from different depths, and different thickneffes of the ftrata of it. In the getting of it different means are employed, as thofe of blafting, picking with implements, for the purpofe of roofing, the ufing of horfes, and machinery wrought by fteam, for forcing up the fubftance, and fome others. The digging, raifing, and working of this article, employs a great number of labourers, and it is of much importance to the county in many points of view.

But though this fort of material is found in feveral different parts of the county, pits, or fhafts of it, are at this time only wrought in the vicinity of the town of Northwich. This arifes from a great many different caufes, but principally from that of the want of water-carriage for the conveyance of the material from them. The number of pits or fhafts, which there are at this time in work, for the purpofe of raifing this article, are about a dozen. They are by much the moft commonly made in fomething of the fquare form, being fecured on the fides by means of ftrong timber, but they have occafionally a round form, and are walled on the fides with bricks.

The beds of this material, that are to be raifed, are wrought at various depths, the deepeft being in general the moft pure, and they vary equally in their thicknefs and directions, as fuggefted above. In fome cafes the beds are of the greateft thicknefs, the more they approach the north-eaft, decreafing in a gradual manner, in their courfe to the fouth-weft; and in fome inftances they incline from north-weft to fouth-eaft, dipping at the rate of about three feet in twenty-feven or thirty.

The ftrata, which are paffed through in getting at and working the rock-falt, lie in a very regular manner, and confift, in general, of a hard clayey fubftance and a fort of gypfeous material in mixture in various ways and proportions, that of the latter kind being the moft predominant as the pit or fhaft approaches the rocky faline fubftance. In working, the clayey matter is defignated by the name of *metal* of the feveral different colours belonging to that fort of fubftance, and the other material by that of *plaifter*. Thefe ftrata are moftly of a folid compact nature, but occafionally broken in particular places, when the metal is termed *fhaggy* by the workmen.

In the bufinefs of working the pits, and raifing the rock-falt, the rocky beds are reduced into pieces of proper fizes for the purpofe, by means of blowing them with gunpowder, and thofe of fplitting and dividing them with hammers and proper wedges for fuch ufes; a good fecure headway or roofing being conftantly provided in the firft place, to the opening from which the falt-rock is to be taken, which is effected by the ufe of fmall fharp picks, carrying on the work in a plain fimple chambering manner.

The workings are funk from thefe chamberings to different depths, as the nature of the beds of rock, and the quantity of the purer kind of rock-falt, or Pruffian rock, as the workmen term it, may direct; but commonly about fifteen feet. Occafionally the roofs or headways of the pits or fhafts are fupported by confiderable fquare pillars difpofed in a fomewhat regular manner, but in other cafes they are wrought out in a fort of long openings, according as the workmen are inclined.

In getting the rock-falt, the workmen are paid by the ton at the rate ufually of about two fhillings, they finding the gunpowder and other tools.

In raifing the falt from the pits or fhafts, horfes were formerly entirely made ufe of, but within thefe few years, recourfe has been had to the improved fteam-engine, as already noticed, though it is not yet generally employed at every pit. See Rock-salt, Rock-salt *Pits*, Salt, and Salt *Brine Springs*.

It is evident from the above account, that in whatever way they are confidered, the quarries of different kinds in this country are of very material importance to its profperity

profperity and convenience; contributing largely to the carrying on of different forts of works and improvements. Without them much ufeful labour muft be wholly at a ftand; a variety of neceffary bufineffes be incapable of being carried on; and the effects of it upon various arts and manufactures, be much too ferious to be thought upon. In fhort, the numerous fubftances of different kinds, which are taken from the bowels of the earth in this country, conftitute one great fource of our national wealth and profperity.

Quarries, *Pits*, &c. *Draining of*, the proper, moft convenient, and appropriate means of rendering all fuch forts of works dry, free from water, and in a fit ftate to be wrought with eafe and advantage. In the effectual performance of all kinds of undertakings of this nature, there is occafion for the application of the fame principles, which are fpoken of and explained in confidering the nature of draining land in general, and the particular manner which is neceffary to be purfued in the practice of fpring draining. See Draining *of Land*, and Spring-*Draining*.

There can be no doubt, indeed, but that the having recourfe to fuch principles, and the modes of practice refulting from them, will be equally expeditious, beneficial, and fuccefsful, as well as in many fituations of very material importance, in the various cafes of this fort, as in thofe which have been mentioned; by leading to and introducing the moft ready and eafy means of diminifhing the quantities of water, which are frequently met with in the courfe of working them, and which not unfrequently obftruct and hinder in a very high degree, but fometimes wholly put a ftop to the work which is carrying on in them. Such, at leaft, is very often the cafe in quarries of the free-ftone, lime-ftone, flag-ftone, marle, and other kinds, as well as in pits of the coal and other forts. The want of this fort of knowledge, of courfe, is one great caufe why fuch a number of quarries and works of that kind, in different parts, often lie altogether, or for a great length of time, in an unwrought ftate; which might otherwife be wrought to very great advantage.

As it is now well underftood, that moft fprings and fubterraneous collections of water are formed and fupplied from fuch grounds or lands as lie higher than that of the places where they are found or met with, which, on account of their being of an open or porous nature, admit that of rain and other forts of moifture to filtrate and pafs freely through them, which finking and defcending to very great depths, through fuch open materials of the rocky, fandy, gravelly, and other loofe qualities, before it becomes impeded and obftructed by fome fort of impenetrable ftratum or layer of an earthy or folid ftony nature, fuch for inftance as thofe of pure ftiff clay or compact rock; it may happen, that in many fuch cafes, in finking pits or fhafts for ftone, coal, or any other kind of fubterraneous material near the bottoms of hills or high grounds, beds of quickfand will be met with, and dug into, which are fo full of water, that to pafs through them becomes a moft troublefome, difficult, and expenfive piece of work, and fometimes impoffible to be performed, but which, from knowing that the water proceeds from the porous ground that lies above, it may often be practicable to intercept and cut off the greater part of the water, before it reaches fuch fand beds in the quarries, pits, and fhafts, by the means of boring into and tapping the water at the *tail* of the banks of this nature, provided that the ground naturally declines lower than the place where the fand is found in the quarries, pits, &c., and the whole or moft of the water be drawn off, and diverted from them at a comparatively trifling expence to that which is employed as the common remedy in fuch cafes and circumftances.

In order to accomplifh this intention, it will be neceffary, in afcending from the quarry or pit, to carefully examine and afcertain, if at any place higher on the declivity, any porous ftratum, bed of rock, fand, or gravel, *tails* out, which may conduct and convey the water contained in it to the fand bed, which is below in the works; and where any fuch bed is found, to cut or bore into it in fuch a manner as to form a drain, that is capable of carrying away the whole or the greateft part of the water, and of courfe to clear, or diminifh the quantity contained in the quarry or pit, which would otherwife have continued to defcend through fuch porous fubftrata or beds, and have continued to fill the fands, or quarries and pits.

But although this part of the bufinefs may have been accomplifhed, and the fupply of water from the higher ground entirely cut off, a fufficient quantity to injure, hinder, and inconvenience the working of the quarries or pits, may yet continue to drain and ooze from the fides of the fand beds, notwithftanding they fhould happen to *dip* towards the lower ground, in which cafes, however, that water may readily and with great eafe be commonly drawn off at fome particular point in it.

In order to effect this, and thereby remove the inconvenience of this filtrating water, in defcending from the quarries or pits along the declivity, it fhould be endeavoured to difcover and afcertain, at what particular point or place in the low ground, the fand terminates or *tails* out, which is moftly beft accomplifhed by means of proper levelling; and if there fhould be there any appearance of the waters having a natural outlet, it may, by means of making in it a deep drain, be far more readily and effectually drawn off and removed; as fprings, for the moft part, naturally pafs and flow through narrow, winding, convoluted openings, or perforations; of courfe, whenever the orifices or paffages are opened, enlarged, or made lower than before, the difcharge of water becomes greater and more expeditious. Where, however, there happens to be a deep impervious layer or covering of clay, or other matter of a fimilar nature, placed above or upon the termination or tail of the fand, the drain need only be cut down to it or a little way into it, as by means of boring through it, or the remaining portion of it, a ready and eafy outlet or paffage may be given to the whole of the water, that may be contained in the fand-bed or other porous ftratum.

This mode of draining quarries and pits may often be of great utility, advantage, and convenience, as it will alfo, in a great degree, remove, or at any rate relieve, the trouble and difficulty that would afterwards have attended the finking the quarry, pit, or fhaft; as the water thus drawn or cut off, muft of neceffity diminifh and reduce the quantity, which would have been found at a greater depth, the fame body of it probably paffing downwards from one ftratum to another, as far as they continue to be porous, or capable of admitting it. Therefore, it is of very material importance to drain and lay dry all fuch ground as is fituated higher, but contiguous to quarries, pits, or other deep fubterraneous works of the fame kind, for the above ftated reafons. And it may, in general, be accomplifhed with but little trouble, difficulty, or expence, by adopting the fame principles, and the fame means.

But in regard to the removal of the water found and contained in the bottoms of fuch quarries, pits, or deep works, it muft be drained off and got rid of in quite a different manner, as the level of the ground may probably be, or decline, nowhere lower than the mouths or openings of fuch quarries, pits,

pits, &c.; as it is folely and particularly on the fuppofition, and in fuch cafes as where the direction of the different ftrata and fand-beds have a *dipping* pofition with the natural inclination of the furface of the land, or lie nearly horizontally, that the method of proceeding which is ftated above is practicable, or capable of being employed with any fort of advantage. But fhould they, for inftance, lie in a reverfe or contrary direction, there is but little poffibility or chance of accomplifhing the object, the removal of the water, unlefs by difcovering or hitting on their terminations, fomewhere on the oppofite fides of the hills or elevations, which in fome cafes may very nearly or exactly be found out, by afcertaining the precife inclination or direction of the materials of the quarries, pits, &c. and by a careful and exact ufe of the level. But this will be much better comprehended, and a more clear, full, and perfect notion of its nature be afforded, by the fection figure in the plate on draining quarries, pits, &c. in agriculture, as given by Mr. Elkington, in his work on that fubject.

This is the manner which is to be purfued in preventing the effects of water, or cutting off that which is met with in finking the quarries, pits, fhafts, or other fimilar works, before reaching or arriving at the ftone, coal, or other fort of material that may be wanted; but that which is found in the bottoms of thefe different kinds of undertakings, or which proceeds from the rocks or their fides, or in other ways, in the courfe of working them, is commonly got quit of by means of fome fort of machinery, as that of the engine or other kind of pump, in order to affift in working of which, the water gained by cutting the drains already noticed may be particularly ufeful, efpecially where the ufual ftream for that purpofe is infufficient in faving the great expence of working fuch machinery by the power of fteam. But without the aid of a natural ftream, which is capable of being converted to this purpofe, it is rarely poffible to find, by means of drains, or in any other way, a quantity of water fufficient to drive fuch weighty machinery, in a fituation of proper height, to have the full and neceffary command of it. However, in many cafes it may be an acquifition of great utility and value. It is explained at *fig.* 2. in the fame plate.

In fome fituations, where a full and proper command of water can be had, and where the entrance to the quarry, pit, fhaft, &c. is alfo fuitable for the purpofe, the ufe to which it may be converted and applied is ftill more important and advantageous, as the driving of machinery for bringing out the various kinds of materials, and at the fame time working an engine-pump, in order to clear the works of the fubterraneous water which flows from the cavities of the rocks, which are met with in working thefe forts of pits, &c.

It has been remarked in Mr. Elkington's work on draining, in thefe cafes, that the duke of Buccleugh's coal-works, near Langholm, in the county of Dumfries, afford a ftriking example of this, as well as of the fuperior powers of water and machinery, when properly combined, where a command of the former can be had, and when the latter is conftructed on proper principles, and conducted with that care and ingenuity which are requifite in fuch difficult undertakings.

In working quarries of lime-ftone, free-ftone, and other forts of materials, it not unfrequently happens, that, at a certain depth, part of the rock or other body, which contains the water, is hit upon, by which they are foon fo filled with it, as completely to put a ftop to the work proceeding any deeper, where the beft and often the greateft part of the ftone is fituated. In all fuch cafes, the moft ufual remedies have been, either the erection of a wind-mill pump, to draw out part of the water, as the whole cannot be taken away by fuch means, or the opening of a new quarry or pit contiguous to the other, which at the fame depth moftly meets with a fimilar obftruction, or the bringing up of a very deep cut, often at great expence, under the level of the water, from the neareft declivity or hollow that can be met with. However, by the following method, all quarries of lime-ftone, free-ftone, marle, or other materials of the fame nature, which are liable to fuch fort of obftruction, may be completely and effectually cleared of the water at but little expence; while, at the fame time, the drain which is made may ferve the double purpofe of that, and the laying of the wet ground, caufed by the fpring contained in the rock, which is found contiguous to it, dry.

There commonly lies, immediately under the rock, a bed of ftrong, ftiff, retentive clay, which upholds all the water received and retained by that rocky ftratum, and which being, at the fame time, bound round on each fide by a covering of the fame fort of clayey material, or other ftiff earthy fubftance, is not able to difcharge itfelf, and of courfe conftantly remains or ftands full in the rock, fo as to prevent the working or taking out the ftone from the bottom.

In fuch cafes it is neceffary, in the firft place, to endeavour to find to what fide the rock *dips* or inclines, which, in general, may eafily be afcertained by the appearance of the furface, in examining the furrounding ground, and the aid of a proper level. When this has been difcovered and fully afcertained, a fuitable drain muft be cut through the clayey covering to the rock, by which the water will be drawn off, which, for want of a proper outlet, formerly ftood pent up in the hollows and cavities of the ftony ftratum or body. This is further and more fully explained by *figs.* 3 and 4, in the fame plate.

But, in fome cafes, this fort of evil or inconvenience may be removed and remedied in a different way. As it frequently happens that a bed or body of the fame ftone, which has a clofe, compact nature or quality, is found lying under one which has a more open porous texture, with fiffures and cracks in it, that are admiffible of water, which obftructs and keeps up the water in the upper bed or layer, in fuch a manner, that not any of it can pafs or filtrate through it to an inferior, or ftill deeper open ftratum or bed; and on finking or cutting through this compact bed of ftone, another layer is met with, which is of fo open and porous a nature, as to admit the reception of any water from the above one, which may come upon it.

And fometimes a bed of gravel or fand is found under that of the clofe ftone, which being ftill more capable of abforbing or taking up any water that may be let down to it, is far better and more properly fuited for the purpofe of clearing the upper bed of ftone from water, than a ftratum of open ftone itfelf.

Therefore, when this is difcovered and afcertained to be the cafe, and the water is *kept up* by the fecond bed of ftone, fo as to be injurious and hurtful to the working of the upper bed, and which will be equally fo in working the fecond; the work may be greatly freed and relieved by boring through the clofe bed of ftone, and letting down the water into the more porous one below, or into a ftratum or body of dry fand or gravel, fhould there be fuch a one underneath it. But in place of boring, the finking of fmall pits through the clofe ftone is a more effectual method of letting down the water, though a much more difficult one in the execution.

The methods of digging and boring, even in the bottoms of quarries, pits, and fhafts, where pumps and other machinery of the fame nature are made ufe of, as has been noticed above, may, in fome cafes, not only be practicable, but advantageous for letting down the water which they contain into an inferior open ftratum.

That

That of boring has been practifed with complete fuccefs in the cafe of a colliery in the county of York, which had been wrought many years, and in which the water was raifed about fixty yards by a fteam-engine: the proprietors of which, on boring down from the bottom of the pit next to the engine-pit, to the further depth of about ten yards, in order to afcertain the depth or thicknefs of a feam of coals, which was fuppofed to lie below thofe then wrought; the workmen, on taking out the boring rods, found that the water from the works, which ufually ran acrofs the bottom of this pit to the engine-pump, now ran down the holes they had made. And that the fteam-engine pump, on being fet to work, contained little or no water, it having efcaped through thefe holes, and continued to run through the fame ever afterwards, rendering the pump ufelefs. It is remarked, that this inftance of water at fo great a depth from the furface, finding a paffage at a further depth of ten yards, or lefs, and immediately below, is extremely fingular and ftriking in its nature. The fituation was much higher than the neareft contiguous vallies, or the level of the fea. Trials of this fort can feldom be made, therefore the cafes are rare, uncommon, and curious. But in extenfive tracts of level land, where lakes or moraffes have been formed, and which cannot be laid dry by cutting open drains, or driving levels through rocks, except at an expence for which the lands, when drained, would never compenfate, the above inftances warrant the trial of experiments with boring rods, which, if not attended with fuccefs, can be made at little expence.

In the county of Lancafter, about the town of Ormfkirk, as well as in fome other parts, ftone quarries are cleared of water exactly in the manner which has been already pointed out, but which *fig.* 5. in the plate will explain much better.

The fuccefs of the practice has likewife been farther fhewn by the late T. Eccleflon, efq. of Scarrifbrick-hall, an ingenious and extenfive proprietor of land in the fame neighbourhood, who remarks, that in ftone quarries thereabouts, wells or pits are occafionally funk to the open bed, which have proved ferviceable. This mode was practifed in a ftone delf near the above town in a very beneficial manner. But in order to lay the delf more effectually dry to a greater depth, Mr. Elkington, on viewing the furrounding ground, marked out where he thought the rock terminated, or tailed out, and at the loweft level fet out a drain to be cut and carried up to the rock, part of which work has been executed, and a very confiderable flow of water comes from it; but on account of its great depth, fixteen feet, the whole will not be finifhed before he has feen the work again. The drain he has thus laid out is about ten feet lower than the bottom of the ftone quarry, and when completed, will lay the head or body of ftone dry lower than the prefent floor. All rocks, for the moft part, where they terminate, are fucceeded by broken loofe ftones of the fame nature as the rock, and they are frequently, nay almoft always, fucceeded by fand, which, when in a thick bed, and of a running nature, fuch us quickfand, often caufe great expence in cutting through to the tail end of any rock. This is more fully explained in fpeaking of the manner of draining in hilly lands, and where the foils are of a mixed nature. See SPRING-*Draining*.

Therefore, in all fuch cafes as this, where there is any danger of meeting a quickfand, boring or finking pits through the bed of clofe ftone, is by much the moft advifeable, and at the fame time the leaft expenfive method that can be purfued.

The fituations of marle pits are for the moft part fuch, that they require very extenfive cuts to be made through fome parts of the furrounding banks or fides of them, in order to carry or convey off the fuperabundant quantity of water which prevents their being dug or wrought to advantage. This bufinefs might frequently be effected in a much lefs troublefome and expenfive manner, by the method of letting the water down by means of finking pits or openings through the retaining and upholding ftratum underneath the bed of marle, into fome abforbent porous body of materials lying ftill deeper, which is capable of receiving it. Where the fpace of ground that is occupied by the marle is of confiderable fize, feveral pits will be required, in order to effectually carry off the water; and where it is neceffary that they fhould be fo deep as to be in danger of falling in, they ought to be walled round the fides, or filled up to near the top with loofe ftones, through which the water can fettle and find its way. And any fuch crofs drains or cuts as may be neceffary for the purpofe of collecting the water muft be fo formed and conducted as to lead into the pits. But in many cafes the water may be removed and got rid of in a ftill more eafy manner, efpecially where the fituation of the ground is favourable and fuited to the purpofe. In inftances where the furrounding banks decline or fall on the oppofite fides *lower than the water*, by cutting drains into them, and boring with an horizontal auger into the tails of the ftrata containing the water, it may be drawn off and brought down to a level lower than that of the bed or body of marle. And as this water is not unfrequently fupplied by a fpring which rifes in fome part of the higher ground, and defcends into the place where the marle is found, it will be neceffary, in all fuch cafes, to cut off the fource of it, and divert the flow of water into fome other channel; as by that means the quantity of water below will be leffened, and more eafily and readily carried off by the pits or drains which may have been formed.

Mines and fhafts, for the purpofe of raifing different forts of metals, are often much impeded, or wholly prevented from being wrought by the water which is brought into them from a diftance, by various kinds of mineral ftrata. In many fuch cafes, the water flowing in this way may be intercepted, by making cuts up to the loweft banks of them, from fome neighbouring water-courfe, or other convenient outlet, and then boring or digging pits in the bottoms of fuch cuts, when the metals to fuch depths or levels will be rendered free from water, and capable of being wrought. This will, however, be more amply fhewn in confidering the manner of draining, in fome cafes of wetnefs, caufed by fprings arifing in this way. See SPRING-*Draining*.

In removing the water, or freeing the bottoms of quarries and pits from it, where machinery is required, the writer of the work on "Landed Property" has remarked, that in cafes where *fhaft-drains* are found to be impracticable, *well-drains* and pumps become neceffary, and are the moft proper; as they may be wrought by water, where ftreams can be conducted to them; or by wind in high expofed fituations; or in works of confequence, where fuel is moderately cheap, by fmall fteam-engines. However, in inftances where large bodies of water are required to be raifed and difcharged at the height of a few feet only, marfh-mills, fuch as are made ufe of in low marfh-land diftricts, are found the readieft and moft ufeful kind of machinery for the purpofe.

In fome cafes of this nature, the bottoms of quarries, pits, and mines, may be cleared from water, fimply by forming openings into them from fome parts of the neighbouring ground where it falls lower than the levels of them, at fufficiently fhort diftances, without any other more expenfive works being undertaken for the purpofe. This fhould always be fully confidered before any means are reforted to

for

for laying them dry, as it may occafionally be the faving of much labour, trouble, and money.

Quarry, in *Glaziery*, a pane, or piece of glafs, cut in a lozenge, or diamond-form.

The word feems formed by corruption, from *quarrel*, (which fee); unlefs we will fuppofe it to come immediately from the French *quarre, fquare*.

Quarries, or quarrels of glafs, are of two kinds; *viz*. fquare and long, each of which is of different fizes, expreffed by the number of pieces which make a foot of glafs; *viz*. 8ths, 10ths, 12ths, 15ths, 18ths, and 20ths; but all the fizes are cut to the fame angle, the acute angle being 77° 19′ in the fquare quarries, and 67° 22′ in the long ones.

Quarry, in *Falconry*, is the game, or fowl, which the hawk is in purfuit of, or has killed.

Quarry, among *Hunters*, is fometimes ufed for part of the vifcera of the beaft taken; given by way of reward to the hounds.

Quarry-*Cart*, a name commonly given to that fort of cart which is principally employed in the work of quarries, and which is generally of a low, compact, ftrong kind, in its nature, form, and manner of conftruction, in order to fuftain heavy weights, and receive them without difficulty, or the danger of being deftroyed. Carts for this purpofe fhould always be made of well-feafoned wood, be well put together, and have fufficient ftrength of timber in thofe parts where the main ftrefs of the load is placed. See Cart.

Some quarry counties have well-formed carts of this nature, as many of thofe towards the northern boundaries of the kingdom.

Quarry-*Waggon*, or *Truck*, a fmall carriage of the low truck kind, which is much employed in the bufinefs of quarries, efpecially thofe of the flate kinds, for the purpofe of holding and conveying the rough materials, which have been blown from the large maffy rocks, or feparated in other ways, out of or from the quarries and pits in which they are fituated and contained, to the places where they are to receive their different preparations and fhapes.

It is formed and conftructed on a frame fomewhat fimilar to that of the common barrow, and mounted on two low light iron wheels on the fore part, having two feet behind, projecting from the frame, bent fomething in the manner of the letter S, and of fufficient length to let it ftand or reft in a horizontal pofition while it is in the act of being loaded. Thefe feet are ufually made of iron, but they may be formed of other materials. A fort of inclined plain is formed from the bottoms of the quarries or pits, up which it is forced, with great eafe and facility, by the workmen, or fmall animals of the horfe kind, after being filled with thefe forts of heavy materials. It is a very ufeful and convenient machine in this application, being met with in moft of the flate quarries in the northern part of Lancafhire, as well as in thofe of many other diftricts of the kingdom.

QUARRYING, the bufinefs of directing and conducting the nature and management of finking the different kinds of quarries, pits, and fhafts, as well as of the different forts of work which are neceffary to be undertaken, carried on, and performed, in the feveral different defcriptions of them; fuch as thofe of feparating, getting up, and preparing the various forts of materials for ufe in the arts, or in other ways. It is a practice which requires confiderable knowledge and experience, to be fully mafter of it in all its different bearings and intentions. See Quarry, and Quarrying *Slates and Stones*.

Almoft every fort of quarrying-work requires a different kind of management, not only in the opening and finking the quarries and pits in the grounds at firft, but afterwards in the methods and practices of working them, and getting up the various forts of materials from them, as well as in the modes of preparing, trimming, and arranging them, after they have been raifed. They are, however, moftly well known and familiar to the quarry-men and pit-men who are ufually engaged in works of the feveral different kinds.

Quarrying *Slates and Stones*, the methods of preparing and fitting them for their different ufes and applications at the quarries and pits where they have been raifed. The former of thefe articles, particularly thofe of the blue, green, and purple or blackifh kinds, undergo feveral different forts of preparation in the quarrying, according to the purpofes to which they are to be afterwards applied. They are feparated and divided into very thin pieces or flates, where light, neat coverings are required, or in much demand; but for more ftrong and heavy coverings, in expofed fituations, or other places, they are fplit into much thicker fheets, layers, or flates, and are, of courfe, more clumfy in their appearance.

Each fort in the bufinefs of quarrying is wrought in a feparate manner, and packed up by itfelf; the different forts having appropriate names, as has been already feen.

The white or brown flates are never divided and prepared in fo fine a way as the other kinds, but feparated into much thicker flakes or laminæ, in this intention. The blue, green, and purple or darkifh forts, are, for the moft part, found capable of being fplit into very thin laminæ or fheets; but thofe of the white, or brownifh free-ftone kinds, can feldom be feparated or divided in any very thin manner, as the layers of the large maffes of the ftones are of a much thicker nature, they confequently form heavy, ftrong, thick coverings, proper for buildings in expofed climates and fituations, and of the more rough kinds, fuch as barns, ftables, and other forts of out-houfes.

In the different operations and proceffes of this fort of quarrying, flate knives, axes, bars, and wedges are chiefly made ufe of in the different intentions of fplitting and cleaning the flates, they being feparated into proper thickneffes by the axe, bar, and wedge, and afterwards chipped into their proper forms and fhapes by the knife. All the different inequalities which may appear upon any part of them, are likewife removed by this laft fort of implement.

In the quarrying of the latter forts of materials, or thofe of ftones, the work is ufually performed in fuch a manner as to fuit the different ufes for which they are intended. Where flags are to be formed, they are fplit or riven into fuitable thickneffes, and fquared to different fizes, fo as to be adapted to different applications. Thefe operations are executed in rather a rough way, as they are afterwards to be finifhed by the ftone-mafon. When for fteps, they have the proper breadths and depths given to them in a fort of fquaring manner, being left to be completed as they may be wanted for particular ufes and applications. Gate-pofts are, for the moft part, quarried fo as to have from about a foot to a foot and a half or more in the fquare. Trough-ftones have the quarrying performed fo as to be formed into various proper-fized fquares or other forms, in a rough manner, being left in thefe ftates to be afterwards hewn and hollowed out, in the intended parts, by the ftone-mafons.

Stones for building purpofes are ufually raifed and quarried out roughly into fomething of the fquare fhape, being left in that ftate for the builders, who afterwards fit them fo as to fuit their own purpofes and intentions.

In the quarrying of ftones, the quarrymen commonly make ufe of large hammers, with cutting ends on one fide, the other being formed in a plain manner; ftrong, fharp, crowbars,

bars, and broad, fharp, iron wedges; by which means thefe matters are, from the conftant practice of the men, fplit and torn into fuch forms as are wanted with great eafe and facility. See QUARRY.

QUARRYING *Tools*, the different forts of implements which are employed or made ufe of in the different works of this kind, as in the raifing and preparing the various forts of materials of this nature. They are principally fuch as thofe which have been noticed already, and different defcriptions of picks, mattocks, and jumpers, or boring implements, for the purpofe of blafting the various kinds of ftone, and other hard materials. Thefe tools are individually defcribed under their particular heads. See each of them.

QUARRYINGS, the fmall pieces which are broken or chipped off from the different forts of materials which are found and wrought in quarries, while they are undergoing their different preparations for various ufes. Thefe fubftances, where they are of the hard kind, fuch as thofe of the blue and lime-ftone, as well as fome other forts, are extremely well calculated for the purpofe of forming and repairing roads, as they are nearly, if not quite, in a ftate fit for immediate application in this way. Materials of thefe kinds ought, therefore, where they can be conveniently had, never to be neglected by thofe who have the care and management of roads, as they will fave much expence and trouble, in a great number of inftances. See ROADS.

QUART, *q. d.* fourth, in *Mufic*. See QUARTE.

QUART is particularly ufed for a diminutive meafure, containing one-fourth, or quarter, of fome other *meafure;* which fee.

The Englifh quart is a fourth of a gallon, or two pints; the Roman quart, or quartarius, was the fourth part of their congius.

The committee appointed for examining the ftandards of weights and meafures, and afcertaining thofe that fhall be ufed in this kingdom, delivered it as their opinion, in their report to the houfe of commons, A. D. 1814, that the gallon ought to contain 10 pounds of pure water, or 276.48 cubical inches; that the quart, or fourth part of the gallon, ought to contain 40 ounces of water, or 69.12 cubical inches; and that the pint, or half of the quart, ought to contain 20 ounces of water, or 34.56 cubical inches.

The French, from whom we borrow the word, befides their quart, or pot of two pints, have various other quarts, diftinguifhed by the whole of which they are quarters; as *quart de muid*, and *quart de boiffeau*. See MUID, and BUSHEL.

QUART *of Butter*, in *Rural Economy*, a name given to a lump which contains the quantity of three pounds; and which is a mode of felling it that is peculiar to fome diftricts, it being carried in this ftate to the markets.

QUART *de Soupir*, in *Fr. Mufic*, is a reft equal to a femiquaver. By a 4th part of a foupir is meant an equivalent to a double croche, or two quavers in French, and one crotchet in Englifh. See TIME-TABLE, and VALUE *of* NOTES.

QUART *de Ton*, Fr., a quarter of a tone, an interval introduced into the enharmonic genus by Ariftoxenus. We have neither ear nor harmonic calculations that can furnifh us with the exact interval or ratio of a quarter-tone; and when we confider what nice geometric operations are neceffary to fettle it on the monochord, we are very apt to fufpect that this true quarter-tone never has been nor ever will be produced exactly in tune either vocally or inftrumentally. Muficians, however, call the difference between A♯ and B♭, a quarter-tone, an interval which, though in nature, is annihilated by temperament.

This quarter-tone is pretended to be of two kinds; the enharmonic major, in the ratio of 576 to 625, which is the complement of two minor femitones to a tone major; and the enharmonic minor, in the ratio of 125 to 128, which is the complement of the fame two minor femitones to the minor tone. Rouffeau.

QUARTAN, in *Medicine*, an ague or intermittent fever, the paroxyfms of which recur every third day, leaving two intervening days without fever. This is vulgarly called a *third-day* ague; but in medical language it is termed quartan, or *fourth-day* ague, becaufe if we reckon the day on which the difeafe commences as *one*, then the fecond paroxyfm is on the *fourth* day, which again becomes *one* in relation to the fucceeding paroxyfms. See FEVER, *Quartan*, and AGUE. See alfo TERTIAN.

QUARTARIUS, a meafure among the ancients, being the fourth part of a fextary, and nearly equal to a quarter of a pint of our wine-meafure.

QUARTARO, in *Commerce*, a liquid meafure at Venice. The amphora, which is a wine-meafure, contains 4 bigoncio; a bigoncia 4 quartari, 16 feechie, or 256lb. Pefo groffo; but a bigoncia of brandy is only 14 feechie, or 56lb. Kelly's Un. Cambift.

QUARTATION, in *Metallurgy*, is the feparation of filver from gold by means of aqua fortis or nitric acid; which is an operation that has fomething fingular in it.

If filver and gold are mixed together into a mafs, and the gold is not lefs than one-third part of the mafs in weight, the beft aqua fortis poured upon it is not at all capable of diffolving the filver; but if you add more filver to this mafs, by melting it again in the fire, with fuch a neceffary addition of that metal alone as fhould bring the gold in the mafs to the proportion of lefs than one-third of the whole, and fuffer it to cool, then aqua fortis poured on it will corrode the filver from it: this is alfo by fo much the more ftrongly performed, as the quantity of gold is lefs than in the proportion of one-third of the whole mafs; but experience has taught us, that aqua fortis diffolves filver mixed with gold quickly enough when the gold conftitutes but one, and the filver three parts of a mixed mafs of them; and in this cafe, if the folution is not too impetuoufly performed, the gold ufually remains in fuch a proportion, in the fame figure that the whole mafs had before the feparation of the filver by this menftruum; fo that, in this cafe, there is no reafon to apprehend the gold's being torn into minute particles, and diffipated in fome meafure; though this can hardly be prevented when the filver exceeds the three-quarter proportion, in regard to the gold in the mafs. The artificers, therefore, always make it their ftudy to obferve very exactly this proportion of the gold being one-fourth part of the mixture; and thence it is that the operation itfelf has been called quartation.

In order to afcertain nearly the proportion of gold and filver in a mafs, the affayers rub this mafs upon a touchftone, fo as to leave a mark upon it; and they then make marks upon the ftone with fome of thofe needles, called touch-needles, the colour of which they think comes neareft to that of the mafs: by comparing the marks of thefe needles with the mark of the mafs, they difcover nearly the proportion of the gold and filver in the mafs. The mafs of gold and filver to be quartered ought previoufly to be granulated, by melting it in a crucible, and pouring it into a large veffel full of cold water, while at the fame time a rapid circular motion is given to the water by quickly ftirring it round with a ftick or broom. The veffels generally ufed for this operation are called parting-glaffes. The aqua fortis muft be purified for this purpofe, and fhould be fo ftrong as to be capable of acting fenfibly on filver when cold, but not fo ftrong as to act violently. If it be very ftrong, and the veffels well

well clofed, a fmall quantity of the gold will be diffolved along with the filver, which is to be guarded againft. Little heat ought to be applied at the beginning, the liquor being apt to fwell and rife over the veffel; but when the acid is nearly faturated, the heat may be fafely increafed. When the folution ceafes, which may be known by the difcontinuance of the effervefcence, or emiffion of air-bubbles, the liquor is to be poured off. If any grains appear entire, more aqua fortis muft be added, that all the filver may be diffolved. If the operation has been performed flowly, the remaining gold will have ftill the form of diftinct maffes, which are to receive folidity and colour by putting them into a teft under a muffle, and making them red-hot. If the operation has been performed haftily, the gold will have the appearance of a black mud or powder, which after five or fix wafhings with pure water, muft be melted. The filver is ufually recovered by precipitating it from the aqua fortis by means of copper veffels, into which the liquor is poured, or of plates of copper, which are thrown along with the liquor into glafs veffels. A confiderable heat is required to accelerate this precipitation. Dr. Lewis obferves, that when the aqua fortis has been perfectly faturated with filver, no precipitation is occafioned by plates of copper, till a drop or two of aqua fortis is added to the liquor, and then the precipitation begins, and continues as ufual. The precipitated filver muft be well wafhed in boiling water, and fufed with fome nitre, the ufe of which is to fcorify any cupreous particles which may adhere to the filver.

Here we may add, that filver and gold may be parted from one another by the vitriolic acid, as effectually, though not fo commodioufly, as by the nitrous. If the compound be reduced into grains or thin plates, and boiled in about twice its weight of oil of vitriol to drynefs, the filver will be fo far corroded, as to be eafily wafhed off by a little more of the acid: or if the mafs, after the corrofion, be melted in a crucible, the gold will feparate and fubfide, the filver forming a fcoria above it. Gold may be purified in the fame manner from feveral other metallic bodies. M. Scheffer fays, that this is the moft direct way of feparating tin from gold. Lewis's Com. Phil. Techn. 95. 149, &c. See Assaying, Depart, and Gold.

QUARTAUT, in *Commerce*, a wine meafure in fome parts of France: thus, at Blois, 3.74 quartauts are equal to 100 Englifh gallons, and each of them contains 6183 cubic inches; in Burgundy, 3.68 quartauts are equal to 100 Englifh gallons, and each contains 6275 cubic inches. Kelly's Un. Cam.

QUARTE, Fr., *Quarta*, Ital., the 4th in mufic, and the third confonance in point of perfection, according to the order in which concords are generated.

The 4th is a perfect concord; its ratio is 3 to 4. It is compofed of three diatonic degrees, formed of four founds; whence it has its name of fourth. Its interval is compofed of two tones and a half: a tone major, a tone minor, and a major femitone.

The 4th may be altered two feveral ways: 1ft, by diminifhing its interval a femitone, and then it is called the diminifhed or falfe 4th; 2dly, by augmenting it a femitone, and then it is called a *tritonus*, or fuperfluous 4th. (See Tritonus.) But the diminifhed 4th is never ufed in harmony, and only touched now and then in melody as an appoggiatura, or note of refinement.

The 4th in thorough-bafe is accompanied by the $\begin{smallmatrix}8\\5\end{smallmatrix}$, and called by fome the chord of the 11th.

Another chord is called the fuperfluous 4th, or tritonus, by the French; which is what we call the chord of the $\begin{smallmatrix}4\\2\end{smallmatrix}$, or $\begin{smallmatrix}6\\4\\2\end{smallmatrix}$, in which the difcord is in the bafe; but it is not the chord of the tritonus, unlefs the 4th is fharp. See Chord, and Accompaniment.

The fucceffion of two perfect 4ths is allowed in compofition, even in fimilar motion, provided they are accompanied by the 6th; but thefe are paffages that muft not be abufed, or pufhed too far, as they are not authorized by the fundamental bafe. The Italians call a regular fucceffion of chords of the 6th *falfo bordone;* for which fee Fourth.

QUARTEEL, in *Commerce*, a meafure for train-oil at Hamburgh: it contains 2 tonnes, or 64 ftubgen, and is reckoned at 2 centners, or 224 lbs. net weight. Kelly.

QUARTELOIS, Cartelois, or *Cortucæ*, furtouts, or upper garments, with coats of arms quartered on them, worn by the ancient knights in their military expeditions.

QUARTER, the fourth part of a whole, or integer divided into four equal portions.

In working of fractions, the quarter is expreffed by $\frac{1}{4}$; three quarters by $\frac{3}{4}$.

Quarter, as a *Weight*, is a fourth part of the quintal, or hundred-weight.

The quarter is 28 pounds avoirdupois.

Quarter is alfo a dry meafure, containing of corn eight bufhels ftriked, or two facks, being that by which corn is generally fold in the London market, and in large quantities in fome diftricts of the country; and the quarter of coals is the fourth part of a chaldron, called a vat.

"Quarterium frumenti conftat ex octo buffellis." Fleta, lib. ii. This feems to have fignified originally the fourth part of a ton in weight, or capacity. See Weight.

Quarter, in *Aftronomy*, the fourth part of the moon's period, or lunation, which is divided into four ftages, or quarters; containing each from feven to eight days.

The firft quarter is from the new moon to the quadrature; the fecond thence to the full moon, &c.

Quarter, in *Heraldry*, is fometimes ufed for an efcutcheon, or coat of arms.

In this fenfe there are fixteen quarters required to prove nobility, in companies, or orders, where none but nobles are admitted.

The word quarters, required as a proof of nobility, is derived hence, that they ufed anciently to put the coats of arms of the father, mother, grandfather, and grandmother, on the four corners of the tomb of the deceafed.

In Flanders and Germany we frequently fee tombs that have eight, fixteen, and even thirty-two quarters.

Quarter is alfo applied to the parts or members of the firft divifion of a coat that is quartered, or divided into four quarters. See Quartering.

The king of Great Britain, in the firft quarter, bears gules three lions paffant or, &c. In the fecond quarter he bears azure three fleurs-de-lis, &c.

Quarter, *Franc*, is a quarter fingle, or alone; which is to poffefs one-fourth part of the field.

This makes one of the honourable ordinaries of a coat. See Ordinary.

Quarter, in *Law*, *Quarterium Anni*, is the fourth part of a year.

Hence the days on which thofe quarters ftatedly commence, are called quarter-days.

Quarter-days are the 25th of March, called Lady-day; the 24th of June, called Midfummer-day; the 29th of September, called Michaelmas-day; and the 25th of December, or Chriftmas-day.

Quarter, Fr., in old counterpoint, was proceeding in difcant by a fucceffion of 4ths; which was called, in barbarous

barous Latin, *diateſſaronare;* of which we have inſtances in the "Micrologus" of Guido.

Quarter, in *Navigation.* A quarter of a point, wind, or rhumb, is the fourth part of a cardinal point, wind, or rhumb; or of the diſtance between two cardinal points, winds, &c.

The quarter contains an arc of 11 degrees 15 minutes.

The quarter is what Wolfius, with regard to the other diviſions, calls a ſecondary point of the ſecond order.

Quarter *of a Ship* is that part of the ſhip's ſide which lies towards the ſtern; or which is comprehended between the aftmoſt end of the main chains and the ſides of the ſtern, where it is terminated by the quarter-pieces. Although the lines by which the quarter and bow of a ſhip are determined, with reſpect to her length, are only imaginary, yet experience appears ſufficiently to have aſcertained their limits; ſo that if we were to divide the ſhip's ſides into five equal portions, the names of each ſpace would be readily enough expreſſed. Thus the firſt, from the ſtern, would be the quarter; the ſecond, abaft the midſhips; the third, the midſhips; the fourth, before the midſhips; and the fifth, the bow. Falconer.

Quarter, *On the*, in *Sea Language*, may be defined an arc of the horizon, contained between the line prolonged from the ſhip's ſtern and any diſtant object, as land, ſhips, &c. Thus if the ſhip's keel lies on an eaſt and weſt line, the ſtern being weſtward, any diſtant object, perceived in the north-weſt or ſouth-weſt, is ſaid to be on the larboard or ſtarboard quarter.

Quarter is alſo uſed for a canton, or diviſion of a city; conſiſting of ſeveral ranges of buildings, &c. ſeparated from ſome other quarter by a river, a great ſtreet, or by ſome other boundary.

Such are the twenty quarters of the city of Paris. Ancient Rome was divided ſeveral times, under its ſeveral augmentations, into quarters, which were called *regions;* as may be obſerved in the topographies of Aurelius Victor, Onuphrius Panvinius, Marillan, Pyrro Ligorio, Boiſſard, and other antiquaries.

In many cities there are commiſſaries of the quarter appointed to look to the policy of them. The prior of the Caporions accounts himſelf the chief and colonel of the fourteen regions, or quarters, of Rome. Muſcarat, p. 134.

Quarters, *Franchiſe of.* See Franchise.

Quarter, in *War*, the place allotted to certain forces to live, lodge, and encamp upon, during a ſiege, or the like. See Camp.

The general's quarter, called the head-quarters of an army, is that where the general lodges and encamps in perſon. They uſed to make lines of communication, to join the ſeveral quarters together.

Quarters *at a Siege*, are the encampments on the principal paſſes about a place; ſerving to ſtop the avenues, and to prevent relief and convoys.

Quarter is alſo uſed for any lodgment made in the field, or champaign, out of a ſiege. Thus they ſay, the general has extended his quarters a good way; the enemy coming by, made him contract his quarters.

Quarters, *Intrenched*, denote a place fortified with a ditch and parapet, to ſecure a body of troops.

Quarters, *Winter*, the place allotted troops to paſs the winter ſeaſon in. Wherein theſe differ from garriſons, ſee Garrison.

Winter quarters, when cold or moiſt, are productive of inflammatory diſorders, particularly hard coughs, with inflammations of the pleura or lungs. See Barracks.

Quarters, *Winter*, are alſo uſed for the time the troops continue in this lodgment; and for the advantage the captains make of it.

In Spain they have alſo ſummer quarters.

Quarter *of Aſſembly*, is the place of rendezvous, where the troops are to meet and draw up, to march in a body.

Quarters *of Refreſhment*, denote ſome well provided, fertile ſpot, to which troops, that have been much fatigued and haraſſed, are ſent to recover their ſtrength, or health; even during the ſeaſon of the campaign.

There are alſo quarters aſſigned for the huckſters, and their equipage.

Quarter alſo denotes the ſafety and good treatment promiſed to perſons or troops that ſurrender, and lay down their arms. Thus we ſay, the enemy begged quarter.

The phraſe took its riſe from an agreement anciently made between the Dutch and Spaniards, that the ranſom of an officer, or ſoldier, ſhould be a quarter of his pay. Hence, to beg quarter was to offer a quarter of their pay for their ſafety; and to refuſe quarter was not to accept of that compoſition for their ranſom.

On an enemy's ſubmitting, and delivering up his arms, the victor cannot with juſtice take away his life. In a battle, quarter is to be given to thoſe who lay down their arms; and at a ſiege, a garriſon offering to capitulate are never to be refuſed their lives. If ſometimes, however, in the heat of action, the ſoldier refuſes to give quarter, it is always contrary to the inclination of the officers, who eagerly interpoſe for ſaving the lives of ſuch enemies as have laid down their arms. Nevertheleſs, there is one caſe, in which life may be denied to an enemy who ſurrenders, and alſo capitulation refuſed to a place. This is when the enemy has been guilty of ſome enormous breach of the law of nations, and particularly if it be at the ſame time a violation of the laws of war. This denial of quarter is no natural conſequence of the war, but the puniſhment of his crime; a puniſhment which the injured party has a right to inflict: but that the puniſhment may be juſt, it muſt fall on the guilty. When the war is with a ſavage nation, which obſerves no rules, and never gives quarter, it may be chaſtiſed in the perſons of any that are ſeized or taken, among the guilty; ſo that by this rigour they may be brought to conform to the laws of humanity. But wherever ſeverity is not abſolutely neceſſary, clemency is to be uſed. Corinth was utterly deſtroyed, for having violated the law of nations towards the Roman ambaſſadors. However, that ſeverity has been cenſured by Cicero, and other great men. He, who has even the moſt juſt cauſe to puniſh a ſovereign as his enemy, will always incur the reproach of cruelty, if he ſhould cauſe the puniſhment to fall on the innocent people. There are other methods of chaſtiſing the ſovereign; as the depriving him of ſome of his rights, taking from him towns and provinces. The evil which a whole nation ſuffers is the participation inevitable to the members of a political ſociety. The learned Vattel expreſſes his aſtoniſhment that, in a knowing age, it could be conceived that it is lawful to puniſh with death a governor who has defended his place to the laſt extremity; or who, in a weak place, has preſumed to make a ſtand againſt a royal army. Yet, even in the 17th century, this notion was ſo common as to make an article in the law of war; and, at a later period, it is not wholly exploded. What a thought! to puniſh a brave man for having performed his duty. Very different were the principles of Alexander the Great, when he gave orders for ſparing ſome Mileſians, "on account of their courage and fidelity." It is in vain to object, that an obſtinate defence, eſpecially in a weak place, againſt a royal army, only cauſes a great effuſion of blood to no purpoſe; for this defence may ſave the ſtate, by delaying the enemy ſome days longer; and,

and, befides, courage fupplies the want of fortifications. It is urged farther, that by threatening a commander with death, you may fhorten the bloody fiege, fpare your troops, and gain a valuable opportunity. The anfwer is, fays Vattel, that a brave man will defpife your menace, or, provoked at fuch ignominious ufage, will fell his life at a dear rate, make you pay for your injuftice, and bury himfelf under the ruins of his fort. Befides, the menace of an unjuft punifhment is unjuft in itfelf; it is an infult and an injury. But to execute it, would be barbarous and horrible; and if it is not to take effect, it muft be allowed to be vain and ridiculous. Neverthelefs, juft and lawful means may be ufed for inducing a governor not obftinately to reduce himfelf to the laft extremity; and this is at prefent done by all wife and humane generals. A governor is fummoned to furrender, and in the progrefs of the fiege an honourable and advantageous capitulation is offered him, with an intimation that if he ftays too long, he will be admitted only to furrender as a prifoner of war, and at difcretion: if he perfifts, and is at length forced to furrender at difcretion, all the feverity of the law of war may be ufed, both againft him and his troops. But this right never extends fo far as to deprive an enemy of life, who lays down his arms, unlefs he has been guilty of fome proportionate crime towards the conqueror. See CAPITULATION, PRISONERS *of War*, and REPRISALS.

QUARTERS, in *Building*, thofe flight, upright pieces of timber, placed between the punchions and pofts; ufed to lath upon. They are of two kinds, fingle and double. The fingle quarters are fawn to two inches thick, and four inches broad; the double are four inches fquare.

QUARTERS in a clock, are little bells, which found the quarters of an hour.

QUARTERS, in *Sea Language*, the feveral ftations of a fhip's crew in the time of action. See QUARTERING *the Men*.

QUARTER, in the *Manege*, to work from quarter to quarter, is to ride a horfe three times upon the firft of the four lines of a fquare; then changing your hand, to ride him three times upon the fecond; and fo to the third and fourth, always changing hands and obferving the fame order.

QUARTERS *of a Saddle*, the parts or pieces of leather, or ftuff, which are made faft to the lower part of the fides, and which hang down below the faddle.

QUARTERS *of a Horfe, and other Animals*, the four principal parts of the animals; the fore-quarters confift of the fhoulders and the fore-legs; the hind-quarters, of the hips and the hind legs.

In the horfe, the fore-quarters or fhoulders fhould always fall in a neat manner backwards, where they join with the breaft, and the hind-quarters be fuitably long and well fhaped towards the rump. Something of a fimilarity of fhape fhould likewife prevail in the quarters of neat cattle, fheep, and fwine, but they fhould be much more flefhy downwards as they approach the thigh and leg parts. See LIVE-*Stock*, HORSE, SHEEP, and SWINE.

QUARTERS *of the Foot*, in horfes, are the fides of the coffin, comprehended between the toe and the heel on both fides; the inner quarters are thofe oppofite to one another, facing from one foot to the other; thofe are always weaker than the outfide quarters, which lie on the external fides of the coffin. A horfe is faid to have a *falfe* quarter, when the hoof has a kind of cleft occafioned by the cafting the quarter and getting a new one, for then the horn becomes uneven, and alfo fofter than the reft of the hoof; and the foot fhould be fhod with fome nicety. But if the cleft be confiderable, and take up a fourth of the hoof, the horfe is worth little afterwards for any purpofe.

QUARTER-*Caft*, among horfes, is when for any difeafe in the coffin-bone or joint, one of the quarters of the hoof is caft off, and when thus caft, the reproduction of a new hoof or part takes place. It is a common occurrence among fome horfes.

QUARTER-*Evil*, among domeftic animals of the neat cattle kinds, is an affection which fometimes takes place in the glands of the udders, and fometimes in different parts of the feet.

QUARTERS, in *Gardening*, the large divifions of garden grounds, or thofe parts of them which are fituated between the different walks, at a diftance from the fmall, narrow portions on the fides ufually termed borders, and which form or conftitute the principal fpaces or compartments for the cultivation and growth of the various forts of the more ufeful culinary vegetables which are raifed in large quantities; fuch as peas, beans, cabbages, cauliflowers, broccoli, early potatoes, and many others.

It is neceffary to have the quarters of garden grounds formed and laid out in fuch a manner as to favour the growth of early and late crops of the feveral different forts, as much as poffible; thofe for the former having a fouthern, or fouth-weftern expofure, and thofe for the latter, an eaftern, or north-eaftern afpect. By thefe means, early crops are, in fome meafure, rendered more forward and fine, and thofe of the more late kinds, in fome degree, prevented from being injured or burnt up and deftroyed by too full an expofure to the heat of the fun.

It is ufual during the winter feafon to have the large quarters of garden grounds laid up in high ridges, in order to be expofed to the influence and effects of froft, by which the earth may be rendered more light and mellow, and be in a more fit ftate for fowing or planting in the fpring months, on throwing them down and rendering them level for the purpofe.

The large quarters of gardens fhould likewife be kept as free and open as poffible, not being inclofed and choaked up, as is too frequently the cafe by planting fruit-trees and fhrubs on their fides, either in the manner of efpaliers or otherways, as by fuch means the growths of the plants are much promoted, and they are prevented from being drawn up in a weak manner. See GARDEN.

All forms of garden grounds are found, except that of the fquare, to derange the regularity of the quarters, and, of courfe, to render them highly troublefome in digging and cropping. Where they are very large they may be fubdivided into fuitable fizes, as one hundred feet in breadth, &c.; but their length does not fignify, as it may be varied in different ways, as by rows of trees, bufhes, or which, in many cafes, are preferable, by trodden walks and the modes of cropping.

QUARTERS *of a Garden*, the feveral divifions into which it is formed for the purpofe of cultivating the different kinds of vegetables, fruits, &c. Thus, there are parts or quarters deftined to the growth of kitchen vegetables, fruit, and other trees, forcing, &c.

QUARTERS *of a Field, or Farm*, in *Agriculture*, are the particular parts of them, which are under, fet apart, or intended for any fort of crops, or peculiar modes of cultivation and management. Farmers are frequently in the practice of dividing their lands or farms into different quarters or parts, according to the different forts of hufbandry which they are proper for, and the manner and fucceffion in which the various kinds of crops are to be grown upon them, and the fame is often the cafe with large fields; four, five, fix, and more divifions or quarters, being common in fuch inftances.

inſtances. This plan of proceeding is ſuppoſed to give caſe, facility, and diſpatch, to the work which is afterwards carried on, as well as to have ſeveral other advantages and conveniences. See FARM.

QUARTER-*Bill*, in *Sea Language*, a roll or liſt, containing the different ſtations, to which all the officers and crew of the ſhip are quartered, in the time of battle, and the names of all the perſons appointed to thoſe ſtations.

QUARTER-*Bullet*, a bullet quartered into four or eight parts.

QUARTER-*Chord*, in *Mining*, ſeven yards and a quarter, which the miner hath croſs-ways of his vein on either ſide, for liberty to lay his earth, ſtones, and rubbiſh on, and to waſh and dreſs up his ore.

QUARTERS, *Cloſe*, in a *Ship*. See CLOSE-*Quarters*.

QUARTER-*Cloths*, are long pieces of painted canvas extended on the outſide of the quarter-netting from the upper part of the gallery to the gang-way. They are generally decorated with martial inſtruments, or allegorical figures.

QUARTER-*Day*. See QUARTER.

QUARTER-*Deck* of a ſhip, is that aloft the ſteerage, reaching to the round-houſe; or that deck in ſhips of war which extends from the main-maſt to the ſtern, next above the upper-deck.

QUARTER, *Fat*, in a *Ship*, denotes the ſame with *broad*. Thus, if the truſſing in, or tuck of a ſhip's quarter under water be deep, they ſay, ſhe hath a *fat* quarter.

QUARTER-*Gallery*, a ſort of ſmall balcony, with or without balluſtrades, on the quarter of a ſhip; which generally communicates with the gallery on the ſtern, by means of a door paſſing from one to the other.

QUARTER-*Guard*. See GUARD.

QUARTER-*Gunner*, is an inferior officer under the direction of the gunner of a ſhip of war, whom he is to aſſiſt in every branch of his duty; as keeping the guns and their carriages in proper order, and duly furniſhed with whatever is neceſſary; filling the powder into cartridges; ſcaling the guns, and keeping them always in a condition ready for ſervice. The number of quarter-gunners in any ſhip is always in proportion to the number of her artillery; one quarter-gunner being allowed to every four cannon.

QUARTER-*Netting*, is a ſort of net-work, extended along the rails on the upper part of a ſhip's quarter. In a ſhip of war theſe are always double, being ſupported by iron cranes, placed at proper diſtances. The interval is ſometimes filled with cork or old ſails, but chiefly with the hammocks of the ſailors, ſo as to form a parapet to prevent the execution of the enemy's ſmall arms in an engagement.

QUARTER-*Pieces*, ſubſtantial pieces of timber, moſtly of fir, that form the outboundary of the ſtern, and connect the quarter-gallery to the ſtern and toffarel.

QUARTER-*Point of the Compaſs*. See POINT.

QUARTER-*Rails*, in a *Ship*, are narrow-moulded planks, generally of fir, reaching from the top of the ſtern to the gang-way. They are ſupported by ſtanchions, and ſerve as a fence to the quarter-deck, to prevent the men from tumbling into the ſea by the rolling of the ſhip, particularly in ſmall veſſels.

QUARTER-*Round*, in *Architecture*, is a term uſed by the workmen for any projecting moulding in general, whoſe contour is a perfect quadrant, or quarter of a circle, or which approaches near that figure.

The architects uſually call it *ovolo;* and Vitruvius, the *echinus*.

QUARTER-*Seſſions, General, Court of*. See COURT *of General Quarter-Seſſions*, and SESSIONS.

QUARTER-*Staff*, a long ſtaff, or pole, borne by foreſters, park-keepers, &c. as a badge of their office; and occaſionally uſed as a weapon.

QUARTER-*Wheeling*, or *Quarter of Converſion*, in the *Military Art*, is the motion by which the front of a body of men is turned round to where the flank was; this making the quarter of a circle.

If it be done to the right, the man in the right-hand angle keeps his ground, and faces about, while the reſt wheel; if to the left, the left-hand man keeps his place, &c.

QUARTER-*Wind*, at *Sea*, is a lateral, or ſide-wind; or a wind which does not blow in ſtern, but a little aſide of it.

Properly, the quarter-wind is that which comes in abaft the main-maſt ſhrouds, even with the quarter of the ſhip.

The quarter-wind is the beſt of all winds, as bearing into all the ſails; whereas a wind blowing full in ſtern, is kept off by the ſails of the mizen.

QUARTERA, in *Commerce*, a corn-meaſure in Spain, containing 12 cortanes: the ſalma contains 4 quarteras, or 48 cortanes; the carga, $2\frac{1}{2}$ quarteras, or 30 cortanes: $78\frac{1}{4}$ quarteras correſpond to 100 Caſtilian fanegas; and 100 quarteras Catalan to 128 Caſtilian fanegas; 39 quarteras Catalan contain 10 Engliſh quarters. The carga of wine and brandy is divided into 16 cortanes, 32 quarteras, or 128 quartillos.

At Barcelona 39.08 quarteras are equal to 10 Engliſh quarters, and a ſingle quartera contains 4401 cubic inches. Kelly's Un. Cambiſt.

QUARTERED, COUNTER. See COUNTER-QUARTERED.

QUARTERIDGE, money paid quarterly, or by the quarter.

QUARTERING *of Soldiers*, in *Military Language*, ſeems to have anciently differed very little from that now in uſe, except that they were indiſcriminately quartered upon all houſeholders, as was practiſed in England ſo late as in the rebellion of the year 1745. Rapin ſays, that William the Conqueror quartered almoſt all his troops upon the monaſteries, and obliged the monks to furniſh them with neceſſaries; by which means he maintained his army without any charge, and had ſpies in all their religious houſes, who watched the actions of the monks; theſe houſes were long after charged with finding carts and horſes for the carrying the baggage of the army; and there are ſtill extant many of the original returns from different monaſteries, ſtating the number of each they were able to furniſh for that purpoſe. About the time of Henry VII. we meet with a regulation that bears ſome reference to quarters: this is a coat and conduct-money; the firſt was a ſpecies of cloathing, probably for recruits; the money for which was advanced by the county in which they were raiſed;—conduct-money was an allowance for ſubſiſtence, to and from the army, according to the number of days which the ſoldiers had to march; a day's march being eſtimated ſometimes at 12 and ſometimes at 15 miles. Both the coat and conduct-money were occaſionally advanced by the different counties in which the troops were quartered, under the promiſe of being repaid by government. Towards the latter end of the reign of king James II. and even after the acceſſion of king William III. ſoldiers uſed to oblige the inhabitants of the towns in which they were quartered, not only to furniſh them with diet and lodging, but alſo to advance them their daily ſubſiſtence. After the revolution, by the mutiny-act, paſſed the 23d day of December, in the year 1689, other laws and regulations reſpecting quarters were enacted.

By the petition of right in the third of Charles I. it is enacted and declared, that the people of the land are not by the laws to be burthened with the ſojourning of soldiers against their wills; it is also enacted by the 31 Car. II. c. 1. that no officer, military or civil, nor any other person whatsoever, shall presume to place, quarter, or billet any soldier on any subject or inhabitant of this realm, of any degree, quality, or profession whatsoever, without his consent; and every such subject or inhabitant may refuse to sojourn or quarter any soldier, notwithstanding any command, order, warrant, or billeting whatever. The present mode of quartering our troops is settled by the Mutiny Act, renewed annually, with little or no alteration. Accordingly by the mutiny act, 49 Geo. III. c. 12. s. 41. the constables and other chief officers and magistrates of cities, towns, villages, and other places, and in their default or absence, any one justice inhabiting in or near such place, and no other, shall and may, during the continuance of this act, quarter and billet officers and soldiers in inns, livery stables, alehouses, victualling houses, and the houses of sellers of wine by retail to be drank in their own houses or places thereunto belonging, (other than person's canteens held under the authority of the commissioners for the affairs of barracks, and other than persons who keep taverns only, being free of the vintners' company in London,) and all houses of persons selling brandy, strong waters, cyder, or metheglin, by retail to be drank in houses, (other than the houses of distillers who keep places of distilling brandy and strong waters, and of shopkeepers whose principal dealings shall be more in other goods than in brandy and strong waters, and who do not permit tipling in their houses,) and no other, and in no private houses whatsoever; nor shall any more billets be ordered than there are effective soldiers; which billets when made out shall be delivered to the commanding officer present: and if any constable, or such like officer or magistrate as aforesaid, shall presume to billet any such officer or soldier in any private house without the consent of the owner or occupier, such owner or occupier shall have his remedy at law against such magistrate or officer, for damages; and if any military officer shall take upon him to quarter soldiers otherwise than by this act, or shall offer any menace or compulsion to any mayor, or other civil officer before-mentioned, tending to discourage any of them from doing their duty, he shall on conviction before any two justices by the oath of two witnesses be *ipso facto* cashiered and disabled to hold any military employment; provided the conviction be affirmed at the next quarter sessions, and a certificate thereof be transmitted to the judge advocate, who shall certify the same to the next court martial. And if any person shall be aggrieved by having more soldiers billeted than in proportion to his neighbours, on complaint thereof to one justice of the division, &c. where quartered, or if the person so billeting them be a justice, then on complaint to two justices they may relieve him.

Note.—The clause above recited, relating to shopkeepers, might as well be now omitted out of the act; for that by the 17 Geo. II. c. 17. no shopkeepers, as such, are allowed to retail any spirituous liquors, but only those who keep taverns, victualling houses, inns, coffee-houses, or alehouses.

By s. 43. No justice, having any military command, shall be concerned in quartering soldiers under his immediate command; but all things done by him therein shall be void.

By s. 50. of this act, an officer taking money for excusing the quartering, shall be cashiered.

By s. 51. If any high constable or other officer or any person whatsoever shall neglect to quarter any officers or soldiers, provided sufficient notice be given him before their arrival, or if he receive or agree for any reward in order to excuse any person from receiving such officer or soldier, or if any victualler, &c. having any officer, &c. billeted upon him, refuse to receive him, or refuse to furnish him as herein provided by this act, and shall be thereof convicted by one justice of the county, &c. where such offence was committed, on confession of the oath of one witness, he shall forfeit not more than 5*l.* nor less than 40*s.* to be levied by distress; which sum shall be applied first to satisfy such soldier for the expence thereby occasioned to him, and the remainder to the overseers of the poor of the parish where the offence was committed.

By s. 56. If any officer, military or civil, shall quarter any of the wives, children, or servants of officer or soldier, in any house, against the consent of the owner; if he be an officer, he shall on proof made thereof to the commander in chief of the army or judge advocate, be *ipso facto* cashiered; and if a civil officer, he shall forfeit to the party grieved 20*s.* on proof thereof to the next justice by distress.

By s. 53. Officers and soldiers, billeted as aforesaid, shall be received and furnished with diet and small beer, paying for the same as hereafter mentioned, out of their subsistence-money.

By s. 54. If any person shall choose rather to furnish non-commissioned officers or private men, with candles, vinegar, and salt, *gratis*, and allow them the use of fire and the necessary utensils for dressing and eating their meat, and shall give notice thereof to the commanding officer, and shall furnish the same accordingly; in such case they shall provide their own victuals and small beer, and the officer who receives their pay shall pay the sums after mentioned out of the subsistence-money for diet and small beer to them, and not to the persons on whom they are quartered.

By s. 55. Every officer receiving the pay or subsistence-money, either for a regiment, or particular troops and companies, or otherwise, shall immediately, upon each receipt of each sum, give public notice thereof to all on whom officers or soldiers are quartered; and shall also appoint such persons to repair to their quarters, at such times as they shall appoint, for the payment of the said pay or subsistence-money to the officers or soldiers, which shall be within four days at the farthest after the receipt of the same, as aforesaid; and such persons shall then and there acquaint such officer with the accounts or debts between them and the officers and soldiers quartered; which accounts the said officer is to accept of, and immediately pay the same, before any part of the pay or subsistence be distributed: provided the said accounts exceed not, for a commission officer of horse being under the degree of a captain, for such officer's diet and small beer, *per diem*, 2*s.*; nor for one commission officer of dragoons, being under the degree of a captain, for such officer's diet and small beer, *per diem*, 1*s.*; nor for one commission officer of foot, under the degree of a captain, for such officer's diet and small beer, *per diem*, 1*s.*; nor for each horse quartered under this act, for hay and straw, *per diem*, 6*d.*; nor for one light horseman's diet and small beer, *per diem*, 7*d.*; and hay and straw for his horse, *per diem*, 6*d.*; nor for one dragoon's diet and small beer, *per diem*, 7*d.*; and hay and straw for his horse, *per diem*, 6*d.*; nor for one foot soldier's diet and small beer, *per diem*, 5*d.*: and if such officer shall not so give notice and shall not immediately upon producing such account stated satisfy the same; upon complaint on oath by two witnesses, at the next quarter sessions for the county or city where such quarters were, the paymaster of the guards, garrisons, and marines, are authorized (upon certificate of the said justices before whom such oath was made, of the sum due upon such accounts and the persons

ſons to whom the ſame is owing) to pay the ſaid ſums out of the arrears due to the ſaid officer, upon pain of ſuch paymaſter forfeiting his place, and being incapacitated from holding it again. The act then ſtates what courſe is to be purſued if there be no arrears due, or no ſubſiſtence-money remitted, and is directory of the courſe to be purſued by the paymaſter.

By ſ. 49. The commanding officer may exchange any men or horſes quartered in any place with another man or horſe quartered in the ſame place, provided the number of men and horſes do not exceed the number at that time billeted on ſuch houſe.

By ſ. 47. And where any horſe or dragoon ſhall be quartered upon any perſon who hath no ſtables, upon his complaint to two juſtices of the diviſion, &c. and his making ſuch allowance as ſuch juſtices ſhall think reaſonable, they may order the men and their horſes, or the horſes only, as the caſe may be, to be removed and quartered upon ſome other perſon who hath ſtables, and may order and ſettle a proper allowance to be made by the perſon having no ſtables, in lieu of his quartering ſuch horſe or dragoons, and order payment thereof to the perſon to whom the removal is made, for or to be applied for the furniſhing of quarters for ſuch men and their horſes.

By 49 Geo. III. c. 37. It is enacted that every non-commiſſioned officer and private ſoldier who ſhall be furniſhed with diet and ſmall beer by the perſons on whom they are quartered, ſhall pay for the ſame 1*s.* 4*d.* *per* day, in like manner as by the firſt act is enacted as to the 7*d.* *per* day.

By ſ. 2. Where the innholder, &c. furniſhes certain articles in lieu of diet and ſmall beer, as in the former act mentioned, he ſhall have one halfpenny *per* day for each non-commiſſioned officer, &c.

By ſ. 3. 1*s.* 3*d.* *per* day is to be paid for each horſe, inſtead of 6*d.* *per* day.

By ſ. 4. The proviſions in the former act relating to the dieting on a march or recruiting are repealed.

By ſ. 5. All non-commiſſioned officers and ſoldiers ſhall receive their diet and ſmall beer at the above rates while on the march and on the day of arrival at the place of their final deſtination, and on the two ſubſequent days, unleſs either of the two be a market day for the place where billeted, or within two miles thereof; in which caſe the innkeeper, &c. ſhall diſcontinue on and from ſuch market-day the diet and ſmall beer, and furniſh in lieu thereof the articles in the ſaid former act ſpecified, and at the rate in this act preſcribed.

By ſ. 6. If any perſon liable to have ſoldiers quartered on him ſhall pay any ſum to any non-commiſſioned officer or ſoldier on the march in lieu of the diet and ſmall beer, he may be proceeded againſt and fined as if he had refuſed to furniſh according to the former act the things to be furniſhed to non-commiſſioned officers and ſoldiers ſo quartered as aforeſaid.

By ſ. 7. The proviſions of ſ. 5. are extended to halting on a march.

By ſ. 8. But if the halt be for longer than one day, and the day after the arrival be market-day as aforeſaid, there is to be no diſcontinuance of diet and ſmall beer.

By ſ. 9. Non-commiſſioned officers and private men employed in recruiting, and the recruits by them raiſed, ſhall, while on the march, and for two days after the day of their arrival at any recruiting ſtation, be entitled to the ſame benefits as before provided for troops on the march; but no recruit enliſted after the two days ſubſequent to the arrival of the party at their recruiting ſtation, ſhall be entitled to be ſupplied with diet and ſmall beer at the rate herein-before preſcribed, except at the option of the party where quartered. Provided that in caſe any recruiting party, with the recruits by them raiſed, ſhall remove from their ſtation, and after a time ſhall return to the ſame place, they and the recruits ſhall not be again entitled to the diet and ſmall beer for two days, unleſs the time of abſence exceeded 20 days. This act to continue to 25th March 1810.

By ſ. 52. Any juſtice within his county, &c. may command any conſtable or other officer who ſhall billet any ſoldiers, to give an account in writing to him of the number of officers and ſoldiers billeted by them, and the names of the perſons on whom quartered, and an account of the place where they dwell, and of their ſigns, if any. See Martial *Law*, and Soldiers.

But by the 50 G. III. c. 96. ſ. 1. it is enacted, that after the 25th of June 1810, every non-commiſſioned officer and private ſoldier who ſhall be furniſhed with diet and ſmall beer within the parts of the united kingdom mentioned in the 50 G. III. c. 28. by the innholders or other perſons on whom ſuch non-commiſſioned officers or private ſoldiers ſhall be quartered and billetted by virtue of the ſaid act, ſhall pay and allow for the ſame, the ſum of eight-pence *per diem* inſtead of one ſhilling and four-pence *per diem*, as in the ſaid act ſpecified; and that for ſuch allowance of eight-pence, the innkeeper or other perſon ſhall furniſh one meal; *videlicet*, a hot dinner if required in each day to each non-commiſſioned officer, trumpeter, drummer, and private ſoldier quartered and billetted on him, to conſiſt of ſuch quantities of diet and ſmall beer as ſhall be ſpecified and fixed in and by any regulations made or to be made from time to time by his majeſty in that behalf, but not to exceed one pound and a quarter of meat previous to being dreſſed, one pound of bread, one pound of potatoes or other vegetables previous to being cooked, and two pints of ſmall beer, and vinegar, ſalt, and pepper.

And by ſ. 2. of the ſame act, the mutiny act, and the ſaid 50 G. III. c. 28. ſhall be applied for the enforcing ſuch regulations as to the diet of ſoldiers and the payment of and accounting for the allowances for the ſame.

Quartering *of Traitors*, in *Law*. See Treason.

Quartering, in the *Sea Language*. When a ſhip under ſail goes at large, neither by a wind nor before a wind, but, as it were, betwixt both, ſhe is ſaid to go quartering.

The term is alſo uſed when a ſhip ſails with quarter-winds.

Quartering *the Men*, the diſpoſing of the ſhip's company at the time of an engagement in ſuch a manner, that each may readily know where his ſtation is, and what he is to do: as, ſome to the maſter, for the management of the ſails; ſome to aſſiſt the gunners to traverſe the ordnance; ſome for plying the enemy with ſmall ſhot; ſome to fill powder in the powder-room; others to carry it from thence to the gunners in cartridges, &c.

The number of men appointed to manage the artillery is always in proportion to the nature of the guns, and the number and condition of the ſhip's crew. They are in general as follow, when the ſhip is well manned, ſo as to fight both ſides at once occaſionally:

To a 42-pounder	-	15 men.	
32	-	-	13
24	-	-	11
18	-	-	9
12	-	-	7
9	-	-	6
6	-	-	5
4	-	-	4
3	-	-	3

This

This number, to which is often added a boy to bring powder to every gun, may be occafionally reduced, and the guns neverthelefs well managed.

The number of men appointed to the fmall arms, on board his majefty's fhips and floops of war by order of the admiralty, are,

Rate of the Ship.	Number of Men.
1ft - -	150
2d - -	120
3d of 80 guns -	100
— of 70 guns -	80
4th of 60 guns -	70
— of 50 guns -	60
5th - -	50
6th - -	40
floops of war -	30

The lieutenants are ufually ftationed to command the different batteries, and direct their efforts againft the enemy. The mafter fuperintends the movements of the fhip, and whatever relates to the fails. The boatfwain and a fufficient number of men are ftationed to repair the damaged rigging: and the gunner and carpenter whatever may be found neceffary, according to their refpective offices. The marines are generally quartered on the poop and forecaftle, or gangway, under the direction of their officers: although, on fome occafions, they affift at the great guns, particularly in diftant cannonading. Falconer. See Engagement.

Quartering, in *Gunnery*, is when a piece of ordnance is fo traverfed, that it will fhoot on the fame line, or on the fame point of the compafs, as the fhip's quarter bears.

Quartering, in *Heraldry*, the act of dividing a coat into four or more quarters, or quarterings, by parting, couping, &c. *i. e.* by perpendicular and horizontal lines, &c. See Quarter and Quarterly.

The king of Great Britain quarters with Great Britain, France, Ireland, Brunfwick, &c.

Colombiere reckons twelve forts of quartering; but other authors give us more—*viz.* party per pale, dividing the efcutcheons from top to bottom. See Pale.—Party per crofs, dividing it from fide to fide. See Cross.—Party of fix pieces, when the efcutcheon is divided into fix parts, or quarters.—Party of ten; of twelve; of fixteen; of twenty; and of thirty-two; when there are fo many partitions refpectively.

Others give the divifions in another manner: as—Party per crofs—per pale—per chief—per pale inclave—per bend dexter—per bend finifter—per chevron—barry bendy of eighty pieces—paleways of fix pieces—barry of fix pieces—barry of eight pieces—bendy of fix—checky—fufilly, or lozengy—pale bendy, or bendy lozengy—barry bendy lozengy, or bend lozengy—gyronny—barry lozengy counterchanged—waved of fix pieces—barry nebule of fix pieces—party per faltier—and party per pale in point. See farther under their refpective articles.

Counter-quartering a coat, is when the quarters are quartered over again, or fubdivided each into four. See Counter-quartered.

There are counter-quartered coats which have twenty or twenty-five quarters.

Quartering is alfo applied to the partitions or compartments themfelves, that is, the feveral coats borne on an efcutcheon, or the feveral divifions made in it, when the arms of feveral families are to be placed on the fame fhield, on account of intermarriages, or the like.

Colombiere obferves, that thirty-two is the greateft number ufed in France; but that the Englifh and Germans fometimes extend to forty: as a teftimony of the truth of which, he fays he faw the efcutcheon of the earl of Leicefter, ambaffador extraordinary in France in the year 1639, divided into the number of forty: and fome, he affirms, do go on to fixty-four feveral coats.

But a multitude of quarters make a confufion; and, accordingly, all the writers of armoury exclaim againft it as an abufe. The firft inftance of quartering, of which we have any account, is faid to be in the arms of Renatus, king of Sicily, &c. in the year 1435, who quartered the arms of Sicily, Arragon, Jerufalem, &c.

William Wickly obferves, that fuch quarterings are much more proper for a pedigree, to be locked up in a cheft, and occafionally produced as an evidence for the clearing or afcertaining of alliances of families, and titles to lands, &c. than to be borne as a cognizance.

In blazoning, when the quartering is performed per crofs, the two quarters a-top are numbered the firft and fecond; and thofe at the bottom the third and fourth; beginning to tell on the right fide. When the quartering is by a faltier, &c. the chief and point are the firft and fecond quarters, the right fide the third, the left the fourth.

Quartering is fometimes alfo ufed for the diftinguifhing of younger brothers from elder. See Difference.

QUARTERIZATION, Quartering, part of the punifhment of a traitor, by dividing his body into four quarters.

"Walfingham, in Ric. II. Auditum et confeffum turpiffima fcelera tractationi, fufpendio, decollationi, exenterationi, et quarterizationi adjudicavit."

QUARTERLY, in *Heraldry*, a perfon is faid to bear quarterly, when he bears arms quartered.

The king of Great Britain bears quarterly of four; in the firft quarter gules, &c. Great Britain; in the fecond, azure, &c. Ireland, &c.

QUARTER-MASTER, an officer in the army, whofe bufinefs it is to look after the quarters of the foldiers; their clothing, bread, ammunition, firing, &c. Every regiment of foot and artillery has a quarter-mafter, and every troop of horfe one, who are only warrant-officers, except in the blues. Whereof there are feveral kinds; *viz.* the

Quarter-master *General*, whofe bufinefs is to provide good quarters for the whole army.

Quarter-master *of Foot*, he who is to provide quarters for a regiment of foot.

Quarter-master *of Horfe*, he who is to provide quarters for a troop of horfe.

Quarter-master, in a *Ship*, is an inferior officer, appointed by the mafter of a fhip of war to affift the mates in their feveral duties; as ftowing the ballaft and provifions in the hold, coiling the cables on their platforms, overlooking the fteerage of the fhip, and keeping the time by the watch-glaffes.

QUARTERN, Quarteron, a diminutive of quart, fignifying a quarter of a pint, as a quart does a quarter of a gallon.

QUARTIER, in *Commerce*, a liquid meafure in Germany, which, according to a regulation of 1713, made in Hanover, muft hold 2lb. of fpring water, and the contents of which are 49 French, or $59\frac{1}{2}$ Englifh cubic inches. A fuder of wine contains 4 exhofts, 6 ahms, or 15 eimers; an ahm, 4 ankers, 40 ftubgens, 80 kannes, 160 quartiers, or 320 noffels. Hence 36 ftubgens, or 144 quartiers, = 37 Englifh wine gallons. A fafs of beer at Lubec contains 42 ftubgens, or 168 quartiers. Kelly's Un. Cambift.

QUARTILE, an afpect of the planets when they are three figns, or 90 degrees diftant from each other.

The

The quartile aſpect is marked thus □. See Aspect.

QUARTILLO, in *Commerce*, a liquid meaſure in Spain. At Barcelona, 128 quartillos are equal to 32 quarteras. (See Quartera.) A moyo of wine contains 16 arrobas; an arroba 8 azumbres, or 2 quartillos. The arroba of wine contains 34lb. of river water (Caſtilian weight), and meaſures 1237¼ Spaniſh, or 981 Engliſh cubic inches; hence four ſuch arrobas are equal to 17 Engliſh wine gallons. The arroba of oil meaſures 966⅘ Spaniſh, or 771 Engliſh cubic inches; ſo that three ſuch arrobas correſpond to 10 Engliſh gallons: this arroba is divided into 4 quartillos, or 100 quarterones, or panillas. A Spaniſh botta contains 30 arrobas of wine, or 38½ of oil; a pipe is 27 arrobas of wine, or 34½ of oil; thus the botta is = 127½ Engliſh gallons, and the pipe = 114¾. Kelly. See *Tab.* XXXII. *of* Measures.

QUARTO, or *4to.* a book whereof four leaves, or eight pages, make a ſheet.

Quarto, in *Commerce*, a money of account in Spain. See Real.

Quarto *Dell Torri*, in *Geography*, a town of Naples, in Capitanata; 12 miles W. of Salpe.

Quarto *die poſt*, in *Law*, denotes the fourth day incluſive beyond the return of a writ, in which thoſe that are ſummoned are allowed to make their appearance. See Essoign *day of term*.

QUARTO-DECIMANS, Quarto-decimani, in *Eccleſiaſtical Hiſtory*, an ancient ſect in the church, who maintained, that Eaſter was always to be celebrated, conformably to the cuſtom of the Jews, on the fourteenth day of the moon in the month of March, whenſoever that day fell out.

And hence their name Quarto-decimani, *q. d.* Fourteenthers.

The Aſiatics were mightily attached to this opinion, pretending that it was built on the authority of St. John, who was their apoſtle; and pope Victor could never bring them to obedience in this article, though he was upon the point of excommunicating them: but it is more probable he contented himſelf with menaces. See Easter.

QUARTUM *par conſtringens*, in *Anatomy*, a name given by Spigelius and ſome others to the muſcle called by Albinus and Riolanus orbicularis oris; and by Cowper and ſome others, conſtrictor labiorum.

QUARTUS *hyoidis muſculus*, a name given by Veſalius, Fabricius, and many other anatomiſts, to a muſcle now generally called the coracohyoidæus.

Quartus *oculum movens*, a name given by Veſalius to one of the muſcles of the eye, called by ſome rectus inferior, and by others humilis.

It is the depreſſor oculi of Albinus, being one of the quatuor recti oculi of that author.

QUARTZ, in *Mineralogy*. No ſubſtance in the mineral kingdom is more abundantly diſtributed than quartz. Grains of quartz generally compoſe a conſiderable part of the ſands on the ſea-ſhore, and of the ſand-ſtones of the ſecondary ſtrata. Rolled pieces of quartz, or pebbles and boulders, are widely ſcatterred over alluvial diſtricts. Quartz is diſſeminated through granite, gneiſs, mica-ſlate, and other compound rocks which conſtitute the loftieſt mountains on the globe; it alſo forms veins of vaſt extent interſecting theſe mountains, and ſometimes entire ſimple rocks are compoſed of this mineral. Quartz has a conſiderable degree of hardneſs, always ſtriking fire with ſteel when the fragments have ſufficient ſolidity to reſiſt the ſhock. Powdered quartz feels harſh, and, when rubbed on poliſhed ſteel, or on glaſs, ſcratches the ſurface. Quartz is infuſible by the common blowpipe. Theſe two qualities, hardneſs and infuſibility, are the eſſential characters of all the varieties of quartz, whatever forms or colours they may preſent, whether maſſive or cryſtallized.

Quartz has moſt commonly a conchoidal fracture, but ſometimes the fracture is undulated, foliated, or ſplintery. The luſtre is vitreous. Quartz has various degrees of tranſparency; from a perfectly pellucid colourleſs ſtate, it paſſes by different gradations to opacity: but all the varieties, except ſinople, admit light through the very minute fragments. The colours are various, owing to the impregnation or intermixture with foreign ſubſtances. The ſpecific gravity of quartz is from 2.58 to 2.65. It yields a phoſphoreſcent light when rubbed, and is not ſoluble in any of the acids except the fluoric. According to Vauquelin, powdered quartz gives a green colour to tincture of violets. Cryſtallized quartz preſents the phenomenon of double refraction, when an object is ſeen through one ſide of the pyramid that terminates the cryſtals, and the oppoſite ſide of the hexagonal priſm on which it is placed, in the moſt common variety of the ſecondary forms of theſe cryſtals.

The ſubſtances found imbedded in quartz are, ores of titanium, antimony, gold, ſilver, copper, and lead, arſenic, and micaceous iron ore, with chlorite, hornblende, felſpar, garnet, and fluat of lime. It is alſo penetrated by fibres of aſbeſtus, and by minute laminæ of mica and epidote: the latter ſubſtance is ſometimes ſo intimately diffuſed through quartz as to give it an homogeneous green colour. This variety of quartz is called praſe.

Quartz cryſtallizes diſtinctly: ſome of the cryſtals are of conſiderable ſize.

In the imperial cabinet of Vienna, there is ſaid to be a cryſtal of quartz ſeven feet in length. The forms of cryſtalline quartz are various; they have been reduced by modern mineralogiſts to ſix or ſeven principal varieties. The moſt common is a ſix-ſided priſm, terminated by a ſix-ſided pyramid, or two ſix-ſided pyramids joined at their baſes. The ſides of theſe pyramids are iſoſceles triangles, having the vertical angle 40°, and each of the angles at the baſe 70°. The ſides of the upper and lower pyramids are inclined to each other at an angle of 104°. According to Haüy, the primitive form of the cryſtal is a rhomboid, varying little from the cube, the angles being 94° and 86°. The primitive rhomboid is rarely found in nature; it occurs ſometimes in red hematite, coated with that mineral, and in chalcedony.

Bubbles containing air, water, and bitumen, are ſometimes ſeen in quartz cryſtals, and have given riſe to much ſpeculation reſpecting their formation. Siliceous earth, of which theſe cryſtals are compoſed, is inſoluble in water, by artificial means; but in the great laboratory of nature, its ſolution is effected probably by the effect of heat and compreſſion, as ſilex exiſts in the boiling fountains of Iceland and the Azores, and in the hot ſprings of Bath, Italy, and various parts of the world. It has been ſuppoſed that the ſiliceous earth was held in ſolution by ſoda; but Klaproth, who analyſed the waters from the Reikum, in Iceland, thinks the quantity of alkali too ſmall to have diſſolved the ſilex. One hundred cubic inches contained nine grains of ſilex, three of carbonate of ſoda, eight of common ſalt, and five of ſulphate of ſoda. If rock cryſtals were formed in an aqueous ſolution greatly heated and compreſſed, it would not be difficult to conceive how volatile matter might be involved in the ſubſtance of the cryſtal during its formation; but our knowledge of the ſubterranean operations of nature is at preſent too limited to enable us to aſcertain, or even to form any rational conjecture in what manner ſome of her more myſterious proceſſes are effected. Thoſe who have frequent opportunities of exploring mines, will not be diſpoſed to deny that ſiliceous ſtalactites, and cryſtals, are now forming at the common temperature of the earth, as they are obſerved

ſerved on the roofs and ſides of artificial excavations, and paſſages which have been undiſturbed for ſome years. According to Chaptal, a quartzoſe or a ſiliceous paſte is formed by tranſudation on ferruginous rocks at Chamillat, near Planches les Mines, in Franche Compté, and where this is waſhed and depoſited by water, rock cryſtals are formed. Siliceous ſtalactites have not unfrequently been ſeen coating the wood which has been left in mines.

Pſeudomorphous cryſtals of quartz, or falſe cryſtals of this mineral, are frequently found in mines; they are tarniſhed and opaque, and their edges are blunted. They aſſume the forms of cubic cryſtals of fluor, and the pyramidal and other forms of calcareous and other cryſtals. Theſe falſe cryſtals are evidently moulded in the cavities which the former have once occupied. Quartz alſo occurs filling up the cavities of ſhells in a ſimilar manner, and the pores of wood and other organic ſubſtances.

Cellular quartz with polyhedral cavities, appears to have been formed round cryſtals of other minerals which are ſubſequently decompoſed. The internal cryſtals are frequently thoſe of the metallic ſulphurets. Brongniart ſays this concluſion is founded on direct obſervation, as the remains found in theſe cavities are ſulphur, native gold, and oxyd of iron, all ſubſtances which originally formed part of the decompoſed ſulphurets. Such is the cellular quartz at Schemnitz in Hungary, and Joachimſthal in Bohemia. The cellular quartz at Berezof, in Siberia, is ſo porous that it is lighter than pumice.

Rock cryſtal, or *Mountain cryſtal*, is the pureſt variety of quartz, differing from common quartz by its tranſparency, and the more regular form of its cryſtals; the fracture is alſo more perfectly conchoidal. According to ſome analyſes, rock cryſtal contains 98 parts of ſilex, with 2 parts of water. Bergman found in one ſpecimen only

Silex	-	93
Alumine		6
Lime	-	1

Amethyſt is a purple variety of rock cryſtal. See AMETHYST.

Cairngorum ſtones are rock cryſtals, from the mountains of Cairngorum, in Scotland. They are valued by jewellers on account of their purity and colour. Clove-brown quartz cryſtals are known by the name of the ſmoke topaz. According to Karſten, the ſpecific gravity of this variety is 2.88. Coloured rock cryſtals loſe their colour, when carefully expoſed to a gentle heat, but retain their tranſparency. The yellow and orange-yellow varieties are the moſt eſteemed.

Milk quartz, called by ſome mineralogiſts roſe quartz, and by others the Bohemian ruby, as it is frequently of a beautiful roſe-red colour, which it derives from manganeſe. By expoſure to the light the intenſity of its colour is diminiſhed. It is uſed in jewellery, and takes a good poliſh; it is ſometimes ſold for the ruby, but is leſs hard, nor has it the tranſparency and brilliancy of that gem. Roſe quartz is found at Rabenſtein, in Bavaria, in conſiderable maſſes, and in a vein of manganeſe which traverſes a coarſe-grained granite. It occurs alſo in Sweden, Greenland, Saxony, in the iſland of Coll, one of the Hebrides, and in Ireland. Some varieties are of a milk-white colour, others pearl-grey.

Irideſcent quartz, *Quarz hyalin iriſé*, preſents on its ſurface, or in its interior, the various colours of the rainbow: it ſometimes derives this property from a thin pellicle of metallic oxyd which covers the ſurface, and ſometimes from minute fiſſures in the ſubſtance of the cryſtal. Theſe colours may be given to quartz by heating it and expoſing it ſuddenly to a cold temperature.

Avanturine quartz (ſee AVANTURINE) owes its brilliancy to minute particles of mica diſſeminated through it, and ſometimes to minute fractures. Avanturines may be formed artificially, in ſome varieties of quartz, by heat.

Blue quartz, *Quarz hyalin ſaphain*, has been found in Spain, Bohemia, and Bavaria.

Black quartz is found, mixed with carbonate of lime, in the department of Iſere in France, in Bohemia, and at Cappe Nuova, on the road to Sienna. Brongniart Mineralogie.

Cat's-eye, *Quarz hyalin chatoyant*, ſo called becauſe it reflects a pearly variety of colours, according as the light falls upon it in different directions: this property is owing to the fibrous texture of this mineral, which may be obſerved in the beſt characterized ſpecimens. It contains 95 parts of ſilex, and according to Brongniart is a variety of quartz, and ought not to be claſſed with felſpar. The geological ſituation of this ſtone is not known. The cut and poliſhed ſpecimens ſeen in cabinets come from Malabar and Ceylon. It is ſaid, alſo, to occur in Egypt and Arabia.

Green quartz, *Praſe*, *Quarz hyalin verd obſcur*. The colour is a leek green; it is ſeldom cryſtallized; the form of the cryſtals are thoſe of common quartz. Praſe has been ſaid to owe its colour to an intimate intermixture with actynolite, but Klaproth is of opinion that this is not well aſcertained.

Sinople is claſſed, by ſome mineralogiſts, with quartz. It is of a deep blood-red colour, and perfectly opaque, or barely tranſmits light on the edges. It reſembles red jaſper, but has a vitreous luſtre, and conchoidal fracture, and is ſometimes cryſtallized.

Ferruginous quartz conſiſts of ſmall cryſtals, or of granular quartz, intimately mixed with oxyd of iron, and has a brown ochre-yellow, or red colour. From the iron which it contains it becomes magnetic when heated. It is harder than pure quartz.

Certain properties, beſide colour, have given names to ſome varieties of quartz.

Fat quartz is ſo called becauſe it has a greaſy appearance, as if the ſurface had been rubbed with oil.

Fetid quartz differs from common quartz, by emitting an odour, when rubbed, like that of ſulphuretted hydrogen gas. When this foſſil is heated below a red heat, it loſes its fetid odour on cooling, and when plunged into water becomes tranſparent. When fetid it is nearly opaque. It is found in the vicinity of Nantes and Chantiloub, in the department of Haute Vienne, forming a conſtituent part of the granitic mountains of that diſtrict. It occurs alſo in the iſland of Elba.

Elaſtic quartz is a ſiliceous ſand-ſtone, found in the Brazils, compoſed of oblong laminæ of quartz, arranged in one direction, and ſo interlocked together as to form a kind of hinge with each other, from whence it poſſeſſes a certain degree of pliability, like that of a ſtiff piece of leather. In appearance, elaſtic quartz reſembles ſome of the ſlaty ſandſtones in the northern counties of England. According to Klaproth its conſtituent parts are

Silex	-	-	96.50
Alumine	-	-	2.50
Oxyd of iron and loſs			1

The uſe of quartz in the arts is principally confined to the manufactures of glaſs, enamels, porcelain, and earthenware. The finer cryſtallizations are employed by the jewellers, and before the diſcovery of glaſs, ornaments and veſſels of great value were made by the ancients from rock cryſtal. Stones in which quartz forms the principal ingredient, are beſt fitted for purpoſes of durable architecture, and in the economy

economy of nature this mineral gives ftability to the folid fabric of the globe, enabling thofe rocks and mountains in which it abounds to refift the decompofing effects of air and moifture, and to brave for ages the impetuous fury of the ocean. For the properties of filex, of which quartz is compofed, fee SILEX.

QUARTZ *Rock*, in *Geology*. Entire rocks and even mountains are compofed of quartz in various parts of the world, in the vicinity of granitic diftricts. The quartz is granular, and fometimes intermixed with a fmall portion of mica. Werner claffes quartz rock as a diftinct order of primary rocks, but it would be perhaps more confonant with a natural arrangement, to confider this rock as a conftituent of granite on a large fcale, certain caufes having feparated the quartz, mica, and felfpar into diftinct maffes. Entire mountains of thefe three fubftances are faid to occur in the Uralian chain, prefenting the materials of granite on a large fcale. Quartz rocks are met with in Scotland. In the highlands the fummits of fome of the mountains are formed of white quartz, and appear as if covered with fnow. The two beautiful conical mountains, called the *Sugar-loafs*, in the vicinity of Dublin, are compofed of granular quartz, of a fimilar kind to what forms veins in the gneifs and mica ftate of the furrounding mountains nearer Dublin.

QUARTZOSE, in *Mineralogy*, a term applied to thofe rocks or minerals which are principally compofed of quartz.

QUASHING, in *Law*, the overthrowing and annulling a thing. Thus, pleas in *abatement* (which fee), when the fuit is by original, conclude to the writ or declaration; by praying "judgment of the writ, or declaration, and that the fame may be quafhed," *caffetur*, made void or abated; but if the action be by bill, the plea muft pray "judgment of the bill," and not of the declaration; the bill being here the original, and the declaration only a copy of the bill. See PLEA, DILATORY *Pleas*, and CERTIORARI.

QUASI-CONTRACT, in the *Civil Law*, an act which has not the ftrict form of a contract, but yet has the force of it.

In a contract there muft be the mutual confent of both parties; whereas, in a quafi-contract, one party may be bound or obligated to the other, without having given his confent to the act by which he is obliged.

For an example: I have done your bufinefs in your abfence, without your procuration; and it has fucceeded to your advantage; I have then an action againft you for the recovery of what I have difburfed; and you an action againft me, to make me give an account of my adminiftration; which amounts to a quafi-contract. See CONTRACT.

QUASI-CRIME, or QUASI-DELICT, the action of a perfon who does damage, or evil, involuntarily.

The reparation of quafi-crimes confifts in making good the damages, with intereft.

QUASI-MODO SUNDAY, *Low Eafter-Sunday*, or the next funday after Eafter; thus called from the initial words of the introit of the mafs for the day, *Quafi modo geniti infantes*.

In the ancient deeds thefe words are fignified by *q. m. g.*

QUASS, the name of a liquor in Ruffia, which ferves the natives not only for drink, but alfo for fauce to a number of difhes; and is the bafis of the favourite cold foup of the North, which is made by adding cold meat cut in pieces, with cucumbers falted after a peculiar manner, or with onions, or garlick, to a bowl of this fubacid liquor. The common Ruffian quafs is prepared by putting into a large pot full of cold water as much rye-flower as will make a thin dough; this is then placed in an oven moderately heated, for three hours, and afterwards taken out and thrown into a tub of cold water; the mixture is worked with a machine like a chocolate mill till it froths. To this liquor are added two bafons of the grounds of old quafs, leaven, or a piece of their four bread; and the tub is covered with a cloth, and laid by till the liquor has acquired a fourifh tafte, which marks its being ready for ufe.

There is a better fort of quafs, which is prepared as follows. Take a chetverik (about 35 pounds Ruff. or 30 pounds Engl.) of barley-malt, two or three handfuls of rye-malt, and a like quantity of unbolted rye-meal; mix them all together in earthen pots, then pour boiling water upon it, and ftir the whole till it acquires the confiftence of a thin pap. The pots muft be full to within an inch of the brim. Upon this mixture muft now be poured about an inch in height of the hufks of oats, from which groats are made. Set the pots in a heated oven, in which fome glowing coals are ftill remaining, which muft be heaped about the pots. This done, clofe the oven, and leave the pots in it four-and-twenty hours. This time being elapfed, take them out; again pour boiling water in till they are brimfull, and ftir all well together. Now pour it all into a wooden veffel or tub, provided with a fpiggot and foffet, firft covering the bottom with a layer of ftraw, as is ufually done in brewing beer; then add warm water, more or lefs, according to the quantity of quafs you want; let it ftand an hour, and afterwards draw it off into veffels. In every veffel a flice of coarfe rye bread muft be put, in order to make it ferment. Set the veffels in a cellar, and after four-and-twenty hours the quafs is fit for drinking.

In making quafs, barley-malt alone may be ufed. The rye-malt is added only from neceffity, when the former, by itfelf, would be too poor, and not be fufficiently fweet. But the rye-meal is abfolutely neceffary.

From the quantity of malt and meal above ftated, is obtained about fix or feven kilderkins, or two ankers of quafs. The Ruffians in the fummer feafon put the veffels of quafs immediately in the cellar, but in the winter they let them ftand a whole night in a warm room, for the quafs to ferment.

QUASSE, in *Geography*, a town of Africa, in Benin. N. lat. 6° 20′. E. long. 3° 30′.

QUASSIA, in *Botany*, received that name from Linnæus. He called it fo in honour of Quaffi, a negro at Surinam, who difcovered the virtues of the wood of this tree, in curing the malignant fevers of that country, to which fo many Europeans fell a facrifice, and who communicated this valuable difcovery to his patron governor Dahlberg. Hence it became known in Europe; particularly by means of a differtation printed in the Amœnitates Academicæ, firft publifhed in 1763.—Linn. Gen. 212. Schreb. 288. Willd. Sp. Pl. v. 2. 567. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 42. Juff. 282. Lamarck Illuftr. t. 343. Gærtn. t. 70.—Clafs and order, *Decandria Monogynia*. Nat. Ord. *Magnoliis affine*, Juff.

Gen. Ch. *Cal.* Perianth inferior, very fhort, of five ovate, permanent leaves. *Cor.* Petals five, feffile, equal, lanceolate, elongated, oblique, converging. Nectary of five ovate villous fcales, attached to the infide of the filaments at the bafe. *Stam.* Filaments ten, thread-fhaped, equal, the length of the corolla; anthers oblong, incumbent. *Pift.* Receptacle flefhy, elevated, orbicular, broader than the germen. Germen ovate, compofed of five feparate ones; ftyle thread-fhaped, with five furrows, the length of the ftamens; ftigma with five angles. *Peric.* Drupas five, diftant, horizontal, ovate, obtufe, fplitting into two parts, all ftanding on a flefhy pentagonal receptacle. *Seeds* folitary, globofe or oval.

Obf. Some flowers have abortive germens, others imperfect anthers.

Eff. Ch.

Eff. Ch. Calyx of five leaves. Petals five. Nectary of five scales. Drupas five, distant, two-valved, single-seeded, placed on a fleshy receptacle.

1. Q. *amara*. Bitter Quassia. Linn. Sp. Pl. 553. Suppl. 235. Amoen. Acad. v. 6. 416. t. at page 429. Willd. n. 1. Ait. n. 1. Curt. Mag. t. 497. Woodv. Med. Bot. t. 77.—Flowers all perfect. Leaves pinnate; leaflets opposite, sessile; common stalk jointed, winged. Flowers racemose.—Native of Surinam. Introduced in 1790, by Mr. Alexander Anderson, to the stoves at Kew, where it flowers in June and July. A *shrub* rather than a tree, whose wood is intensely bitter. *Leaves* alternate; of two pair of *leaflets*, with an odd one, all elliptic-lanceolate, pointed, entire, veiny, very smooth, two or three inches in length, on a linear winged stalk, abrupt and jointed at the insertion of each pair. *Clusters* long, drooping one way. *Flowers* numerous, above an inch long, not much expanded, of a rich scarlet, as well as their stalks. The younger Linnæus errs in saying, in the Supplement, that the branch figured in Am. Acad. does not belong to the flowers.

This is the true original Quassia, whose wood is more powerful than that of the other species; but being very rare, and of small bulk, its place is said to be usually supplied by *Q. excelsa* hereafter described.

2. Q. *Simaruba*. Wing-leaved Quassia. Linn. Suppl. 234. Willd. n. 2. Ait. n. 2. Woodv. Med. Bot. t. 76. (Simarouba amara; Aubl. Guian. v. 2. 859. t. 331, 332.)—Flowers monoecious. Leaves pinnate; leaflets alternate, not quite sessile; common stalk naked. Clusters panicled.—Native of various parts of the West Indies, in a sandy soil, flowering in November and December. It was sent to Kew in 1787, by Mr. Alexander Anderson, but has not blossomed there. This is a tall and stout tree, whose wood is hard, white, without any peculiar flavour. *Leaves* alternate, with six, seven, or eight alternate obovate, rather narrow, entire, stalked *leaflets*, two inches long, whitish beneath; their common stalk simple, roundish. *Flowers* yellowish-white, much smaller than the preceding, either monoecious, or, as some say, dioecious, in branched or panicled clusters. The bark of the *root* is bitter, and much celebrated as a cure for the dysentery. Dr. Wright has given a full history of the plant, with a plate, in the Transactions of the Royal Society of Edinburgh, vol. ii. It is known in Jamaica by the name of Mountain Damson, Bitter Damson, and Stave-wood. In that island, according to Dr. Wright, the male flowers are never found on the same tree with the female.

3. Q. *excelsa*. Lofty Quassia. Swartz in Stockh. Trans. for 1788. 302. t. 8. Ind. Occ. v. 2. 742. Willd. n. 3.—Flowers polygamous. Stamens five. Leaves pinnate; leaflets opposite, stalked; common stalk naked.—Native of rather mountainous woods, in Jamaica and the Caribbean islands. The English commonly call it bitter wood, or bitter ash. The *tree* is lofty, with a very straight trunk; the wood whitish, moderately close-grained, very bitter; frequently sold by the druggists for the true *Quassia amara*, and found useful in intermittent fevers, debility of the stomach, worms, dropsy, and chlorosis. It is also used for making cabinets, for preserving insects, or other natural curiosities; this wood being supposed inaccessible to worms. The *leaves* are larger than the last, and composed of from four to six pair of opposite, elliptical, pointed, firm, entire, smooth leaflets, on short partial stalks. *Clusters* panicled, bearing very numerous, small, pale *flowers*, some male, the rest hermaphrodite, in the same cluster. Swartz describes the *nectary*, of five minute villous scales, contrary to the remark of Willdenow, under his *Zwingera*, Sp. Pl. v. 2. 569, where it is said to be wanting in this species of *Quassia*. The *stamens* are mostly five, rarely four or six. *Germens* from two to four.

Quassia *Amara*, bitter quassia, in the *Materia Medica*. The root, bark, and wood of this tree are all comprehended in the catalogues of the Materia Medica; and it is observed that the leaves, flowers, &c. possess similar qualities. The roots, being perfectly ligneous, may be medically considered in the same light with the wood, which is now most generally employed, and seems to differ from the bark in being less intensely bitter; so that the latter is thought to be a more powerful medicine. The wood is sent to this country from Jamaica and the Caribbean islands in billets; and is reduced to chips, or rasped by the druggists. Quassia has no sensible odour; its taste is that of a pure bitter, more intense and durable than that of any other substance. It imparts its virtues more completely to watery than to spirituous menstrua, and its infusions are not blackened by the addition of martial vitriol. When the infusion is evaporated to dryness, it leaves a brownish-yellow, somewhat transparent, brittle extract, which has been regarded as a vegetable constituent *sui generis*, and named the bitter principle. (Edinb. Phil. Transf. iii. 207.) The infusion is rendered muddy by nitrate of silver, and a soft, flaky, yellow precipitate is formed; acetate of lead occasions a copious white precipitate; and hence it has been inferred that these salts are incompatible in formula with it. The watery extract is from a sixth to a ninth of the weight of the wood; the spirituous about a twenty-fourth.

Quassia derived its name, as has been already observed, from a negro named Quassi (by Fermin written Coissi, and by Rolander, Quass), who employed it with uncommon success as a secret remedy in the malignant, endemic fevers, which frequently prevailed at Surinam. In consequence of a valuable consideration, this secret was disclosed to Daniel Rolander, a Swede, who brought specimens of the quassia-wood to Stockholm in the year 1756; and since that time the effects of this drug have been very generally tried in Europe, and numerous testimonies of its efficacy published by many respectable authors. Its antiseptic powers have been submitted to various trials, from which it has been concluded, that it has considerable influence in retarding the tendency to putrefaction; which, in professor Murray's opinion, cannot be attributed to its sensible qualities, as it possesses no astringency whatever, nor to its bitterness, as gentian is much more bitter, but less antiseptic. The medicinal virtues ascribed to quassia are those of a tonic, stomachic, antiseptic, and febrifuge: it has been found very effectual in restoring the tone of the stomach, producing appetite for food, assisting digestion, expelling flatulency, and removing habitual costiveness, produced from debility of the intestines, and common to a sedentary life. Dr. Lettsom observes, that in hysterical atony, to which the female sex is so prone, the quassia affords more vigour and relief to the system than the Peruvian bark, especially when united with the vitriolum album, and still more with the aid of some absorbent. In dyspepsia, arising from hard drinking, and also in diarrhœas, he exhibited the quassia with great success. Although he does not concur in opinion with Linnæus, who says, "me quidem judice chinchinam longè superat;" yet he has met with several instances of low remittent and nervous fevers, the symptoms of which the bark uniformly aggravated, though administered in intermissions the most favourable to its success, in which quassia, or snake-root, was successfully substituted. In such cases, he mostly observed that there was great congestion in the hepatic system, and the debility at the same time discouraged copious evacuations. And in many fevers, without evident

remissions

remiffions to warrant the ufe of the bark, whilft, at the fame time, increafing debility began to threaten the life of the patient, the doctor found that quaffia, or fnake-root, fingly or combined, upheld the vital powers, and promoted a critical intermiffion of fever, by which an opportunity was offered for the bark to effect a cure. Dr. Cullen fays, (Mat. Med. vol. ii. p. 174.) "I believe quaffia to be an excellent bitter, and that it will do all that any pure and fimple bitter can do; but our experience of it in this country does not lead us to think it will do more; and the extraordinary commendations given of it are to be afcribed to the partiality fo often fhewn to new medicines." It is faid to have been given, combined with nitric acid, with evident benefit in typhus, and alfo in fluor albus. It may be given in infufion, which is the beft form of adminiftering it; or in pills made from the watery extract. It may alfo be given in fubftance in dofes of from grs. x to ℈j three or four times a day. The officinal preparations are the "infufum quaffiæ" of the London Pharmacopeia, and the "tinctura quaffiæ" of that of Dublin. The infufion is prepared by macerating for two hours in a lightly covered veffel a fcruple of quaffia-wood, chipped, in half a pint of boiling water, and ftraining. In hyfteria, this may be combined with purgatives and tincture of valerian; in atonic gout, with aromatics; and in dyfpeptic affections, with chalybeates, fulphate of zinc, or mineral acids. The dofe is from f℥j to f℥iij, given twice or thrice a day. The tincture is prepared by digefting for feven days an ounce of chips of quaffia-wood in two pints of proof fpirit; and then ftraining. This may be ufed in the fame cafes as the infufion.

It is afferted that the brewers have, of late years, ufed quaffia-wood inftead of hops. Beer made with it certainly does not keep, fays Thomfon, but foon becomes muddy and flat, has a mawkifh tafte, and runs into the acetous fermentation. It is confequently lefs nutritious and wholefome than that which is properly hopped. Wood. Mat. Med. Thomfon's Lond. Difp.

QUASSIA *Simaruba*. See SIMARUBA.

QUATCHEOU, in *Geography*, a town of Afia, in the country of Hami; 30 miles E. of Tche-tcheou. N. lat. 40° 28′. E. long. 94° 27′.

QUATER-COUSINS, QUATRE-COUSINS, fourth coufins, or the laft degree of kindred.

Hence, when perfons are at variance, it is faid they are not quater, or cater-coufins.

QUATERNA FOLIA, among *Botanifts*. See LEAF.

QUATO, in *Zoology*. See SIMIA *Panifcus*.

QUATORZIEME, Fr., the 14th, or double octave of the 7th. It is called the 14th, becaufe 14 founds muft be formed to pafs diatonically from one of its terms to the other.

QUATOTOMOMI, in *Ornithology*, the name of an American bird of the wood pecker kind, having a red creft on its head, and two white lines running down the fides of the neck to the breaft. It is called by Nieremberg *Picus imbrifxtus*; which fee.

QUATOZTLI. See TANAGRA *Leucocephala*.

QUATRE FACARDINS, *Les*, in *Geography*, four fmall iflands in the South Pacific ocean, fo named by M. Bougainville, in the year 1768. S. lat. 18° 40′. W. long. 140° 30′.

QUATREFOIL, a decoration refembling a rofe with four leaves, which conftantly occurs in pointed architecture.

QUATRE-NATIONS, *q. d. Four Nations*, the denomination of a college founded in 1661, by cardinal Mazarin, for the education and mainteuance of fixty children, natives of the four countries conquered by Lewis XIV., *viz.* fifteen for Pignerol and Italy, fifteen for Alfatia, twenty for Flanders, and ten for Rouffillon.

QUATRICHROMA, in the *Italian Mufic*, is what we call a *demi-femi-quaver*, thirty-two of which make a bar in common time. See TIME, and TRIPLE.

QUATRO CASE, in *Geography*, a town of Italy, in the department of the Mincio; 17 miles S.E. of Mantua.

QUATROL, a fmall ifland in the gulf of Siam, near the coaft of Camboja. N. lat. 10° 13′. E. long. 103° 25′.

QUATROS, CORONADOS, *Los*, an ifland in the Pacific ocean, difcovered by Quiros in 1606. S. lat. 18° 40.

QUATTRINO, in *Commerce*, a copper coin at Florence; alfo a money of account, 60 quattrini being equal to 12 crazie, $1\frac{1}{2}$ paoli, or 2 lira. At Rome, the fcudo is divided into $3\frac{1}{3}$ teftoni, 500 quattrini, or 1000 mezzi quattrini; fo that 5 quattrini make 1 paolo, and 3 paoli 1 teftone. See SCUDO.

QUATUOR, Lat., a name given to any mufical compofition, vocal or inftrumental, in four parts, and in dialogue, or *a parte equale*, when each have folo parts alternately. The Italians fometimes call a quatuor *quartello*, but more frequently *quartto*, and the Englifh *quartet*.

A vocal quartet, fays Rouffeau, is more difficult for the poet to write, as well as for the compofer to fet, than a trio or chorus,

In the vocal quartet of a mufical drama, four diftinct characters fhould be fupported both in the words and mufic, according to the fituation and ftate of mind of the feveral perfonages who have petitions or complaints to make, or anfwers to give.

The inftrumental quartets of Haydn have been the delight of all that have performed, or heard them performed, for full 30 years, and bid fair to continue to afford delight for at leaft 30 years more.

QUATUOR *Principalia Artis Muficæ*, the title of a MS. in the Bodleian library at Oxford (Digby 90.), which has been afcribed to feveral authors. Anthony Wood gives it to Tewkefbury, to whom it is likewife afcribed in the Oxford Catalogue of MSS., with very little foundation. Bifhop Tanner has honoured Dr. John Hambois with this production, a writer on mufic, who flourifhed more than a century after this MS. was finifhed, as appears from the teftimony of the fcribe himfelf.

There is, however, at Oxford, among the MSS. another volume of Mufical Tracts (Bodl. 515.), which had not been fufficiently examined by any of the catalographers who have mentioned it: for, on a careful perufal and collation, we found in it, befides two other tracts by Simon Tunftede, or Tuftede, a duplicate of the Quatuor Principalia; and as no doubt has been thrown upon Tunftede having been the author of the two firft tracts in the volume, it feems as if we might venture, without doubt or hefitation, to affign to him this ample, and, for the time when it was written, excellent treatife. That Simon Tunftede was a man of fcience, and an able mufician, as well as a doctor of divinity, appears at the end of MS. Digby 90. After faying that the book was finifhed in 1351, we have the following paffage: "Ille autem anno regens erat inter minores Oxoniæ fratres, Simon de Tunftede, doctor facræ theologiæ, qui in mufica pollebat, et eciam in feptem liberalibus artibus." Pits, Bale, Tanner, and all our biographical writers, fpeak of him as a learned mufician; and Pits enumerates the Quatuor Principalia among his writings. (De illuft. Angl. Script.) Simon Tunftede, a Francifcan friar, born at Norwich, was in fuch favour for his learning and piety, as to be unanimouſly choſen provincial maſter of all England. He died at Bruzard, in Suffolk, in 1369.

The title of the tracts in the Oxford Catalogue of MSS. has occaſioned the great diverſity of opinions about the writer of the Quatuor Principalia; for N° 515 is entitled "De Muſica continua et diſcreta, cum Diagrammatibus, per Simonem Tunſtede, A.D. 1351." However, in the beginning of the volume, the author propoſes to treat "De quatuor Principalibus in quibus tocius Muſica radices conſiſtunt," &c. which exactly agrees with the other MS.; and there is no difference from the beginning to the end, except in the omiſſion of a kind of prologue, or argument to the work, which appears in the tract aſcribed to Tewkeſbury (Digby 90.), beginning "Quemadmodum inter Triticum," and is omitted in that to which the name of Tunſtede is prefixed. Bodl. 515.

What the author calls the "Four Principals of Muſic," will beſt appear from his own manner of dividing the work. In the firſt part or principal, conſiſting of nineteen chapters, he treats of muſic in general, its conſtituent parts and diviſions. II. Of its invention, intervals, and proportions, twenty-four chapters. III. Of plain chant, and the eccleſiaſtical modes, fifty-eight chapters. IV. Of meaſured muſic, or time; of diſcant, and their ſeveral diviſions. This laſt principal is divided into two ſections, of which the firſt contains forty-one chapters, and the ſecond forty-nine. The whole treatiſe fills a hundred and twenty-four folio pages; the diagrams, which are very numerous, are beautifully written, and illuminated with different coloured inks; and it ſeems to be in all reſpects the moſt ample and complete work of the kind which the fourteenth century can boaſt.

Quatuor *Hominis Prepoſiti*. See Prepositi.

Quatuor-Vir, in *Antiquity*, frequently written iiii. vir, a Roman magiſtrate, who had three colleagues joined with him in the ſame adminiſtration.

To the quatuor-vir was committed the charge of conducting and ſettling the colonies ſent into the provinces.

Upon unlucky accidents, and other dangerous affairs, it was uſual to create quatuor-viri, with commiſſion to take care *ne quid detrimenti reſpublica caperet, that the republic were not prejudiced.*

There were alſo quatuor-viri appointed to inſpect and take care of repairs, &c.

QUAUCHOCHOPITLI, in *Ornithology*. See Picus *Tricolor*.

QUAVER, in *Muſic*, a meaſure of time, equal to one-half of the crotchet, or one-eighth of the ſemi-breve.

The quaver is marked by the character

The Engliſh quaver makes what the French call *crochue*, crotchet, becauſe of the hook at bottom. See Crotchet.

The quaver is divided into two ſemiquavers, noted and four demiſemiquavers, marked. See Characters.

QUAVERING, the act of trilling, or ſhaking; or the running a diviſion with the voice.

QUAUHAYOHUATLI, in *Botany*, a name by which ſome authors have called the tree, whoſe fruit is the caſſia fiſtula of the ſhops. Hern. p. 87.

QUAUHCILUI, in *Ornithology*. See Merops *Cinereus*.

QUAUHIOYAMATL, in *Zoology*. See Sus *Tajaſſu*.

QUAUHTECALLOTLQUAPACHTLI. See Sciurus *Variegatus*.

QUAUHTECHALOTT-THLITTIC. See Sciurus *Niger*.

QUAUHTLA-COYMATL. See Sus *Tajaſſu*.

QUAUHTZONECOLIN, in *Ornithology*, the American name for a bird called by moſt a quail, but eſteemed by Nieremberg a ſpecies of partridge.

It is of the ſize of the European partridge, and of a browniſh colour, and ornamented with a creſt upon its head.

There are alſo in America two other ſpecies of partridge much allied to this: the one with a yellow body, and black and white head; the other ſmall and brown, and without a creſt. See Tetrao *Criſtatus*.

QUAUHYAC Oculensium, in *Botany*, the name of a very large Indian tree, bearing leaves reſembling thoſe of the citron. The bark is aſtringent, heating, drying, and of a ſtrong ſmell: it reſtrains a diarrhœa, and excites a ſweat. The juice, ſnuffed up the noſe, cauſes ſneezing, purges the head, and thus removes fevers, and pains in the head: for which reaſons, it is preſerved in families as a popular remedy. Nieremberg.

QUAVITL, a name given by ſome authors to the cocoa-tree. Hern. p. 79.

QUAUTOTOPOTLI, in *Ornithology*. See Picus *Canadenſis*.

QUAY, Kay, a ſpace of ground paved on the ſhore of a river, or port, deſtined for the loading and unloading of merchandize. See Kay and Wharf.

QUEAGA, in *Geography*, a town of Pegu, on the Ava; 18 miles S. of Lundſey.

QUEBEC, a city of America, the capital of the lower province of Canada, as Niagara is of the upper, was founded by the French in the year 1608, and is ſituated on a very lofty point of land, on the N.W. ſide of the river St. Lawrence, at its confluence with the river St. Charles, about 320 miles from the ſea. Nearly facing it, on the oppoſite ſhore, there is another point; and between the two the river is contracted to the breadth of three-quarters of a mile; but after paſſing through this ſtrait, it expands to the breadth of five or ſix miles, taking a great ſweep behind that point on which Quebec ſtands. The city derives its name from the word Qūebec, or Quebeio, which, in the Algonquin tongue, ſignifies a ſudden contraction of a river. The wide part of the river, immediately before the town, is called "the Baſon," and it is ſufficiently deep and ſpacious to float upwards of 100 ſail of the line. Quebec is divided into two parts, called the upper and the lower towns. The upper town is ſituated on a rock of limeſtone, on the top of the point; and the lower town, built round the bottom of the point, cloſe to the water, on land which has been gradually gained from the river. The rock on which the upper town ſtands riſes, in ſome places towards the water, nearly perpendicularly, ſo as to be totally inacceſſible; in other places it is not ſo ſteep as to prevent a communication between the two towns, by means of ſtreets winding up the ſide of it; though here the aſcent is ſo great, that there are long flights at one ſide of the ſtreets, for the accommodation of foot-paſſengers. The lower town lies very much expoſed to an enemy, being defended merely by a ſmall battery towards the baſon, which, at the time of high tides, is nearly on a level with the water; and by barriers towards the river, in which guns may be planted, when there is any danger of an attack.

The upper town is a place of immenſe ſtrength. Towards the water it is ſo ſtrongly guarded by nature, that ſlight

ſlight walls are a ſufficient defence; and in ſome places, where the rock is inacceſſible, no walls are neceſſary. Here, however, are ſeveral redoubts and batteries. The principal battery, which points towards the baſon, conſiſts of twenty-two 24-pounders, two French 36-pounders, and two large iron mortars: this battery is flanked by another of ſix guns, that commands the paſſes from the lower town. On the land ſide the fortifications are ſtupendous. When general Wolfe attacked this place, he thought it a vain attempt to make an aſſault on the ſide of the town which lies towards the water, where the rock is ſo ſteep, and ſo eaſily defended. In order to carry on the attack on the land ſide, he firſt attempted to land his troops ſome miles below the town, near the Falls of Montmorenci; but here he was repulſed by a large diviſion of the French forces with loſs. Foiled in his firſt attempt to get on ſhore, the brave Wolfe formed the bold deſign of aſcending to the top of the banks above Quebec, commonly called the Heights of Abraham. After previous preparation, the ſoldiers clambered up the heights with great difficulty, and the guns were hauled up by means of ropes and pullies fixed round the trees, with which the banks are covered from top to bottom. At the top the plain commences, and extends cloſe under the walls of the city. Here the memorable battle was fought, in which the much lamented general fell, at the moment when all his noble exertions were about to be crowned with the ſucceſs which they ſo eminently merited. The ſpot where the illuſtrious hero breathed his laſt is marked with a large ſtone, on which a true meridional line is drawn. Although the great Wolfe found it ſo difficult a taſk to gain poſſeſſion of Quebec, and it has been rendered much ſtronger ſince his time, the people of the United States imagine, that, in caſe of a rupture with Great Britain, it might be eaſily taken; and yet at the cloſe of the year 1775, and the commencement of 1776, an attempt was made by American troops, under the command of Arnold and Montgomery, without ſucceſs. On this occaſion Montgomery fell, and Arnold's attempt, on the practicability and ſucceſs of which he had previouſly boaſted, proved fruitleſs. St. John's gate, which he endeavoured to force, and the adjoining walls, are ſtupendous; and the mere ſight of them may convince any perſon, that an attempt to ſtorm them muſt be altogether ineffectual, without the aid of heavy artillery, with which the Americans were not provided.

Independently of its fortifications, and ſituation on the ſummit of a rock, Quebec owes much of its ſtrength and ſecurity to the long duration and extreme ſeverity of the winter; as in that ſeaſon it is wholly impracticable for a beſieging army either to carry on any works, or to blockade the town. Mr. Weld ſays, that 5000 ſoldiers are neceſſary to man the works at Quebec completely. A large garriſon is always kept in it, and abundance of ſtores of every deſcription. The troops are lodged partly in barracks, partly in block-houſes near Cape Diamond, which is the moſt elevated part of the point, and is reckoned to be upwards of 1000 feet above the level of the river. The Cape is ſtrongly fortified, and may be conſidered as the citadel of Quebec: it commands the town in every direction, and alſo the plains on the outſide of the walls. The evening and morning guns, and all ſalutes and ſignals, are fired from hence. Notwithſtanding the great height of the rock above the river, water may be readily obtained even at the very top of it, by ſinking wells of a moderate depth; and in ſome particular places, at the ſides of the rock, it guſhes out in large ſtreams; and the water is of a very good quality. It is ſuppoſed, ſays Mr. Weld, that including the upper and lower towns and ſuburbs, there are at leaſt 2000 dwellings; and the number of inhabitants, allowing ſix to a houſe, may be eſtimated at 12,000. Mr. Heriot ſays, that, in 1806, the number of inhabitants amounted to 15,000; and if this ſtatement be correct, the increaſe muſt have been very rapid, for, in the year 1784, Quebec contained only 6472 inhabitants. About two-thirds of the inhabitants are of French extraction. The ſociety is agreeable, and very extenſive for a place of its ſize, which is owing to its being the capital of the lower province, and therefore the reſidence of the governor, different civil officers, principal lawyers, &c. The large garriſon always maintained in it contributes to make it gay and lively.

The lower town is moſtly inhabited by the traders who are concerned with the ſhipping, and it is a very diſagreeable place. The ſtreets are narrow and dirty, and, on account of the height of the houſes in moſt of them, the air is much confined; and in the ſtreets next the water, there is an intolerable ſtench from the ſhore when the tide is out. The upper town, on the contrary, is extremely agreeable; from its elevated ſituation, the air is very pure, and the inhabitants are never oppreſſed with heat in ſummer; it is, however, far from being well laid out, the ſtreets being narrow and very irregular. The houſes are generally built of ſtone, and, except ſome few, built of late years, ſmall and inconvenient. The chateau, in which the governor reſides, is a plain building of common ſtone, ſituated in an open place, the houſes round which form three ſides of an oblong ſquare. It conſiſts of two parts. The old and the new are ſeparated from each other by a ſpacious court. The former ſtands juſt on the verge of an inacceſſible part of the rock; behind it, on the outſide, there is a long gallery, from whence, if a pebble were let drop, it would fall at leaſt ſixty feet perpendicularly. This old part is chiefly taken up with the public offices, and all the apartments in it are ſmall and ill contrived; but in the new part, which ſtands in front of the other, facing the ſquare, they are ſpacious, and tolerably well finiſhed, but none of them can be called elegant. This part is inhabited by the governor's family. The chateau is built without any regularity of deſign, neither the old nor the new part having even an uniform front. It is not a place of ſtrength, as commonly repreſented. In the garden adjoining to it is merely a parapet wall along the edge of the rock, with embraſures, in which a few ſmall guns are planted, commanding a part of the lower town. Every evening during ſummer, when the weather is fine, one of the regiments of the garriſon parades in the open place before the chateau, and the band plays for an hour or two, at which time the place becomes the reſort of numbers of the moſt genteel people of the town, and has a very gay appearance.

Oppoſite to the chateau there is a monaſtery belonging to the Recollets, or Franciſcan friars; a very few only of the order are now left. Contiguous to this building is the college belonging to the Jeſuits, whoſe numbers have diminiſhed even ſtill faſter than that of the Recollets.

The nunneries are three in number, and as there is no reſtriction upon the female religious orders, they are all well filled. The largeſt of them, called L'Hoſpital General, ſtands in the ſuburbs, outſide of the walls; another, of the order of St. Urſule, is not far diſtant from the chateau.

The engineer's drawing-room, in which is kept a variety of models, together with plans of the fortifications of Quebec and other fortreſſes in Canada, is an old building, near the principal battery. Adjoining to it ſtands the

 houſe

houfe where the legiflative council and affembly of reprefentatives meet, which is alfo an old building, that has been plainly fitted up to accommodate the legiflature.

The armoury is fituated near the artillery barrack, in another part of the town. About ten thoufand ftand of arms are kept in it, arranged in a fimilar manner with the arms in the Tower of London, but, if poffible, with greater neatnefs and more fancy.

The artillery barracks are capable of containing about five hundred men, but the principal barracks are calculated to contain a much larger number; they ftand in the market-place, not far diftant from the fquare in which the chateau is fituated, but more in the heart of the town.

The market of Quebec is extremely well fupplied with provifions of every kind, which may be purchafed at a much more moderate price than in any town vifited by Mr. Weld in the United States. It is a matter of curiofity to a ftranger to fee the number of dogs yoked in little carts, that are brought into this market by the people who attend it. The Canadian dogs are found extremely ufeful in drawing burthens, and there is fcarcely a family in Quebec or Montreal, that does not keep one or more of them for that purpofe. They are fomewhat fimilar to the Newfoundland breed, but broader acrofs the loins, and have fhorter and thicker legs; in general they are handfome, and wonderfully docile and fagacious; their ftrength is prodigious. A fingle dog will draw a man for a confiderable diftance, that could not weigh lefs than ten ftone. People, during the winter feafon, frequently perform long journeys on the fnow with half a dozen or more of thefe animals yoked in a cariole or fledge.

An attempt was made in 1711 by the Englifh and Americans, under the command of brigadier Hill, to furprife Quebec; but it proved abortive. In 1759 it was taken by the Englifh, under the command of the valiant Wolfe, who facrificed his life in the engagement; and by the peace, in 1763, it was ceded, with the reft of Canada, to the conquerors, in whofe poffeffion it has fince continued.

The fcenery that is exhibited to the view from various parts of the upper town of Quebec, furpaffes for grandeur, beauty, and diverfity, any other, as Mr. Weld fays, that he has feen, either in America, or in any other part of the globe. In the variegated expanfe that is laid open before you, ftupendous rocks, immenfe rivers, tracklefs forefts, and cultivated plains, mountains, lakes, towns, and villages, in turn ftrike the attention, and the fenfes are almoft bewildered in contemplating the vaftnefs of the fcene. Nature is here feen on the grandeft fcale; and it is fcarcely poffible for the imagination to paint to itfelf any thing more fublime than are the feveral profpects prefented to the fight of the delighted fpectator. From cape Diamond, fituated one thoufand feet above the level of the river, and the loftieft part of the rock on which the city is built, the profpect is confidered by many as fuperior to that of any other fpot. A greater extent of country opens upon you, and the eye is here enabled to take in more at once, than at any other place; but it appeared to Mr. Weld, that the view from the cape is by no means fo fine as that, for inftance, from the battery; for in furveying the different objects below you from fuch a ftupendous height, their magnitude is in a great meafure loft, and it feems as if you were looking at a draft of the country, more than at the country itfelf. It is the upper battery that Mr. Weld alludes to, facing the bafon, and is about three hundred feet above the level of the water. Here, if you ftand but a few yards from the edge of the precipice, you may look down at once upon the river, the veffels upon which, as they fail up to the wharfs before the lower town, appear as if they were coming under your very feet. The river itfelf, which is between five and fix miles wide, and vifible as far as the diftant end of the ifland of Orleans, where it lofes itfelf amidft the mountains that bound it on each fide, is one of the moft beautiful objects in nature, and on a fine ftill fummer's evening it often wears the appearance of a vaft mirror, where the varied rich tints of the fky, as well as the images of the different objects of the banks, are feen reflected with inconceivable luftre. The fouthern bank of the river, indented fancifully with bays and promontories, remains nearly in a ftate of nature, cloathed with lofty trees; but the oppofite fhore is thickly covered with houfes, extending as along other parts of the river already mentioned, in one uninterrupted village, feemingly, as far as the eye can reach. On this fide the profpect is terminated by an extenfive range of mountains, the flat lands fituated between and the villages on the banks not being vifible to a fpectator at Quebec, it feems as if the mountains rofe directly out of the water, and the houfes were built on their fteep and rugged fides.

Beautiful as the environs of the city appear when feen at a diftance, they do not appear lefs fo on a more clofe infpection; and in paffing through them the eye is entertained with a moft pleafing variety of fine landfcapes, whilft the mind is equally gratified with the appearance of content and happinefs that reigns in the countenances of the inhabitants. Indeed, if a country as fruitful as it is picturefque, a genial and healthy climate, and a tolerable fhare of civil and religious liberty, can make people happy, none ought to appear more fo than the Canadians. There are, however, in the vicinity of Canada two fcenes, more particularly deferving of attention than any others: thefe are the falls or cataracts of the rivers *Chaudiere* and *Montmorency;* which fee refpectively. N. lat. 46° 48′ 38″. W. long. 71° 5′ 29″. Weld's Travels, vol. i.

QUEBITEA, in *Botany*, a name which feems to have been whimfically extracted by Aublet, from the Caribbean appellation of this plant, *Daquejoabite*. Aubl. Guian. v. 2. 838. t. 327. This has many creeping *roots*, and a twifted, decumbent, hairy *ftem*, with alternate, elliptical, broad, entire, hairy *leaves*, three or four inches long, on hairy *footftalks*. *Flowers* minute, in fhort, denfe, axillary, ftalked *fpikes*, with a fmall fcale at the bafe of the ftalks. Aublet did not inveftigate the ftructure of thefe flowers, but he fufpects the plant to be nearly akin to *Dracontium*, under which genus it is accordingly noticed by Juffieu. The roots, when chewed, are very acrid. The bruifed herb is ufed externally, to cure the bite of ferpents. It grows on the banks of rivulets in Guiana.

QUEBRANTAHUESSOS, in *Ornithology*. See PROCELLARIA *Gigantea*.

QUEÇALA, in *Geography*, a town of Mexico, in the province of Mechoacan; 105 miles S.S.E. of St. Luis de Potofi.

QUECHUA, in *Literary Hiftory*. See PERU.

QUEDA, a fea-port city on the W. coaft of the peninfula of Malacca, the capital of a kingdom, tributary to Siam, with a good harbour at the mouth of a river that will admit a veffel drawing 12 or 14 feet water on the fprings over the bar, which is gravel and mud. The town contains about 400 houfes, inhabited by Chinefe and Malays. The environs are agreeable and fertile; the woods abound in elephants and other animals, and in fome places are mines of lead, which fupply large quantities of thofe metals for exportation to Hindooftan, Arabia, and Perfia. The government is monarchical, under a Malay Mahomedan prince, who, like many other Malay princes, engroffes almoft the whole foreign trade of the port, excepting that of an annual Chinefe junk, which pays a certain fum only as duty, and then has leave to trade freely with the inhabitants. This junk imports immenfe quantities of coarfe China-ware, thin iron pans, and many other articles from that country, and exports biche de mer, called fwallow, fharks' fins, edible bird's nefts, rattans, tin, rice, dammer, tortoife-fhell, deer's fkins and finews, bullocks and buffalos' hides and horns, jerked beef, and many other coarfe articles. At Queda there is great plenty of rice, bullocks, buffalos, and poultry; but not fuch abundance of fruit and vegetables as at Acheen. The territory of Queda is a flat country, favourable for the cultivation of rice; a hill north of the town and inland, called the Elephant, favours the navigator's approach; alfo the fmall iflands called Peers, 20 miles weft of the bar, covered with trees, and good regular mud foundings, a great way off, even by night, indicate the diftance to the mariner; 300 miles E.N.E of Acheen. N. lat. 6° 20′. E. long. 100° 18′.

QUEDENAU, a town of Pruffia, in Samland; three miles N. of Königfberg.

QUEDLINBURG, a town of Weftphalia, in the principality of Halberftadt, on the Boda, which divides it into the Old and New Towns. It has feveral churches, a hofpital, and a college. Near this town is a princely abbey, fituated on a hill: it was founded by king Henry I. between the years 932 and 936, and fince enriched by various endowments. In 1539 it embraced Lutheranifm, and obliged itfelf, by folemn oaths, to maintain that form of religion. It lately confifted of four dignitaries, *viz.* of the lady abbefs and three others, diftinguifhed by the titles of provoft, dean, and canon. In 1802, the abbey and its revenues were voted to the king of Pruffia, as an indemnity; and by the treaty of Tilfit, transferred to the kingdom of Weftphalia. The town of Quedlinburg is feven miles S.S.E. of Halberftadt. N. lat. 51° 48′. E. long. 11° 20′.

QUEDLITZ, a town of Pruffia, in the province of Ermeland; four miles S. of Wartenburg.

QUEECE, in *Agriculture*, a term fometimes provincially applied to the wood-pigeon, or birds of that kind.

QUEECHY, in *Geography*, a river of Vermont, which runs into the Connecticut at Hartland.

QUEEN, Regina, a woman who holds the crown of a realm fingly, and by right of blood.

The word queen is derived from the Saxon *cwen*, *uxor*, *the wife of any one*, but applied, by way of excellency, to the wife of the king only; whence fhe was anciently called the *king's queen;* the Weft Saxons having no other name for a queen but the *king's wife*. (Affer de Ælfred, rebus, &c.) She was alfo called *lady*, in Saxon *wlæfdig;* juft as *madame*, *mademoifelle*, were ufed in France, for the wife and daughter of the duke of Orleans.

The name queen is alfo given, by way of courtefy, to her that is married to the king; called, by way of diftinction, *queen confort*. In refpect of whom the former is called *queen regnant*, or regent.

The widow of a king is alfo called queen, but with the addition of *dowager*.

In the firft fenfe, queen is, in all conftruction, the fame with king; and has the fame powers, prerogatives, rights, dignities, and duties that the king has. This is exprefsly declared by ftatute 1 Mar. I. ft. 3. c. 1.

The *queen confort* is inferior, and a perfon diftinct from, and a fubject of, the king. In England, though fhe be a feme-covert, yet may fhe fue, and be fued, in her own name; and may make leafes, and grants, &c. as a feme-fole.

She has feveral other prerogatives. Though an alien, fhe may purchafe lands in fee-fimple, without either naturalization, or denization; fhe may prefent to a benefice; nor is plenarty a bar againft her more than againft the king. She is alfo capable of taking a grant from the king, which no other wife can do from her hufband; and fhe may have a feparate property in goods as well as lands, and has a right to difpofe of them by will. She pays no toll, and fhall not be amerced, if fhe be nonfuited in any action; and may not be impleaded till firft petitioned.

To confpire her death, or violate her chaftity, is high treafon. She has an ancient peculiar revenue, called *queen-gold;* befides a very large dower, with a royal court, and officers, diftinct from the king's; and her attorney and folicitor-general are entitled to a place within the bar of his majefty's courts, together with the king's counfel.

Another ancient perquifite belonging to the queen confort, mentioned by all our old writers, and, on this account only, worthy of notice, is this, that on the taking of a whale on the coafts, which is a royal fifh, it fhall be divided between the king and queen; the head only being the king's property, and the tail of it the queen's. One reafon of this whimfical divifion, as affigned by our ancient records, was to furnifh the queen's wardrobe with whalebone.

The *queen dowager*, as the widow of the king, enjoys moft of the privileges belonging to her as queen confort. But it is not high treafon to confpire her death; or to violate her chaftity, becaufe the fucceffion to the crown is not thereby endangered. Yet ftill, *pro dignitate regali*, no man can marry a queen dowager without fpecial licence from the king, on pain of forfeiting his lands and goods. She has alfo this particular, that fhe lofes not her dignity, though fhe marry a private gentleman; as peereffes dowager do their peerage, when they marry commoners. Thus queen Catherine, widow of Henry V. being married to Owen ap Tudor, efq. maintained an action as queen of England. Much lefs does a queen regnant follow her hufband's condition, or is fubject to other queens; but fhe is fovereign to her own hufband, as queen Mary was to king Philip, and queen Anne to prince George of Denmark; unlefs it be otherwife appointed by parliament. The hufband may be guilty of high treafon againft her; but in the inftance of conjugal infidelity, he is not fubject to the fame penal reftrictions. For which the reafon feems to be, that if a queen confort is unfaithful to the royal bed, this may debafe or baftardize the heirs to the crown; but no fuch danger can be confequent in the infidelity of a hufband to a queen regnant.

Queen Caroline, in *Biography*, when princefs of Wales, is told in the dedication of the opera of Julius Cæfar to her royal highnefs, that the firft mufical founds which her highnefs heard, were thofe produced by the voice of the celebrated Piftocio, the father of good tafte, then in the fervice of his illuftrious fire, at the court of Anfpach.

Mufic doubtlefs was a ferious part of her majefty's education, as it is, and has ever been, of all the princes and princeffes of Germany; who have likewife frequent opportunities of hearing great performers and fplendid performances; yet we do not recollect having heard that her majefty was a performer herfelf, or even an admirer or patronefs of the art. This princefs died in November 1737.

Queen Mary. (See Mary.) During the fhort reign of this bigoted and intolerant princefs, ecclefiaftical mufic was again

again transferred to Latin words and the mafs, both of which had been excommunicated during the reign of her brother, Edward VI. But metrical pfalmody had not yet been generally received in our parochial churches. Mary was herfelf a performer on the virginal and lute, as appears by a letter fent to her by her mother, queen Katherine, after her feparation from the king, in which " fhe encourages her to fuffer chearfully, to truft to God, and keep her heart clean. She charged her in all things to obey the king's commands, except in matters of religion. She fent her two Latin books, the one 'De Vita Chrifti,' and the other the 'Epiftles of St. Jerom;' in them, (fays the queen,) I truft you fhall fee good things. And fometimes, for your recreation, ufe your virginals or lute, if you have any."

Fuller tells us, that " eight weeks and upwards paffed between the proclaiming of queen Mary and her affembling the parliament; during which time two religions were together fet on foot, *Proteftantifme* and *Poperie;* the former hoping to be continued, the latter labouring to be reftored; —and during this interim the churches and chapels in England had a mongrel celebration of their divine fervices betwixt reformation and fuperftition. For the obfequies for king Edward were held by the queen in the Tower, Auguft 7th, 1553, with the dirige fung in Latin, and on the morrow a maffe of requiem, and on the fame day his corps were buried at Weftminfter with a fermon fervice, and communion in Englifh."

In October following the laws of her predeceffor, Edward, concerning religion, were all repealed. And in November 1554, bifhop Bonner " fet up the old worfhip at Paul's, on St. Katherine's day; and it being the cuftom, that on fome holydays, the quire went up to the fteeple to fing the anthems, that fell on that night:—and the next day, being St. Andrew's, he did officiate himfelf, and had a folemn proceffion."

After this period, during the fubfequent years of Mary's reign, the public fervice was every where performed in the Roman Catholic manner, throughout the kingdom; and we may imagine that the numerous compofitions to Latin words, which have been preferved of Dr. Tye, White, Tallis, Bird, and the reft of our moft eminent harmonifts, were produced and performed at this time, while the Romifh religion had the afcendant. And indeed it appears by a record, now in the poffeffion of the Antiquarian Society, that the lift of Mary's chapel eftablifhment contains nearly the fame names as that of her brother Edward.

Queen Elizabeth. (See Elizabeth.) In fpeaking of mufic during the long and profperous reign of queen Elizabeth, our nation's honour feems to require a more diffufe detail than at any other time: for perhaps we never had fo juft a claim to equality with the reft of Europe, where mufic was the moft fuccefsfully cultivated, as at this period; when indeed there was but little melody any where. Yet, with refpect to harmony, canon, fugue, and fuch laboured and learned contrivances as were then chiefly ftudied and admired, we can produce fuch proofs of great abilities in the compofitions of our countrymen, as candid judges of their merit muft allow to abound in every kind of excellence that was then known or expected.

Elizabeth, as well as the reft of Henry VIII.'s children, and indeed all the princes of Europe at that time, had been taught mufic early in life. For Camden, in giving an account of her ftudies, fays, that " fhe underftood well the Latin, French, and Italian tongues, and was) indifferently well feen in the Greek. Neither did fhe neglect muficke, fo far forthe as might become a princeffe, being able to fing and play on the lute prettily and fweetly."

There is reafon to conclude, that fhe continued to amufe herfelf with mufic many years after fhe afcended the throne. Sir James Melvil gives an account of a curious converfation which he had with this princefs, to whom he was fent on an embaffy by Mary, queen of Scots, in 1564. After her majefty had afked him how his queen dreffed? What was the colour of her hair? Whether that or her's was beft? Which of them two was faireft? And which of them was higheft in ftature? " Then fhe afked, what kind of exercifes fhe ufed?" I anfwered, fays Melvil, " that when I received my difpatch, the queen was lately come from the Highland hunting: that when her more ferious affairs permitted, fhe was taken up with reading of hiftories: that fometimes fhe recreated herfelf in playing upon the lute and virginals. She afked if fhe played well? I faid, reafonably for a queen."

" The fame day, after dinner, my lord of Hunfden drew me up to a quiet gallery, that I might hear fome mufic, (but he faid, that he durft not avow it,) where I might hear the queen play upon her virginals. After I had hearkened a while, I took by the tapeftry that hung before the door of the chamber, and feeing her back was toward the door, I entered within the chamber, and ftood a pretty fpace hearing her play excellently well. But fhe left off immediately, fo foon as fhe turned about and faw me. She appeared to be furprifed to fee me, and came forward, feeming to ftrike me with her hand; alleging, fhe ufed not to play before men, but when fhe was folitary, to fhun melancholy. She afked how I came there? I anfwered, as I was walking with my lord Hunfden, as we paffed by the chamber door, I heard fuch a melody as ravifhed me, whereby I was drawn in ere I knew how; excufing my fault of homelinefs, as being brought up in the court of France, where fuch freedom was allowed; declaring myfelf willing to endure what kind of punifhment her majefty fhould be pleafed to inflict upon me for fo great offence. Then fhe fate down low upon a cufhion, and I upon my knees by her; but with her own hand fhe gave me a cufhion, to lay under my knee; which at firft I refufed, but fhe compelled me to take it. She enquired whether my queen or fhe played beft. In that I found myfelf obliged to give her the praife."

If her majefty was ever able to execute any of the pieces that are preferved in a MS. which goes under the name of " Queen Elizabeth's Virginal Book," fhe muft have been a very great player: as fome of thefe pieces, which were compofed by Tallis, Bird, Giles, Farnaby, Dr. Bull, and others, are fo difficult, that it would be hardly poffible to find a mafter in Europe, who would undertake to play one of them at the end of a month's practice.

Befides the lute and virginals, Elizabeth was a performer on the violin, and on an inftrument fomething like a lute, but ftrung with wire, and called the *poliphant.* A violin of a fingular conftruction, with the arms of England, and the creft of Dudley, earl of Leicefter, this queen's favourite, engraved upon it, was purchafed at the fale of the late duke of Dorfet's effects. The date of its make, 1578. It is very curioufly carved; but the feveral parts are fo thick and loaded with ornaments, that it has not more tone than a mute, or violin with a fordine; and the neck, which is too thick for the grafp of the hand, has a hole cut in it for the thumb of the player, by which the hand is fo confined, as to be rendered incapable of fhifting, fo that nothing can be performed upon this inftrument, but what lies within the reach of the hand in its firft pofition. Playford tells

tells us, that "Queen Elizabeth was not only a lover of this divine ſcience (muſic), but a good proficient therein; and I have been informed, (ſays he,) by an ancient muſician, and her ſervant, that ſhe did often recreate herſelf on an excellent inſtrument, called the *poliphant*, not much unlike a lute, but ſtrung with wire."

Among the Sloane MSS. in the Britiſh Muſeum, No 1520, there is a liſt of the officers of the court of revenue in this reign; in which is included the muſical eſtabliſhment of her majeſty's houſehold, about the year 1587.

Her majeſty's chapel eſtabliſhment was nearly the ſame, in number and ſalaries, as that of her brother and ſiſter, Edward and Mary. Indeed, it ſeems as if the religious ſcruples of muſicians had been conſiderably diminiſhed by the ſeverity with which Teſtwood had been treated in the time of Henry VIII., and the peril into which Marbeck's zeal for reformation had involved him. For in comparing the chapel eſtabliſhments of Edward, Mary, and Elizabeth, we find, that however the creeds of theſe monarchs differed, their muſicians had conſtantly tuned their conſciences to the court pitch: *i. e.* in perfect uniſon with the orders of their ſovereign, the ſupreme head of the church.

Camden ſays, that "the Romiſh religion remained a full moneth and more after the death of queen Mary, in the ſame ſtate as before." For Elizabeth, who began her reign November 17th, 1558, had a ſolemn ſervice performed for her ſiſter Mary at Weſtminſter, December 5th, and another December 20th, for the emperor Charles V.; and theſe, as well as her own coronation, were celebrated in the Romiſh manner.

Burnet ſays, that "Elizabeth had been bred up from her infancy with a hatred of the Papacy, and a love to the Reformation; but yet as her firſt impreſſions in her father's reign were in favour of ſuch old rites as he had ſtill retained; ſo in her own nature ſhe loved ſtate, and ſome magnificence, in religion as well as in every thing elſe."

We have no other muſic printed expreſsly for the cathedral ſervice to Engliſh words during the reign of Edward VI. than that of Marbeck, which was mere canto fermo, without counterpoint; but the year after the publication of the Engliſh Liturgy by queen Elizabeth, the following choral work appeared: "Certaine notes ſet forth in foure and thre partes, to be ſong at the Morning Communion, and Evening Praier, very neceſſarie for the Churcheof Chriſte to be frequented and uſed: and unto them be added divers Godly Praiers and Pſalmes, in the like forme, to the honour and praiſe of God. Imprinted at London, over Alderſgate, beneath St. Martins, by John Day, 1560." The authors of theſe compoſitions were Tallis, Cawſton, Johnſon, Oakland, Shepherd, and Taverner.

In 1565, our eccleſiaſtical compoſers, encouraged probably by the reception of the former publication, and favour of the queen, printed another collection of offices, with muſical notes, under the following title: "Morning and Evening Prayer and Communion, ſet forthe in foure partes, to be ſong in Churches, both for Men and Children, with dyvers other Godly Prayers and Anthems, of ſundry Mens doynges."

The muſicians who contributed to this collection were Thomas Cawſton, Heath, Robert Haſleton Knight, Johnſon, Tallis, Oakland, and Shepherd.

Theſe two publications by John Day, fixed, for near a century, the ſtyle of our choral muſic; of which the movement was grave, the harmony grateful, and the contrivance frequently ingenious.

The great muſicians of queen Elizabeth's reign were Dr. Tye, John White, Thomas Tallis, William Bird, Dr. Bull, and Thomas Morley. And theſe, as eccleſiaſtical compoſers, were perhaps equal in learning and genius to the greateſt contemporary contrapuntiſts on the continent of Europe.

We muſt not terminate our account of the cultivation and progreſs of muſic by queen Elizabeth and her ſubjects, without making honourable mention of her majeſty's "Virginal Book," and referring for a ſummary account of its contents to BIRD, WILLIAM. In all our enquiries after muſical curioſities throughout Europe, we have met with no pieces ſo elaborate and difficult for the harpſichord, as thoſe by our ingenious countrymen.

This book, equally valuable for its antiquity and contents, was purchaſed by Bremner at Dr. Pepuſch's ſale, 1762, whoſe property it was to the time of his death. After which it paſſed into the hands of viſcount Fitzwilliams, in whoſe poſſeſſion, we believe, it ſtill continues.

It is a magnificent folio MS. curiouſly bound in red Morocco, with gilt leaves. There are nearly 70 pieces by Dr. Bull in this volume. The writing is ſmall, but uncommonly neat, upon ſix lines. The compoſitions are in general extremely elaborate and difficult; particularly thoſe by Bird, Dr. Bull, and Giles Farnabie, who have all contributed largely to the furniſhing of this volume, which contains near three hundred pieces. The firſt movement in the book is an old Engliſh tune, called "Walſingham," beginning in C natural, and ending in A major, which Dr. Bull has varied in a moſt full and complicated ſtyle, thirty different ways. Signora Margarita, the wife of Dr. Pepuſch, when ſhe quitted the Opera ſtage, applied cloſely to the practice of the harpſichord; upon which inſtrument ſhe became a great proficient. However, with all her own diligence and talents, aſſiſted by the ſcience and experience of of her husband, she was never able to vanquish the difficulties of this piece, by Dr. Bull. And several of Dr. Pepusch's friends and pupils, who went frequently to his apartments at the Charter-house, have assured us, that though this manuscript was constantly open upon her harpsichord desk, she never advanced to the end of the variations; as seems likewise manifest from the colour, as well as wear and tear, of the leaves, which are much more clean and entire in every other part of the book, than at the first strains of this composition.

Queen Mary II. joint sovereign with William III., seems to have done little more for music, than patronise Mrs. Arabella Hunt, and the old Scots tune of "Cold and raw the wind doth blow." See Mary.

Queen Anne, in *Geography*, a post-town of America, in Prince George county, Maryland, situated on the W. side of Patuxent river, across which is a wooden bridge. This small town is laid out on a regular plan, at the foot of a hill. It contains a few stores, and warehouses for the inspection of tobacco; 25 miles E.N.E. of Washington.

Queen Anne's, a county of Maryland, bounded W. by Chesapeak bay, and N. by Kent county; containing 16,648 inhabitants. Its chief town is Centerville. Belonging to this county is Kent island, 14 miles long from N. to S. and $6\frac{1}{2}$ broad from E. to W. It is low, but the land is fertile, and its eastern side is bordered with salt marsh.

Queen Catherine's *Foreland*, the northernmost point of Terra del Fuego, at the east entrance into the straits of Magellan, discovered by Frobisher in 1576.

Queen Charlotte's *Foreland*, the S.E. extremity of New Caledonia. N. lat. 22° 15'. E. long. 167° 14'.—Also, the S.W. point of New Hanover, in the East Indian sea, so called in 1767 by Capt. Carteret. The land about it is remarkable for a number of little hummocke, or hills. S. lat. 2° 29'. E. long. 148° 27'.

Queen Charlotte's *Island*, an island in the Pacific ocean, about six miles long, and one broad, discovered in the year 1767, by captain Wallis. It is described as sandy and level, full of trees, without underwood, and abounding with scurvy-grass. The canoes of this island appeared to be about 30 feet long, 4 feet broad, and $3\frac{1}{2}$ deep. The inhabitants were of a middle stature, and dark complexion, with long black hair, hanging loose over their shoulders. The men were well made, and the women handsome. Their garments were a kind of coarse matting, fastened about their middle, and capable of being brought round their shoulders. The men who landed saw no appearance of any kind of metal, but observed several tools made of shells and stones, sharpened and fitted into handles, like adzes, chissels, and awls. They saw several repositories of the dead, in which bodies were left to putrefy, under canopies, and not deposited in the ground. The island was taken possession of by captain Wallis and his crew, in the name of his Britannic majesty. They also left some hatchets, nails, glass bottles, beads, shillings, sixpences, and halfpence, as presents to the natives. S. lat. 19° 18'. W. long. 138° 4'.

Queen Charlotte's *Islands*, a group of islands, discovered in 1767 by Capt. Carteret, consisting of Egmont's island or New Guernsey, Lord Howe's island or New Jersey, and several others. A quarrel having occurred in consequence of the imprudent conduct of the master of Capt. Carteret's ship, between the crew and the natives, several of the latter were killed, and four of the former died in consequence of their wounds. This unfortunate event prevented any intercourse with the inhabitants of these islands. *Egmont island*, says Capt. Carteret, who called it by this name in honour of the earl, is the same with the *Santa Cruz* of the Spaniards; and the place in which the ship had lain he called *Swallow bay*; about ten miles W. from this bay is a small island, near the coast, called *Portland's island*; and to the bay farther west, where the ship's cutter had been attacked by the Indians, he gave the name of *Bloody bay*. In this bay is a small rivulet of fresh water, and here were seen many houses, and near the water-side, one much longer than any of the rest, which seemed to be a kind of common hall, or council-house, and was neatly built and thatched. The sides and the floor of this edifice were covered with a kind of fine matting, and bundles of arrows were hung up in it ready for use. At this place there were also many fine gardens and plantations, inclosed by a fence of stone, and planted with cocoa-nut trees, bananas, plantains, yams, and other vegetables. About three miles W. of this town was another of considerable extent, in the front of which, near the water, was a breast-work of stone, about four feet six inches high, angularly formed like a fortification; from which, and from other circumstances, there is reason to believe that the natives have frequent wars among themselves. At the distance of two or three miles farther westward was found a small bight, receiving a river, which was called *Granville's river*, and westward of it is a point, to which was given the name of *Ferrar's point*. From this point the land forms a large bay, near which is a town of great extent, and apparently very populous. About seven miles W. of Ferrar's point is another, that was called *Carteret's point*, from which a reef of rocks, that appears above water, runs out to the distance of about a cable's length. To the W. of this was another large town, fronted like the last, and the people who thronged to the beach while the ship was passing, performed the same kind of circular dance with those of the former place. They were furnished with a number of canoes of different sizes. The inhabitants of Egmont island are extremely nimble, vigorous, and active, and seem as well qualified to live on the water as on the land, for they were in and out of their canoes almost every minute. With their bows and arrows they do execution at an incredible distance. Their arrows were pointed with flint, nor was there seen among them any appearance of metal. The country, in general, is woody and mountainous, intermixed with many vallies; several small rivers flow from the interior part of the country into the sea, and upon the coast there are many harbours. S. lat. 9° 50' to 11° 20'. E. long. 163° 30' to 165° 10'. Hawkesworth's Voyages, vol. i. p. 349, &c.

Queen Charlotte's *Islands*, called by Capt. Gray, of the United States, who visited them in 1789, and by American navigators, "Washington islands," a group of islands on the N.W. coast of America. See *Queen* Charlotte's *Island*.

Queen Charlotte's *Sound*. See *Queen* Charlotte's *Sound*. Mr. Anderson, who visited this sound four times, has made the following remarks on the country near it. The land is every where uncommonly mountainous, rising immediately from the sea into large hills, with blunted tops. At considerable distances are vallies, or rather impressions on the sides of the hills, which are not deep, each terminating towards the sea in a small cove, with a pebbly or sandy beach, behind which are small flats, where the natives generally build their huts, at the same time landing their canoes upon the beaches. The bases of these mountains, at least towards the shore, are constituted of a brittle, yellowish sand-stone, which acquires a blueish cast, where the sea washes it. It runs, in some places, in horizontal, and, at other places, in oblique strata; being frequently divided, at small distances, by thin veins of coarse quartz. The mould, or soil, which covers this, is of a yellowish cast, not unlike marle, and is commonly

monly from a foot to two or more in thicknefs. The quality of this foil is beft indicated by the luxuriant growth of its productions: the hills being one continued foreft of trees, owing the ftrength of their vegetation partly to the foil, and partly alfo to the agreeable temperature of the climate. In February, correfponding to our Auguft, the thermometer was not higher than 66°; and in June, correfponding to our December, the mercury never fell lower than 48°. The weather is, in general, good; but fometimes windy, with heavy rain, which, however, never lafts above a day; nor is it ever exceffive. Among the trees, which covered the hills, and which are of two forts, one fupplied the place of fpruce in making beer, for which purpofe a ftrong decoction of its leaves was fermented with treacle or fugar. The other fort of tree refembled a maple, and its wood ferved for fuel. On the fmall flat fpots behind there is a great variety of trees. Among other plants that were ufeful, may be reckoned the wild celery, which grows plentifully almoft in every cove, and one that was called fcurvy-grafs, though very different from the plant to which we give that name. Both forts were boiled every morning, with wheat ground in a mill, and with portable foup for the people's breakfaft, and amongft their peafe-foup for dinner. Sometimes they were ufed as fallad, or dreffed as greens. There is another plant, which produces a fine filky flax, of which the natives make their garments. A fpecies of long pepper is alfo found in great plenty. The birds are almoft entirely peculiar to the place. The principal fifh caught with the feine were mullets and elephant-fifh, with a few foles and flounders; but thofe which the natives moftly fupplied were a fort of fea-bream, of a filver colour, with a black fpot on the neck, large conger-eels, and a fifh in fhape like the bream, but fo large as to weigh five, fix, or feven pounds, and called "Mogge" by the natives. Of all the forts of fifh, which are here numerous, the mogge, fmall falmon, and colour fifh, as the feamen called it, though different from ours, are fuperior to the reft. The rocks furnifh a great variety of fhell-fifh. Infects are very rare. In this extenfive land there are not even traces of any quadruped, excepting only a few rats, and a fort of fox-dog, which is a domeftic animal with the natives. Neither is there any mineral worth notice, but a green jafper or ferpent-ftone, of which the New Zealanders make their tools and ornaments.

The natives do not exceed the common ftature of Europeans, and, in general, are not fo well made. Their colour is of different cafts, from a deep black to a yellowifh or olive tinge; and their features are alfo various, fome refembling Europeans. But in general their faces are round, with their lips full, and alfo their nofes towards the point; though the firft are not uncommonly thick, nor the laft flat. Their teeth are generally broad, white, and well fet; and their eyes large, with a very free motion, which feems the effect of habit; their hair is black, ftraight, and ftrong; commonly cut fhort on the hind part, with the reft tied on the crown of the head; but fome have it curling, and of a brown colour. In the young, the countenance is generally free or open; but in many of the men it has a ferious caft, and fometimes a fullennefs or referve, efpecially if they are ftrangers. The women are in general fmaller than the men; but have few peculiar graces. The drefs of both fexes is alike; and confifts of an oblong garment, about five feet long and four broad, and made of the filky flax before mentioned. This feems to be their moft material and complex manufacture, and is executed by knotting; and their work is often ornamented with pieces of dog-fkin, or chequered at the corners. They bring two corners of this garment over their fhoulders, and faften it on the breaft, with the other part which covers the body; and about the belly it is again tied with a girdle made of mat. Sometimes they cover it with large feathers of birds, (which feem to be wrought into the piece of cloth when it is made,) or with dog-fkin; and that alone fometimes worn as a covering. Over this garment many of them wear mats, which reach from their fhoulders to their heels. But the moft common outer covering is a quantity of fedge-plant, badly dreffed, which they faften on a ftring to a confiderable length, and throwing it about the fhoulders, let it fall down on all fides, as far as the middle of the thighs. By way of ornament, they fix in their heads feathers, or combs of bone or wood, adorned with pearl-fhell, or the thin inner fkin of fome leaf; and in the ears both of men and women, which are pierced, or rather flit, are hung fmall pieces of jafper, bits of cloth, or beads, when they can get them. A few alfo have the feptum of the nofe bored in the lower part. They wear long beards, but are fond of having them fhaved. Some are punctured or ftained in the face, with curious fpiral and other figures, of a black or deep blue colour; but it is doubtful whether this be ornamental, or intended as a mark of peculiar diftinction: and the women who are marked fo, have the puncture only on their lips, or a fmall fpot on their chins. Both fexes often befmear their faces and heads with a red paint, which feems to be a martial ochre, mixed with greafe; and the women fometimes wear necklaces of fhark's teeth, or bunches of long beads, which feem to be made of the leg-bones of fmall birds, or a particular fhell. They live in fmall coves, in companies of forty or fifty, or more; and fometimes in fingle families, building their huts contiguous to each other; which are in general miferable lodging places. The beft was about thirty feet long, fixteen broad, and fix high; built exactly in the manner of an Englifh barn. They feemed to have no other furniture than a few fmall bafkets or bags, in which they put their fifhing-hooks and other trifles. They live chiefly by fifhing, making ufe either of nets of different kinds, or of wooden fifh-hooks, pointed with bone; but fo oddly made, that a ftranger would be at a lofs to know how they can anfwer fuch a purpofe. Their boats are well built of planks, raifed upon each other, and faftened with ftrong withes, which alfo bind a long narrow piece on the outfide of the feams, to prevent their leaking. Some are fifty feet long, and fo broad as to be able to fail without an outrigger; but the fmaller fort commonly have one; and they often faften two together by rafters, forming a double canoe. They carry from five to thirty men, or more; and often have a large head, ingenioufly carved, and painted with a figure at the point, which feems intended to reprefent a man with his features diftorted by rage. Their paddles are about four or five feet long, narrow, and pointed; with which, when they keep time, the boat is pufhed along pretty fwiftly. Their fail, which is feldom ufed, is made of a mat of a triangular fhape, having the broadeft part above. Their method of feeding correfponds with the naftinefs of their perfons, which often fmell difagreeably, from the quantity of greafe about them, and their clothes never being wafhed. We have feen them eat the vermin with which their heads are plentifully ftocked. They alfo ufed to devour with the greateft eagernefs large quantities of ftinking train oil, and blubber of feals, which we were melting at the tent, and had kept near two months; and on board the fhips they were not fatisfied with emptying the lamps, but actually fwallowed the cotton and fragrant wick with equal voracity. Thefe people manifeft as much ingenuity, both in invention and execution, as any uncivilized nations under fimilar circumftances. For, without the ufe of any metal tools, they make every thing by which they procure their fubfiftence, clothing, and warlike

 weapons,

weapons, with a degree of neatneſs, ſtrength, and convenience for accompliſhing their ſeveral purpoſes. Their chief mechanical tool is formed exactly after the manner of our adzes, and is made, as are alſo the chiſſel and goudge, of the jaſper already mentioned, or of a black, ſmooth, and very ſolid ſtone. But their maſter-piece ſeems to be carving, which they uſe for various purpoſes, even the moſt trivial. Their ſubſtitute for a knife is a ſhell, a bit of flint or jaſper: and as an auger, they fix a ſhark's tooth in the end of a ſmall piece of wood. They have alſo a ſmall ſaw made of ſome jagged fiſhes' teeth, fixed on the convex edge of a piece of wood, nicely carved: but this, they ſay, is only uſed to cut up the bodies of their enemies whom they kill in battle. No people have a quicker ſenſe of injury done to them, and none are more ready to reſent it. Their temper is ſuſpicious and miſtruſtful; and they are ſo diſhoneſt, that they ſteal every thing upon which they can lay their hands. Such conduct may be expected, where little ſubordination exiſts, and where no man's authority ſeems to extend further than his own family. Their public contentions are frequent, or rather perpetual, and it appears, from their number of weapons, and dexterity in uſing them, that war is their principal profeſſion. Theſe weapons are ſpears, patoos, and halberts, or ſometimes ſtones. The firſt are made of hard wood, pointed, from five to twenty, or even thirty feet in length. The ſhort ones are uſed for throwing as darts. The "patoo," or "emeete," is of an elliptical ſhape, about eighteen inches long, with a handle made of wood, ſtone, the bones of ſome ſea animal, or green jaſper, and ſeems to be their principal dependence in battle. The halbert, or long club, is about five or ſix feet long, tapering at one end with a carved head, and at the other broad or flat, with ſharp edges. Before they begin the onſet, they join in a war-ſong, to which they all keep the exacteſt time, and ſome raiſe their paſſion to a degree of frantic fury, attended with the moſt horrid diſtortion of thier eyes, mouths, and tongues, to ſtrike terror into their enemies: which, to thoſe who have not been accuſtomed to ſuch a practice, makes them appear more like demons than men, and would almoſt chill the boldeſt with fear. To this ſucceeds a circumſtance, almoſt foretold in their fierce demeanour, horrid, cruel, and diſgraceful to human nature; which is, cutting in pieces, even before they are perfectly dead, the bodies of their enemies, and, after dreſſing them on a fire, devouring the fleſh, not only without reluctance, but with peculiar ſatisfaction. And yet theſe ſavages lament the loſs of their friends, with a violence of expreſſion, which indicates the moſt tender remembrance of them. The children are initiated, at a very early age, into all the practices, good and bad, of their fathers. They not only join in the war-ſong, but they likewiſe ſing, with ſome degree of melody, the traditions of their forefathers, their actions in war, and other indifferent ſubjects; of all which they are immoderately fond, and ſpend much of their time in theſe amuſements, and in playing on a ſort of flute. Their language is far from being harſh or diſagreeable, though the pronunciation is frequently guttural; and whatever qualities are requiſite in any other language to make it muſical, certainly obtain to a conſiderable degree here, if we may judge from the melody of ſome ſorts of their ſongs. It is alſo ſufficiently comprehenſive, though, in many reſpects, deficient, if compared with our European languages, which owe their perfection to long improvement. Mr. Anderſon has given a ſpecimen of it. (Cook's Third Voyage, vol. i.) In the year 1770 Capt. Cook left among the inhabitants a boar and two ſows, with ſome vegetables for cultivation. In 1773 he ſaw one of the ſows, and underſtood that the other and the boar were both living. The ſheep and goats did not ſucceed; the latter having been killed by one of the natives, and the ram having ran into the ſea.

QUEEN's, the middle county of Long iſland, New York, about 30 miles long, and 12 broad, containing ſix townſhips, and 19,336 inhabitants. Jamaica, Newtown, Hampſtead, in which is a handſome court-houſe, and Oyſter bay, are the principal towns in this county.

QUEEN's, a county of Nova Scotia, comprehending a part of the lands on the cape, on the S. ſide of the bay of Fundy. The ſettlements are as follow; *viz.* Argyle, on the S. ſide of the bay of Fundy, where a few Scots and Arcadians reſide: next to this is Yarmouth, ſettled chiefly by emigrants from New England; Barrington, within the iſland, called cape Sable, ſettled originally by Quakers from Nantucket. Beſides theſe are Port Raiſoir, ſo called by the French, and originally ſettled by the North Iriſh; Liverpool and Roſeway, ſettled and inhabited by emigrants from New England.

QUEEN's *County*, a county of Ireland, eſtabliſhed in the reign of the firſt Mary, which comprehended the old diſtrict of Leix. Both the county and chief town, Maryborough, received their names in compliment to the ſovereign. It is ſituated on the S.W. of Kildare, from which it is partly divided by the river Barrow, and is of a very compact form, being 25 Iriſh (nearly 32 Engliſh) miles in length, and as many in breadth. The ſuperficial contents are about 235,300 acres, or 367 ſquare miles, equal to 378,023 acres, or about 590 ſquare miles Engliſh. There are 50 pariſhes, 26 only of which have churches, and a population of 82,000 according to Dr. Beaufort, and about 90,000 as the medium of various calculations. The high and ſteep mountains of Sliebh-bloom (called alſo Ard-na-Erin, which in the Iriſh language ſignifies the height of Ireland) form ſo impracticable a barrier between the King's and Queen's counties, that in a range of fourteen miles they afford but one, and that a very difficult and narrow paſs into the King's county, called the "Gap of Glandine." In this great ridge are the ſources of the Barrow and the Nore; the Barrow running N.E. to Monaſterevan, where it changes its direction to the S., and the Nore croſſing the Queen's county by a ſouthern courſe into Kilkenny. The Dyſart hills in the eaſtern diviſion are conſpicuous and pictureſque, ſtanding rather ſingly than connected. From theſe eminences, through the viſtas formed by their particular ſituation, is commanded the view of a fine and beautiful country, highly adorned with rich plantations and magnificent demeſnes. The reſt of the county is rather flat, but lies high. The whole is watered with rivers and numerous mountain ſtreams, and according to ſir Charles Coote, its ſuperficial appropriations may be thus eſtimated.

	Acres.
Arable lands, paſture, and meadow	210,000
Woods and plantations -	1,300
Water - - -	1,000
Bog, mountain, and waſte -	21,000
Roads - - -	2,000
	235,300

The map belonging to the grand jury, reckons 244,938 acres, and of theſe 60,000 bog and mountain.

Almoſt every deſcription of ſoil is found in this county, and it varies from a very ſtiff clay to a ſandy loam, which, though light, is yet fertile; a ſtrong gravelly ſoil, very favourable to corn, is alſo prevalent. Lime-ſtone is ſo common, that there are rich quarries of it in almoſt every townland. The ſoil foil of the Sliebh-bloom mountains is variable, the furface inclining to a black and alternately yellow ftiff clay, of unequal depths, covering a loofe, rotten rock, or a gritty gravel, with occafionally a little appearance of lime-ftone. The weftern fide, more generally, inclines to a ftrong red clay, not unlike the nature of the foil in fome of th northern counties in Ireland, where oats and potatoes only are fown; but it generally is, throughout, fpongy, wet, and boggy to the fummit, and very rocky. Through the whole of the county, except in the fouth-eaftern corner, near Carlow, where the collieries are extenfive, bog is well interfperfed, and is the general fuel. The depth of thefe bogs is various, and in fome parts undifcovered, the beft fuel lying in fome a few fpades depth below the furface, in others very deep. The moors are a fhallow bog, with a ftratum of gravel or clay, under one or two fpades depth; this particular kind is eafily reclaimed, and becomes the beft and fureft land in the county, and the coft is here but trifling, indeed often repaid in one year, having all the materials within themfelves.

Amongft the mineral productions of this county, fir Charles Coote, the author of the Statiftical Survey, enumerates "coal, iron, copper, manganefe, mica, lime-ftone, marble, free-ftone, ochre, marle, fuller's-earth, and a great variety of clays valuable in every branch of pottery." Such an enumeration is of little ufe; being recommended neither by detail of facts and places, nor by accuracy of information. The coal diftrict is in another part of the fame work more fully noticed; but the reader who wifhes for information, is more likely to find it in the report of Mr. Griffith, mining engineer of the Dublin Society, which is fhortly to be publifhed. The coal is of that defcription called *ftone coal*, the *glance-coal* of Jamefon, and beft known by the name of Kilkenny coal. The Queen's county collieries feem to have laboured under many difadvantages, from want of capital or of proper exertion; but a profpect is opening upon us of more attention to this fource of wealth. There is a very fmall quantity of old timber in the Queen's county. There are, indeed, leafes ftill in exiftence, by which the tenant was obliged to cut, burn, or deftroy fo many acres of wood, to clear the land for the plough; a fyftem which, if neceffary to the eftablifhment of order in the county, was the caufe of reducing it to the bare ftate with refpect to timber, with which the Englifh traveller is fo often ftruck. The Barrow and the Nore are the principal rivers which water this county. The latter is not navigable, though, being a fine deep and fpacious river, it might be eafily rendered fo, by levelling the numerous weirs, that are of great detriment to the adjoining lands, and throw up a confiderable quantity of back water.

The Barrow is navigable throughout from Portarlington, near which it beautifully expands and winds through extenfive and fertile banks. There are no lakes which deferve notice. Maryborough is the county town, near which, as well as Mountmelich and Mountrath, there was a confiderable woollen manufacture of ftuffs, &c. which has declined. For any particulars refpecting the towns, the reader is referred to the refpective articles. Befides thofe mentioned, Portarlington is a place of fome importance, and Stradbelly a neat town. The county is reprefented in parliament by two knights of the fhire, and by one member for the borough of Portarlington. Maryborough and Ballynekill were disfranchifed at the union. Sir C. Coote's Statiftical Survey. Beaufort's Memoir.

QUEEN'*s Creek*, a river of America, in North Carolina, which runs into the Atlantic, N. lat. 34° 37′. W. long. 77° 28′.

QUEEN'S *River*, a river of the ifland of Dominica, which runs into the fea near Rofeau.

QUEEN-*Bee*, a term given by late writers to what ufed to be called the *king-bee*, or king of the bees; a large and long-bodied bee, of which kind there is only one found in every fwarm, and which is always treated with the greateft refpect by the reft.

It is well known that the generation and whole economy of bees principally depend upon this female fovereign, and that her prefence is abfolutely neceffary to the profperity and fafety of the whole community; infomuch that the lofs of the queen proves the certain and total deftruction of the fwarm or hive, unlefs the owner fupplies them in time with another ruler. Without her prefence and direction, the other bees will do no manner of work; they will gather neither wax, nor honey, nor any other materials; nor can they breed and propagate their kind without her. A ftock deprived of its queen, would yield to robbers, or elfe languifh and pine away, fo that the whole fociety would perifh. But as foon as a languifhing ftock is fupplied with a queen, pleafure and activity are apparent through the whole hive; the prefence of the fovereign reftores vigour and exertion, and her voice commands univerfal refpect and obedience: of fuch importance is the queen to the exiftence and profperity of the other members of this community. As the parent and fovereign of every fwarm is a female, the whole government is vefted in one; fo that where there happen to be more, as there fometimes are, and efpecially in fwarms that are united, confufion and difcord prevail, until all, except one, are expelled and flain.

As in forming artificial fwarms, and for other purpofes, it will be neceffary to diftinguifh the queen from the other bees, we fhall obferve, that fhe may be known by her fize, which is much larger than that of the common working-bees, and longer than that of the drones; by the form and fhape of her body, efpecially of the hinder part of it, which is more taper, and terminates in a much fharper point than the bodies of the other bees, in order the more readily to reach the bottom of the cells, where the eggs are depofited for the propagation of the fpecies (fee *Generation of* BEES): and alfo by her colour; her upper parts being fcarcely at all different in this refpect from the honey-bees, but her belly and legs are of a very deep yellow, refembling the pureft and the richeft gold. It is faid that fhe may alfo be diftinguifhed by the note of her voice, which is an octave; and by her being one of the laft which falls with her belly upwards, when the bees of a fingle ftock are dropped into an empty hive, in order to be united with thofe of another ftock.

Naturalifts have obferved, that the queen-bees are produced in a manner peculiar to themfelves, and different from the drones and working-bees. Some have fuppofed that the eggs laid by the queen in a hive, and deftined for the production of queen-bees, are of a peculiar kind; but though this is not the cafe, as M. Schirach has lately difcovered, yet there are particular cells appropriated for this purpofe. Thefe cells are generally near the edges, and at the bottom of the combs, and fometimes on the fides of a honey-comb; they are of an oblong orbicular form, and very ftrong; and are more or lefs numerous in different hives, as occafion feems to require. It has been alfo fuppofed, that the matter with which they are nourifhed is of a different kind and quality from that employed for the nourifhment of the other bees; that which has been collected out of the royal cells being of a gummy glutinous nature, of a deep tranfparent red, and diffolving in the fire rather than crumbling to powder.

It has been generally fuppofed, that the queen-bee is the only female contained in the hive; that the drones are the males by which fhe is fecundated; and that the working-bees are neutral, or of neither fex. But M. Schirach has lately eftablifhed a different doctrine, which has been alfo confirmed by the later obfervations of Mr. Debraw. According to this writer, all the working or common bees are females in difguife; and the queen-bee lays only two kinds of eggs, *viz.* thofe which are to produce the drones, and thofe from which the working-bees are to proceed; and from any one or more of thefe, one or more queens may be produced; fo that every worm of the latter or common kind, which has been hatched about three days, is capable, under certain circumftances, of becoming the queen, or mother of a hive. In proof of this doctrine, new and fingular as it may feem, he alleges a number of fatisfactory and decifive experiments, which have been fince verified by thofe of Mr. Debraw. For the proof of this doctrine by Schirach and Debraw, and the objections of Mr. Hunter, we refer to the article *Generation of* BEES.

From this doctrine we may juftly infer, that the kingdom of the bees is not, if the expreffion may be ufed, a *jure divino*, or hereditary monarchy, but an elective kingdom; in which the choice of their future ruler is made by the body of the people, while fhe is yet in the cradle, or in embryo; and who are determined by motives of preference which will perhaps for ever elude the penetration of the moft fagacious naturalifts.

The conclufions drawn by M. Schirach, from experiments of the preceding kind, very often repeated by himfelf and others with the fame fuccefs, are, that all the common or working bees were originally of the female fex; but that when they have undergone their laft metamorphofis, they are condemned to a ftate of perpetual virginity, and the organs of generation are obliterated; merely becaufe they have not been lodged, fed, and brought up in a particular manner, while they were in the worm ftate. He fuppofes, that the worm defigned by the community to be a queen, or mother, owes its metamorphofis into a queen, partly to the extraordinary fize of its cell, and its peculiar pofition in it; but principally to a certain appropriate nourifhment found there and carefully adminiftered to it by the working bees, while it was in the worm ftate; by which, and poffibly other means unknown, the developement and extenfion of the germ of the female organs, previoufly exifting in the embryo, is effected; and thofe differences in its form and fize are produced, which afterwards fo remarkably diftinguifh it from the common working bees. Schirach's Hiftoire Nat. de la Reine des Abeilles, &c. 8vo. 1772. Or, for an abftract, Monthly Review, vol. xlviii. p. 564, &c. Phil. Tranf. vol. lxvii. part i. p. 29, &c. See *Generation* and *Sex of* BEES.

This difcovery is capable of being applied towards forming artificial fwarms, or new colonies of bees, by which means the number of thefe ufeful infects might be increafed, and their produce in honey and wax proportionably augmented. M. Schirach, as well as M. Haftorff, feem, however, to have been miftaken, when they affert, that the artificial queens, formed and reared in a community confifting *only* of working bees, proceed almoft immediately to lay eggs, and to people the hive, without having had any communications with the drones, and at a time when, as they fuppofe, there were no drones in being. It is not neceffary to admit the idea of the prolific quality of a virgin queen-bee; as nature has provided drones of different fizes, for the purpofe of impregnating the eggs laid by the female, and continuing the fpecies, adapted to different occafions and circumftances. See DRONE.

QUEEN'*s Bench.* See KING'*s Bench*, &c.

QUEEN'*s Gilliflower*, or *Violet*, in *Botany*. See HESPERIS.

QUEEN *Gold, aurum regina*, an ancient royal revenue, belonging to the queen of England, during her marriage to the king; and payable by divers perfons (upon feveral grants of the king) by way of oblation out of fines, amounting to ten marks, or upwards; *viz.* one full tenth part above the entire fine, or ten pounds for every hundred pounds fine, on pardons and contracts or agreements.

This becomes a real debt to the queen, by the name of *aurum reginæ*, upon the party's bare agreement with the king for a fine, and recording it without any farther promife, or contract, for this tenth part extraordinary.

QUEEN *of the Meadows*, in *Botany*. See SPIRÆA.

QUEEN'*s Ware.* See POTTERY.

QUEEN'*s Theatre* in the Haymarket, now the Opera-houfe, was built in queen Anne's time by fir John Vanburgh, and not finifhed till the fummer of 1705, at which time there were only two theatres open; Drury Lane, and Lincoln's-Inn-Fields. Betterton, who was at the head of the Lincoln's-Inn-Fields company, removed to the new theatre in the Haymarket, April 9th, 1705; when it was opened with a new prologue, written by fir Samuel Garth, and fpoken by Mrs. Bracegirdle. The play was Dryden's "Indian Emperor," with finging by the Italian boy. April 23d, "The Merry Wives of Windfor," Falftaff by Betterton, with dancing by Mad. de la Val. And on the 24th, a new farce called "The Confultation;" after which was performed an Indian paftoral, called the "Loves of Ergafto," fet to mufic by Giacomo Greber, the German mufician, who had brought over from Italy Margarita de l'Epine; the part of Licoris by the Italian boy. And this was the firft attempt at dramatic mufic in the Opera-houfe. The company continued acting plays here till the end of June, when there were three reprefentations of "Love for Love," acted all by women. July 20th, according to the Daily Courant, Betterton and his company returned to the theatre in Lincoln's-Inn-Fields, where they continued to act till the Queen's theatre was entirely finifhed. We are the more minute about the performances in this theatre, as Cibber's account, which has been generally followed by others, is very inaccurate. October 30th, Betterton and his company quitted Lincoln's-Inn-Fields a fecond time, and returning to the Haymarket, opened that theatre, not with an opera, but with fir John Vanburgh's comedy of the "Confederacy," which was now acted for the firft time. This excellent comedy, though the parts were very ftrongly caft (Leigh, Dogget, and Booth, being among the men, and Mrs. Barry, Mrs. Porter, and Mrs. Bracegirdle, among the women,) ran but fix nights fucceffively, though the performance of M. des Barques, a dancer juft arrived from France, was added to the entertainment. It was, indeed, repeated once in November, and twice in December, this year; but it was generally found neceffary, even in a new theatre, and with fo ftrong a company, to fortify the beft plays with dances or mufic, and often with both. Sometimes there was finging in Italian and Englifh, by fignora Maria, as lately taught by fignor N. Haym: and fometimes mufic compofed by fignor Bononcini, and fongs by fignora Lovicini, &c. Daily Courant.

QUEENBOROUGH, in *Geography*, a borough and market-town in the liberty of the ifle of Shepey, lathe of Scray, and county of Kent, England, is fituated about three miles fouth from Sheernefs, and forty-five eaft by fouth from London. It was anciently called Cyningburgh, from belonging

longing to the Saxon kings, who had a caſtle here, near the weſtern entrance of the Swale, which, after the conqueſt, was denominated the caſtle of Shepey. This fortreſs being totally demoliſhed in the reign of Edward III., that monarch commenced, in 1360, a more extenſive and magnificent one, which was finiſhed in the period of ſix years, under the ſuperintendance of the celebrated William of Wykeham, afterwards biſhop of Wincheſter. When the caſtle was completed, Edward came and reſided in it ſeveral days, during which time he conſtituted the then village a free borough, and ordered it to be called Queenborough, in honour of his conſort Philippa of Hainault. By the charter of incorporation, which bears date in 1366, he conferred ſundry privileges upon the burgeſſes, and empowered them to elect a mayor, two bailiffs, four jurats, a town ſerjeant, and a water bailiff, who were to take their oath of allegiance before the conſtable of the caſtle, and to act as juſtices of the peace within the liberty of the corporation. This charter was confirmed, with additional privileges, by king Charles I.

Queenborough conſiſts chiefly of one ſtreet, which is very wide, and is formed moſtly of modern buildings. According to the parliamentary returns of 1811, the borough, which coincides in extent with the pariſh, contains 163 houſes and 805 inhabitants, who are principally fiſhermen and oyſter dredgers. The market days are Monday and Thurſday weekly, and there is a well-attended fair on the 5th of Auguſt. This town ſends two members to parliament, who are elected by the mayor, jurats, bailiffs, and burgeſſes, about 150 in number, though by the laſt deciſion of the houſe of commons in 1729, the elective franchiſe was declared to reſide only in the mayor, jurats, and common council. The mayor is the returning officer, and the patronage is in the admiralty and board of ordnance.

Of the caſtle built by king Edward, no traces remain except the moat by which it was ſurrounded, and a well, by which it was ſupplied with water, as the town ſtill is. Though a large and maſſive ſtructure, and erected, as the letters patent expreſs it, "for the ſtrength of the realm, and for the refuge of the inhabitants of this iſle," it does not appear to have ever been of any particular uſe, at leaſt it is never mentioned in hiſtory as having been beſieged, or occupied as an important military poſt. It was nevertheleſs ſeveral times repaired; firſt by Richard II., and again in the time of Henry VIII. Queen Elizabeth alſo ſeems to have contributed to its preſervation and embelliſhment, as her arms were diſplayed on the cieling of the great hall, ſurrounded by thoſe of the nobility, and principal gentry of the county, with the date 1593, affixed to ſome panegyrical verſes in honour of that princeſs. The church here was originally built as a chapel to Minſter, a village ſituated about two miles from the town, and deriving its name from the minſtre, or nunnery founded there by Sexburga, widow of Ercombert, king of Kent, about the year 673. That princeſs placed ſeventy-ſeven nuns in her new inſtitution, and took upon herſelf the office of abbeſs; which ſhe afterwards reſigned to her daughter Ermenilda, and retired to Ely, where her ſiſter Etheldred preſided. During the incurſions of the Danes, this nunnery was deſerted and nearly deſtroyed; but when their invaſions ceaſed, it was again tenanted by a few nuns, and continued to exiſt, though in a very mean ſtate, till the year 1130, when the buildings were re-edified by Corbel, archbiſhop of Canterbury, and filled with nuns of the order of St. Benedict. At the diſſolution their number was limited to a prioreſs and ten nuns, whoſe eſtates were eſtimated at 129*l.* 7*s.* 10½*d.* annual rent. Theſe, with the ſeite of the ſuppreſſed monaſtery, were then granted to ſir Thomas Cheyney, lord warden and treaſurer of the houſehold to king Henry VIII. Of the buildings, a gate-houſe, and part of the church, are the only remains. The latter conſiſts of two aiſles, a chancel, and a neat chapel, with the lower diviſion of a ſquare tower at the weſt end. In conformity with the date of its erection, ſome of the arches are ſemicircular in form, but moſt of them are in the early pointed ſtyle. In the ſouth wall of the chancel, under a range of cinquefoil arches, is the effigy of a knight templar, ſaid to repreſent and commemorate ſir Robert de Shurland, lord of Shurland, who was created a knight banneret by Edward I., for his gallant conduct at the ſiege of Carlaverock, in Scotland. Behind the figure, towards the back of the receſs, is the repreſentation of a horſe's head in the act of ſwimming, which has given riſe to much enquiry among antiquaries, and to many fabulous and ſuperſtitious ſtories among the vulgar. On the pavement are ſeveral braſſes of knights and their ladies; and under the arch ſeparating the chancel from the chapel, is a gorgeous altar-tomb in honour of ſir Thomas Cheyney, above-mentioned. Another altar-tomb, near it, bears the recumbent figure of a Spaniſh general, or admiral taken priſoner by ſir Francis Drake, on the defeat of the "Invincible Armada." From an entry in the pariſh regiſter, he appears to have died on board a ſhip at the Nore in 1591. Beauties of England and Wales, vol. vii. by E. W. Brayley.

QUEENSBURY, a townſhip of America, in Waſhington county, New York, bounded eaſterly by Weſtfield and Kingſbury; 35 miles N.E. of Albany.

QUEENSFERRY, South, a royal burgh and ſea-port town in the county of Linlithgow, Scotland, is ſituated on the ſouthern ſhore of the Frith of Forth, at the diſtance of nine miles W.N.W. from Edinburgh, on the great road to the north. It is firſt mentioned in the charters of king Malcolm IV. by the deſignation of "Paſſagium Reginæ," as is generally ſuppoſed from the frequent uſe of the ferry here by his great grandmother Margaret, queen to Malcolm Canmore, a princeſs highly celebrated in Scottiſh hiſtory for her charitable and beneficent qualities. At that period, however, it was only a village and port, endowed with ſome trifling privileges: indeed, its conſtitution as a royal burgh did not take place till about the year 1556, when its elevation to that rank was ſtrenuouſly oppoſed by the corporation of Linlithgow. It is now governed by a provoſt, one land baillie, two ſea baillies, a dean of guild, and a town council, who, like moſt other counſellors in royal boroughs, are ſelf-elected. Formerly this port enjoyed a conſiderable trade, and even ſo late as the year 1640, it was frequented by above twenty ſhips belonging to reſident owners; but its traffic is at preſent confined to the importation of coal, for the conſumption of the inhabitants, and of the materials uſed in the manufacture of brown ſoap, which, with the fiſhery and the buſineſs of the ferry, conſtitute the chief ſupport of the town. The harbour is in good repair, and is frequently reſorted to as a place of retreat in hard gales, by the ſmaller veſſels navigating the Forth. The paſſage here does not exceed two miles in breadth, and, except in very boiſterous weather, may be croſſed at all times with ſafety and expedition. Much obſcurity prevails relative to the founding of this ferry. The right of it is private property, and ſeems originally to have been attached to the lands of Murie Hall, which lie in the vicinity of the town, and are traditionally ſaid to have been appropriated for "upholding the paſſage." The preſent proprietors are ſeveral gentlemen poſſeſſing land on either ſide of the Forth, who let the paſſage yearly by public auction. As all the northern mails, and moſt carriage travellers, paſs at this ferry, the intercourſe between its ſhores is conſtant and regular. Cattle alſo are tranſported

ported over in great numbers, as well as carts and waggons; but the difficulty and danger of effecting these objects, have induced cattle-drivers and carriers to go round by the bridge at Stirling.

The parish of Queensferry is of small extent, being confined entirely to the royalty. In ecclesiastical matters it forms part of the presbytery of Linlithgow, and synod of Lothian and Tweedale; and, according to the population returns of 1811, contains 77 houses and 558 inhabitants.

On the summit of the ridge rising from the shore here, stands Hopetoun-house, the seat of the earl of Hopetoun, which is perhaps equal in magnificence of aspect to any palace or residence in Great Britain. The mansion is seated on a noble lawn, forming a kind of terrace along the Forth for more than a mile in front, and only terminated by the Frith, which winds round it, and appears like a wide and extensive lake, interspersed with islands and enlivened with a variety of shipping. Behind the house the ground is more various, breaking into hills, vallies, and promontories, which shoot into the Forth. All the grounds, to a considerable distance, are planted and adorned; and the house is judiciously flanked with a thick wood, to protect it against the violence of the northern winds. On this side the Forth assumes, at different points, different appearances, sometimes putting on the semblance of a lake, and sometimes that of a river. The house is a very noble display of architectural magnificence. It was begun by the celebrated architect sir William Bruce, and finished by Mr. Adam, who is believed to have added the wings. It is much to be regretted, that the interior of this princely mansion does not correspond with the grand scale of the exterior, in the size and decorations of the apartments. Beauties of Scotland by Robert Forsyth, vol. iii. Carlisle's Topographical Dictionary of Scotland, 4to. 1813.

QUEENSFERRY, *North*, a small sea-port town in the district and parish of Dunfermline, Scotland, is situated on the northern shore of the Frith of Forth, opposite to the royal burgh of South Queensferry, described in the preceding article. The principal export is whin-stone for paving, which is found in vast abundance in the extensive "whinstone quarries" adjoining. Of that material a large proportion is conveyed to London, and many towns on the eastern coast of England. A hamlet, called St. Margaret, between this village and the head-land, which forms the western boundary of Inverkiething bay, is noted as the landing place of prince Edgar Atheling, and his sister Margaret, afterwards queen of Scotland, when they fled from England to avoid the effects of the conqueror's jealousy of Edgar's claim to the English crown. By an act of parliament, lately passed, the ferry has been placed under excellent regulations; and the harbour on each side, but particularly on the north side, has been much enlarged and improved. A signal house here contains apartments for the accommodation of the trustees, the superintendant, and boatmen. Carlisle's Topographical Dictionary of Scotland, 4to. 1813.

QUEEN'S-HOPE, or EAST-HOPE, a town in the parish of Estyn, or Hope, cwmwd of Merffordd, cantref of Uwch, Nant, (now called the hundred of Mold,) and county of Flint, North Wales, is situated near the river Alun, at the distance of six miles N.W. from Wrexham. Together with the adjoining castle and hamlet of Caer-Gwrle, it constitutes a burgh, both by prescription, and in virtue of a charter granted by Edward the Black Prince in 1351. That deed orders that the constable of the castle shall be mayor, *ex officio*, and shall nominate two bailiffs, to govern under him, from among the burgesses. This place obtained the appellation of Queen's-Hope, after the year 1282, from the circumstance of its having been then bestowed by Edward I. on his beloved and heroic consort Eleanor; or, as some affirm, from her majesty having lodged here, when on her way to Caernarvon to give the Welsh a ruler born within their own territories. The etymology of its ancient name, "Caergawr-lle," (the camp of the gigantic legion,) seems to indicate that it was once occupied by the Romans; and in confirmation of this conjecture we may observe, that a Roman hypocaust has lately been discovered here, some of the tiles used in the construction of which were inscribed "Legio XX." Pennant supposes that it was an outpost to the grand station Deva, and notices the remains of two roads. The ruins of the castle of Caergwrle are seated on a lofty rock isolated from the surrounding land, and, on one side, extremely precipitous. At what time, or by whom it was originally built, is unknown; but in the reign of Owen Gwynnedd, it formed part of the possessions of a chieftain named Gryffydd Maelor. Edward I. made a grant of it to prince David, and afterwards, as above-mentioned, to queen Eleanor, at whose death both castle and manor were given to John de Cromwell, on condition that he repaired the former, which had been set fire to, and considerably damaged, as was supposed by design, while the king and queen were resident in it. All that remains of this once magnificent fortress, are a circular tower, and a few fragments of walls, together with the deep fosse, by which it was defended. This fosse is excavated from the solid rock, which is composed of brescia, or an excessively coarse grit.

The conjoint borough of Queen's-Hope and Caergwrle, is contributary with the town of Flint in the election of a representative to the British parliament. It formerly had the privileges of a market and fairs, but these are now discontinued. The parish is divided into two districts, called Hope and Kinnerton, and contains, according to the parliamentary returns of 1811, 547 houses and 2617 inhabitants. Of these a large proportion reside in the town, which consists of three broad parallel streets, intersected at right angles by three others of less breadth, the whole placed on the side of a rising ground, gently sloping to the river. The principal building is the church, which contains two mural monuments, one decorated with kneeling figures, but without any inscription; and the other commemorating sir John Trevor, knt. secretary to the earl of Nottingham, the conqueror of the boasted invincible armada.

Some objects in the vicinity of the place claim notice. On a hill, opposite to that of Caergwrle, is the British encampment of Caer-Estyn, which is formed by a single ditch and rampart. The adjacent summits consist chiefly of limestone, and display on their surface numerous organic examples of the fossil remains called entrochi and astroites. The uncommon species of the latter, usually denominated the arborescent sea-star, has been found here. At Rhyddyn are two springs strongly impregnated with muriate of soda, the waters of which are found highly serviceable in such chronic disorders as elephantiasis and scrophula. At this place is a fine old bridge over the river Alun. On the road to Mould, about two miles from Queen's-Hope, is Plas-Teg, the seat of the Trevor family. The house is a very noble building, and is generally believed to have been the work of Inigo Jones. Beyond this is Harts-Heath Hall, the property of Guillwn Lloyd Wardle, esq. It is a large modern mansion, forming a square, with three fronts, and is surrounded by fine plantations. Carlisle's Topographical Dictionary of Wales, 4to. 1812. Pennant's Tour in Wales.

QUEEN-

QUEENSTADT, a town of Weſtphalia, in the principality of Halberſtadt; three miles N.E. of Halberſtadt.

QUEENSTOWN, a poſt-town of America, in Queen Anne's county, Maryland, on the E. ſide of Cheſter river; ſix miles S.W. of Centerville, and 65 from Waſhington.

QUEENSTOWN, a town or village of Upper Canada, which lies on the W. ſide of the ſtraits of Niagara, near fort Niagara, and ſeven miles below the Falls. It is at the head of navigation for ſhips; and the portage occaſioned by the Falls of Niagara commences here. From the ſudden change in the face of the country in the neighbourhood of Queenſtown, and the equally ſudden change in the river with reſpect to its breadth, depth, and current, it has been conjectured, that the great falls of the river muſt originally have been ſituated at the ſpot where the waves are ſo abruptly contracted between the hills; and moreover it is a fact well aſcertained, that the falls have receded very conſiderably ſince they were firſt viſited by Europeans, and that they are ſtill receding every year. See Weld's Travels, vol. ii. p. 130.

QUEE-SAN ISLANDS. See CHUSAN.

QUE ESTATE, in *Law*, a plea whereby a man entitling himſelf to land, &c. ſaith, that the ſame eſtate which another had, he now has from him.

Thus, *e.gr.* the plaintiff alleges that ſuch four perſons were ſeiſed of lands whereunto the advowſon in queſtion belonged in fee, and who did preſent it; and that afterwards the church was vacant; *que eſtate*, i. e. *which eſtate* he now has; and, by virtue thereof, he preſents, &c. See PRESCRIPTION.

QUE EST MEME, a term uſed in actions of treſpaſs, &c. for a direct juſtification of the very act complained of by the plaintiff as a wrong.

Thus, in an action upon the caſe, the plaintiff ſaying the lord threatened his tenants at will in ſuch ſort, as he forced them to give up their lands; the lord in his defence pleads, that he ſaid to them if they would not depart, he would ſue them at law. *Que eſt meme, i. e.* this being the ſame threatening that he uſed, the defence is good.

QUEGASCA HARBOUR, in *Geography*, a bay on the S. coaſt of Labrador. N. lat. 50° 7′. W. long. 61° 22′.

QUEI, in *Natural Hiſtory*, a name given by the Chineſe to a peculiar earth found in many parts of the Eaſt.

It is of the nature of an indurated clay, and in ſome degree approaches to the talcs, as our ſteatites and the galactites do. It is very white and abſterſive, uſed by the women of China, to take off ſpots from the ſkin, and render it ſoft and ſmooth, as the Italian ladies uſe talc of Venice. They ſometimes uſe the fine powder of this ſtone dry, rubbing it on the hands and face after waſhing; ſometimes they mix it with pomatum.

QUEICH, in *Geography*, a river of France, which paſſes by Landau, and runs into the Rhine, near Germerſheim.

QUEI-CHUN, a city of China, of the ſecond rank, in the province of Quang-ſi. N. lat. 23° 22′. E. long. 106° 44′.

QUEIGE, a town of France, in the department of Mont Blanc; four miles N.E. of Conflans.

QUEIGNE, a town of Africa, in the kingdom of Bambouk.

QUEI-LING, a city of China, and capital of the province of Quang-ſi, derives its name from a flower called "quei," which grows on a tree reſembling a laurel; it exhales ſo ſweet and agreeable an odour, that the whole country around is perfumed with it. This city is ſituated on the banks of a river, which throws itſelf into the Ta-ho; but it flows with ſuch rapidity, and amidſt narrow vallies, that it is neither navigable nor of any utility to commerce. Quei-ling is a large city, and the whole of it is built almoſt after the model of our ancient fortreſſes; but it is much inferior to moſt of the capitals of the other provinces. Birds are found in great numbers in the territories belonging to it, the colours of which are ſo bright and variegated, that the artiſts of this country, in order to give additional luſtre to their ſilks, interweave with them ſome of their feathers, which have a ſplendour and beauty that cannot be imitated. Quei-ling has under its juriſdiction two cities of the ſecond claſs, and ſeven of the third. N. lat. 25° 12′. E. long. 109° 51′.

QUEIOS, a river of Spain, in Navarre, which runs into the Ebro, near Tudella.

QUEIRA, a town of Africa, in Ludamar; eight miles S. of Benowm.

QUEIS, a river of Sileſia, which riſes in the principality of Jauer, paſſes by Friedberg, Grieſſenberg, &c. and joins the Bober, between Sprottau and Sagan.

QUEI-TE, a city of China, of the ſecond rank, in Quang-ſi. N. lat. 23° 18′. E. long. 107° 4′.

QUELAINES, a town of France, in the department of the Mayenne; eight miles S. of Laval.

QUELEA, in *Ornithology*, a ſpecies of *Emberiza*; which ſee.

QUELINES, in *Geography*, mountains of Mexico, between the provinces of Guaxaca and Chiapa.

QUELLINUS, ERASMUS, in *Biography*, called the Old, born at Antwerp in 1607, was a pupil of Rubens, and became a painter of hiſtory of very conſiderable reputation. He lived to the age of 71, and left a ſon John Eraſmus Quellinus, who alſo became a painter, but who left the Flemiſh for the Venetian ſtyle of art, which he practiſed at Antwerp, his native city, till he arrived at the advanced age of 85, having been born in 1630.

QUELPAERT, in *Geography*, an iſland in the ſea of Corea, on which a Dutch veſſel, called the Sparrow-hawk, was wrecked in the year 1635, then ſubject to the king of Corea. No iſland preſents a finer aſpect; the middle of the iſland is occupied by a peak of about 800 toiſes, viſible at the diſtance of about 18 or 20 leagues, and the land gradually ſlopes towards the ſea, ſo that the habitations reſemble an amphitheatre. The ſoil to a great height ſeems to be well cultivated. It belongs, however, to a people who are forbidden to hold any intercourſe with ſtrangers, and who detain in ſlavery unfortunate perſons who are wrecked on the coaſts. Some Dutchmen of the Sparrow-hawk, after a captivity of eighteen years, during which they received many baſtinadoes, found means to take away a bark, and to croſs to Japan, from which they arrived at Batavia. N. lat. of the ſouth point 33° 14′. E. long. 126° 35′.

QUELUSIA, in *Botany*, a name given by Vandelli to the beautiful *Fuchſia coccinea*, now ſo common in gardens. The author ſuppoſed it a new genus, and meant thus to honour a royal villa near Liſbon, called *Quelus*, where he firſt ſaw this plant in bloom.

QUEM *redditum reddit*, in *Law*, an old writ which lay where a rent-charge, or other rent, which was not rent-ſervice, was granted by fine holding of the grantor. If the tenant would not attorn, then the grantee might have had this writ.

QUEMARY, in *Geography*, a town of Bootan; 20 miles E. of Beyhar.

QUEMENES, a ſmall iſland in the Engliſh channel, near the coaſt of France. N. lat. 48° 22′. W. long. 4° 48′.

QUEMI, in *Botany*, a name ufed by fome authors for the nigella, or geth.

QUEMIGNY, in *Geography*, a town of France, in the department of the Côte d'Or; nine miles S.W. of Dijon.

QUENDAL Bay, a bay at the S. extremity of the ifland of Shetland. N. lat. 59° 49'. W. long. 1° 40'.

QUENDON *Water-Barrow*, in *Rural Economy*, a contrivance of the barrow kind, much employed in the neighbourhood of the little village of Quendon, in Effex, and from which it takes its name, for the purpofe of conveying water, wafh, and other liquid matters, to live ftock of different kinds, as fattening cattle, hogs, horfes, and other animals, as well as for fome other ufes. It is a fimple and excellent invention for all fuch intentions, as very great facility is given to its motion by means of the wheels, and it is, on the whole, very compact in its general formation, which gives it a fuperiority over many other contrivances of a fimilar nature, as being capable of being put in motion, when full, without any great difficulty, or the application of any extraordinary power or force.

It is reprefented at *figs*. 6 and 7, in *Plate Agriculture*, fhewing the methods of clearing quarries, pits, &c. from water. *Fig*. 6. explains the plan, in which *a b*, *a b*, are the wheels, that faften on to the fide-beams *c d*, *c d*, which are about four feet in length, and have their ends *c*, *c*, formed in fuch a manner as to ferve for handles. E is an oval tub about thirty inches in depth, twenty-four in length, and eighteen in breadth, which is fupported on the beams by two gudgeons, which play in femicircular boxes fixed near the ends of the beams: a crofs piece connects the two beams at *ff*, as does another at *g g*, to which two little curved pieces come, parallel to the form of the tub. The wheels are about four feet in height, and carry the tub fufpended between them; for the gudgeons play almoft over the two fhort axles, which fquare into the beams. Two flight legs are fixed underneath the barrow at *i i*, to keep it in an upright pofition, but they are not at all effential, for the tub would remain in a ftate of equipoife between the wheels even without fuch aid. It muft be noticed, that the tub is funk rather more than one-half below the gudgeons.

Fig. 7. difplays the profile of the vehicle; the dotted line fhews the fize and place of the tub, which is made oval, for the purpofe of confining the breadth between the wheels, fo as to pafs in at narrow door-ways, &c.

It is probable that it might be fomewhat improved by having the axles hooked within, fo as to bear upon two loops in one of the iron hoops, and by this means render the ufe of gudgeons and boxes wholly unneceffary. The tub would lift off and on, as eafily as at prefent, while it would hang in a more precife and perfectly centrical manner. And ftill further, it would be a great convenience, if the upper part of the tub were furnifhed with a proper fpout in the front, in order to pour water or other liquid materials through between the pales, &c. for the fupplying of cattle, &c. This would be more eafily accomplifhed, if the tub were allowed to fwing in a free manner, as it might in that cafe be tilted up with great facility, fo as to favour its being done, as fhewn by the dotted line in *fig*. 2. About the little town noticed above, it is a great deal employed in carrying water for houfe ufe as well as that of farms. It is defcribed in the Agricultural Magazine. Many other forms of water-barrows are made ufe of in different places. See Water-*Barrow*.

QUENEG, or Quenena, in *Geography*, a diftrict of Africa, in the country of Sugulmeffa, near mount Atlas.

QUENOY, Le, a town of France, in the department of the North; five miles N.N.W. of Lille.

QUENTIN, in *Commerce*, a fmall weight ufed in Germany; the ounce contains two lochs, or eight quentins.

Quentin, *St.*, in *Geography*. See St. Quintin.

QUEPO, a town of Mexico, in the province of Cofta Rica, on the Eftrella; 70 miles S S.W. of Carthage.

QUERA, a town of Italy, in the Trevifan; 15 miles W. of Ceneda.

QUERALOS, a town of Spain, in Catalonia; 24 miles E. of Urgel.

QUERCERA, in *Medicine*. See Epialos.

QUERCETO, in *Geography*, a town of Etruria; nine miles S.S.W. of Volterra.

QUERCUS, in *Botany*, the Oak, an ancient Latin name, whofe etymology has been confidered as very uncertain, if not quite inexplicable. So it well might feem to thofe who looked no further than the Greek or Latin languages; for though fome have deduced the word from χοιρος, *a pig*, becaufe pigs feed on acorns, this explanation has not proved fatisfactory. De Theis, on the authority of Lepelletier, has found a much better etymology for *Quercus*, in the Celtic *quer*, fine, and *cuez*, a tree; and this appellation is fuppofed to have been appropriated to the oak, not only for the beauty of the tree, but becaufe it bore the facred plant, mifeltoe. This tree was alfo called in the Celtic tongue *derw*, whence came the word *druid*, or prieft of the oak, and even the Greek δρυς, *an oak*, vulgarly fuppofed the original of druid. (See Druids.)—Linn. Gen. 495. Schreb. 646. Willd. Sp. Pl. v. 4. 423. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 1025. Ait. Hort. Kew. v. 5. 287. Juff. 410. Tourn. t. 349. Lamarck Illuftr. t. 779. Gærtn. t. 37. (Ilex; Tourn. t. 350. Suber; ejufd.)—Clafs and order, *Monoecia Polyandria*. Nat. Ord. *Amentaceæ*, Linn. Juff.

Gen. Ch. Male, in a loofe catkin, *Cal*. Perianth of one leaf, bell fhaped, membranous, with about five fmall, fharp, often cloven fegments. *Cor*. none. *Stam*. Filaments from four to ten, capillary, fhort; anthers large, of two round lobes.

Female, from a bud ufually on the fame tree, *Cal*. Perianth of one leaf, inferior, coriaceous, hemifpherical, rough, entire, very fmall in the flower, permanent. *Cor*. none. *Pift*. Germen fuperior, ovate, very fmall; ftyle fimple, divided above into from two to five fegments, longer than the calyx: ftigmas fimple, permanent. *Peric*. none. *Seed* an oval or roundifh coriaceous nut, of one valve, fmooth, attached by its fcarred bafe to the bottom of the fhortifh, hardened, permanent, cup-like calyx.

Eff. Ch. Male, Calyx bell-fhaped, membranous, lobed. Corolla none. Stamens from five to ten.

Female, Calyx bell-fhaped, coriaceous, entire, rough. Corolla none. Style one. Stigmas from two to five. Nut coriaceous, embraced at the bafe by the hardened calyx.

This genus, fo diftinct in its botanical characters, andfo valuable for its economical ufes, confifts, in the *Species Plantarum* of Linnæus, of no more than thirteen fpecies. The difcoveries of Thunberg, but efpecially thofe of American travellers, aided by the more accurate enquiries of botanifts, have fo greatly enriched the fubject, that Willdenow, who has ftudied it well, enumerates feventy-fix kinds of *Quercus*, and even thefe are not all that we have to defcribe. The importance of many fpecies requires that they fhould all be particularized. Two or three of the Eaft Indian ones, now for the firft time defcribed, offer fome exceptions to the generic character of the calyx.

Section 1.—*Adult leaves undivided and entire*.

1. Q. *Phellos*. Deciduous Willow-leaved Oak. Linn. Sp. Pl. 1412. Willd. n. 1. Ait. n. 1. Purfh n. 1. Sm. in

in Abbot's Insects of Georgia, v. 2. 181. t. 91. Michaux Querc. n. 7. t. 12. (Q. virginiana, salicis longiore folio, fructu minimo; Pluk. Amalth. 180. t. 441. f. 7.)—Leaves membranaceous, linear-lanceolate, tapering at each end, entire, smooth, with a small point. Nut roundish.—Native of North America; in low swampy forests, near the sea-coast, from New Jersey to Florida, flowering in May. *Pursh.* It is said by Mr. Aiton, on the authority of Knowlton's MSS., to have been cultivated in England by Mr. Fairchild, before the year 1723; and indeed, by the collection at Bulstrode, this tree appears to have been planted there much earlier, among those introduced by the first earl of Portland. It rises in its native country, as well as in England, to the height of fifty or sixty feet. The *bark* is smooth; the *wood* is good, and much in use, but of slow growth. *Leaves* scattered, on short stalks, four or five inches long, and not an inch wide, smooth, thin and pliant, of a fine green, with a willow-like aspect, deciduous, their edges slightly wavy. *Acorns* in pairs, roundish, scarcely above half an inch long, with a thin, tuberculated, or tessellated cup. The *leaves* of the young plant are somewhat angular, or toothed at each side. There is said to be a dwarf straggling variety, with shorter *leaves*, which Catesby has figured in his vol. 1. t. 22. Michaux has two supposed varieties, which other botanists esteem distinct species; see the two following. The specific name, chosen by Linnæus, is not a good one, φελλος being the cork-tree.

2. Q. *maritima.* Ever-green Willow-leaved Oak. Willd. n. 2. Pursh n. 2. (Q. Phellos maritima; Michaux Querc. n. 7. var. 2. t. 13. f. 3.)—Leaves coriaceous, elliptic-lanceolate, entire, smooth, with a small point. Nut roundish.—Found on the sea-coast of Virginia and Carolina, flowering in May and June. This differs from the foregoing in its low shrubby habit, and firm evergreen *leaves*, which are more elliptical in shape, and not above two inches long. The whole plant is from three to eight feet only in height. It appears by the accounts of authors to be distinct from the above-mentioned variety of *Phellos.*

3. Q. *sericea.* Silky Willow-leaved Oak. Willd. n. 3. Pursh n. 3. (Q. Phellos; Sm. in Abb. Ins. v. 2. 101. t. 51. Q. Phellos pumila; Michaux Querc. n. 7. var. 3. t. 13. f. 1, 2.)—Leaves lanceolate-oblong, somewhat wavy; obtuse at the base; rather dilated upwards; silky beneath. Nut almost globular.—Native of the sea-coast, from Carolina to Florida, flowering in May. It is perhaps the most humble of the whole genus, scarcely ever exceeding two feet in height, and throwing out creeping scyons, whence it has obtained the name of the Running Oak. The silkiness of the *leaves* beneath gives them a glaucous appearance.

4. Q. *myrtifolia.* Myrtle-leaved Oak. Willd. n. 4. Pursh n. 4.—"Leaves coriaceous, oblong, entire, smooth, acute at each end."—Native of Carolina, according to Willdenow, who alone has noticed this species, and from whom Pursh has admitted it into his work. The *branches* are round, brown. *Leaves* an inch, or rather more, in length, coriaceous, evergreen, oblong, somewhat acute at the base; entire and slightly revolute at the margin; shining above; opaque, but smooth, beneath; on short *footstalks.* The form of the *leaves* is much like the common broad-leaved myrtle. The *flowers* and *fruit* are unknown. *Willd.*

5. Q. *virens.* Live Oak. Ait. Hort. Kew. ed. 1. v. 3. 356. ed. 2. n. 2. Willd. n. 5. Pursh n. 5. Michaux Querc. n. 6. t. 10, 11. (Q. Phellos β; Linn. Sp. 1412. Q. sempervirens; Walt. Card. 234.)—Leaves coriaceous, elliptic-oblong, revolute, entire, pointless; obtuse at the base; clothed with starry down beneath. Fruit stalked. Nut oblong.—Found near the sea-coast of North America, in a soil of sand upon clay, from Virginia to Florida and Missisippi, flowering in May. Miller cultivated it at Chelsea in 1739, but we know not that this species is still preserved, or, at least, distinguished from *Q. Ilex*, in our gardens or plantations. It is one of the most valuable American trees, growing to the height of forty or fifty feet, and extending its *branches*, in open situations, to a great extent; whence it serves, by its dense evergreen *leaves*, to shelter cattle from the summer's heat and winter's cold. The *wood* is the finest and most durable ship timber. It is felled towards the end of autumn, and kept three months before it is used. Michaux recommends this tree to the notice of the French and Spaniards, as likely to thrive well on the sandy coasts of the Mediterranean, and of the western ocean. By his account it succeeds best where there is a basis of clay under the sand, to fix the larger roots. The aspect of the *leaves* is not unlike our European *Q. Ilex*, but they are, except when very young, more uniformly entire, and more shining; their under side less densely pubescent; and their short *footstalks*, as well as the mid-rib, reddish. The foliage of seedling plants, and of vigorous young shoots, is, indeed, strongly toothed. The adult *leaves* are scarcely more than two inches long, somewhat oval, or obovate and bluntish, without any terminal bristle; silky in the spring; subsequently of a dark but shining green, and downy, with starry pubescence, beneath. The *stamens* are but four or five. *Stalks* of the fruit an inch long. *Acorn* cylindrical, an inch long, with a tessellated, but not rugged or tuberculated, cup. The acorns are said to be greedily devoured by hogs, and several wild animals; and to afford an oil, which the savages of Florida mix with their food.

6. Q. *cinerea.* Ash-coloured Silky-leaved Oak. Willd. n. 6. Ait. n. 3. Pursh n. 6. Michaux Querc. n. 8. t. 14. (Q. humilis; Walt. Carol. 234. Q. Phellos β, sericea; Ait. Hort. Kew. ed. 1. v. 3. 354. Q. Phellos γ; Linn. Sp. Pl. 1412.)—Leaves coriaceous, elliptic-lanceolate, revolute, entire, bluntish with a small point; clothed with starry down beneath. Fruit sessile. Nut nearly globose.—Native of dry barren situations, and pine forests, from Virginia to Georgia, flowering in May. Michaux says it springs up chiefly on land that, after having been cultivated, becomes abandoned on account of the bad quality of the soil. The form of the *tree* is unsightly, and its size very variable, from four to twenty feet in height. The *wood* is of no use but for firing. *Leaves* longer than in the preceding; the young ones dilated at the top, with three points. *Fruit* nearly or quite sessile, almost globular, and not much above half an inch long.

7. Q. *microphylla.* Small-leaved Dwarf Oak. Willd. n. 7. Nee in Annal. Scient. Nat. v. 3. 264. Fisch. Misc. Hisp. v. 1. 99. *Willd.*—"Leaves lanceolate, pointed, entire, villous; downy beneath. Calyx of the fruit villous. Nut roundish."—Found by Louis Nee, on the hills of Arambaro, in New Spain. A *shrub*, from three to five feet high, with a rough ash-coloured bark. *Leaves* on short stalks, scattered, numerous, from four to six lines long, scarcely two lines broad, veiny, revolute, wavy, pointed, reddish-grey; villous above; densely downy beneath; those about the extremities of the branches opposite. *Stipulas* awl-shaped, falling off at the close of summer. *Acorns* in axillary pairs, about the ends of the branches, ovate, the size of a large pea, half covered by the villous cup, which is invested with unequal scales. *Nee.*

8. Q. *salicifolia.* Mexican Willow Oak. Willd. n. 8. Nee in Annal. Scient. Nat. v. 3. 265. Fisch. Misc. Hisp. v. 1. 101. *Willd.*—"Leaves oblong-lanceolate, entire, smooth; the forks of the veins villous and brown beneath. Nut oblong."

long."—Found by Lewis Nee, in the kingdom of Mexico, near Acapulco. A *tree* twenty-eight feet high, with alternate *branches*; the young ones ſomewhat furrowed, and clothed with browniſh-red hairs. *Leaves* from five to ſeven inches long, an inch wide, ſcattered, on ſhort ſtalks, rather coriaceous, ſmooth, veiny, entire, wavy, pointed; reticulated and green above; yellowiſh beneath, with tufts of hairs, as big as a pin's head, in the forks of the veins. *Acorns* nearly ſeſſile, in axillary pairs, the ſize of a hazelnut, downy, half covered by the hemiſpherical, greyiſh, villous cup, beſet with very thin ſcales. *Nee.*

9. Q. *glabra*. Smooth-leaved Japan Oak. Thunb. Jap. 175. Willd. n. 9.—"Leaves lanceolate-oblong, pointed, ſmooth, with parallel veins."—Gathered by Thunberg in Japan. A *tree*, whoſe *branches* grow two or three together, ſlightly ſpreading, rugged and knotty. *Leaves* alternate, ſtalked, lanceolate-oblong, entire, pointed, with parallel ribs (veins); tapering at the baſe; ſmooth on both ſides; ſhining above, yellowiſh beneath. *Spikes* of flowers either ſolitary, or two or three together, downy. *Thunberg.*

10. Q. *concentrica*. Concentric-furrowed Oak. Loureir. Cochinch. 572. Willd. n. 10.—"Leaves lanceolate-ovate, pointed, incurved, entire. Calyx lax, very ſhort, furrowed concentrically."—Native of the lofty foreſts of Cochinchina. A large *tree*, whoſe wood is ſerviceable for various uſes. *Branches* aſcending. *Leaves* ſcattered, ſtalked, ſmooth on both ſides. *Acorns* ſtalked, oblong-ovate, ſmooth, red, pointed, their cups ſhort and lax, externally marked with five parallel circular furrows; ſee n. 27.

11. Q. *molucca*. Molucca Oak. Linn. Sp. Pl. 1412. Willd. n. 11. Rumph. Amboin. v. 3. 85. t. 56.—Leaves elliptic-lanceolate, entire, acute at each end, ſmooth. Nut roundiſh, furrowed.—Native of the Molucca iſles. A large and lofty *tree*, whoſe wood is hard and heavy, laſting long under water. *Leaves* ſix or eight inches long and three broad, on ſhort ſtalks, with eight or ten irregular lateral veins. *Acorns* ſhort and roundiſh, furrowed in their upper part; the cup ſhort, warty. By Rumphius's account, there ſeem to be more ſpecies than one comprehended under the chapter above cited, but he does not give us ſufficient marks to define them ſpecifically.

12. Q. *ſpicata*. Cluſter-fruited Oak.—Leaves elliptic-lanceolate, taper-pointed, entire, ſmooth. Spikes axillary, ſolitary, dioecious. Fruit ſpiked, aggregate, ovate.—Gathered by Dr. Francis Buchanan, in woods at Suembu, in Upper Nepaul, flowering in May, 1802. This is a *tree* of vaſt dimenſions, whoſe wood is uſeful, though inferior in quality to that of *Q. annulata*, n. 22. The younger *branches* are angular, clothed with very minute green pubeſcence. *Leaves* alternate, ſtalked, of a broad lanceolate, or elliptical figure, with a taper point, entire throughout, ſix or ſeven inches long, and two and a half wide; bright green, ſmooth and ſhining above; paler, opaque, but ſcarcely pubeſcent, beneath; furniſhed with numerous, parallel, tranſverſe veins. *Footſtalks* not an inch long, depreſſed. *Stipulas* deciduous. *Flowers* in long, linear, downy, pale, ſtraight, ſolitary, axillary *ſpikes*; the males with about eight *ſtamens*, much longer than the calyx, and a roundiſh rudiment of a germen in the centre; females on a ſeparate tree, crowded three together in ſeſſile groups in each ſpike. *Acorns* eatable, but not very good, the ſize and ſhape of a large filberd, even, pointed, dark brown; their cups ſhort, ſcaly. The original natives of Nepaul, or Nawars, know this tree by the name of *Guey Saſhi*, or *Pacuſhingali*: their Hindu conquerors, the Parbutties, call it *Arcaula*.

13. Q. *tribuloides*. Caltrop-fruited Oak.—Leaves ovato-lanceolate, taper-pointed, entire, ſmooth. Spikes aggregate. Calyx of the fruit ſpinous, covering the nut.—Diſcovered by the ſame able botaniſt as the preceding, in the foreſts of Upper Nepaul, flowering and fruiting at various ſeaſons. A *tree* with ſmooth *branches*. *Leaves* on ſhort ſtalks, lanceolate, more or leſs ovate, ſomewhat unequal at the baſe, about four inches long, and one and a half broad, rigid and rather coriaceous, with irregular, diſtant, ſlightly curved veins; the upper ſurface poliſhed; the under paler and opaque. *Flowers* monoecious, in ſlender, downy, cluſtered, axillary or terminal, pendulous ſpikes, the male ſpikes moſt numerous. *Stamens* about eight, with a dotted central diſk. *Acorns* ſpiked, ſcattered, ovate, ſmooth, obliquely pointed, about half an inch long, entirely concealed in the greatly enlarged *calyx*, which is downy, globoſe, and armed with very numerous, rigid, prominent, ſharp thorns, a quarter of an inch, or more, in length, ſpreading in every direction. This ſpecies is called *Cattum*, or *Cattunge*, in the Parbutty language; *Shingali*, or *Catu Shingali*, by the Nawars. Its great peculiarity conſiſts in the acorns, which are eatable, being entirely encloſed in a ſtrongly muricated *calyx*, or globoſe cup, which approaches the nature of the cheſnut, *Fagus Caſtanea*, and in ſome of our ſpecimens ſeems even to ſplit into two or three valves. The flowers, however, agree with *Quercus*, to which genus Dr. Buchanan referred this remarkable plant. On one tree he obſerved the *flowers* to be all female.

14. Q. *laurifolia*. Laurel-leaved Oak. Willd. n. 12. Ait. n. 4. Purſh n. 8. Michaux Querc. n. 10. t. 17, 18.—Leaves obovate, entire, ſmooth, nearly ſeſſile; tapering at the baſe. Nut roundiſh, even.—Native of ſhady foreſts, and the ſea-coaſt, in Georgia and South Carolina, flowering in May. This is ſometimes called the Swamp Willow, and was firſt brought alive to England, by the late Mr. Fraſer, in 1786. It riſes to the height of fifty or ſixty feet. Michaux ſpeaks of the wood as of a good quality, but inferior on the whole to that of our fifth ſpecies, *Q. virens*. The *leaves* are crowded about the ends of the branches, deciduous, about four inches long, uſually acute, but ſometimes, as in Michaux's t. 18, remarkably obtuſe. *Acorns* ſolitary, nearly ſeſſile, almoſt globoſe, with a ſcaly cup.

15. Q. *imbricaria*. Shingle Oak. Willd. n. 13. Ait. n. 5. Purſh n. 7. Michaux Querc. n. 9. t. 15, 16.—Leaves elliptic-oblong, acute at each end, entire, almoſt ſeſſile; downy beneath. Nut nearly globoſe.—Native of the banks of rivers among the Allegany mountains, and in the countries to the weſt, rarely to the eaſt of thoſe mountains, flowering in May and June. Brought to England in 1786, by Mr. Fraſer. The *leaves* are twice the ſize of the laſt, acute, but not contracted, at their baſe, and downy on the under ſide. *Acorns* much like the laſt-deſcribed. This *tree* is forty or fifty feet high. Its wood is chiefly uſed, by the French ſettlers in the Illinois country, for making boards to cover houſes, whence the appellation of *Q. imbricaria* in Michaux, and of Shingle Oak among the Engliſh Americans. For although the ſcales of the cup are rather larger than thoſe of *Q. laurifolia*, the ſpecific name does not allude to that circumſtance.

16. Q. *elliptica*. Oval-leaved Mexican Oak. Willd. n. 14. Nee in Annal. Scient. Nat. v. 3. 278. Fiſch. Miſc. Hiſp. v. 1. 117.—"Leaves elliptical, entire, coriaceous, nearly ſeſſile; rounded at each end; roughiſh beneath. Gathered by Louis Nee, but without flowers or fruit, in the kingdom of Mexico, by the road from Ixmiquilpan to Cimapan, as well as between Tixtala and the river Azul. The *trunk* is thick, twelve feet high, with a grey bark. *Branches* horizontal; the ſmaller ſhoots erect; all

all very leafy. *Leaves* three inches long, and one and a half broad, flightly revolute; fmooth above; roughifh and veiny beneath, the veins forked. *Footftalks* thick and very fhort. *Nee.*

17. Q. *acuta.* Pointed-leaved Japan Oak. Thunb. Jap. 175. Willd. n. 15.—" Leaves oblong, pointed, entire, with parallel veins; rounded at the bafe; downy when young."—Obferved by Thunberg in Japan. The *branches* are knotty, afh-coloured, dotted with white, fmooth downy at the fummit. *Leaves* alternate, ftalked, fmooth, when full-grown; covered at the back, when young, with rufty down. *Spikes* axillary, clothed with fimilar pubefcence. *Thunberg.*

18. Q. *magnoliæfolia.* Magnolia-leaved Oak. Willd. n. 16. Nee in Annal. Scient. Nat. v. 3. 268. Fifch. Mifc. Hifp. v. 1. 103.—" Leaves ovate-oblong, coriaceous, entire, fhining; downy beneath; fomewhat emarginate at the bafe. Fruit racemofe."—Found by Louis Nee, in the kingdom of Mexico, between Chilpancingo and Tixtala, and about the river Azul. This is an elegant *tree*, twenty feet, or more, in height. *Trunk* thick, with a dark-coloured bark full of fiffures. *Branches* horizontal; younger ones furrowed, and dotted with white. *Leaves* fix or eight inches long, and three broad, ovate, rigid; fometimes emarginate at the bafe; green and fhining above; downy beneath, with the larger veins prominent, and the fmaller reticulated. *Footftalks* thick, a line in length. *Stipulas* crifped, downy, deciduous. Female *clufters* folitary, axillary, two inches long; the lower ones alternate, upper oppofite. *Acorns* ovate, half covered by their hemifpherical cup, which is the fize of the feed of *Cicer arietinum*, its fcales fcarcely at all imbricated. *Nee.*

19. Q. *lutea.* Yellow-leaved Mexican Oak. Willd. n. 17. Nee in Annal. Scient. Nat. v. 3. 269. Fifch. Mifc. Hifp. v. 1. 105.—" Leaves obovate, entire, fhining; fomewhat heart-fhaped at the bafe; downy and yellow beneath." —Found in Mexico by the fame celebrated traveller and botanift. This agrees with the preceding in its mode of growth, and fructification, infomuch that it may be thought a variety; yet the *leaves* are very different. They are of a larger fize, broader towards the end, and contracted towards the *footftalk*, as well as more deeply emarginate at the bafe; and their under fide is clothed with ochrey yellow pubefcence.

20. Q. *femecarpifolia.* Marking-nut-leaved Oak.—Leaves obovate, obtufe, coriaceous, entire; heart-fhaped at the bafe; downy beneath; the young ones with fpinous teeth. —Gathered by Dr. F. Buchanan, on the banks of torrents in Upper Nepaul, where its Parbuttie appellation is *Caffur*, and its Nawar name *Ghirfi.* This is a middle-fized *tree*, with angular *branches*, clothed when young with fcaly down. *Leaves* evergreen, alternate, on fhort thick *ftalks*, obovate-oblong, four or five inches in length, and two in breadth; more or lefs heart-fhaped at the bafe; their upper furface fmooth and fhining; the under opaque, clothed with rufty down, and furnifhed with numerous, irregular, rather diftant, tranfverfe, prominent veins; their margin entire, flightly wavy. The extremity is ufually rounded and obtufe, fometimes abrupt, fometimes tipped with a little fpine. On young branches the *leaves* are ferrated with ftrong fpines, or even finuated, and clothed on both fides with rufty down. *Stipulas* in pairs, awl-fhaped, erect, permanent, as long as the footftalks. Dr. Buchanan did not obferve the *flowers* or *fruit.* The afpect of the adult *leaves* is much like thofe of *Semecarpus Anacardium*, or fome of the entire-leaved fpecies of *Ficus.*

Section 2.—*Leaves more or lefs toothed or ferrated.*

21. Q. *glauca.* Glaucous-leaved Oak. Thunb. Jap. 175. Banks Ic. Kæmpf. t. 17. Willd. n. 11. (Kas no ki: Kæmpf. Amoen. 816.)—Leaves obovate, pointed; ferrated towards the extremity; glaucous beneath. Nut roundifh. —Gathered near Nagafaki, in Japan, by profeffor Thunberg, to whom we are obliged for a fpecimen. He defcribes it as a very large *tree*, whofe *branches* are fomewhat umbellate, erect, round, purple, fmooth, except fome prominent white points. The *leaves* are alternate, about three inches long, and near two broad, with a blunt projecting point; their upper furface fmooth and polifhed; the under covered with a fine glaucous mealinefs, and marked with prominent, ftraight, parallel, but rather diftant, obliquely tranfverfe veins; the margin diftantly ferrated upwards. *Footftalks* about half an inch long, purple. *Flowers* axillary. *Acorns*, by Kæmpfer's figure, axillary, often in pairs, of a roundifh tumid fhape, pointed, not an inch long, their cups fhort, feemingly marked with concentric lines; their *ftalks* fimple, fhort and thick.

22. Q. *annulata.* Ring-cupped Oak.—Leaves obovate, pointed; ferrated in their upper half; fomewhat glaucous and downy beneath. Fruit fpiked. Nut oblong. Calyx furrowed concentrically.—Gathered by Dr. Buchanan, at various places in Upper Nepaul, bearing fruit, in December 1802. A very large *tree*, whofe wood is excellent; the *branches* two or three together, fmooth. *Leaves* evergreen, rigid, exactly like thofe of the laft fpecies, but fomewhat filky beneath, and lefs glaucous; the young ones very filky. *Stipulas* linear, hairy, longer than the footftalks, deciduous. *Male flowers* in pendulous, hairy, yellowifh, fhortifh fpikes, fpringing from buds below the leaves, whofe fcales are imbricated in five rows: *female* from three to fix, in folitary, axillary, upright, ftalked, fmooth fpikes, about the length of the footftalks. *Calyx* of the female flowers globofe, fmaller than hempfeed, compofed of feveral concentric imbricated layers, of which the outermoft is fmooth and notched, the reft downy and entire. *Germen* globofe. *Style* very fhort and thick. *Stigmas* three, obtufe. *Acorns* quite feffile on the common flower-ftalk. *Cup* rather fmaller than that of our Britifh oaks, entire and even at the edge, compofed of feven or eight concentric, annular, imbricated, crenate fcales, externally filky. *Nut* ovate, acute, fmooth and even, twice as long as the cup. The Parbutties call this tree *Phullaat*; the Nawars *Gufhi*, or *Paca ftringali.*

We find great reafon to think that it may be, as Dr. Buchanan fufpected, the fame fpecies with Thunberg's *glauca* laft defcribed. The *leaves* of his fpecimen fhew a flight degree of pubefcence about the veins, but have not the minute filkinefs of our's. The greateft and moft effential difference, if Kæmpfer be as correct as ufual, confifts in the female inflorefcence. He delineates the acorns of *glauca* on fhort, fimple, axillary *ftalks*, either folitary or in pairs; and Thunberg defcribes the *flowers* as axillary. In our plant the female *flowers* are indeed axillary, but they compofe a ftalked *fpike*, and neither they nor the *acorns* have any partial ftalks. Such differences are found between other fpecies of Oaks, and prove effential and invariable. We therefore cannot but, for the prefent at leaft, rely on Kæmpfer's known fidelity, and propofe our *Q. annulata* as a diftinct fpecies.

23. Q. *lamellofa.* Many-cupped Oak.—Leaves elliptic-oblong, pointed, ferrated, many-veined; glaucous and fomewhat downy beneath. Calyx of many concentric entire layers, as long as the nut.—Difcovered by Dr. Buchanan, in the more remote woods of Nepaul, bearing fruit in December 1802. In the Nawar language it is called *Tuppafufhi.* The *tree* is lofty, with fmooth bluntly-angular *branches.* *Leaves* alternate, fix inches in length and two in breadth, elliptic-

elliptic-oblong, rigid, taper-pointed, ſharply ſerrated; ſmooth and green above; glaucous and often finely downy beneath, with innumerable, prominent, crowded, ſtraight, parallel, moſtly oppoſite, obliquely tranſverſe veins: the aſpect and ſize of the *leaves* much reſembling *Dillenia indica*. *Footſtalks* an inch and half long, tumid at the baſe. *Stipulas* deciduous. Female *flowers* in ſhort axillary ſpikes. *Acorns* ovate, pointed, the ſize of cheſnuts, each completely enveloped and concealed by the large, globular, downy *cup*, which is as big as a ſmall apple, and conſiſts of eight or nine diſtinct, concentric, entire, imbricated layers, much more deeply ſeparated than the rings of *Q. annulata*. An approach towards the genus *Fagus*, or *Caſtanea* of ſome authors, may be obſerved, as Dr. Buchanan ſuggeſts, in this ſpecies, which is nevertheleſs a genuine *Quercus*, and far leſs doubtful than our *tribuloides*, n. 13. It proves however that the mere elongation of the acorn, beyond the cup, is not an indiſpenſable character of the preſent genus. See alſo *tomentoſa*, n. 42.

24. Q. *cuſpidata*. Pointed Japan Oak. Thunb. Jap. 176. Willd. n. 19. (Sui, vulgò Sſi no ki; Kæmpf. Amoen. 816.) "Leaves ovate, pointed, ſerrated, ſmooth. Calyx prickly." —Native of Japan, about Nagaſaki. A *tree*, with ſtriated, ſmooth, ſpreading *branches*. *Leaves* alternate, ſtalked, an inch long, ovate, rounded at the baſe, pointed, ſmooth on both ſides, with parallel veins; their upper half ſerrated. *Female flowers* ſcattered over the young branches, ſolitary, nearly ſeſſile. Cup of the *acorn* prickly, the ſize of a hazelnut. *Thunb*. This ſpecies, like n. 13, appears, by its prickly cup, allied to *Fagus;* eſpecially as Kæmpfer, who calls it *Fagus folio fraxini*, deſcribes the dry cup as ſplitting into three, four, or five parts. The *nut* is eaten by the Japaneſe, either raw or cooked.

25. Q. *ferrata*. Saw-leaved Japan Oak. Thunb. Jap. 176. Willd. n. 20.—"Leaves oblong, ſerrated, villous and downy, with parallel veins."—Native of Japan, flowering in May and June. A *tree*, with alternate, ſmooth, aſh-coloured, knotty, ſpreading *branches*, beſprinkled with white tubercles. *Leaves* alternate, pointed, all acutely and equally ſerrated, furniſhed with ſtraight parallel veins; green above and very ſilky when young; paler beneath, ſilky and downy at firſt, but ſubſequently more ſlightly villous; their length from one to three inches. Male *flowers* in hairy, drooping, long-ſtalked *ſpikes*, each an inch long. Our ſpecimen is in an early ſtate of foliage, nor have we any account of the *fruit*, or female *flowers*.

26. Q. *dentata*. Tooth-leaved Japan Oak. Thunb. Jap. 177. Willd. n. 69. (Koku; Kæmpf. Amoen. 816.) —"Leaves obovate-oblong, obtuſe, deeply toothed; downy beneath."—Native of hills in Japan, flowering in April and May. A *tree*, with thick, erect, rugged, furrowed *branches*, beſprinkled with dots and tubercles; downy at the ſummits. *Leaves* crowded about the extremities, on very ſhort ſtalks, obovate-oblong, obtuſe, with deep teeth deſtitute of ſpines; villous above; downy beneath; pliant, two inches long; their veins parallel. *Thunb*. Kæmpfer ſays the wood is white.

27. Q. *lanata*. Woolly-leaved Nepaul Oak.—Leaves elliptic-oblong, ſharply ſerrated, coriaceous; denſely woolly beneath. Fruit in axillary ſolitary ſpikes. Calyx ſcaly, without prickles. Native of the mountains of Upper Nepaul, flowering in April. *Buchanan*. The Parbutties call it *Banza*, or *Banja;* the Nawars *Soſhi Shingali*. This is a *tree* of vaſt dimenſions, with a ſcaly bark, and rigid, brown, warty *branches*, clothed, when young, with denſe white down. *Leaves* alternate, ſomewhat two-ranked, ſtalked, elliptic-oblong, ſometimes rather obovate, pointed, from three to five inches in length, and two or more in breadth ſtrongly and ſharply ſerrated, except at the very baſe, which is more or leſs rounded, and occaſionally unequal; the upper ſurface green, ſhining, and naked, (except when young), but not quite ſmooth to the touch; the under clothed with fine, denſe, uniform, white, woolly pubeſcence, and marked with prominent, parallel, but not very crowded, obliquely-tranſverſe veins. *Footſtalks* ſtout, downy, ſcarcely an inch long. *Stipulas* ovate, membranous, deciduous. Male *flowers* in ſhort, denſe, hairy *ſpikes*, at the baſe of the young ſhoots, as they protrude from the bud. *Calyx* with five or ſix teeth. *Anthers* about ſix, ſeſſile. Female *flowers*, as far as Dr. Buchanan could obſerve, on a ſeparate tree, in very ſhort, ſolitary, axillary *ſpikes*. *Acorns* either ſolitary, or ſeveral crowded together, ſmall, ovate, hairy, half covered by their ſcaly unarmed cups.

28. Q. *diverſifolia*. Various-leaved Mexican Oak. Willd. n. 21. Nee in Annal. Scient. Nat. v. 3. 270. Fiſch. Miſc. Hiſp. v. 1. 107. *Willd*.—Leaves ovate, undivided or deeply toothed; yellow and downy beneath. Fruit ſpiked, globoſe.—Found by Louis Nee, between the villages of Chalma and Santa Roſa in New Spain. A *ſhrub*, from ten to fourteen feet high; its *trunk* ſeldom ſtraight; the *bark* cracked, dark-coloured; the *branches* alternate. *Leaves* either an inch and half long, and undivided, or two inches and a half, and deeply toothed; ſmooth and ſhining above; downy, and dull yellow, beneath. *Footſtalks* hardly a line in length. *Stipulas* oblong, reddiſh, membranous, contracted at the baſe, deciduous. *Acorns* four or five, ſeſſile, on a thread-ſhaped axillary ſtalk, two inches long. *Cup* the ſize and ſhape of a pea, covered with ſcales. *Nuts* ſcarcely projecting above a line beyond the cup. *Nee*. The *fruit*, being ſeſſile, is evidently ſpiked, not, as the authors quoted term it, racemoſe.

29. Q. *agrifolia*. Holly-leaved American Oak. Willd. n. 22. Nee in Annal. Scient. Nat. v. 3. 271. Fiſch. Miſc. Hiſp. v. 1. 108. *Willd*. Purſh n. 9.—Leaves roundiſh-ovate, ſomewhat heart-ſhaped, ſmooth on both ſides, with ſpinous teeth. Fruit axillary, ſeſſile. Scales of the calyx lax. Nut ovate.—Native of the weſt (not eaſt) coaſt of North America, near Monterey, and Nootka ſound. *Nee*. *Branches* ſmooth, aſh-coloured. *Leaves* about two inches long, and almoſt as wide, ſmooth, veiny, nearly heart-ſhaped, bordered with diſtant ſpinous teeth. Spikes of *male flowers* an inch long. *Calyx* ſhorter than the ſtamens. *Anthers* five, two-celled. *Female flowers* axillary, ſeſſile, moſtly two together. *Calyx* hemiſpherical, beſet with lax yellow ſcales. *Nut* thrice as long as the calyx, meaſuring eight lines, ovate, acute. *Nee*.

Plukenet's t. 196. f. 3, cited with doubt by Willdenow and Purſh, appears to belong, as Linnæus thought, to his own *Hippomane ſpinoſa*. The ſhape of the leaves certainly does not agree with the above deſcription, though perfectly anſwerable to Plumier's figure of this *Hippomane*, which is *Sapium ilicifolium* of Willdenow, Sp. Pl. v. 4. 573, who there copies the ſame ſynonym from Linnæus, without any mark of uncertainty.

30. Q. *gramuntia*. Holly-leaved Montpellier Oak. Linn. Sp. Pl. 1413. Willd. n. 23. Ait. n. 6. (Ilex foliis rotundioribus et ſpinoſis, e luco gramuntio; Magn. Monſp. 140.)—Leaves roundiſh-elliptical, nearly ſeſſile, undulated, with deep ſpinous divaricated teeth; denſely downy beneath; ſomewhat heart-ſhaped at the baſe.—Native of the wood of Gramont, near Montpellier, and of Spain. Cultivated in England in 1730. It bloſſoms in June. This is rather a ſmall ſtraggling *tree*, with numerous round grey *branches*, downy when young. *Leaves* evergreen, ſcarcely an inch long,

long, rigid, broadly elliptical, often nearly orbicular, very much undulated at the margin, their deep broad fpinous teeth pointing every way; the upper furface dark green, rather glaucous, befprinkled with minute ftarry hairs; the under denfely clothed with white entangled down. We have feen neither *flowers* nor *fruit*. Willdenow appears miftaken in difcarding the fynonym of Magnol, which anfwers extremely well to the Linnæan fpecimens, though indeed the author fpeaks of his plant as a variety of *Q. Ilex*. It is, neverthelefs, true that Linnæus confounded herewith a plant from Magnol's herbarium, which is not diftinct from *Q. Ilex*.

31. Q. *Ballota*. Sweet-acorn Oak. Desfont. Atlant. v. 2. 350. Willd. n. 24. (Ilex major; Cluf. Hift. v. 1. 23?)—Leaves elliptical, coriaceous; entire or ferrated; very downy beneath. Bark even. Nut cylindrical, elongated.—Native of feveral places in the neighbourhood of mount Athos, according to profeffor Desfontaines, from whom we have a wild fpecimen. It flowers in May. This is a large and handfome evergreen *tree*, whofe *trunk* is from twenty to thirty feet high; the *wood* hard, compact, and very ufeful; the *bark* even, not corky, though full of fiffures; *branches* downy. *Footftalks* a quarter of an inch long, downy. *Leaves* various in fhape, but more or lefs elliptical, an inch or inch and half long; either quite entire, or ferrated with fmall fpinous teeth; their upper furface, at leaft when young, befprinkled with minute ftarry hairs; the under always very white and denfely downy. *Male flowers* in copious, long, lax, pendulous *fpikes*, with ufually feven *ftamens; female* on the fame tree, axillary, folitary or aggregate. *Acorns* cylindrical, an inch and half or two inches long, half an inch in diameter, eatable and very palatable, either raw or roafted. *Cup* hemifpherical, covered with numerous, obtufe, downy, clofely imbricated fcales.

32. Q. *Ilex*. Common Evergreen Oak, or Holm Oak. Linn. Sp. Pl. 1412. Willd. n. 25. Ait. n. 7.—Leaves ovate-oblong, acute, coriaceous; entire or ferrated; hoary beneath. Bark even. Nut ovate. The varieties are; α, with lanceolate entire leaves; Smilax Dalech; Bauh. Hift. v. 1. part 2. 101. Suber fecundus; Matth. Valgr. v. 1. 188, as to the figure: β, with lanceolate ferrated leaves; Ilex; Matth. Valgr. v. 1. 186. Duham. Arb. v. 1. t. 123: γ, with rounder, lefs rigid, and more or lefs ferrated leaves; Phellodrys; Matth. Valgr. v. 1. 189, as to the figure. Ilex n. 3; Duham. Arb. v. 1. t. 124. This fpecies occurs in various parts of the fouth of Europe, and north of Africa, and is hardy, as well as evergreen, with us, thriving particularly near the fea, though of flow growth, flowering in May and June. It ufually forms a large bufhy tree, but occafionally rifes with a ftraight naked trunk, and round head, to a great height. The *wood* is hard and heavy, valuable for many purpofes. The French ufe it for pullies in the navy. The *bark* is hard and even, not corky. *Leaves* various in fhape and fize; dark green, convex, and quite fmooth, above; hoary or downy beneath; their edges either revolute and entire, or irregularly notched and ferrated. *Footftalks* half an inch long, downy. *Acorns* ufually two, on an axillary downy ftalk which is longer than the footftalk, ovate, hardly an inch long, with a fcaly downy cup. They are eaten by hogs, but are very different in fhape and quality from thofe of the laft-defcribed fpecies. So many varieties, or fpecies, nearly correfponding with thefe two, are mentioned by authors, that it is difficult to underftand them. The fubject requires, and well deferves, a practical inveftigation. Lamarck, under the article Chêne, in his dictionary, mentions feveral kinds, which he knew but imperfectly, and which we have no means of elucidating further, fo that we dare not adopt, or attempt to reduce them to order.

33. Q. *Suber*. Cork Tree. Linn. Sp. Pl. 1413. Willd. n. 26. Ait. n. 8. Hunter's Evel. Sylv. 362, with a plate. (Suber; Camer. Epit. 115. S. primus; Matth. Valgr. v. 1. 187. S. latifolium, perpetuò virens; Duham. Arb. v. 2. 291. t. 80. S. latifolium; Ger. Em. 1347, the middle figure only.)—Leaves ovate-oblong, bluntifh, coriaceous; entire or fharply ferrated; downy beneath. Bark cracked, fungous.—Native of the fouth of Europe, and north of Africa. Duhamel fays it can hardly bear the climate of the north of France. It lives however in our Englifh gardens, where it has been kept more than a century. The *bark* is remarkable for a thick fpongy coat, yielding the well-known fubftance called cork. The *leaves* much refemble the broad variety of *Q. Ilex*, nor do the *acorns* greatly differ from thofe of that tree. We have not been able to afcertain what authors mean by their *Suber anguftifolium non ferratum*, the figure of which, Matth. Valgr. v. 1. 188. Duham. Arb. v. 2. t. 81, we have cited as our firft variety of *Ilex*. We fhould fufpect the *Suber* itfelf to be altogether a variety of *Ilex*, differing only in the bark; and that there might be a broad and a narrow-leaved variety of each; were not the dwarf tufted ftumpy habit of the Cork Tree, on the fandy plains of Italy, Spain, &c. fo peculiar. Yet this poffibly may, as well as the nature of the bark, be owing to the foil, for in ftrong ground the cork, according to Duhamel, degenerates. Willdenow fays "the *leaves* of *Q. Suber* are a little elongated at the bafe, running down into the *footftalk*, which is not the cafe with *Ilex*;" but this character feems fcarcely permanent.

34. Q. *coccifera*. Kermes Oak. Linn. Sp. Pl. 1413. Willd. n. 27. Ait. n. 9. (Ilex coccifera; Camer. Epit. 774. I. aculeata cocciglandifera; Garid. Aix. 245. t. 53. Niffole in Mem. de l'Acad. des Sciences for 1714. 435. t. 17, 18. I. coccigera; Ger. Em. 1342.)—Leaves elliptic-oblong, rigid, fmooth on both fides, with fpreading, briftly, fpinous teeth. Nut ovate. Calyx with fpreading pointed fcales.—Native of the fouth of Europe, and the Levant, flowering in the fpring. This is a bufhy evergreen *fhrub*, celebrated for producing the *kermes*, a valuable article of dyeing, before the introduction of cochineal, and which afforded the *color kermefinus*, or crimfon. The *kermes* is an infect, of the genus *Coccus*, which fticks to the branches, in the form of a red ball, the fize of a pea. It is now out of ufe among dyers, and is only ufed by French apothecaries. The *leaves* of this fhrub are, at moft, but half the fize of the laft, though they vary much in magnitude as well as figure. They are diftinguifhed by their rigidity, fmoothnefs on both fides, and their prominent needle-like marginal prickles. The fcales of the mature *calyx* are alfo much more elongated and prominent than in *Ilex* or *Suber*, and of an angular awl-fhaped figure.

35. Q. *Pfeudo-coccifera*. Baftard Kermes Oak. Desfont. Atlant. v. 2. 349. Willd. n. 28.—Leaves elliptic-oblong, rigid, fmooth on both fides, with fpinous ferratures. Nut ovate. Calyx with flat, flightly fpreading, fcales.—Obferved by Desfontaines at Algiers and about mount Athos. At Tunis it is called the "meal-bearing oak," probably from the ufe of the acorns as food. This is a *tree*, from fifteen to twenty feet high, with round *branches*, clothed with rufty down when young. The *leaves* are twice or thrice as large as thofe of *Q. coccifera*, thicker and lefs wavy, with much fmaller and fhorter fpinous ferratures, rather than teeth. *Calyx* clothed with numerous, flat, fhort, flightly fpreading fcales. *Nut* ovate, pointed. Willdenow, not having feen a fpecimen, has mifunderftood the

the nature of the *calyx*, and has in other refpects altered Desfontaines' fpecific character for the worfe.

36. Q. *rigida.* Rigid-leaved Oak. Willd. n. 29.—(Ilex aculeata cocciglandifera, glande maximâ, nunc cylindraceâ, nunc fubrotundâ, cupulâ echinatâ; Tourn. Cor. 40?—"Leaves oblong, undivided, with fpinous ferratures, fmooth; glaucous beneath; heart-fhaped at the bafe. Footftalks bearded at the fummit. Scales of the calyx of the fruit rigid, fpreading."—Native of the coaft of Caramania. *Willdenow.* A pretty fpecies, fufficiently diftinct from its allies. *Branches* pale brown, dotted. *Leaves* oblong, an inch or rather more in length, rigid, with fpinous ferratures; deep green and fhining above; glaucous beneath; cordate at the bafe. *Footftalks* very fhort, fmooth, except at the top, where a line of brownifh hairs, on each fide, runs up the midrib. *Calyx* of the fruit feffile, befet with rigid, woody, lanceolate, fpreading fcales. *Willd.*

A fpecimen before us, gathered by the late Dr. Brouffonet at Algiers, anfwers precifely to this defcription, efpecially in the curious character of the hairy lines, running a little way up the midrib of the leaf; but the foliage is equally green and fhining on both fides. The *calyx* refembles that of *coccifera,* but its inner fcales are longer, and more fpreading.

37. Q. *rotundifolia.* Round-leaved Spanifh Oak. Lamarck Dict. v. 1. 723. Willd. n. 30.—"Leaves obovate-oblong, abrupt, with fpinous teeth; heart-fhaped at the bafe; fmoothifh above; downy beneath."—Native of Spain. Seen by Lamarck, in a young ftate, in the garden of Monf. Cels, and by Willdenow dry without fructification. The *branches* are round and downy. *Leaves* ftalked, an inch or more in length; glaucous-grey, and not quite fmooth, above; white and cottony beneath. The *acorns* are faid to be large and long, eatable like chefnuts. This defcription is not inapplicable, on the whole, to our n. 31, *Q. Ballota.*

38. Q. *humilis.* Dwarf Portuguefe Oak. Lamarck Dict. v. 1. 719. Willd. n. 31. Ger. Em. 1340. (Q. pedem vix fuperans; Bauh. Pin. 420. Robur 7; Cluf. Hift. v. 1. 19.)—Leaves obovate, with fpinous ferratures; heart-fhaped at the bafe; downy beneath. Calyx of the fruit flattened. Nut oblong.—Found by Clufius in barren fandy ground near Lifbon, very abundantly. The whole plant is rarely more than a foot high when wild; though Lamarck fays it becomes twice or thrice as tall by culture. The young *branches* are downy. *Leaves* an inch, or inch and half long, on fhort *footftalks;* fmooth and fhining above; downy and hoary beneath; their larger veins ftraight and parallel. The *acorns* are defcribed as more bitter than our common oak, their form oblong, their cups remarkably fhort and flattened.

39. Q. *lufitanica.* Portuguefe Gall Oak. Lamarck Dict. v. 1. 719. Willd. n. 32. (Q. valentina; Cavan. Ic. v. 2. 25. t. 129? Robur 4; Cluf. Hift. v. 1. 18, and R. 5; ibid. 19. Galla five Robur majus; Ger. Em. 1348, and G. minor; ibid. 1349.)—"Leaves elliptical, with deep pointed ferratures; downy beneath. Fruit racemofe. Calyx hemifpherical. Nut oblong."—Native of Portugal, and perhaps Spain. Lamarck fays this fpecies confifts of feveral varieties, all very low *fhrubs,* fubject to bear galls; their *branches* copious and flender; their *leaves* fmall, intermediate in form between the evergreen and the ordinary oaks of Europe. Willdenow defcribes the *leaves* an inch in length, oblong, obtufe, rigid; their ferratures fomewhat pointed; the upper furface polifhed and fmooth; the under hoary with flender, ftarry, crowded hairs. *Footftalks* fhort. *Fruit* racemofe, or rather, as we fhould imagine, fpiked. He adds that the figure of Cavanilles fcarcely anfwers to the plant in queftion; and indeed that author defcribes his as a lofty *tree,* taller than *Q. Ilex,* with deciduous *leaves,* and large, folitary *acorns.* We have feen no fpecimen.

40. Q. *infectoria.* Oriental Gall Oak. Olivier's Travels, Englifh edition, v. 2. 42. t. 14, 15. Willd. n. 33.—Leaves ovate-oblong, very fmooth on both fides, deeply toothed, fomewhat finuated, deciduous. Fruit feffile. Calyx teffellated. Nut elongated, nearly cylindrical.—This oak, according to Olivier, is fcattered throughout all Afia minor, from the Bofphorus as far as Syria, and from the coafts of the Archipelago, as far as the frontiers of Perfia. It feldom attains the height of fix feet, and the *ftem* is crooked, with the habit of a *fhrub* rather than a *tree.* The *leaves* are an inch or inch and half long, deciduous, bright green, fmooth on both fides, but paler beneath; their ferratures deep and broad, not acutely pointed. *Fruit* folitary, nearly feffile. *Cup* flightly downy, its fcales not very diftinct. *Acorn* two or three times longer than the cup, fmooth, nearly cylindrical. The galls produced on the young branches of this oak, from the puncture of a fpecies of *Diplolepis,* are preferred to all others for dyeing, and are a great article of the Levant trade. (See GALLS.) Olivier obferves that the plant bears a number of different galls, befides the above, which are neglected, as ufelefs.

41. Q. *mucronata.* Pointed-toothed Mexican Oak. Willd. n. 34. (Q. caftanea; Nee in Annal. Scient. Nat. v. 3. 276. Fifch. Mifc. Hifp. v. 1. 114. *Willd.*)—"Leaves oblong-lanceolate, with pointed awned ferratures; polifhed above; downy beneath; heart-fhaped at the bafe."—Found by Louis Nee, without flowers or fruit, in New Spain, between Ixmiquilpan and Cimapan. The *tree* is twelve feet high, with a ftraight *trunk,* covered with a brittle dark-coloured *bark.* *Branches* erect, alternate, fmooth, much fub-divided. *Leaves* three inches long, and one broad, acute; abrupt and heart-fhaped at the bafe, their ferratures awned; the upper furface green and fmooth; the under clothed with fine yellow down. *Footftalks* two lines long. *Stipulas* none. *Nee.*

42. Q. *tomentofa.* Downy Mexican Oak. Willd. n. 35. (Q. peduncularis; Nee in Annal. Scient. Nat. v. 3. 270. Fifch. Mifc. Hifp. v. 1. 106. *Willd.*)—"Leaves oblong-ovate, with tooth-like notches; denfely downy beneath. Fruit racemofe. Nut globofe, nearly covered by the calyx."—Native of New Spain, in the road from Mexico to Acapulco, beyond the river Mefcala. A *tree,* twenty feet high, with an upright *trunk,* and grey brittle *bark.* *Branches* numerous, alternate, clothed with denfe reddifh wool. *Leaves* five inches long, hardly two wide, crowded; obtufe at the bafe; pointed at the end; bordered with tooth-like notches; green and fmoothifh above; downy, with prominent veins, beneath. *Footftalks* downy, very fhort. *Female flowers* on an axillary folitary ftalk, three or four inches long. *Acorns* but little bigger than pepper-corns, each almoft entirely concealed in its fcaly, downy, reddifh cup. *Nee.* This fpecies agrees with our thirteenth, *tribuloides,* in having its acorn concealed by the cup. The *fruit* is defcribed, by the authors we are obliged to copy, as *racemofe.* We have feen no fpecimens, but analogy would induce us to fuppofe it rather *fpiked.*

43. Q. *circinata.* Round-toothed Mexican Oak. Willd. n. 36. Nee in Annal. Scient. Nat. v. 3. 272. Fifch. Mifc. Hifp. v. 1. 109. *Willd.*—"Leaves ovate, crenate, undulated; acute at each end; downy beneath. Nut fcarcely longer than the calyx."—Native of New Spain, between Tixtala and Chilpancingo. A *tree* twenty or twenty-five feet high. *Trunk* erect. *Bark* brittle, afh-coloured. *Branches* horizontal; the young ones erect, furrowed,

rowed, villous. *Leaves* alternate, from five to seven inches long, and three broad; green and shining above; more or less downy, and flesh-coloured, or reddish-brown, beneath; the margin undulated and crenate, the notches rounded, their edges turned towards the point of the leaf. *Fruit* supported by a very short common stalk. *Calyx* hemispherical, the size of Chick peas, *Cicer arietinum;* its scales acute at the point. *Nut* but little larger than the calyx. Plukenet's t. 54. f. 3, in some measure resembles the species before us, but is said to have a large fruit, and is cited by authors as *Q. Prinus. Nee.*

44. Q. *splendens.* Silky-leaved Mexican Oak. Willd. n. 37. Nee in Annal. Scient. Nat. v. 3. 275. Fisch. Misc. Hisp. v. 1. 113. *Willd.*)—"Leaves oblong-ovate, bluntly toothed; slightly downy above; densely silky beneath."—Native of New Spain, near Taxala. *Trunk* erect, much branched, fifteen feet high. *Branches* partly horizontal, partly erect, clothed with red shining down. *Leaves* scattered, crowded, three inches long, and an inch and half broad; green, with a thin downy coat, above; thickly clothed beneath with shining pubescence, the midrib only being prominent; their edges bluntly and unequally toothed. *Footstalks* very short, with an awl-shaped villous *stipula* at each side. *Flowers* and *fruit* not observed. *Nee.*

45. Q. *rugosa.* Rugged Mexican Oak. Willd. n. 38. Nee in Annal. Scient. Nat. v. 3. 275. Fisch. Misc. Hisp. v. 1. 112. *Willd.*—"Leaves ovate-oblong, coriaceous, rugose; toothed towards the end; heart-shaped at the base; downy and rusty beneath."—Native of the woods of Huisquiluca and Ocuila, in the way from Mexico to Santo Christo de Chalma. A middle-sized *tree*, having numerous, alternate, round, grey *branches*, rough with minute prominent points. *Leaves* three inches in length, hardly two in breadth, thick and coriaceous; rugged, green and shining on the upper side; brown and downy at the back; heart-shaped at the base; the margin toothed from the middle to the extremity. *Footstalks* two lines long, thickened at their base. *Female flowers* in scaly axillary clusters. *Nee.*

46. Q. *macrophylla.* Large-leaved Mexican Oak. Willd. n. 39. Nee in Annal. Scient. Nat. v. 3. 274. Fisch. Misc. Hisp. v. 1. 111. *Willd.*—"Leaves obovate, crenate; tapering and heart-shaped at the base; downy beneath. Fruit spiked."—Found by Louis Nee, the discoverer likewise of the five preceding species, in the districts of Chilpancingo and La Curva, and on the mountains of Quirapu, in New Spain. This is a *tree*, thirty feet high, with a stout upright *trunk*, and dense *head*. The principal *branches* are horizontal; the rest upright, furrowed when young. *Leaves* a foot long, and seven or eight inches broad; rounded at the end; gradually tapering down to the emarginate, or heart-shaped, base, where they measure only four lines across; their upper surface green and shining; the under yellowish, clothed with very minute down; the margin crenate and wavy. *Footstalks* very short and thick. *Female flowers* sessile on a common stalk, and encompassed with downy *bracteas. Nee.*

47. Q. *Prinus.* Chesnut-leaved White Oak. Linn. Sp. Pl. 1413. Willd. n. 40. Ait. n. 10. Pursh n. 30. (Q. Prinus, var. 1, palustris; Michaux Querc. n. 5. t. 6. Q. castaneæ foliis, procera arbor virginiana; Pluk. Almag. 309. Phyt. t. 54. f. 3. Catesb. Carol. v. 1. t. 18.)—Leaves on longish stalks, obovate, acute; somewhat downy beneath; with nearly equal, dilated, callous-tipped, tooth-like serratures. Calyx of the fruit contracted at the base. Nut ovate.—Found in low shady moist woods, and on the banks of rivers, from Pennsylvania to Florida, flowering in May. It appears to have been known in England in 1730. This is one of the tallest trees produced in the southern parts of the United States, and remarkable for the beauty of its form, as well as the large size of its *acorns*, which are plentiful and sweet, a delicious and beneficial food for hogs and other wild animals. The *wood* is excellent, much used for making wheel-carriages, and yet so readily split as to serve for basket-work and brooms. The *leaves* are six inches, or more, in length, and three broad; silky in the spring; smooth and glaucous in summer; sometimes very downy on old trees. *Footstalks* an inch long. *Stamens* five to ten. *Acorns* an inch and half long, ovate; their cups shallow, covered with numerous closely-imbricated scales. Michaux says the *bark* is whitish, peeling off in long strips.

48. Q. *Chinquapin.* Chinquapin, or Dwarf Chesnut Oak. Pursh n. 34. (Q. prinoides; Willd. n. 41. Q. Prinus, var. 4, pumila; Michaux Querc. n. 5. t. 9. f. 1. Q. Prinus Chinquapin; Michaux Arb. v. 2. 65. t. 10, good. *Pursh.*)—Leaves on short stalks, obovate, smooth; glaucous beneath; tapering at the base; with nearly equal, dilated, acute, callous-tipped, tooth-like serratures. Calyx of the fruit hemispherical. Nut ovate.—Found on dry mountainous lands, from Pennsylvania to Carolina, flowering in May, when, according to Mr. Pursh, it is highly ornamental. This is a humble *shrub*, not above three or four feet high. The young *leaves* are whitish and downy beneath; the adult ones smooth and glaucous, scarcely above one-third the size of the preceding. *Female flowers*, according to Michaux, small, two or three together, on a short, solitary, axillary *stalk*. *Acorns* of a middling size, with a thin, nearly hemispherical, cup.

49. Q. *montana.* Rock Chesnut Oak. Willd. n. 42. Pursh n. 32. (Q. Prinus; Sm. in Abbot's Inf. v. 2. 163. t. 82. Q. Prinus, var. 2, monticola; Michaux Querc. n. 5. t. 7.)—Leaves on shortish stalks, obovate, acute; downy and white beneath: with nearly equal, dilated, short, blunt, callous-tipped tooth-like serratures. Fruit in pairs, on short stalks. Calyx hemispherical, with rugged scales. Nut oblong-ovate.—Found abundantly, in rocky situations, on the mountains of North America, from New England to Carolina, flowering in May. Michaux suggests that this species would be well worth cultivating in Europe. The *tree* rises to the height of sixty feet; the *wood* is tough and very useful, the *bark* excellent for tanning. It differs from *Q. Prinus*, n. 47, with which it has been confounded, in the constant white downiness of the under side of the *leaves*, which are much smaller and less dilated upward. The *acorns* moreover are but half the size of that species, and more oblong, two together on a very short stalk.

50. Q. *bicolor.* Swamp White Oak. Willd. n. 43. Pursh n. 31. (Q. Prinus, var. 5, tomentosa; Michaux Querc. n. 5. t. 9. f. 2. Q. Prinus discolor; Michaux Arb. v. 2. 46. t. 6. *Pursh.*)—Leaves nearly sessile, obovate; downy and white beneath; with very broad, unequal, obtuse, callous-tipped, lobe-like teeth. Fruit in pairs, on long bristle-pointed stalks. Calyx hemispherical. Nut oblong-ovate.—Native of low wet woods, from Pennsylvania to Carolina, flowering in May. *Pursh.* It grows to a very large *tree*. The *leaves* have extremely broad shallow teeth, or, as they might be called, lobes, approaching to the figure of our common English Oak leaves; their under side white and very downy. The *acorns* are sweet and eatable, like most of the *Prinus* tribe. Willdenow says the teeth are occasionally variable in size, one or two of them being sometimes remarkably elongated; and that the base of the *leaf* is more entire than in the foregoing.

51. Q. *Castanea.* Yellow Oak. Willd. n. 44. Pursh n. 33. (Q. Prinus, v. 3, acuminata; Michaux Querc. n. 5. t. 8.)

t. 8.)—Leaves on long footſtalks, oblong-lanceolate, pointed; ſomewhat downy beneath; with numerous, nearly equal, dilated, acute, callous-tipped, tooth-like ſerratures. Calyx hemiſpherical. Nut roundiſh-ovate.—Found in the Allegany mountains, and on the banks of the Delaware, flowering in May. *Purſh.* Michaux ſays it occurs in all the fertile countries to the weſt of thoſe mountains; and as the temperature of that climate agrees with the north of Europe, the tree in queſtion would be well worth trying here. The *wood* is excellent; *bark* very ſerviceable in tanning; and the *acorns* ſweet. The *tree* is large and handſome, ſeventy or eighty feet high. *Leaves* much like thoſe of our Sweet Cheſnut in form, but glaucous and often downy beneath. *Acorns* much rounder than in any of the four preceding, and ſhorter in proportion to the cup. Theſe Cheſnut Oaks, *Prinus* and its allies, ſeem not to have as yet attracted the notice of European cultivators, perhaps from their having been improperly confounded by botaniſts. The above accounts of their diſtinctions, and their valuable qualities, it is hoped, may cauſe them to be ſought out, and introduced into this country. Their different acorns might ſurely be eaſily imported.

Section 3.—*Leaves lobed at the extremity.*

52. Q. *aquatica.* Water Oak. Soland. in Ait. Hort. Kew. ed. 1. v. 3. 357. ed. 2. n. 11. Willd. n. 45. Purſh n. 11. Michaux Querc. n. 11. t. 19. t. 20. f. 1, 3, 4, 5, and t. 21. (Q. foliis cuneiformibus, obſoletè trilobis, intermedio productiore; Gron. Virg. 149. Q. folio non ſerrato, in ſummitate quaſi triangulato; Cateſb. Carol. v. 1. t. 20. Herb. Linn.)—Leaves wedge-ſhaped, ſmooth; tapering at the baſe; dilated and obſcurely three-lobed at the end, the middle lobe largeſt. Calyx nearly hemiſpherical. Nut roundiſh.—Native of ſwamps in North America, from Maryland to Florida, bloſſoming in May. Miller is ſaid to have cultivated this ſpecies in 1748, but it is little known in England. The *tree* is forty feet high; its wood, according to Purſh and Michaux, is little eſteemed; but the latter is of opinion that it might prove more valuable if felled in winter; he mentions alſo that the tree is not peculiar to ſwamps, or inundated meadows, but occurs ſometimes in dry ſandy ground, as on plains near the ſea-coaſt of Florida. Few trees vary ſo much in the ſhape of their *leaves*, according to age or ſituation, as this. The proper form of its *foliage* is wedge-ſhaped, much elongated and tapering at the baſe; dilated, rhomboid, or very ſlightly and bluntly three-lobed at the extremity; the edges entire; both ſides uſually ſmooth. *Footſtalks* variable in length, but rather ſhort; clothed, when young, with ſtarry hairs, which are ſometimes ſcattered over the back of the young leaf. Some of its *leaves* however, even on the ſame tree, are deeply three-lobed; and thoſe of young plants are, the firſt year, oblong and quite entire; the next two or three ſeaſons, variouſly toothed and ſinuated; inſomuch that botaniſts know not well how to diſtinguiſh its varieties from ſome of the following ſpecies. The *acorns* are ſhort and roundiſh, with a ſhallow cup, and ſtand generally in pairs, on ſhort ſtalks.

53. Q. *nigra.* Barren Oak, or Black Jack. Linn. Sp. Pl. 1413. Willd. n. 46. Ait. n. 12. Purſh n. 15. Sm. in Abbot's Inſ. v. 2. 115. t. 58. Michaux Querc. n. 12. t. 22, 23. (Q. marylandica, folio trifido, ad ſaſſafras accedente; Cateſb. Carol. v. 1. t. 19.)—Leaves wedge-ſhaped; ſomewhat heart-ſhaped at the baſe; dilated, abrupt, and very ſlightly three-lobed at the end; the middle lobe ſhorteſt; ſmooth above; ruſty beneath. Calyx hemiſpherical, with membranous ſcales. Nut roundiſh-ovate.—In barren ſandy or gravelly woods, from New Jerſey to Florida, flowering in May. This tree is of low growth, eſpecially in the more northern ſtates. It bears abundance of acorns, very good food for hogs. The wood is ſmall, but excellent for fuel. *Purſh.* The *leaves* are twice or thrice the ſize of the laſt, ſingularly dilated, and abrupt, at the end; their lobes, when young, more evident, and each tipped with a briſtle, which ſoon falls off. *Acorns* moſtly in pairs, nearly ſeſſile, with very ſcaly cups.

54. Q. *triloba.* Downy Black Oak. Willd. n. 47. Ait. n. 13. Purſh n. 14. Michaux Querc. n. 14. t. 26. (Q. rubra; Abbot's Inſ. v. 1. 99. t. 50.)—Leaves wedge-ſhaped, with three terminal, briſtly-pointed lobes, the middle one longeſt; downy beneath. Calyx of the fruit flattiſh. Nut nearly round.—Native of barren tracts, near the ſea-coaſt, from New Jerſey to Georgia, flowering in May. It was brought to England in 1800, by Meſſrs. Fraſer. The *tree* is fifty or ſixty feet high, of rapid growth, even in a poor ſoil. Michaux deſcribes it as very fit for making live fences; though the wood is moſt generally uſed in America for paling. The *leaves* are much ſmaller than thoſe of *Q. nigra*, rounded, not heart-ſhaped, at the baſe, and with longer *footſtalks*. Their lobes are direct, not laterally dilated, each tipped with one or more ſmall briſtles, and the under ſide is covered with denſe white down. The *foliage* of young ſhoots, that ſpring up where foreſts of this tree have been burnt, are often near a foot long, deeply pinnatifid, and ſharply lobed; as repreſented in Michaux, t. 26. f. 2.

55. Q. *nana.* Dwarf Jagged Oak. Willd. n. 48. Purſh n. 13. (Q. aquatica; Sm. in Abbot's Inſ. v. 2. 117. t. 59. Q. aquatica elongata; Ait. n. 11, γ.)—Leaves oblong-wedge-ſhaped, ſmooth, ſomewhat ſinuated; three-lobed at the extremity: lobes divaricated, pointed, the middle one largeſt; forks of the vein downy beneath.—In barren lands, called pine-barrens, of South Carolina, flowering in May. Purſh deſcribes it as "a low-growing ſpecies, always keeping diſtinct from *Q. aquatica.*" The *leaves* are almoſt ſeſſile, two or three inches long, much more diſtinctly lobed than in *aquatica* or *nigra*, and more ſinuated or angular beſides, than in any of the three laſt deſcribed. The *acorns* are almoſt globular, with a very ſhallow cup.

Section 4.—*Leaves ſinuated, with pointed lobes.*

56. Q. *hemiſphærica.* Hemiſpherical Oak. "Bartram's Travels 320." Willd. n. 49. Purſh n. 12. (Q. aquatica maritima; Michaux Querc. n. 11. t. 20. f. 2.)—"Leaves evergreen, oblong-lanceolate; undivided, three-lobed, or ſinuated; ſmooth on both ſides; lobes pointed." *Willd.*—Native of Georgia and Florida. Some of the *leaves* are very deeply three-lobed, or pinnatifid; others linear-oblong and undivided. Willdenow ſays they are evergreen, and that the *foliage* of the young plant is ſo like *Q. Phellos*, our firſt ſpecies, as to be hardly diſtinguiſhable. Michaux, however, aſſerts this ſuppoſed ſpecies to be but a maritime variety of *aquatica*, and Purſh thinks it a young plant of that kind.

57. Q. *elongata.* Downy-leaved Oak. Willd. n. 50. Ait. n. 14. (Q. falcata; Michaux Querc. n. 16. t. 28. Purſh n. 22. Q. diſcolor; Ait. ed. 1. v. 3. 358.)—Leaves downy beneath, ſinuated, with three or more ſomewhat falcate, briſtle-pointed lobes; the terminal one elongated, jagged. Calyx hemiſpherical.—In ſandy ſoil, near the ſea-coaſt; from New Jerſey to Georgia, flowering in May. A very large *tree*, commonly called Spaniſh Oak; in the ſouthern ſtates, Red Oak. *Purſh.* The height of the *tree* is fifty or ſixty feet. *Leaves* on long ſtalks; obtuſe or rounded at the baſe; deeply lobed, or in ſome meaſure palmate; the lobes often recurved, or ſickle-ſhaped; taper-pointed, and more or leſs notched at the end, each ſegment tipped with a long briſtle. *Acorns* ſmall, roundiſh; its cup hemiſpherical, with

lax

lax fcales. The *leaves* of young trees are faid to be very like thofe of *triloba*, n. 54.

58. Q. *tinctoria*. Dyers' Oak, Black Oak, or Quercitron. Willd. n. 51. Ait. n. 15. Purfh n. 16. (Q. tinctoria angulofa; Michaux Querc. n. 13. t. 24. Q. difcolor; Willd. Arb. 274.)—Leaves downy beneath, obovate-oblong, dilated, widely finuated; lobes fhort, obtufe, flightly toothed, briftle-pointed. Calyx of the fruit flat underneath. Nut globofe.—In all large woods, particularly in the mountainous parts, from New England to Georgia, flowering in May. It is one of the largeft trees of the American foreft, highly valuable for its timber, as well as bark, which laft is fo very fuperior in tanning to any other fpecies of Oak. *Purfh.* Michaux fays, this Oak is found only in a good foil, always at a diftance from the fea; attaining its greateft fize, which is eighty feet in height, and eight in diameter, in the vallies between the high mountains of North Carolina. The bark is ufed by tanners, throughout the north and weft parts of the United States. It gives a yellowifh colour, whence the name of Quercitron, and which enhances the value of the leather. The bark, bruifed and powdered, was in great requeft among dyers in France, before the war interrupted this branch of commerce. The *leaves* are confpicuous for their broad, angular, abrupt figure, a fpan long, and nearly as wide, with fhallow finufes, and briftle-tipped angles. *Acorns* almoft feffile, globular, with a fcaly, fhallow, flattifh cup.

59. Q. *difcolor*. Sinuous Dyers' Oak. Willd. n. 52. Purfh n. 17. Sm. in Abbot's Inf. v. 2. 111. t. 56. (Q. tinctoria finuofa; Michaux Querc. n. 13. t. 25. Q. virginiana, venis rubris muricata; Pluk. Phyt. t. 54. f. 5.)—Leaves downy beneath, oblong, pinnatifid; leaves oblong, toothed, briftle-pointed. Calyx turbinate. Nut ovate.—In large forefts, from Pennfylvania to Carolina, flowering in May. This refembles the preceding and *Q. coccinea*, n. 61. The young expanding *leaves* are covered with white down on both fides, which is not the cafe with either *rubra* or *coccinea*. *Purfh.* This differs from the laft in having much more finuated, or pinnatifid *leaves*, and larger, more ovate, *acorns*, whofe cups are turbinate, or tapering at the bafe. The qualities of the wood and bark probably agree with the *tinctoria*, or Michaux, who confiders the prefent plant as but a variety, would have mentioned the contrary.

60. Q. *rubra*. Mountain Red Oak. Linn. Sp. Pl. 1413. Willd. n. 53. Ait. n. 16. Purfh n. 20. Michaux Querc. n. 20. t. 35, 36. Abbot's Inf. v. 2. 205. t. 103. (Q. efculi divifurâ, foliis amplioribus aculeatis; Pluk. Phyt. t. 54. f. 4.)—Leaves fmooth, oblong, finuated, on long ftalks; lobes acute, fharply toothed, briftle-pointed. Calyx of the fruit flat underneath. Nut ovate.—Native of forefts on a fertile foil, from Canada to Pennfylvania, and in all the country weft of the Allegany mountains, bloffoming in May. It was cultivated by Miller before 1739, and is to be found in feveral plantations. A large and handfome timber *tree*, of rapid growth; its *wood* highly ufeful for building and for carriages; and the *bark* is faid by Michaux to be the very beft known for tanning, the European tanners, fettled in America, having found it, by experiment, more efficacious than any of the oak barks of Europe. The *tree* is ninety or one hundred feet high. *Leaves* four or five inches long, on *footftalks* about half that length; unequally finuated or pinnatifid, with rather fpreading, but not remote, lobes, whofe ends are very acute, as well as, here and there, fharply toothed, each tooth and point tipped with a long briftle. *Acorns* rather large, ovate, with a fhortifh flat-bottomed cup. The *leaves* turn of a deep red in autumn, which hue is common to moft American trees and fhrubs, in a greater or lefs degree. Purfh fays, this is exclufively known by the name of Red Oak, though various others are fo denominated in feveral parts of America.

Q. *ambigua*, Michaux Arb. v. 2. 120. t. 24. Purfh n. 19, is fuppofed by the latter to be a hybrid between this and the following.

61. Q. *coccinea*. Scarlet Oak. Willd. n. 54. Ait. n. 17. Purfh n. 18. Michaux Querc. n. 18. t. 31, 32. (Q. rubra β; Ait. ed. 1. v. 3. 357.)—Leaves fmooth, oblong, deeply and widely finuated, on long ftalks; lobes divaricated, acute, fharply toothed, briftle-pointed. Calyx of the fruit turbinate, half as long as the nut.—Native of woods, on a fertile foil, from New England to Georgia, bloffoming in May. This was one of the firft American trees brought to Europe, having been cultivated before the end of the 17th century, by bifhop Compton, as well as by the firft earl of Portland. The bright red of the foliage in autumn gives the tree a beautiful and ftriking appearance, both in its native forefts and our European plantations. It nearly equals the preceding in fize; the *wood*, according to Michaux, is better, but the *bark* lefs valuable. The *leaves* are larger, with deeper, more rounded, finufes, and more diftant lobes. *Acorns* half covered by the deeper, more turbinate, cup.

62. Q. *Catefbæi*. Barren Scrub Oak. Willd. n. 55. Purfh n. 21. Michaux Querc. n. 17. t. 29, 30. (Q. rubra β; Sm. in Abbot's Inf. v. 1. 27. t. 14. Q. efculi divifura, foliis amplioribus aculeatis; Catefb. Carol. v. 1. t. 23.)—Leaves fmooth, oblong; wedge-fhaped at the bafe; deeply and widely finuated, on fhort ftalks; lobes three or five, divaricated, acute, two or three-cleft, briftle-pointed. Calyx of the fruit turbinate, half as long as the nut.—Native of dry barren ground in Maryland, Virginia, Carolina, and Georgia, abundantly, flowering in May. This fpecies is fhrubby, not above fifteen feet high; its *wood* of a bad quality, ufed only for firing. The fhortnefs of the *footftalks*, and the fewnefs of the lobes of the *leaves*, added to their acute bafe, are fufficient botanical diftinctions between the prefent and the two laft, efpecially as the fize and quality of the tree are fo unlike thofe fpecies.

63. Q. *paluftris*. Marfh, or Pin, Oak. Willd. n. 56. Ait. n. 18. Purfh n. 23. Michaux Querc. n. 19. t. 33, 34.—Leaves fmooth, oblong, deeply and widely finuated, on long ftalks; lobes diftant, parallel, acute, fharply toothed, briftle-pointed; forks of the veins denfely woolly beneath. Calyx of the fruit flattened. Nut nearly globofe.—Native of low fwampy woods, from New England to Pennfylvania, and in the Illinois country, flowering in May. Meffrs. Frafer are recorded as having brought this fpecies to England in 1800, but it was previoufly cultivated in Holland and France. This is a large *tree*, whofe wood is tough, ufed for making fpokes of wheels. The *leaves* are fmaller than thofe of *rubra* or *coccinea*, and with more numerous lobes than *Catefbæi*; their finufes rounded and very wide, and the forks at the origin of their veins marked by a tuft of glandular hairs. The *acorns* are fmall, globular, with fhallow cups, and generally very abundant.

64. Q. *acutifolia*. Pointed-leaved Mexican Oak. Willd. n. 57. Nee in Annal. Scient. Nat. v. 3. 267. Fifch. Mifc. Hifp. v. 1. 102. *Willd.*—"Leaves ovato-lanceolate, finuated, taper-pointed; unequal at the bafe; lobes toothed, briftle-pointed; forks of the veins villous beneath. Fruit racemofe."—Native of New Spain, in the road from Acapulco to Mexico. This is the largeft of all the Oaks in New Spain. *Trunk* thick, twenty-five feet high, ornamented with a denfe head of innumerable *branches*. *Leaves* from five to feven inches long, an inch and a half or two inches

inches broad, their *footſtalks* an inch in length; ovate and unequal at the baſe, gradually contracting upwards to a ſharp point, ſinuated, beſet with awl-ſhaped teeth; green and ſhining above; reddiſh and veiny beneath, the forks of the veins villous. *Female flowers* in axillary four-flowered cluſters, (or rather, we preſume, *ſpikes.*) *Germens* ovate. *Acorns* ſmall, ſcarcely ſo big as a pea, nearly covered by the cup, which is clothed with blackiſh ſcales. *Nee.*

65. Q. *candicans.* Hoary Mexican Oak. Willd. n. 58. Nee in Annal. Scient. Nat. v. 3. 277. Fiſch. Miſc. Hiſp. v. 1. 115. *Willd.*—"Leaves ovate, ſinuated; white and downy beneath; lobes toothed, briſtle-pointed."—Native of New Spain, in ſandy ground near Tixtala. A *tree* of a middling ſize, with a denſe head of upright *branches. Leaves* nine inches long, four wide, tapering at each end, ſinuated, with briſtle-pointed teeth; green and ſmooth above; white and downy underneath. *Footſtalks* four lines in length. *Flowers* and *fruit* not obſerved. *Nee.*

66. Q. *ilicifolia.* Holly-leaved, or Bear Oak. "Wangenh. Amer. 79. t. 6. f. 17." Willd. n. 59. Ait. n. 19. (Q. Baniſteri; Michaux Querc. n. 15. t. 27. Purſh n. 24. Q. aquatica? Sm. in Abbot's Inf. v. 2. 157. t. 79?)—Leaves obovate-wedge-ſhaped, with three or five deep briſtle-pointed lobes, entire; downy beneath. Fruit ſtalked, in pairs.—Found in dry barren fields, and on mountains, from New Jerſey to Virginia, flowering in May; covering, wherever it occurs, large tracts of ground, thence termed Oak-barrens. It is known by the name of Bear Oak, Black Scrub Oak, and Dwarf Red Oak. *Purſh.* A *ſhrub* four to ſix feet, occaſionally more, in height, with downy *branches. Footſtalks* downy, near an inch long. *Leaves* two inches, or two inches and a half long, and near two wide, tolerably uniform, acute at the baſe, cut into five, rarely but three, deep divaricated, broad, acute lobes, entire at the margin, and ſcarcely toothed at the ſummit, though tipped with one or two briſtles; the upper ſide green, veiny, and ſmooth; the under pale, and finely downy. *Female flowers* in pairs, on thick, ſolitary, axillary, downy *ſtalks*, much ſhorter than the footſtalks. *Acorns* about half an inch long, nearly globular, half covered by their ſcaly hemiſpherical cups. Michaux thinks this ſpecies would ſerve well for making quick hedges. A ſpecimen from Kalm, unnamed, is in the Linnæan herbarium.

67. Q. *Pſeudo-ſuber.* Baſtard Cork Oak. "Santi Viagg. 156. t. 4." Spreng. Antiq. Bot. 16. t. 1. Willd. n. 60. Desfont. Atlant. v. 2. 348.—Leaves ovate-oblong, ſinuated, hoary beneath; lobes numerous, pointed, entire. Bark fungous, cracked. Nut ovate. Calyx muricated, with lax, recurved, linear ſcales.—Native of the mountains of Tuſcany, Spain, and Barbary. Desfontaines gathered it on mount Atlas, and the abbé Durand near Tangier. A *tree* fifty or ſixty feet high, whoſe *bark* is corky, though leſs ſo than in *Q. Suber*, n. 33. Young *branches* downy or hoary, ſometimes ſmooth, ſtriated. *Leaves* deciduous, an inch and a half to three inches long, an inch or an inch and a half wide, acute; entire and ſlightly heart-ſhaped at the baſe; ſomewhat dilated upwards, and bordered with numerous, uniform, ſmall, broad, acute, lobes or ſerratures, ſeparated by roundiſh ſinuſes; upper ſurface green and ſmooth; under glaucous, hoary, or ſomewhat downy. *Acorns* on ſhort ſtalks, ovate, above an inch long, half covered by the cup, which is downy, and clothed with lax bluntiſh ſcales, recurved at their tips. Desfontaines ſays the *leaves* of young trees are deeply ſinuated and ſerrated; thoſe of old ones more ſlightly ſo. In our ſpecimens from Durand and Brouſſonet, the under ſide is ſcarcely downy, except a denſe fringe to the mid-rib. The tranſverſe veins are more numerous, ſtraight, and parallel, than in Sprengel's plate. *Footſtalks* rather above half an inch long, ſmooth or downy. *Acorns* nearly ſeſſile, crowded about the ends of the branches. Yet we think it muſt be, at leaſt, the plant of Desfontaines.

68. Q. *Aegilops.* Great-prickly-cupped Oak, or Velanida. Linn. Sp. Pl. 1414. Willd. n. 61. Ait. n. 20. Mill. Ic. t. 215. Olivier's Travels, Engliſh edition, v. 2. 44. t. 13. (Q. orientalis, caſtaneæ folio, glande recondita in cupula craſſa et ſquamoſa; Tourn. Cor. 40. Velani; Tourn Voy. v. 1. 128. Glans Cerri; Dalech. Hiſt. v. 1. 7.)—Leaves ovate-oblong, with briſtle-pointed tooth-like lobes; hoary beneath. Calyx of the fruit very large, hemiſpherical, with lanceolate, elongated, ſpreading ſcales.—Native of the Levant. Miller cultivated this Oak in 1731. The *tree* is not ſo lofty as ſome other ſpecies, nor is the *wood* much eſteemed, or uſed, but in cabinet work. *Leaves* ſtalked, about three inches long, bright green; a little downy at the back; their edges, as in the laſt, very coarſely and acutely ſerrated, rather than lobed, each tooth tipped with a briſtly point. *Acorn* large, ſhort, a little hollow at the top. *Cup* ſeſſile, woody, two or three inches in diameter, from the projection of its numerous, oblong, thick ſcales. Theſe cups are uſed, as well as the gall-nut, (ſee n. 40.) by the Orientals, Italians, and Engliſh, in dyeing, and are a conſiderable article of commerce. Tournefort ſays the modern Greeks call theſe acorns *Velani*, a corruption of *βάλανι*, and the tree *Velanida.* The young acorns and cups, gathered from the tree, are much more eſteemed than ſuch as fall of themſelves, when fully grown, and ſell for twice the price of the latter. Dalechamp, Lobel, and Bauhin, miſtake the unripe cup and acorn of this ſpecies, as belonging to *Q. Cerris*, n. 83.

Sect. 5.—*Leaves ſinuated, with blunt or pointleſs lobes.*

69. Q. *alba.* White Oak. Linn. Sp. Pl. 1414. Willd. n. 62. Ait. n. 21. Purſh n. 29. Michaux Querc. n. 4. t. 5. (Q. alba virginiana; Cateſb. Carol. v. 1. t. 21. f. 2.)—Leaves oblong, deeply pinnatifid; glaucous beneath; lobes linear-oblong, obtuſe, entire, dilated upwards. Fruit ſtalked. Calyx depreſſed, warty.—Native of woods, on a fertile ſoil, from New England to Carolina, flowering in May; cultivated here in 1724, by Mr. Furber. Purſh ſays it is one of the moſt abundant and uſeful of its genus, in America, and grows in the middle States to an immenſe ſize. The adult *leaves* are nearly a ſpan long, deeply and elegantly pinnatifid; tapering and acute at the baſe; gradually dilated upward; ſomewhat abrupt, though three-lobed, at the end; their lobes all entire, blunt, pointleſs, veiny; the upper ſurface green and ſhining; the under opaque and glaucous; not downy, as Linnæus and Willdenow define them, except perhaps when young. *Footſtalks* ſtout, angular, half an inch, or more, in length. *Fruit-ſtalks* twice as long, each bearing one or two, laterally ſeſſile, ovate *acorns*, full an inch in length, with a ſhort tuberculated cup. Michaux obſerves, that this Oak is preferred to all others in America, for building houſes and ſhips; as well as for caſks. The wood is ſo tough and pliable, as to ſerve for making baſkets and brooms. The acorns are ſweet, and Parkinſon records that, in his time, the Indians were ſaid to obtain from them, by boiling, an oil which they uſed in cookery. A ſuppoſed variety, called *repanda*, is figured by Michaux, in which the *leaves* are merely waved, not lobed; and green on both ſides, though downy beneath. With this we are unacquainted, as alſo with Willdenow's intermediate variety, called *pubeſcens.*

70. Q. *Eſculus.* Italian, or Small-prickly-cupped Oak. Linn.

Linn. Sp. Pl. 1414. Willd. n. 63. Ait. n. 22. (Phagus esculus, mas et foemina; Dalech. Hist. 5.)—Leaves ovate-oblong, sinuated, smooth; paler beneath; segments bluntish; somewhat angular at the base. Fruit nearly sessile. Calyx scaly, hemispherical.—Native of the south of Europe. Cultivated by Miller in 1739; hardy in our gardens, flowering in May. *Aiton.* So little attention has been paid to this species by botanical writers, that we can find no certain description nor figure of it, except in Dalechamp. We even doubt whether the plant intended in the first edition of the Hortus Kewensis be the true one; yet this seems what Willdenow meant in his *Arbores*, or Baumzucht, though he does not cite either that work or Hort. Kew. in his Sp. Pl. What Linnæus briefly described in his Mantissa, 496, under the name of *Esculus*, seems to be *Cerris*, with which latter the description, copied by Willdenow, and the specific character extracted therefrom, well agree; but not at all with the original and authentic specimen of *Esculus* in the Linnæan herbarium. By this last alone can any one determine what Linnæus had in contemplation, when he wrote both editions of Species Plantarum, and we shall here describe the specimen. The *branch* is angular, furrowed, and smooth. *Leaves* scattered, aggregate at the top, from two to three inches long, and one and a half, at most, in breadth; smooth and shining above; paler, rather glaucous, and almost equally smooth, beneath, with finely reticulated veins; tapering at the very base, but just above it dilated, angular, and in some measure cordate, as Dalechamp's figures more distinctly shew. The summit is obtuse, and the margin cut unequally, on each side, into about five broad, blunt, entire, tooth-like serratures, or small lobes. *Footstalks* near an inch long, destitute of the long, linear, tufted, stipulaceous scales, or *ramenta*, found in *Aegilops, Cerris*, and *austriaca* hereafter mentioned. Young *acorns* axillary, nearly sessile, solitary or in pairs; the cups scaly, the size of small peas. Dalechamp represents the full-grown acorns about an inch long, embraced by an hemispherical scaly cup, about one-third that length. He says they are sweet and eatable, brought to table roasted by the Spaniards, as well as the rustic Italians, but sometimes found to affect the head, like darnel. The name *Esculus* is derived by etymologists from *esca*, food, and is commonly taken for the Beech-tree, ordinary readers of Virgil's Georgics not distinguishing one from the other; just as the *Cicada* of that poet has been vulgarly supposed the grasshopper. The Delphin edition of the Georgics has the above word *Aesculus*, as Linnæus has adopted it, unwarrantably, for the generic appellation of the Horse Chesnut; and the editors rightly observe, that some persons confound it with *Fagus*, the Beech. Our *Q. Esculus* is most probably the φηγος of Dioscorides, which he expressly says is a kind of Oak. See FAGUS.

71. Q. *Robur*. Common British Oak. Linn. Sp. Pl. 1414. Sm. Fl. Brit. n. 1. Engl. Bot. t. 1342. Woodv. Med. Bot. t. 126. Mart. Rust. t. 10, var. pedunculata. (Q. pedunculata; Willd. n. 65. Ehrh. Arb. 77. Pl. Off. 168. Ait. n. 24. Q. foemina; Roth. Germ. v. 1. 408. v. 2. p. 2. 488. Fl. Dan. t. 1180. Q. racemosa; Lamarck Dict. v. 1. 715. Q. cum longo pediculo; Bauh. Pin. 420. Q. hemeris; Dalech. Hist. 4. Quercus; Fuchs. Hist. 229. Matth. Valgr. v. 1. 184. Duham. Arb. v. 2. t. 47. Tabern. Kreuterb. 1374. Oak-Tree; Hunt. Evel. Sylv. 69, with a plate.) Leaves deciduous, oblong, smooth, dilated upwards; sinuses rather acute; lobes obtuse. Stalks of the fruit elongated. Nut oblong.—Common in woods and hedges, throughout the more temperate parts of Europe, flowering in April. Nothing is more general in the woods and hedges of Britain, nor more important as an object of national culture. The *tree* is the most ornamental to our plantations and landscapes; the *wood* more useful than any other, for its hardness, toughness, and durability; the *bark* peculiarly valuable for tanning. The *leaves* are alternate, with short, or scarcely any, footstalks, obovate-oblong, smooth, irregularly sinuated, with obtuse, rounded, pointless, entire lobes; their upper side of a rich shining green; the under paler, slightly glaucous; the base somewhat heart-shaped, or auricled. *Clusters*, or rather *spikes*, axillary; the male ones lax, pendulous, many-flowered, yellow; female on stalks an inch and a half or two inches long, composed of about three, laterally sessile, green *flowers*, surmounted by a naked elongation of the common stalk. *Calyx* of the male membranous, bell-shaped, mostly five-cleft, with about ten *stamens*; of the female coriaceous, scaly, downy, globose, at length hemispherical, woody, entire. *Germen* ovate. *Style* short, cylindrical. *Stigmas* three. *Acorn* elliptic-oblong, thrice the length of the cup. This being what Linnæus, as well as British botanists, always considered as *Quercus Robur*, the superior quality of its wood, no where better understood than here, entitling it, above all others, to that appellation, we cannot, on any account, submit to the errors of Willdenow, or any other writer, who has been pleased to change the name; and we feel equal surprise and regret that the excellent editors of the new Hort. Kew. should, in this case at least, have carried their implicit conformity so far. We trust they will hereafter correct themselves in this point, as well as in the barbarous name *Araucaria*, retained by Willdenow, contrary to all propriety, for DOMBEYA. See that article.

72. Q. *sessiliflora*. Sessile-fruited Oak. Salisb. Prodr. 392. Sm. Fl. Brit. n. 2, α. Engl. Bot. t. 1845. (Q. Robur; Willd. n. 64. Ait. n. 23. Lamarck Dict. v. 1. 717. Mart. Rust. t. 11, var. sessilis. Q. sessilis; Ehrh. Arb. 87. Q. platyphyllos mas et foemina; Dalech Hist. 2, 3. Q. latifolia mas, quæ brevi pediculo est; Bauh. Pin. 419. Raii Syn. 440.)—Leaves on longish footstalks, deciduous, oblong, smooth; sinuses opposite, rather acute; lobes obtuse. Fruit sessile. Nut oblong.—Native of woods and hedges, in the temperate parts of Europe; rather less common in England than the preceding, flowering in April or May. Professor Martyn has rightly corrected Miller, who mentions the present as the common Oak of this country, and the former as rare. Why the German botanists, like Lamarck, take this for *Robur*, is difficult to understand, unless the measure originated in inattention to the qualities, as well as history, of the trees. The *wood* of our *sessiliflora*, in which name we gladly follow Mr. Salisbury, is of far less value than the true British Oak, and the importance of distinguishing the two species becomes, therefore, the more obvious. The *leaves* grow on longer *footstalks*, and are generally more equally and regularly pinnatifid. The *female flowers*, and the *acorns*, are almost perfectly sessile. In English Botany four *stigmas* are delineated; but we know not how far that character, which would be an excellent one, is constant.

73. Q. *pubescens*. Downy-waved-leaved Oak. Willd. n. 66, excluding the reference to Fl. Brit. (Q. Robur lanuginosa; Lamarck Dict. v. 1. 717. Robur prima; Clus. Hist. v. 1. 18.)—Leaves oblong-obovate, stalked, sinuated; downy beneath; lobes obtuse, angular, wavy; somewhat heart-shaped and unequal at the base. Fruit nearly sessile.—Native of France, Austria, Hungary, Tartary, and of the Val d'Aost, Piedmont, in which last place it was gathered by Mr. Davall. We have seen a tree of

this species, growing on the north lawn at Holkham, Norfolk, the seat of Mr. Coke, where it was planted by his ancestor, the earl of Leicester; but no British writer seems acquainted with the species in question, though unquestionably distinct. Willdenow justly says it is like his *Robur*, our *sessiliflora*, but abundantly different, being of more humble stature, with smaller *leaves*, downy beneath, very hoary and white in the spring, somewhat heart-shaped at the base, and with smaller *fruit*. To this we would add, the *leaves* are remarkably undulated, especially in drying, and their upper surface is more or less besprinkled with very minute, scattered, starry hairs. The *fruit* in Mr. Davall's specimens is quite sessile, either solitary, or in one instance accompanied by two abortive ones; in those from Holkham the female *flowers* are more or less elevated, three together, on a thick downy *stalk*. Hence perhaps Willdenow terms the *fruit* subsessile. The scales of the *cup* in both are downy, thin, flat, and closely imbricated.

A variety of this, with deeper segments, and of more humble growth, is Robur tertia, Clus. Hist. v. 1. 18. f. 1. Of this a specimen, erroneously named *Cerris*, and pinned to *Esculus*, n. 70, above described, is preserved in the Linnæan herbarium.

74. Q. *atro-virens*. Durmast Oak. Mart. Rust. t. 12. (Q. sessiliflora β; Sm. Fl. Brit. 1027. Q. pubescens; Ait. n. 25, but not of Willdenow. Q. Robur nigra; Lamarck Dict. v. 1. 717. Chêne noir; Secondat du chêne. 3. t. 5?)—Leaves elliptic-oblong, stalked, sinuated; downy and hoary beneath; lobes numerous, obtuse, even, and entire; base equal. Fruit sessile.—Native of France and the south of England, flowering in April and May. Professor Martyn had his specimens from the New Forest, Hampshire, where it is known by the name of the Durmast Oak. The whole *tree* is well described by him as having much the air of a chesnut, and being of freer growth than the true *Robur;* the *bark* lighter coloured and smoother; the *wood* not so strong, nor of so firm a texture. The *leaves* are less deeply, but more copiously, sinuated, with five, six, or seven short lobes at each side; the under surface downy, and of a hoary grey, with purplish ribs. The *foliage* appears later than in either of our common Oaks, and lasts longer, sometimes the whole winter. *Acorns* sessile, rather large. Lamarck's description, indicated above, accords exactly with our English plant, to which also, we presume, the synonym of Secondat must belong, though we have not been able to consult his book. A more accurate study of this genus has led us to agree with our departed friend Willdenow, in distinguishing the Durmast Oak from our *sessiliflora*, but he errs in referring it to his *pubescens*, and has led Mr. Aiton into the same mistake. Its *leaves* are more oblong, less deeply sinuated, flat, not undulated; the under side whiter, with coloured veins. The *fruit* larger, and more decidedly sessile.

75. Q. *pyrenaica*. Pyrenean Oak. Willd. n. 67.—"Leaves oblong, pinnatifid, stalked; downy beneath; somewhat heart-shaped and unequal at the base; lobes obtuse, slightly toothed. Fruit stalked."—Native of the Pyrenees. The *leaves* are larger than in *sessiliflora*, stalked, deeply sinuated; densely downy underneath. *Footstalks* downy. *Acorns* four, sessile on one common elongated stalk. It differs abundantly from *pubescens*, in having much larger *leaves*, sinuated in a pinnatifid manner, very downy beneath; and stalked *fruit*. Such is Willdenow's account. We have seen no specimen. Can this be our above-mentioned variety of *pubescens?*

76. Q. *faginea*. Beech Oak. Lamarck Dict. v. 1. 725. Willd. n. 68. (Phellodrys alba angustifolia, folio serrato; Dalech. Hist. 25.)—Leaves on short downy stalks, obovate, with numerous, uniform, shallow lobes; downy beneath; somewhat heart-shaped and unequal at the base. Fruit sessile.—Native of Spain and the south of France. *Leaves* small, an inch and half long, deciduous, obovate, very slightly sinuated, or, more properly speaking, coarsely toothed, the lobes being very short, equal, and obtuse; the upper side polished and smooth; the under white and downy. *Footstalks* downy. *Fruit* sessile. *Willdenow*. In the Linnæan herbarium are specimens, gathered by Baron Alstroemer in Spain, which answer extremely well to the above description, and not amiss to the figure of Dalechamp, which Lamarck cites with hesitation. In these however, the lobes, or teeth, are acute, and the upper surface covered with minute starry hairs. There are also long, linear, recurved, ramentaceous *stipulas*, that are soon deciduous. We do not scruple to consider this as Lamarck's plant at least, and probably Willdenow's.

77. Q. *lobata*. Round-lobed Mexican Oak. Willd. n. 70. Nee in Annal. Scient. Nat. v. 3. 277. Fisch. Misc. Hisp. v. 1. 116. *Willd.*—"Leaves obovate-wedge-shaped, sinuated, smooth; lobes toothed."—Native of New Spain. *Branches* furrowed, alternate. *Leaves* four inches long, two inches and a half wide, smooth, alternate, orbicular towards the extremity; wedge-shaped at the lower part; sinuated; the lobes rounded, obtuse, toothed. *Footstalks* slender, three or four lines in length. *Nee.*

78. Q. *obtusiloba*. Blunt-lobed Iron Oak. Michaux Querc. n. 1. t. 1. Pursh n. 25. (Q. stellata; Willd. n. 71. Ait. n. 26. Wangenh. Amer. 78. t. 6. f. 15.)—Leaves oblong, sinuated, roughish on both sides; lobes obtuse; the upper ones dilated, abrupt, slightly divided. Calyx of the fruit hemispherical.—Found in most of the upland forests, from Canada to Florida, blossoming in May. The *tree* is fifty or sixty feet high, spreading, its timber of great value for ship-building. The whiteness of the *bark*, as in *Q. alba*, causes both these species to be called White Oak by the Americans, who nevertheless know how to distinguish their timber. The *leaves* of the present are roughish beneath, with minute rusty hairs, not hoary; and their upper surface appears to partake occasionally, if not always, of the same sort of pubescence. Their length is from three to five inches; the base wedge-shaped, spreading upwards into two smaller, opposite, rounded lobes, beyond which the *leaf* dilates, suddenly and widely, into a pair of broad, slightly cloven, or emarginate, lobes, and, after another sudden contraction, ends in a terminal three-cleft one. The margin is entire throughout. *Footstalks* short, downy. *Acorns* three or four on a short stalk, of a middling size, scarcely exceeding our British Oaks, elliptical, about half enclosed in the scaly cup.

79. Q. *lyrata*. Over-cup Lyrate Oak, Swamp-post, or Water White Oak. Walt. Carol. 235. Willd. n. 72. Ait. n. 27. Pursh n. 28. Michaux Querc. n. 3. t. 4.—Leaves oblong, deeply sinuated, smooth; much contracted in the middle; lobes acute; the upper ones dilated, angular, and abrupt. Calyx of the fruit globose, muricated, nearly covering the nut.—Native of swamps, from Carolina to Florida, and on the Missisippi; flowering in May. *Pursh.* Michaux says, that though he always found this species in watery places, its growth, in a dry nursery-ground, exceeded that of most other species planted with it. He gives fifty or sixty feet as the height of the *tree;* Pursh from eight to fifteen only. The smooth fine-green *leaves* have more acutely-angular lobes than the foregoing, and are remarkably contracted about the middle. *Acorn* globose, nearly covered by the globular prickly cup.

80. Q. *macrocarpa*. Large-fruited Oak, or Over-cup White Oak. Willd. n. 73. Purſh n. 26. Michaux Querc. n. 2. t. 2, 3. Leaves oblong, lyrate; downy beneath; terminal lobe very large, three-cleft, ſinuated. Calyx of the fruit hemiſpherical, ſcaly, fringed with briſtles.—Found on dry ſlate or limeſtone hills, in all the countries to the weſt of the Allegany mountains, flowering in May. A large *tree*, whoſe *wood*, according to Purſh and Michaux, is very excellent. The *bark* of the young branches is corky. In wet ſituations the whole plant languiſhes, and becomes covered with lichens. The *leaves* are a foot long, more truly and preciſely lyrate than thoſe of the laſt; but the ſpecific name of the preſent is excellent, the *acorns* being larger than thoſe of any other known American ſpecies. Their form is oval, their length two inches, and they are half covered by the cup, ſeveral rows of whoſe broad ſcales end in long briſtles, making a rigid fringe.

81. Q. *olivæformis*. Olive-ſhaped Moſſy-cup Oak. "Michaux Arb. v. 2. 32. t. 2." Purſh n. 27.—"Leaves oblong, ſmooth; glaucous beneath; deeply and unequally pinnatifid. Fruit elliptic-ovate. Calyx cup-ſhaped, fringed."—Obſerved by Michaux on the banks of Hudſon's river, and in the weſtern parts of New York; by Purſh in Pennſylvania and Virginia, on iron-ore hills; flowering in May. This is deſcribed as a large *tree;* the *foliage* handſome, ſomewhat reſembling that of the laſt. We have not examined either a ſpecimen or figure. Willdenow does not mention this ſpecies.

82. Q. *crinita*. Hairy-cupped Oak. Lamarck Dict. v. 1. 718, ε. Olivier's Travels, Engliſh edition, v. 2. 5. t. 12. (Q. Tournefortii; Willd. n. 74. Q. orientalis latifolia, foliis ad coſtam pulchrè inciſis, glande maximâ, cupulâ crinitâ; Tourn. Cor. 40. Voy. v. 2. 172.)—Leaves on long ſtalks, oblong, deeply pinnatifid; downy beneath; lobes lanceolate, bluntiſh, nearly entire. Calyx of the fruit hemiſpherical, downy, briſtly.—Gathered by Tournefort in vallies and plains near Tocat, in Armenia. Olivier ſays it is met with throughout great part of Aſia Minor and Syria. The timber is brought to the arſenal of Conſtantinople, from the ſouthern ſhores of the Black Sea, and is alſo moſt commonly employed for the frame-work of houſes. The *tree* grows to a conſiderable height, and furniſhes excellent wood. This author, who takes the tree in queſtion for *Q. Cerris* of Linnæus, may, poſſibly, confound the real *Cerris* along with it, as Lamarck, though not without ſcruple, has combined them. Olivier's plate, however, very clearly repreſents the above plant of Tournefort; and Lamarck's excellent definition of the ſame, as variety ε of his *crinita*, is abundantly ſufficient to ſtamp it a ſpecies. "Leaves very ſoftly villous, deeply pinnatifid; their ſegments oblong, nearly ſimple, obtuſe, ſomewhat pectinate," (or parallel.) He ſays it is reported to grow wild in the province of Angoumois, and is a tree of handſome aſpect, remarkable for its ſoft, downy, broad *leaves*, cut very deeply into large ſegments, blunt at their extremity, often ſimple, ſometimes furniſhed with a few angles, or ſhort lobes, at their poſterior margin. *Acorns* ſeſſile, their cup briſtly, as in the Burgundy Oak (*Cerris*). Tournefort's ſpecimens agree with the Angoumois Oak, as it is called, ſeen by Lamarck in a cultivated ſtate at Godonvillier. We have ſeen no ſpecimen, but the above accounts are ſufficiently clear to admit of no doubt. Olivier's plate repreſents the *leaves* three or four inches in length, their ſegments about an inch long, almoſt all ſimple and undivided, bluntiſh, entire, more or leſs diſtant, each making an angle with the narrow linear border of the main rib. *Footſtalks* ſlender, an inch, more or leſs, in length, apparently ſmooth. *Acorns* lateral, about an inch long, elliptical, obtuſe, ſolitary, on ſhort ſimple ſtalks; the *cups* beſet with numerous ſoft taper briſtles, divaricated upwards and downwards, near half an inch long. Nothing is exhibited, or deſcribed, concerning the *ſtipulas*, which are very remarkable in the two following ſpecies.

83. Q. *Cerris*. Turkey Oak. Linn. Sp. Pl. 1415. Willd. n. 75. Ait. n. 28, γ. (Q. crinita α et β; Lamarck Dict. v. 1. 718. Q. haliphlæos; Juſſ. in Hort. Paris. Q. burgundiaca, calyce hiſpido; Bauh. Pin. 420. Cerris Plinii, majore glande; Lob. Ic. v. 2. 156. Dod. Pempt. 831. Ger. Em. 1345. Cerrus; Dalech. Hiſt. v. 1. 6, good.)—Leaves on very ſhort ſtalks, oblong, deeply and unequally pinnatifid; hairy beneath; lobes lanceolate, acute, ſomewhat angular. Stipulas longer than the footſtalks. Calyx of the fruit hemiſpherical, briſtly.—Native of France, Italy, and the Levant. Sometimes cultivated in England, but not commonly. This is a tall handſome *tree*, whoſe ſynonyms are much confounded by old writers with *Q. Aegilops*, n. 68, and by more recent botaniſts with the following. Its *leaves* are deeply pinnatifid in the manner of the foregoing; more or leſs unequally; but the lobes are more acute, pointed, and moſt generally angular, ſometimes remarkably lobed or compound. The under ſide differs eſſentially, in being neither downy nor hoary, but rough with minute, ſcattered, tawny, briſtly hairs; the upper, which is of a darker green, and rather ſhining, is alſo occaſionally roughiſh to the touch. *Footſtalks* rough, thick, hardly a quarter of an inch, ſometimes not a line, in length. *Stipulas* linear, acute, downy, from half an inch to an inch long, permanent, accompanied by an axillary tuft of ſimilar, but ſmaller, ſcales. The *acorns* we have not ſeen. They are repreſented ſeſſile, two or three together, large, oblong, with an hemiſpherical cup, which is ſhaggy with long briſtles, projecting in every direction. They are ſaid to be peculiarly bitter and auſtere.

Lamarck aſſerts, from his own obſervation, that the Q. orientalis latifolia, glande maximâ, cupulâ crinitâ, Tourn. Cor. 40, ſcarcely differs in any reſpect from this. If ſo, the term *latifolia* is not happily applied, unleſs Tournefort had alſo noticed, as in our laſt, the deep diviſions of the *leaves*, which are full as remarkable in the preſent ſpecies.

84. Q. *auſtriaca*. Auſtrian Oak. Willd. n. 76. (Q. Cerris; Hoſt. Syn. 520, α and β. Ait. n. 28. Q. crinita γ, cerris Linn.; Lamarck. Dict. v. 1. 718. Q. calyce hiſpido, glande minore; Bauh. Pin. 420. Cerrus; Cluſ. Hiſt. v. 1. 20, excellent. Cerri minoris ramulus cum flore; Ger. Em. 1346, with Cluſius's figure. Cerris Plinii minore glande; Lob. Ic. v. 2. 156. Ger. Em. 1345. Aegilops minore glande; Dod. Pempt. 831. Haliphloeos, Cerrus foemina; Dalech. Hiſt. v. 1. 7.)—Leaves on longiſh ſtalks, ovate-oblong, ſlightly but copiouſly ſinuated; downy and hoary beneath; lobes ſhort, ovate, acute, entire. Stipulas ſhorter than the footſtalks. Calyx of the fruit hemiſpherical, briſtly.—Native of Auſtria, Hungary, Carniola, Italy, and other parts of the ſouth of Europe, in ſtony mountainous places. It occurs not unfrequently in plantations of exotic trees, both in France and England, being generally miſtaken for *Q. Cerris*, from which nothing can be more certainly diſtinct. This *tree* is taller than the Common Oak, *Q. Robur*, and in favourable ſituations riſes perpendicularly to a conſiderable height, as Cluſius deſcribed it, though Lamarck ſays it is ſmaller, leſs handſome, more twiſted and knotty, than the laſt, as well as often hollow. The *wood* is whiter, ſofter, and leſs valuable, than *Q. Robur;* the *bark* grey, tolerably even. *Branches* forming

a round

a round and compact head. *Leaves* two or three inches long, acute, generally rounded and a little unequal at the base; their upper surface of a fine shining green, and nearly smooth; the under whitish, clothed with fine dense down; the margin cut, at each side, into four, five, or six, tolerably regular, rounded or ovate, acute, pointed, entire lobes, more or less deep, separated by round sinuses; the disk of the leaf being left entire, of a considerable width. *Footstalks* near an inch long, downy. *Stipulas* as in the foregoing, but smaller and shorter, usually about half the length of the footstalks. *Acorns* like those of the last, but smaller. The figures of Lobel, Dodonæus, and Ger. Em. 1345, do not well represent the *leaves* of this species, or indeed of the former: that of Clusius, adopted by the editor of Gerarde, in p. 1346, is perfectly correct. The cuts of Dalechamp, both of one and the other, are sufficiently expressive, and very correct as to the footstalks. The lobes of neither of these species are quite pointless, but rather more pointed, as well as acute, than those of *Esculus*, n. 70.

We have thus added eight species of *Quercus* to Willdenow's list. Those botanists who may take the trouble of following us with attention, will perceive that this valuable genus still requires elucidation, particularly with respect to the European, and, above all, the oriental kinds; some of which last, barely indicated by authors, we have been obliged to leave unexplained. Of the most common and important species, *Q. Robur*, we have seen in Mr. Coke's woods at Holkham, some striking varieties, at least, whose distinctions and qualities are well worthy of examination. Two of these have shorter *flower-stalks* than the common *Robur*, and one of them is three weeks earlier in coming into leaf than the other. The *footstalks* of both are longer than is usual in *Robur*. How far a difference of quality in the wood may accompany these botanical distinctions, we must refer to the inquiries of those who are interested in, and have the means of investigating, so important a subject, which is indeed of the first economical, and even national, consequence. It is much to be wished that the species of the Norway Oak, so valuable for floors, on account of its straightness, and freedom from knots, could be determined. Perhaps these circumstances are owing to its being drawn up straight, with few branches, in its close native forests, and therefore it may not be specifically different from one or other of our own species. Michaux, and other writers on the American Oaks, have taught us, that the pubescence of the *leaves* in this genus is of more specific importance than had previously been supposed, and we therefore have paid the more regard to it in discriminating some of the European kinds. The *flowers*, male and female, appear still to demand more precise investigation and comparison, than they have any where received. S.

Quercus, in *Gardening*, furnishes plants of the forest, deciduous, evergreen, ornamental tree-kinds, of which the species cultivated are, the common oak-tree (Q. robur); the willow-leaved oak-tree (Q. phellos); the chesnut-leaved oak-tree (Q. prinus); the black oak-tree (Q. nigra); the red oak-tree (Q. rubra); the white oak-tree (Q. alba); the Italian or small prickly-cupped oak-tree (Q. esculus); the great prickly-cupped oak-tree (Q. ægilops); the Turkey oak-tree (Q. cerris); the evergreen or holm oak-tree (Q. ilex); the holly-leaved evergreen oak-tree (Q. gramuntia); the cork-barked oak, or cork tree (Q. suber); and the kermes oak-tree (Q. coccifera).

Of the first there are several varieties; as with the acorns on long peduncles. This is found in the wilds of Kent and Sussex, where there are many large trees. The leaves are not so deeply sinuated, nor are they so irregular as in the common sort, but the indentures are opposite; they have scarcely any footstalks, but sit close to the branches; but the acorns stand upon very long footstalks. The timber of this sort is accounted better than that of the common oak, and the trees have a better appearance.

The broad-leaved evergreen oak, which grows upon the Apennines, and also in Suabia and Portugal. The leaves are broader, and not so deeply sinuated as those of the common oak; they are of a lighter green on their upper side, and pale on their under; have very short footstalks, and their points are obtuse; the acorns have very long footstalks, which frequently sustain three or four in a cluster.

The dwarf oak, which grows in the south of France and Italy, and is a low bushy oak, rises but six or seven feet high, sending out many slender branches the whole length. The leaves are oblong, and obtusely indented, about three inches long, and an inch and a half broad, standing upon slender footstalks; the acorns small, growing in clusters.

There are also many other varieties of common oak, which dealers in timber and woodmen distinguish by their use, qualities, and accidents, and to which they give different names; but these being merely local, and not founded on permanent characters, it is difficult to ascertain them.

In the second species they distinguish two sorts; one of which is called the Highland willow oak, and grows upon poor dry land; the leaves are of a pale green, and entire, shaped like those of the willow tree; the acorns are very small, but have pretty large cups. The other grows in low moist land, and rises to a much greater height; the leaves are larger and narrower, but the acorns are of the same size and shape. It is suggested, as probable, that their difference may be owing to the soil in which they grow. Martyn observes, that the latter becomes a large timber tree, and that there are said to be several varieties of it.

The third species has seemingly two varieties, one of which grows to a much larger tree than the other; but this may be occasioned by the soil, for the largest trees grow in rich low lands, where they become bigger than any of the North American oaks. The wood is not of a very fine grain, but is very serviceable; the bark is grey and scaly; the leaves are five or six inches long, and two inches and a half broad in the middle, indented on the edges with many transverse veins running from the midrib to the borders; they are of a bright green, and so nearly resemble those of the chesnut tree as scarcely to be distinguished from it. The acorns are very large, and their cups are short. The leaves of the other variety are not so large, nor so strongly veined; and the acorns are smaller, and a little longer. The different varieties are distinguished by the form of their leaves, which in the one is ovate, and in the other oblong.

The fifth sort has several varieties.

And in the ninth sort there are several varieties.

The tenth species has likewise several varieties, differing greatly in the size and shape of their leaves; but these will all arise from acorns of the same tree: even the lower and upper branches have very frequently leaves very different in size and shape; those on the lower branches being much broader, rounder, and their edges indented and set with prickles; but those on the upper long, narrow, and entire. The leaves are from three to four inches long, and an inch broad near the base, gradually lessening to a point; they are of a lucid green on their upper side, but whitish and downy on their under, and do not fall till they are thrust off

off by young leaves in the ſpring. The acorns are ſmaller than thoſe of the common oak, but of the ſame ſhape.

The twelfth ſpecies has alſo two or three varieties; one with a broad leaf, a ſecond with a narrow leaf, both evergreen; and one or two which caſt their leaves in autumn: but the broad-leaved evergreen is the moſt common. The leaves of this are entire, about two inches long, and an inch and quarter broad, with a little down on their under ſides, on very ſhort footſtalks: theſe leaves continue green through the winter till the middle of May, when they generally fall off juſt before the new leaves come out, ſo that the trees are often almoſt bare for a ſhort time. The acorns are very like thoſe of the common oak.

The exterior bark forms the cork, which is taken from the tree every eight or ten years; but there is an interior bark which nouriſhes them, ſo that ſtripping off the outer bark is ſo far from injuring the trees, that it is neceſſary to continue them: for, when the bark is not taken off, they ſeldom laſt longer than 50 or 60 years in health; whereas trees which are barked every eight or ten years will live 150 years, or more. The bark of a young tree is porous, and good for little: however, it is neceſſary to take it off, when the trees are twelve or fifteen years old, for without this the bark will never be good. After eight or ten years, the bark will be fit to take off again; but this ſecond peeling is of little uſe. At the third peeling, the bark will be in perfection, and will continue ſo for 150 years; as the beſt cork is taken from old trees. The time for ſtripping the bark is in July, when the ſecond ſap flows plentifully: the operation is performed with an inſtrument like that which is uſed for diſbarking the oak.

It is from the laſt ſpecies they collect the kermes, or ſcarlet grain, a little red gall, occaſioned by the puncture of an inſect called *coccus ilicis.* With this the ancients uſed to dye cloth of a beautiful colour.

Method of Culture.—Theſe trees are all capable of being raiſed from the ſeed or acorns, which, in the common oak, ſhould be gathered in autumn when quite ripe, juſt as they drop from the trees; but thoſe of moſt of the foreign oaks are generally procured from abroad, and ſold by the ſeedſmen.

All the ſorts ſhould be ſown as ſoon after they are obtained as poſſible, as they are apt to ſprout if they remain long out of the ground; and for their reception, a ſpot of light ground in the nurſery ſhould be prepared by digging or ploughing, dividing it into four feet wide beds, in which the acorns ſhould be ſown, either in drills, two inches deep, in five or ſix rows lengthwiſe of the bed; or rake the mould off the bed, the depth of two inches, into the alleys; then ſowing the acorns all over the ſurface, about two or three inches apart, preſs them down with the ſpade, and ſpread the earth evenly over them two inches thick. When they come up in the ſpring, they ſhould have occaſional waterings and weeding; and when the plants are one or two years old, it is proper to plant them out in nurſery-rows: this may be done in autumn, winter, or early in the ſpring, taking them carefully up out of the ſeed-bed, ſhortening their perpendicular tap-roots, and trimming off any lateral ſhoots from the ſtem, leaving their top perfectly entire; then planting them in lines two feet and a half aſunder, and fifteen or eighteen inches in the rows, where they ſhould ſtand, with the uſual nurſery care, till of a proper ſize for final planting out either as foreſt trees, or for ornament, training them up as full ſtandards, with clean ſtraight ſtems, and with their tops ſtill entire.

But in raiſing the ſtriped-leaved varieties of the common oak, and any particular variety of the other ſpecies, it ſhould be by grafting, (as they will not continue the ſame from ſeed,) which ſhould be performed upon any kind of oakling ſtocks raiſed from the acorns, and trained for ſtandards, as in other kinds.

With reſpect to the final planting out, it may be performed in all ſorts of deciduous oaks any time in open ſettled weather, from November till February or March; and in the evergreen kinds in October, November, or the ſpring; and in a mild open ſeaſon in any of the winter months.

When the trees of all the ſorts are from about three or four to ſix feet ſtature, they are proper for being planted out for good; though, as foreſt or timber trees, it is better to plant them out finally while they are quite young, as from two to three or four feet in height; or when planted immediately from the ſeed-bed, where they are to remain, it may be advantageons, as the very young oaks root more freely than older trees, and take a freer growth. Thoſe deſigned as foreſt or timber trees ſhould be planted in large open tracts of ground, to form woods, placing them in rows only from four or five to ten feet aſunder, and from two or three to five or ſix feet in the rows, to allow for a gradual thinning. But perhaps the beſt method of all for raiſing them, as timber trees, is from the ſeed, by ſowing or ſetting the acorns. See PLANTATION and PLANTING.

Sometimes, indeed, large plantations of theſe trees, for woods, are raiſed by ſowing the acorns at once in the places where they are to remain; it being generally found that the trees raiſed at once from the acorn, from their not being checked, much outſtrip the tranſplanted trees in their growth. The method of performing it is this: the ground being prepared by good ploughing and harrowing in the autumn, having procured a proper quantity of acorns, draw drills acroſs the ground four feet aſunder, and two inches deep, dropping the acorns into them ſix or eight inches aſunder, allowing for failing and thinning, covering them in evenly with the earth the depth of the drills; or, inſtead of drilling them in, they may be planted with a dibble the ſame depth and diſtance.

The general management of theſe trees in woods, or timber plantations, is the ſame as directed for foreſt trees in general. See PLANTATION.

All the above ſorts of trees may be employed to diverſify large ornamental plantations in out-grounds, and in forming clumps in ſpacious lawns, parks, and other extenſive open ſpaces: the evergreen kinds, in particular, have great merit for all ornamental purpoſes in pleaſure-grounds and plantations. And all the larger growing kinds, both deciduous and evergreens, are highly valuable as foreſt trees for timber; but the firſt ſort claims precedence as a timber tree, for its prodigious height and bulk, and ſuperior worth of the wood.

In planting any of the ſpecies for ornament or variety in large pleaſure-grounds, ſome may be diſpoſed in aſſemblage in any continued plantation, ſome in clumps, and others ſingly.

All the different ſorts of the oak will ſucceed in any ſoil of a middling quality, where the expoſure is not unfavourable; but to the moſt advantage, where the land is of a loamy nature: they, however, thrive tolerably in thoſe ſoils which are of a gravelly, ſandy, or clayey deſcription.

Beſides the great value of theſe ſorts of trees for the utility and durability of their wood, as timber, for the purpoſes of ſhip-building, houſe-building in ſome parts, parkpaling, poſts, railings, and a variety of other ſtrong uſes; they, in many of the kinds, afford conſiderable additional advantage

advantage by their produce in bark, for the ufe of the tanners and cork-cutters, in tanning leather, and being made into corks; after the former of which, it is alfo much employed in gardening, for the forming of bark hot-beds, in raifing tender hot-houfe exotic plants: as well as in their annual crops of acorns, as an excellent food for the keeping and fattening of fwine, deer, and fome other animals.

QUERCUS, in *Planting*, a claffical term fometimes applied to the oak-tree in nurfery collections, intended for this fort of application. See OAK-*Tree*.

QUERCUS *Marina*, the *Sea-Oak*, in *Botany*, the name of one of the broad-leaved dichotomous fea-fucufes.

It is not agreed, among the late botanifts, what was the fea-oak of Theophraftus; and the moft ancient botanifts, Clufius and Cæfalpinus, fuppofe it to have been a fpecies of the fhrubby coralline; but that feems by no means to have been the cafe, fince Theophraftus fays his fea-oak had a long, thick, and flefhy leaf, whence we may much more naturally conclude it to have been of the fucus clafs.

QUERCY, in *Geography*, a province of France before the revolution, in the government of Guienne; bordered on the E. by Rouergue and Auvergne, on the S. by Upper Languedoc, on the W. by Perigord and Agenois, and on the N. by Limofin: it contained two bifhoprics, *viz.* Cahors and Montauban. The air is good, and the land is fertile: its capital was Cahors. It now conftitutes the department of the Lot.

QUEREIVA, in *Ornithology*, the purple-throated chatterer of Latham, a fpecies of Ampelis.

QUERELA, QUARREL, in *Law*, denotes an action, or declaration, preferred in any court of juftice. See QUARREL.

In an action where the plaintiff is called *querens*, *i. e.* complainant, his brief, complaint, or declaration, is called *querela*.

QUERELA *Audita*. See AUDITA.

QUERELA *coram rege et concilio*, a writ by which one is called to juftify a complaint of a trefpafs made to the king himfelf, before the king and his council.

QUERELA *Duplex*. See DOUBLE *Quarrel*.

QUERELA, *Ex gravi*. See EX GRAVI, &c.

QUERENGHI, ANTONIO, in *Biography*, a man of letters, was born at Padua in 1546. He difplayed, at an early period of his life, a decided attachment to literature; he wrote verfes before he was twelve years of age, and foon became diftinguifhed by his deep knowledge of the languages, civil laws, and the philofophy that was taught at that period. For fome time he applied himfelf to theology, and made confiderable proficiency in it. He next went to Rome, where he entered into the fervice of feveral cardinals, and at length became fecretary of the facred college, in which capacity he was prefent at the election of five popes. Clement VIII. conferred upon him the canonry of Padua, which occafioned him to refide in that city, but he returned to Rome in the pontificate of Paul V., by whom he was promoted to fome offices of truft. He died at Rome in 1633, at the age of 87. He was a man of various and extenfive literature, and was much regarded by the learned of the time in which he flourifhed. His writings were numerous, and comprehended the fciences and polite literature. He is chiefly known to pofterity by his poems, which are correct and elegant, but by no means animated. Moreri.

QUERETANO, in *Geography*, a town of Mexico; 80 miles N.N.W. of Mexico. N. lat. 20° 25′. W. long. 101° 36′.

QUERFAA, in the *Materia Medica of the Arabians*, a name given by Avicenna and others to cinnamon, when gathered with the wood of the young branches.

It was a common practice in the early times not to ftrip the fmall bark from medicinal trees, but to cut off the little boughs, and ufe the bark and wood together. This the Greeks called *xylo cinnamomum*, or woody cinnamon; and the Arabians, *querfaa*, *querfe*, or *kerfe*.

QUERFURT, in *Geography*, a town of Saxony, fituated on the little river Weite, inconfiderable in itfelf, but having large fuburbs; the number of houfes is eftimated at upwards of 500. The old caftle belonging to it ftands on a hill, and it has likewife a fuperintendency; 16 miles S.W. of Halle. N. lat. 51° 23′. E. long. 11° 45′.

QUERIA, in *Botany*, received that name from Loefling and Linnæus, in compliment to Don Jofeph Quer y Martinez, a Spanifh furgeon, who though he wrote againft the Linnæan fyftem, and even the fexes of plants, contending that palm-trees ripen fruit without impregnation, was an affiduous practical botanift. He publifhed a Spanifh Flora, in his native tongue, confifting of four volumes quarto, of which the firft three appeared in 1762, and the fourth in 1764. A fifth and fixth were added by Ortega in 1784. Quer was profeffor of botany in the royal garden at Madrid, and died in 1764, aged 69. He wrote alfo on the *Uvi Urfi*, (which he removes from the genus *Arbutus*,) as a fpecific in calculous complaints; and on the medical ufe of *Cicuta*.—See Haller's Bibl. Bot. v. 2. 516. and Dryandr. Bibl. Banks.— Linn. Gen. 43. Schreb. 58. Willd. Sp. Pl. v. 1. 493. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 1. 185. Juff. 300. Lamarck Illuftr. t. 52. Gærtn. t. 128?—Clafs and order, *Triandria Trigynia*. Nat. Ord. *Caryophylleæ*, Linn. Juff.

Gen. Ch. *Cal.* Perianth inferior, of five erect, oblong, acute, permanent leaves; the outermoft recurved. *Cor.* none. *Stam.* Filaments three, capillary, fhort; anthers roundifh. *Pift.* Germen fuperior, ovate; ftyles three, the length of the ftamens; ftigmas fimple. *Peric.* Capfule roundifh, of one cell, with three valves. *Seed* folitary, roundifh, compreffed.

Eff. Ch. Calyx of five leaves. Corolla none. Capfule of one cell, with one feed.

Obf. Linnæus remarks, that this genus differs evidently from MINUARTIA, fee that article, in having a folitary feed. *Q. canadenfis*, figured by Gærtner, is removed hence by Michaux to his genus *Anychia*, which belongs to a different natural order, the *Holeraceæ* of Linnæus, and has a capfule deftitute of valves. Gærtner indicates its clofe affinity, except in number of ftamens, to his PARONYCHIA, fee that article. Michaux and Purfh affert that its ftamens vary from two to five.

1. Q. *hifpanica*. Spanifh Queria. Linn. Sp. Pl. 132. Willd. n. 1. Ait. n. 1. Loefl. It. 48. 83. Quer. Fl. Efpan. v. 6. 667. t. 15. f. 2.—Flowers crowded into a tuft.—Native of fandy grounds in Spain. Seeds were fent to Kew, in 1800, by the late marchionefs of Bute. The plant is a diminutive hardy annual, flowering moft part of the fummer. *Root* fibrous. Whole *herb* whitifh, brittle, one or two inches high, with feveral leafy, round, rather downy, flightly reddifh *ftems*. *Leaves* oppofite, feffile, awl-fhaped, three-ribbed, curved to one fide, rather longer than the joints of the ftem. Head of *flowers* obfcurely quadrangular, denfely dichotomous, eafily breaking off from the ftem. *Bracteas* oppofite, awl-fhaped, recurved, and hooked, eafily catching hold of the coats of animals. *Flowers* very minute.

2. Q. *canadenfis*. Canadian Queria. Linn. Sp. Pl. 132. Willd. n. 2. Ait. n. 2. Gærtn. v. 2. 217. t. 128. f. 10. Gron. Virg. ed. 2. 16. (Mollugo foliis oppofitis, ftipulis quaternis,

quaternis, caule dichotomo; Gron. Virg. ed. 1. 14. Anychia dichotoma; Michaux Boreal-Amer. v. 1. 113. Purſh v. 1. 176.)—Flowers ſolitary, ſtem forked.—Native of dry lime-ſtone hills, from New York to Kentucky, flowering from June to Auguſt. Introduced at Kew, in 1806, by his royal highneſs the duke of Kent, according to Mr. Aiton, who marks it as a hardy biennial. Linnæus and others make it perennial; which the appearance of the plant contradicts. The *root* is ſmall, tapering, with a few pale fibres. *Stem* ſolitary, near a ſpan high, round, jointed, ſmooth, reddiſh, erect, leafy; ſimple below; repeatedly ſubdivided, forked and ſpreading, above; the branches divaricated, capillary, leafy, many-flowered. *Leaves* oppoſite, on ſhort ſtalks, obovate, entire, ſmooth, from one-fourth to three-fourths of an inch long, covered on both ſides with reddiſh dots, which become prominent as the leaves dry. Theſe dots, Linnæus ſays, diſappear by culture. *Stipulas* two at each ſide, membranous, acute. *Flowers* very ſmall, axillary or lateral, green, on ſhort ſtalks. *Calyx-leaves* concave, or vaulted, below the point. *Stamens*, according to Michaux, always five in the wild plant; in the cultivated one often but two. Linnæus juſtly points out the reſemblance of this herb, at firſt ſight, to *Linum catharticum;* but its ſtrict affinity to *Illecebrum*, *Polygonum*, &c. is far more ſtriking, as well as its total unlikeneſs to the original *Queria;* ſo that there can be no doubt of the neceſſity of removing it from the preſent genus, whether the *Anychia* of Michaux be permanently eſtabliſhed or not.

3. Q. *trichotoma*. Three-forked Queria. Thunb. in Tranſ. of the Linn. Soc. v. 2. 329. Willd. n. 3. (Rubia ſpicis ternis; Thunb. Jap. 357.)—Flowers racemoſe. Stem triply forked.—Native of Japan.—*Herb* with widely ſpreading, thread-ſhaped, ſmooth *branches*. *Leaves* oppoſite, on very ſhort ſtalks, ovate, acute, nearly entire, ſmooth, widely ſpreading, as long as the finger nail. *Cluſters* axillary, three; two oppoſite, one terminal, compoſed of three or four pair of oppoſite, minute, deciduous *flowers*. To this deſcription Thunberg adds—"*Corolla* cylindrical. *Fruit* inferior, oblong, ſmooth."—This muſt be altogether a miſtake, if the plant has any pretenſions to be reckoned a *Queria*. Having ſeen no ſpecimen, we leave the matter as we find it. The genus before us muſt probably depend on the firſt ſpecies only; and whether the character of the ſolitary ſeed, by which alone it ſtands diſtinguiſhed from *Minuartia*, be ſufficient, there being the ſtricteſt conformity in habit and every other particular, we feel much inclined to doubt.

QUERIGUT, in *Geography*, a town of France, in the department of the Arriége, and chief place of a canton, in the diſtrict of Foix; 27 miles S.E. of Taraſcon. The place contains 809, and the canton 2483 inhabitants, on a territory of 132½ kiliometres, in ſeven communes.

QUERIMBA, a cluſter of iſlands, deriving its name from the principal, in the Indian ſea, near the coaſt of Africa; fertile in dates, oranges, grapes, and other fruits and legumes. The paſtures feed great numbers of large and ſmall cattle, and the coaſts abound with fiſh. Theſe iſlands, when firſt diſcovered by the Portugueſe, were inhabited by Arabians; but at preſent they are chiefly occupied by the deſcendants of Portugueſe. S. lat. 12° 20′. — Alſo, a country of Africa, bordering on the coaſt. S. lat. 9° to 13°. —Alſo, a river of Africa, which runs into the Indian ſea, S. lat. 12° 20′.

QUERKEINESS, or Kerkeines, two iſlands in the Mediterranean, near the coaſt of Tripoli; one of them about ten miles long and five wide, anciently called "Cercina;" the other, which is ſmaller, is united to the larger by a bridge; 15 miles S.S.E. of cape Oudia. N. lat. 34° 59′. E. long. 11° 12′.

QUERO, a town of South America, in the juriſdiction of Riobamba.

QUERPO. See Cuerpo.

QUERQUEDULA, in *Ornithology*, a ſpecies of *Anas*. See Duck and Teal.

QUERRE′, in *Geography*, a town of France, in the department of the Mayne and Loire; 12 miles N. of Angers.

QUERRIEN, a town of France, in the department of the Finiſterre; ſix miles N. of Quimperle.

QUERRIES, or Equerries. See Equerry.

QUERRIEUX, in *Geography*, a town of France, in the department of the Somme; ſix miles N.E. of Amiens.

QUERRY, *Gentleman of the*, is an officer appointed to hold the king's ſtirrup, when he mounts on horſeback.

QUERS, in *Geography*, a town of France, in the department of the Upper Saone; three miles S.E. of Luxeuil.

QUESADA, a town of Spain, in the province of Jaen; 12 miles S.E. of Ubeda.

QUESENDORF, a town of Pruſſia, in the palatinate of Culm; four miles S.E. of Bretchen.

QUESNAY, Francis, in *Biography*, a celebrated French phyſician, was born at Merey, a little town not very diſtant from Paris, in 1694. His family were employed in ruſtic occupations, and gave him no other education than was deemed neceſſary for their mode of life; ſo that at the age of ſixteen he was ſcarcely able to read. About this time, however, a thirſt for information ſeized him, and partly by the aſſiſtance of a country ſurgeon, and the few books that he poſſeſſed, but principally by his own labour, he acquired a knowledge of Latin and Greek, and entered with ardour into the ſtudy of the ancient and modern writings on philoſophy. In oppoſition to the grovelling notions of his relations, he reſolved to turn his purſuits to medicine, having perceived its connection with the various branches of phyſical ſcience; and his maſter, the ſurgeon of Ecquevilly, was ſoon convinced of the ſuperior acquirements of his pupil, ſome of whoſe eſſays he preſented as his own, on applying for admiſſion into the college of St. Côme, and they were received with great applauſe. This ſtill farther rouſed the zeal of Queſnay, and he repaired to Paris, where he entered with great aſſiduity into the ſtudies connected with the profeſſion. After ſome time he ſettled at Mantes, a conſiderable town in his native province. Here he was diſcovered by Garengeot, an eminent ſurgeon, who was engaged with Peyronie in an attempt to eſtabliſh an academy of ſurgery, for the collection of ſurgical knowledge. Having written a refutation of the doctrines of Silva, reſpecting blood-letting, which led him to a public controverſy, in which he was deemed victorious by Peyronie, he diſplayed ſuch profound views, indefatigable zeal, and great general knowledge, as determined Peyronie to appoint him the ſecretary of his new academy. This diſtinguiſhed poſt raiſed him ſtill higher in the public eſtimation; but the labours connected with it at length injured his health, which had been for ſome time delicate, and he determined to turn his attention to medicine more particularly, and took the degree of doctor of phyſic. He had been employed during the campaigns of the king, and on the death of M. Terray was appointed conſulting phyſician to his majeſty; and was much eſteemed and favoured by madame de Pompadour; he ſeems, indeed, to have been much employed, and to have been held in high conſideration by the dauphin, the

the father of Louis XVI., and by the whole court. After the dauphin had undergone the ſmall-pox, the king preſented him with letters of nobility, unſolicited, as a mark of his eſteem. He was appointed alſo firſt phyſician in ordinary to his majeſty. He was a member of the Academy of Sciences, of the Royal Society of London, &c. Notwithſtanding his long life, and his courtly favour, as well as extenſive employment, he died poſſeſſed of little fortune, his liberality to his friends having prevented him from accumulating money. His death took place at Verſailles, in December, 1774, at the age of eighty.

This able and indefatigable man left ſeveral works, which bear the ſtamp of conſiderable reſearch, clear and methodical views, and acute obſervation, mixed, however, with ſome diſpoſition to hypotheſis. His firſt eſſay on blood-letting, already mentioned, was publiſhed in 1730, under the title of "Obſervations ſur les Effets de la Saignée, avec des Remarques critiques ſur la Traité de Silva;" and a ſecond edition, conſiderably enlarged, was printed in 1750. But in the mean time he publiſhed another work, entitled "L'Art de Guerir par la Saignée," Paris, 1736, in which he recommends blood-letting in many diſeaſes. In the ſame year appeared his "Eſſai Phyſique ſur l'Economie Animale," in two volumes, 12mo., which was reprinted in 1747, in three volumes. This work, however, was deemed very imperfect by Haller, and is in fact characteriſed by a love of hypotheſis, rather than by the details of experience and obſervation. In 1743, his "Preface des Memoires de l'Academie de Chirurgie," gained him conſiderable applauſe, as a work of literary reſearch. In 1744 he publiſhed his "Recherches critiques et hiſtoriques ſur l'Origine, ſur les divers Etats, et ſur les Progrés de la Chirurgie en France," which called forth ſome replies on the alleged inaccuracy of ſome of the hiſtorical ſtatements. His other publications were entitled, "Teſtament de M. de la Peyronie du 18 Avril, 1747;" "Examen impartial des Conteſtations des Medecins et des Chirurgiens de Paris," 1748, 12mo.; "Memoire préſenté au Roi par ſon premier Chirurgien, où l'on examine la Sageſſe de l'Ancienne Légiſlation ſur l'Etat de la Chirurgie en France," 4to.; "Traité de la Suppuration," 12mo.; and "Traité de la Gangrene," 12mo.; all in the year 1749. And laſtly, his "Traité des Fièvres continues," 1753, in two volumes, 12mo. Eloy Dict. Hiſt. de la Médécine.

QUESNE, Abraham du, an able French naval commander, was deſcended from a noble family in Normandy. He was born in 1610, and was brought up to the ſea-ſervice under his father, who gave him the command of a veſſel when he was only ſeventeen years of age. In 1637 he was preſent at the attack of the iſles of Sainte Marguerite, and in the following year contributed greatly to the defeat of the Spaniards before Gattori. He was afterwards in various actions on the coaſt of Spain. In 1644 he went to ſerve in Sweden, and was promoted to the rank of vice-admiral of the Swediſh fleet. In this ſtation he had a command in the famous battle in which the Danes were entirely defeated, and his veſſel was one that boarded and took the enemy's admiral ſhip. On his return to France he commanded a ſquadron ſent to the expedition againſt Naples. The French navy being in a low ſtate on account of the minority of the king, he fitted out ſeveral ſhips at his own expence in 1650, with which he aſſiſted in the reduction of Bordeaux, which had revolted, and was aided by a Spaniſh fleet. In 1676 he had the glory of being oppoſed to the great De Ruyter. The Spaniſh and Dutch fleets had united to prevent the French from ſuccouring the inhabitants of Meſſina, but Du Queſne, after a deſperate fight, ſucceeded in entering the port. He was alſo engaged with De Ruyter when the latter was mortally wounded. Du Queſne obtained a more glorious and decided ſucceſs in another engagement with the Spaniſh and Dutch fleets at Palermo, when, by means of his fire-ſhips, he deſtroyed twelve large ſhips of the enemy, and thus procured for his king the ſovereignty of the Mediterranean. In 1682 he was ſent with a fleet to awe the piratical ſtates of Barbary, which had committed depredations on the French coaſts, and in the following year he ſailed to Algiers, and bombarded the town with ſuch fury as nearly to lay it in ruins. In the following ſpring the admiral anchored before the city, and did not leave it till he had deſtroyed almoſt all the buildings, with the whole of the ſhipping and fortifications, the conſequence of which was they were obliged humbly to ſue for peace. He ſtruck equal terror into the ſtates of Tripoli and Tunis, which were likewiſe compelled to purchaſe peace with France by ſubmiſſion. He performed other great and important ſervices for his ſovereign, but the recompence due to him on account of all he did was impeded by his firm attachment to the reformed religion in which he was bred, and which the bigotry of the king regarded as criminal. He received, however, the royal gift of a fine eſtate, which was erected into a marquiſate, and gave him a title; and on the repeal of the edict of Nantes, he was the only perſon exempted from its penalties. This great hero, one of the chief boaſts of the French navy, preſerved an extraordinary degree of health and vigour, notwithſtanding the many wounds which he had received, till his death in 1688, when he had attained to the 78th year of his age. He left a ſon, of whom we ſhall ſay a few words.

Quesne, Henry du, was born in 1652, and at the age of fourteen he entered the French navy, and ſerved with great diſtinction under his father. He was preſent at the bombardment of Algiers in 1683, and negotiated the peace of Tunis. At the period when the higheſt proſpects in his profeſſion lay before him, his attachment to the Proteſtant religion cauſed him, at the repeal of the edict of Nantes, to quit his country and the ſervice, but he refuſed with indignation the offers that were made him to take a command in the armies of its enemies, and retired to Switzerland. His high reputation raiſed him to great credit with the Proteſtant powers, which he employed in engaging them to undertake the protection of his perſecuted brethren; and through his means a great number of victims of the moſt cruel intolerance procured their liberation from the gallies. In 1701 he ſold his eſtate in Switzerland, and retired to Geneva, of which he was admitted to the citizenſhip. Here he died in 1723, reſpected alike for his learning and piety. As an author he had taken a conſiderable ſhare in the verſion of the New Teſtament publiſhed by the paſtors of Geneva, and he was author of a work entitled "Reflexions Anciennes et Modernes ſur l'Euchariſtie."

Quesne, *Fort du*, in *Geography*. See Pittsburg.

QUESNEL, Pasquier, in *Biography*, a French prieſt of much celebrity, was born at Paris in the year 1634. Having completed his education, and being admitted a member of the congregation of the oratory, he took prieſt's orders in 1659. From this time he devoted himſelf, with great diligence, to the ſtudy of the ſcriptures, and of the fathers, and to the compoſition of books in practical piety. At the age of 28 he was appointed firſt director of the inſtitution belonging to his order at Paris. The firſt of his publications was entitled "Moral Reflections upon the Goſpels." After this he was employed in preparing for the preſs a new edition of "The Works of St. Leo," in two volumes, 4to. in which he has given a vaſt number of notes that

that reflect great honour on the learning of the editor. Its value was enhanced, in the judgment of his countrymen, by his introducing into it an able defence of the sentiments of the Gallican church, in opposition to the pretensions of the church of Rome. This circumstance gave great offence to the papal government, and the edition was condemned in the following year at Rome. On account of his attachment to father de Sainte-Marthe, general of the oratory in France, he was obliged to quit his diocese, and from other unpleasant circumstances he thought it right to withdraw privately from France into foreign countries. He took refuge at Brussels, where he continued his "Moral Reflections" on the acts of the apostles, and the epistles. This, with his former work, he published in 1687. He afterwards revised and made additions to the former work on the Evangelists, and printed an uniform edition of the whole in 1693 or 1694, in four vols. 8vo. In the year 1703 the Jesuits, always inimical to the rights and liberties of mankind, and who, to the utter disgrace of the present period, have been just re-established in their powers, availed themselves of their influence with an ignorant and bigotted king of Spain, to obtain an order for the arrest of father Quesnel, who was now thrust into a dungeon belonging to the archiepiscopal palace at Brussels. From this situation he was unexpectedly delivered in less than four months by the ingenuity of a Spaniard, who contrived to open a passage through the walls of the prison sufficiently large for his escape. Having thus obtained his liberty, he made the best of his way to Holland, where he published several pieces in vindication of himself and writings from charges preferred against both before the ecclesiastical court of Mechlin, and the sentence of condemnation pronounced by the archbishop. In the year 1705 the enemies of Quesnel applied to the pope Clement XI. for the condemnation of the "Moral Reflections," to which he acceded, although he had some years before expressed his decided approbation of them, and even wished to engage the author to come to reside at Rome. Such, however, was the pontiff's inconsistency, that he issued a decree which condemned the "Moral Reflections" in general, but without specifying any particular doctrines which merited such a sentence. At length, at the instigations of the Jesuits, eager in the cause of persecution, Lewis XIV. joined himself against Quesnel, and applied to the pope for a more definite decree; his holiness, for so the most wicked as well as most virtuous of the popes have ever been denominated, in consequence of this application, established a congregation of cardinals, prelates, and divines, to enter into a particular examination of the doctrines and maxims which Quesnel had advanced. That his work might not be condemned without any efforts on his part to vindicate it from the accusations of his enemies, our author wrote, on this occasion, two letters to the pope, which were safely conveyed to Rome, but Clement did not deign to give a reply. State policy had already determined what measures he should adopt, and, after the sessions of the congregation were ended, he issued the celebrated bull Unigenitus, in September 1713, which pronounced a sentence of condemnation upon 101 propositions extracted from the "Moral Reflections."

Father Quesnel spent the last years of his life at Amsterdam, where he formed some Jansenist churches, and published his apologetic and controversial pieces against the bull Unigenitus, and its abettors. He died in 1719, in the 86th year of his age. Independently of his "Moral Reflections," he was author of several other works of high reputation, of which we may mention, a treatise on "Predestination and Grace," in four vols. 12mo. under the fictitious name of sieur Germain; and "The Discipline of the Church deduced from the New Testament," in two vols. 4to. A list of this author's works may be seen in Moreri.

QUESNOI, Francis du, called the Fleming, an excellent sculptor, was born at Brussels in 1594. He learned his art under his father, who was a sculptor, and at an early age displayed so much ability, that the archduke Albert gave him a pension and sent him into Italy. After the death of that prince, he was patronized by the constable Colonna; and the celebrated Poussin residing with the constable at the same time, the two artists contracted an intimate friendship, and studied together. Quesnoi formed himself upon the taste of the ancients, and chiefly excelled in making bas-reliefs and models in a small size, representing cupids and children, to which he gave singular grace and delicacy. He employed himself several years on a marble saint, for the chapel of Loretto, in which he imitated the genuine beauties of the antique. When the canopy of St. Peter's was finished, pope Urban VIII. ordered four colossal statues to be placed in the niches. That of St. Andrew was given to Quesnoi, and although one of his competitors ventured to affirm that he would only produce a great child, yet when the figure was completed, it entirely effaced his own performance. Notwithstanding the talents of this artist, which were united to much perseverance and industry, he could barely earn a subsistence, and was in a very low state of health and spirits, when, in 1642, Lewis XIII. engaged him as his sculptor, and as the head of an intended school for that branch of art, at a very liberal salary. This change of fortune he was unable to bear, and as he was on the point of setting out, he sunk into a melancholy derangement, from which he never recovered. His death, which happened at Leghorn in 1646, has been imputed, but probably on insufficient evidence, to poison, administered by the hand of a brother with whom he lived on very bad terms. He was mild in his manners, but of a reserved disposition. His reputation is chiefly founded upon the exquisite softness which he gave to marble, and the peculiar grace and beauty of his infantile groups, finished with perfect anatomical exactness.

QUESNOY, Le, in *Geography*, a town of France, in the department of the North, and chief place of a canton, in the district of Avesnes. The place contains 2960, and the cantons, to which belong the east and west divisions, 9099 each, on a territory of 235 kiliometres, in 29 communes. N. lat. 50° 15′. E. long. 3° 43′.

Quesnoy-*sur-Deule*, a town of France, in the department of the North, and chief place of a canton, in the district of Lille. The place contains 4002, and the canton 15,047 inhabitants, on a territory of $82\frac{1}{2}$ kiliometres, in nine communes.

QUEST, or Inquest, an inquisition, or inquiry, made upon oath of an impannelled jury. See Inquest, and Jury.

The word is formed from the French *quete, search*; of the Latin *quæsitum, a thing sought.*

Quest, in *Hunting*, the seeking out of hounds, or the venting and winding of spaniels. See Hound.

QUESTEMBERT, in *Geography*, a town of France, in the department of Morbihan; five miles W.S.W. of Rochfort. The place contains 3668, and the canton 12,118 inhabitants, on a territory of $257\frac{1}{2}$ kiliometres, in nine communes.

QUESTION, Quæstio, in *Logic, &c.* a proposition, whose truth a person being inquisitive about, proposes by way of interrogation to another.

Logical questions are variously distributed; the ordinary division

division is into *firſt* or *primary* queſtions; as, *Quid eſt? What is ſuch a thing?* And *ſecondary*, which ariſe out of the former; as, *How is it?*

Question, *Quodlibetical.* See Quodlibetical.

Question, in *Law*. The *quæſtio de jure* is generally to be diſtinguiſhed from the *quæſtio de facto.*

Question is alſo ſometimes uſed for *torture;* which ſee.

QUEST-MEN, perſons choſen yearly in each ward, to inquire into abuſes and miſdemeanors, eſpecially ſuch as relate to weights and meaſures.

Quest-men, in *Eccleſiaſtical Law*. See Sidesmen.

QUESTOR, Quæstor, formed *a quærendo, ſeeking, ſearching*, or *collecting the revenues of the ſtate*, an officer in ancient Rome, who had the care of the public treaſure.

The queſtorſhip, *quæſtura*, is very ancient, as having been eſtabliſhed under the kings, probably in the time of Romulus or Numa, or at leaſt under Tullus Hoſtilius. Tacitus (Annal. xi. 22.) ſays, that the firſt queſtors were elected by the people, 64 years after the foundation of the republic; but he is of opinion that they had, long before that period, been annually appointed by the conſuls, and even by the kings. But this obſcure point of antiquity is conteſted by other writers. Dionyſius and Livy date the original of queſtors about A. U. C. 269. Plutarch refers the inſtitution to the time of Valerius Poplicola, when he allotted the temple of Saturn for the treaſury, and granted the people the liberty of chooſing two young men for the treaſurers. Afterwards, *viz.* A. U. C. 332, two others were created to take care of the payment of the armies abroad, of ſelling the plunder and booty, &c. for which purpoſe they generally accompanied the conſuls in their expeditions; and they were diſtinguiſhed by the name of *peregrini* from the other queſtors, who aſſumed the title of *urbani.* This number continued till the entire conqueſt of Italy; and then, A. U. C. 439, it was again doubled. The four that were added reſided with the proconſuls and proprætors, in the provinces, where they were employed in regulating the taxes and cuſtoms due to the ſtate.

In the time of the republic, the ſenate appointed queſtors in each province, to aſſiſt the proconſuls, as lieutenants or treaſurers, in the adminiſtration of the revenues; but, under the emperors, there was properly but one queſtor, or treaſurer-general of the empire; thoſe other inferior or ſubordinate queſtors were then called aſſiſtants of the queſtor, *adjutores quæſtoris.*

The queſtor's office was originally confined to the army. They paid the ſoldiery, and took charge of monies coming by ſpoil and plunder, &c.

At length there were new ones erected to reſide in the city, and to receive the public money, taxes, tribute, &c. Their number was increaſed as the empire increaſed. Sylla augmented it to twenty; Julius Cæſar to forty; ſome being nominated by the emperor, and the others by the people. Tacitus (Annal. xi. 22.) ſeems to conſider twenty as the higheſt number of queſtors; and Dion (lib. xliii. p. 374.) inſinuates, that if the dictator Cæſar once created forty, it was only to facilitate the payment of an immenſe debt of gratitude. Under ſucceeding emperors their number was not fixed. Of theſe, two were appointed for the city, to take care of the public treaſure, and to keep the laws and decrees of the ſenate; the others pertained to the provinces and the armies.

The queſtorſhip was the firſt office which any perſon could bear in the commonwealth, and might be undertook at the age of twenty-four or twenty-five years. Accordingly, the quæſtorſhip was called the firſt ſtep of honour, and the queſtors, who were generally employed in the provinces abroad, aſſigned to them ſeverally by lot, no ſooner returned from their provincial adminiſtration than they took their places in the ſenate; and from that time forward, from the rank of equeſtrians, or what we commonly call knights, became ſenators for life.

The youth and inexperience of the queſtors, who entered on that important office in the 25th year, engaged Auguſtus to remove them from the management of the treaſury; and though they were reſtored by Claudius, they ſeem to have been finally diſmiſſed by Nero. In the provinces of the imperial diviſion, the place of the queſtors was more ably ſupplied by the procurators, or, as they were afterwards called, "rationales." But in the provinces of the ſenate we may ſtill diſcover a ſeries of queſtors till the reign of Marcus Antoninus. From Ulpian we may learn, that under the government of the houſe of Severus, their provincial adminiſtration was aboliſhed; and in the ſubſequent troubles, the annual, or triennial elections of queſtors, muſt have naturally ceaſed.

There was alſo another kind of queſtors, called *quæſtores parricidii*, whoſe office was to enquire into, and take cognizance of capital crimes, after the conſuls were denied this privilege.

Questor *ſacri palatii*, or of the *ſacred palace*, was one of the firſt dignities under the emperors of Conſtantinople.

It was this queſtor that ſubſcribed the reſcripts of the emperor, and the anſwers to the petitions and ſupplications preſented to him. He alſo drew up and ſigned the laws and conſtitutions which the emperor thought fit to publiſh; and took care of the adminiſtration of juſtice.

Some compare his function to that of our lord high chancellor. It was uſually one of the juriſconſulti that was charged with this office; it being required, that he ſhould know the laws of the empire, be able to preſcribe and ſee them executed, and judge of cauſes brought by way of appeal before the emperor.

Conſtantine was the firſt who erected queſtors of the ſacred palace.

QUESTUS, or Quæstus. See Quæstus.

Questus *eſt nobis*, a writ of nuſance, which, by ſtat. 15 Edw. I. lies againſt him to whom a houſe, or other thing, that breeds a nuſance, is deſcended, or alienated; whereas before that ſtatute, the action lay only againſt him who firſt levied, or cauſed the nuſance, to the damage of his neighbour.

QUETIF, James, in *Biography*, a learned French Dominican monk, was born at Paris in the year 1618. He embraced the monaſtic profeſſion among the preaching friars when he was not more than 17 years of age, and having completed his philoſophical courſe at Paris, he was ſent by his ſuperiors to Bordeaux, where he ſtudied divinity, and received prieſt's orders in 1648. He lived to a great age, exerciſing his talents in various ways, and died in the year 1698, highly reſpected for his great erudition, his extenſive knowledge, and his virtues. He publiſhed a new edition of the "Summa Theologiæ" of Aquinas, in three vols. folio, with notes. He did the ſame by a work entitled "Concilii Tridentini Canones." He was editor of "The Spiritual and Aſcetic Letters of Savonarola;" and he publiſhed, with his own notes, "The Life of Savonarola," from the Latin of John Picus, count of Mirandula, with conſiderable additions. He wrote the preface to "The Letters of Peter Morin," which he publiſhed from the author's manuſcripts; as he alſo did his treatiſe "On the good Uſe or Abuſe of the Sciences." He was author of a conſiderable part of the work

work entitled "Scriptores Ordinis Prædicatorum, cum notis Hiſtoricis," which was completed by father Echard.

QUETREVILLE, in *Geography*, a town of France, in the department of the Channel; ſix miles S. of Coutances.

QUETTEHOU, a town of France, in the department of the Channel, and chief place of a canton, in the diſtrict of Valognes; nine miles N.E. of Valognes. The place contains 1291, and the canton 14,956 inhabitants, on a territory of 150 kiliometres, in 18 communes.

QUETTENBRUN, a town of Auſtria; eight miles E. of Laab.

QUETZ, a town of Saxony, in the circle of Leipſic; two miles S.S.E. of Zorbig.

QUEVACAMPS, a town of France, in the department of Jemappe, and chief place of a canton, in the diſtrict of Tournay. The place contains 955, and the canton 10,264 inhabitants, on a territory of $107\frac{1}{2}$ kiliometres, in 15 communes.

QUEVAUVILLERS, a town of France, in the department of the Somme; eight miles S.W. of Amiens.

QUEUE, in *Commerce*, a wine meaſure uſed in ſome parts of France. A queue of Champaigne contains 384 pintes of Paris, or about 95 Engliſh gallons; a queue of Burgundy contains 432 pintes of Paris, or 107 Engliſh gallons.

Queue, *Fr.* tail, as applied to the heads of muſical notes; the minim is the only white note with a tail to it, and the crotchet the firſt black note with a tail to it.

Queue, in *Heraldry*, the tail of a beaſt.

If a lion has a forked tail, he is blazoned by double-queued.

Queue *d'Aronde*, q. d. *ſwallow's tail*, in *Fortification*, a term applied to outworks, when narrower at the gorge than at the face or front; *i. e.* where the ſides open towards the champaign, and contract towards the gorge. The name is occaſioned by its reſemblance, in figure, to a ſwallow's tail, which the French call queue d'aronde.

Of this kind are ſome ſingle as well as double tenailles; and ſome horn-works whoſe ſides are not parallel.

On the contrary, when the ſides are leſs than the gorge, the work is called *contre queue d'aronde*.

Queue *d'Aronde*, in *Carpentry*, a method of jointing, called alſo dove-tail.

QUEVEDO de Villegas, Francisco, in *Biography*, a celebrated Spaniſh writer, was born at Madrid in 1570. He became diſtinguiſhed at an early period for his literary attainments, and obtained the honour of knighthood, but indulging his ſatirical vein too freely againſt the adminiſtration of count d'Olivares, he was thrown into priſon, from whence he did not make his eſcape till the diſgrace of that miniſter. He died in the year 1645, at the age of 75. He is regarded by his countrymen as having attained to a conſiderable degree of excellence in moſt of the different kinds of compoſition. His heroical poems are ſaid to be characterized by energy and ſpirit; his lyrical by ſweetneſs and beauty; and his humorous poems by eaſe, pleaſantry, and ingenious invention. His printed works fill three vols. 4to. of which two are occupied by poetry and one by proſe. The former were collected by Joſeph Gonzales de Salas, who illuſtrated them with notes and diſſertations. They were publiſhed in 1650, at Madrid, under the title of "Il Parnaſſo Eſpagnol." The humorous pieces of Quevedo have rendered his name beſt known in foreign countries, and have been tranſlated into the Engliſh and other languages.

QUEVILLY, in *Geography*, a town of France, in the department of the Lower Seine; three miles W. of Rouen.

QUEULEN, a river of Chili, which runs into the Pacific ocean, S. lat. 39° 10′.

QUEYPO, a town of Mexico, in the province of Coſta Rica, near the Pacific ocean.

QUEYRAS, a town of France, in the department of the Higher Alps; 12 miles S.E. of Briançon.

QUEYTOR, a name ſometimes given to the river Ava, at leaſt to that part which runs between Ava and Prom.

QUI, in *Rural Economy*, a common term frequently applied to the female of the cow kind of animals while in the young ſtate. It is the moſt generally employed in the northern parts of the country. See Why.

Qui-*Calf*, a name uſually made uſe of in the northern parts of the iſland, to ſignify a female or heifer calf. See Why-*Calf*.

Qui *Tam*, in *Law*, is uſed where an information is exhibited againſt any perſon on a penal ſtatute at the ſuit of the king and the party who is informer, when one part of the penalty for breach of the ſtatute is to be given to the king, the poor, or to ſome public uſe, and the other part to the informer or proſecutor; and the party informing proſecutes for the king and himſelf. The ſuit is called a *qui tam* action, becauſe it is brought by a perſon, "qui tam pro domino rege, &c. quam pro ſe ipſo in hac parte ſequitur." If the king, therefore, himſelf commences this ſuit, he ſhall have the whole forfeiture. (2 Hawk. P.C. 268.) But if any one hath begun a "qui tam" or "popular" action, no other perſon can purſue it; and the verdict paſſed upon the defendant in the firſt ſuit is a bar to all others, and concluſive even to the king himſelf. This has frequently occaſioned offenders to procure their own friends to begin a ſuit, in order to foreſtall and prevent other actions; which practice is in ſome meaſure prevented by a ſtatute made in the reign of a prince very ſharp-ſighted with regard to penal laws, *viz.* 4 Hen. VII. c. 20.; which enacts, that no recovery, otherwiſe than by verdict, obtained by colluſion in an action popular, ſhall be a bar to any other action proſecuted *bonâ fide*. A proviſion, ſays judge Blackſtone, that ſeems borrowed from the rule of the Roman law, that if a perſon was acquitted of any accuſation, merely by the prevarication of the accuſer, a new proſecution might be commenced againſt him. Ff. 47. 15. 3. See Information.

QUIA, in *Logic*. See Reason.

Quia *dominus remiſit curiam*, in *Law*. See Recto.

Quia *emptores*, a denomination given to the ſtatute of Weſtm. 3. 18 Edw. I. which directs, that upon all ſales or feoffments of land, the feoffee ſhall hold the ſame, not of his immediate feoffor, but of the chief lord of the fee, of whom ſuch feoffor himſelf held it; and hence it is held that all manors exiſting at this day muſt have exiſted by immemorial preſcription, or at leaſt ever ſince this ſtatute was made: for no new manor can have been created ſince that ſtatute; becauſe it is eſſential to a manor, that there be tenants who hold of the lord, and that ſtatute enacts, that for the future no ſubject ſhall create any new tenants to hold of himſelf.

Qui *improvidè*, a ſuperſedeas granted in many caſes where a writ is erroneouſly ſued out, or miſawarded.

Such is that granted in behalf of a clerk of the chancery ſued againſt the privilege of the court, in the common pleas, and purſued to the exigent.

QUIADKOUA, in *Geography*, a town of Pruſſia, in the province of Bartenland; nine miles S.E. of Allerſburg.

QUIBBLETOWN, a town, or rather a village of America,

rica, in Middlefex county, New Jerfey; fix miles N. of New Brunfwick.

QUIBERON, a fortified town of France, in the department of Morbihan, and chief place of a canton, in the diftrict of L'Orient, fituated at the extremity of a peninfula, to which it gives name, oppofite to the ifland of Belle Ifle; remarkable for an unfortunate expedition of Englifh troops and emigrants againft France, in the year 1795; 17 miles S.E. of Port Louis. The place contains 1916, and the canton 5618 inhabitants, on a territory of 95 kiliometres, in three communes. N. lat. 47° 30'. W. long. 3° 2'.

QUIBO, a fmall ifland on the outer part of the bay of Panama; it is uninhabited, but affords wood and water for fhipping.

QUIBONDO, a fmall ifland in the Indian fea, near the coaft of Africa. S. lat. 8° 8'.

QUIBOR, a town of South America, in the government of Caraccas; 15 miles S.W. of Segovia Nuova.

QUIBURI, a town of New Navarre; 20 miles S.S.E. of Cafa Grande.

QUICAPOUX, a river of America, which runs into the Miffifippi, N. lat. 43° 4'. W. long. 92° 5'.

QUICARO, a town of New Navarre; 150 miles S.S.E. of Cafa Grande.—Alfo, a fmall ifland in the Pacific ocean, near the coaft of Veragua. N. lat. 7° 54'. W. long. 82° 42'.

QUICI, in *Entomology*, a fpecies of the cerambyx, mentioned by Marcgrave.

QUICK, in *Gardening*, a term applied to fignify any fort of young plant, but efpecially thofe of the white-thorn kind. By it is alfo often underftood a live hedge, but more properly the fhrubs of which fuch live hedge is formed. In a ftrict fenfe it is, however, applied to the cratægus oxyacantha, or hawthorn, the young plants or fets of which are commonly fold by the nurfery gardeners under the name of quicks.

In the choice of thefe fets, thofe which are raifed in the nurfery are in general to be preferred to fuch as are drawn out of the woods, as the latter have feldom good roots: many perfons, however, prefer them, as they are larger plants than are commonly to be had in the nurfery. See CRATÆGUS.

QUICK. See MEDLAR and PYRUS.

QUICK-*Beam*. See PYRUS, and SERVICE-*Tree*.

QUICK-*Beam*, in *Planting*, a name given in fome places to the tree ufually known by the title of mountain-afh. It has been recommended as ufeful for forming fences, in fome cafes, by Dr. Anderfon, and others. Where it is employed in this way, the plants muft be kept down to the proper height, by being cut over as often as there may be occafion; and thus encouraging them to throw out lateral branches in a greater abundance, and, of courfe, induce the fence to become more clofe and thick in its lower parts. By thefe means a tolerably perfect hedge may be raifed, from plants of this fort, in fituations where the white-thorn will not fucceed in any proper manner.

QUICK-*Hatch*, in *Zoology*. See URSUS *Lufcus*.

QUICK-*Hedges*, in *Agriculture*, a name given to all fuch as are raifed from quicks, or any other fort of living plants. The proper forming and planting of quick-hedges have hitherto been much too little attended to by the farmer, as it is a matter of great importance, and which interefts him in a very high degree. Whatever fort of plants may be employed for this purpofe, the work fhould conftantly be well performed in the firft inftance, and the hedges and plants be afterwards kept in due order and regularity by fuitable pruning, cutting in, and other proper management. There is a great number of different methods of raifing and making hedges of this kind, as by planting the fets on the plain furface, or the mould a little raifed above it, or on mounds, formed by the fods and mould dug up in the line of the hedge, elevated to different confiderable heights; by fetting the plants out in one row only, in double ones, or fometimes in a ftill greater number; by putting them in, in ftraight lines, in irregular manners, in the triangular form, or in the quincunx method. They are fometimes cut over at certain heights, at others not cut down at all; the fides are alfo in fome cafes clipped or cut in, but in others this is avoided altogether. When planted on banks, they are moftly cleaned and moulded up annually.

A great variety of different forts of plants is employed in forming and conftructing thefe hedges, as thofe of the hawthorn, the black-thorn, the crab-tree, the hazel, the willow, the beech, the elder, the poplar, the alder, and feveral other kinds, according to particular circumftances and fituations. And on the expofed coafts or fhores of the fouthern parts of the kingdom, a new fort of fhrub or plant has lately been recommended for this ufe, which is that of the tamarifk, or *tamarix gallica*, as it thrives rapidly, it is faid, when planted in fituations moft expofed to the blaft or ftroke of the fea; forms an admirable fhelter, and being of quick growth, foon comes to anfwer the end defigned. The writer of the agricultural report of the county of Cornwall has known a hedge of it, which he has been told was planted about feven years ago, and the bufhes, apparently, cannot be lefs now than from ten to twelve feet in height, and are feathered to the very bottom. It thrives well about the Lizard, bears cutting perfectly well, and in expofed fituations, where it might be injured if left to grow high, may be kept clofe and low to much advantage. It unfortunately, however, will not ftand the froft, and fhould never be attempted, of courfe, in fituations expofed to the fevere effects of it. The propagation of it is by cuttings, which take root without any difficulty. It is fuppofed that this fhrub was brought by the monks from Normandy to Mont St. Michael in the above county, and thence fpread to other parts. See HEDGE, and QUICKSET *Hedge*.

The quick-hedges of this country are in a very great degree raifed from the white-thorn, which unqueftionably forms the cheapeft and moft durable kind, where the nature of the foil, fituation, and other circumftances are favourable for the purpofe. It will not, however, flourifh in bad land, in expofed fituations, where the bottom is wet and fpringy, or where the growth of weeds is very abundant. In all fuch cafes other kinds of plants are therefore had recourfe to in the formation of them.

In many upland diftricts beech-hedges have been planted to confiderable extents, and found, when kept under proper management, to be very handfome, and of great fervice in fuch expofures. Birch-hedges have likewife been tried in different cafes, and found to grow remarkably faft, even in cold bare tilly foils, but they require to be cut over at the time they are about four feet in height and carefully plafhed. Both thefe forts of hedges have this in their favour, that they will grow in very poor foil as well as in very expofed fituations; and both will flourifh and grow ftrongly where the white thorn cannot live. Their want of prickles, however, is a great objection to them in this view: but they afford good fhelter.

Quick-hedges conftitute the ordinary fort of fences in this country, and unlefs in particular fituations, and for particular purpofes, are the moft proper and eligible. It has been

been obferved by the writer of a late work, that in parts which have been long inclofed without arable cultivation, hedges, of feemingly great age, are met with, which are many times crooked, ragged, and irregular, as though they had been, in the firft inftance, formed and laid out from the wild underwood of fuch places. While in other cafes, low plants of the various coppice kinds rife and grow on dikes or mounds but little raifed above the furface of the land, feemingly as though they had formerly been collected from brufh-woods and replanted on fuch banks, in fomewhat the fame manner as is ftill practifed on higher banks in particular diftricts towards the weft, and in South Wales. But taking the country at large, the method of raifing quick-hedges by fetting grown plants taken from fuch fituations, has long ceafed to exift and prevail as a general practice ; young plants of white-thorn, or other forts, fet out in the bank and ditch mode with a low protecting dead fence on the fide contrary to the ditch at firft, is the plan commonly had recourfe to, fuch plants being firft raifed in fmall grounds for the purpofe in regular rows, and not taken, as formerly, from brufh-woods and wafte commons.

QUICK-*Lime*, in *Rural Economy*, fuch lime as is in the cauftic or moft active ftate, and which poffeffes the greateft power of operating upon different fubftances with which it may come in contact. It is quite the oppofite in its qualities and properties, to that which has fallen down into a powdery ftate, in confequence of being faturated with water and carbonic acid gas, or fixed air, or which is flaked and become effete. Its powers, when applied upon land in this condition, have already been noticed in fpeaking of lime. See LIME.

But it poffeffes qualities and properties in the way of a cement, the utility of which for building, for various domeftic purpofes, properly belong to this place. According to Dr. Anderfon, lime is in the beft and moft fit ftate for this ufe when the moft perfectly cauftic, or in the moft cryftallizing condition. It is remarked, that the powder of lime, when reduced by means of water into a thin or fluid fort of pafte-like form, and then fuffered to become dry, concretes into a coherent mafs, which fixes to ftones and other rough bodies in a very firm manner, and in this way becomes a proper cement for building any fort of walls. And that, after this pafty material has once become firmly dry, it is quite indiffoluble in water, and incapable of ever being foftened again by the moifture of the atmofphere or other fimilar caufes. Hence it excels many other forts of cements.

When compofed for the purpofe of building walls, &c. it is ufually denominated *mortar ;* but when formed as an application in the way of a fmooth coating upon any plain furface without intermixture with ftony matters, it is commonly here termed *plaifter*.

When made from the lime of the purer fort of lime-ftone, it is found to be more foft and crumbly, and to acquire a lefs degree of hardnefs, and to be broken with much lefs force, than where the lime-ftone from which it is made contains a large proportion of fand, in which cafe it becomes much more hard, firm, and durable.

It has, however, been difcovered that the pureft lime may be rendered a firm cement by adding a proper proportion of clean hard fand to it ; hence the practice of blending fand with lime, when intended for mortar, has become fo univerfal. This is fully fhewn to have been very early the cafe, by the oldeft lime-built walls which are now to be met with.

It neverthelefs ftill remains a defideratum to afcertain the due proportion of fand which is neceffary, as both writers and practical mafons greatly difagree in opinion on this matter, as well in their directions about the mode of mixing the materials, as of applying the cement ; fome of the more modern, efpecially, afcribing extraordinary effects to a fmall variation in thefe particulars, while others deny that thefe circumftances have any fenfible effect on the durability and firmnefs of the cement.

It is conceived that thefe different and contradictory opinions arife from an imperfect knowledge of the nature of quick-lime, and the variations it may admit of ; for thefe variations are fo very great, as to render it impoffible to afford any general rules that can poffibly apply in all cafes. It is, therefore, conceived to behove thofe who are defirous of acquiring any confiftent and fatisfactory knowledge on this head, to endeavour to afcertain, in the firft place, the circumftances which render calcareous fubftances *at all* capable of becoming a cement, and then to trace the feveral changes that may be produced upon it by other extraneous caufes.

Having explained the circumftances which caufe the differences in lime-ftone, and pointed out the different conftituent principles of it, as well as various other peculiarities ; it is ftated that lime, which has in any way abforbed its full quantity of air from the atmofphere and become mild, is altogether unfit for becoming a cement, and that, of courfe, it is evident, that a great change may be produced upon the quality of any lime, by having allowed lefs or more of it to be in this ftate before it is worked up into mortar. And further, that if a large quantity of water be put to frefh flaked quick-lime, and beat up with it into a thin fort of pafte, the water diffolves a fmall portion of the lime, which as it gradually abforbs its air, is converted into cryftals ; between the particles of which cryftals, that part of the lime which was not diffolved, and the other extraneous matters which may have been mixed with it, are entangled, fo as to form a firm coherent mafs of the whole. And that the pafty fubftance formed in this manner, is the well-known article mortar ; and this heterogeneous, imperfectly femi-cryftallized mafs, conftitutes the common cement employed in building ordinary walls or other erections. Thefe circumftances, therefore, being known, it is thought that it will not be difficult to comprehend what are the particulars that are neceffary to form the moft perfect cement of this nature. That fince lime becomes a cement only in confequence of a certain degree of cryftallization taking place in the whole mafs, it is fufficiently obvious that the firmnefs and perfection of that cement muft depend upon the perfection of the cryftals ; and the hardnefs of the matters that are entangled among them ; for if the cryftals are ever fo perfect and hard of themfelves, if they be feparated from one another by any brittle incoherent medium, it is evident that the whole mafs muft remain in fome degree brittle and incoherent. That as water can only diffolve a very fmall proportion of lime, even when in its moft perfect faline or cauftic ftate, or while it remains deprived of its carbonic acid gas, and as happens in other fimilar cafes, no more of the lime can be reduced to a cryftalline mafs than has been actually diffolved in the water ; it happens of courfe, that if mortar be made of pure lime and water alone, a very fmall proportion only can be diffolved by that fmall quantity of water that is added to it : and as this fmall proportion alone can afterwards be cryftallized, all the remaining undiffolved particles of the lime will be entangled among the few cryftals that are formed. And as the undiffolved lime in this mafs will in time abforb its air, and be converted into *mild* calcareous earth without having had a fufficiency of water to allow it to cryftallize, it muft concrete into a friable mafs exactly refembling chalk ; it follows, that this kind of mortar,

tar, when as dry as it can be made, and in its higheſt degree of perfection, will always be ſoft, and eaſily crumbled into powder.

But that, if, inſtead of forming the mortar of pure lime alone, a large proportion of ſand be added to it, the water will in this caſe diſſolve as much of the lime as in the former; and the particles of hard ſand, like ſticks or threads, when making ſugar-candy or other cryſtals, while ſurrounded by the watery ſolution, will help to forward the cryſtallization, and render it more perfect than it otherwiſe would have been, ſo as firmly to cement the particles of ſand to one another. And as the granules of ſand are perfectly hard of themſelves, ſo as not to admit of being broken down like the particles of chalk, it neceſſarily follows, that the cement made of theſe materials muſt be much more perfect in every reſpect than the former.

After conſidering a variety of circumſtances in regard to the ſolubility of lime in water, and its cryſtallization, it is remarked, that when a large quantity of ſand is mixed in the mortar, that ſand will of courſe bear a great proportion to the whole maſs; ſo that the water that may be mixed with the mortar will be much greater in proportion to the quantity of lime contained in this mortar, than if the whole had conſiſted of pure calcareous matter. And that, as the ſand abſorbs none of that water,—that water, now pure, is at liberty to act once more upon thoſe few particles of cauſtic lime that may ſtill remain in the mortar, which will be diſſolved and converted into cryſtals in their turn. In this way it may happen, in ſome circumſtances, that a very large proportion of the lime may become cryſtallized; ſo that the mortar will conſiſt almoſt entirely of ſand enveloped in cryſtalline matter, and become in due time as hard as ſtone itſelf; whereas mortar, conſiſting of pure lime, without ſand, can hardly ever be much harder than chalk. It is not, however, to be ſuppoſed, that in any caſe this dried mortar will aſſume that tranſparent cryſtalline form, or the compact firmneſs of ſome ſorts of calcareous matters, ſuch as marble and lime-ſtone. In mortar, in ſpite of the utmoſt care that can ever be taken, a very conſiderable quantity of the lime muſt remain undiſſolved; which undiſſolved lime, although it may be ſo much ſeparated by the ſand and cryſtalline lime-ſtone as not much to affect the hardneſs of the mortar, yet it muſt ſtill retain its white chalk-like appearance. As marble and lime-ſtone are, however, always formed by thoſe particles of lime that have been wholly diſſolved in water, and from which they have been gradually ſeparated by a more ſlow and more perfect mode of cryſtallization, they have nothing of that opaque calx-like appearance, but aſſume other colours, and appear more firm, uniform, and compact; the ſand and other matters that may be enveloped in them being entirely ſurrounded with a pure cryſtalline matter.

But to obtain the moſt perfect kind of mortar, it is not, however, enough that a large proportion of ſand ſhould be employed, and that the ſand ſhould be intimately mixed with the lime; it is alſo of the utmoſt importance that a large proportion of water be added; for without this it is impoſſible that a large proportion of the lime can be cryſtallized: and the mortar, in that caſe, would conſiſt only of a mixture of chalky matter and ſand, which could hardly be made to unite at all, and would be little more coherent than ſand by itſelf, and leſs ſo than pure chalk. In that caſe, pure lime alone muſt afford rather a firmer cement than lime with ſand. It is alſo of very great importance that the water be retained as long in the mortar as poſſible: for if it be ſuddenly evaporated, it will not only be prevented from acting a ſecond time upon the lime, after a part of what was firſt diſſolved has been cryſtallized, but even the few cryſtals that would be formed when the water was ſuddenly evaporating, would be of themſelves much more imperfect than they otherwiſe moſt certainly would have been. In proof of which, inſtances of the cryſtallization of common ſalt, lump ſugar, and ſugar-candy, are adduced; after which it is noticed, that every one knows what a difference there is between the firmneſs of the different ſubſtances; and that as great muſt be the difference between the firmneſs of that cement which has been ſlowly dried, and that which has been haſtily hardened by the powerful action of a warm air.

It is contended, that it is owing to this circumſtance that the lime, which remains all winter in a mortar tub filled with water, is always found to be much firmer and more coherent than the mortar that was taken from the ſame tub and uſed in any work of maſonry, although in this caſe the materials were exactly the ſame. From the ſame cauſe, any work cemented with lime under water, if it has been allowed to remain undiſturbed and uninjured until it has once become hard, is always much firmer than that which is above the ſurface of the water.

In order to render the force of the above reaſoning more ſtrong and convincing, lime cement or mortar is compared to a maſs of matter conſiſting of a congeries of ſtones cloſely compacted together, and united by a ſtrong cementing matter that had, while in a fluid ſtate, pervaded all the interſtices between the ſtones, and afterwards become a ſolid indiſſoluble ſubſtance. If the cementing matter be exceedingly hard and coherent, and if the ſtones bedded among it be alſo very hard and firm, the whole maſs will become like a ſolid rock, without fiſſures, that can hardly be broken to pieces by the power of man. But, although the cement ſhould be equally firm, if the ſtone, of which it conſiſts, be of a ſoft and friable nature, ſuppoſe chalk or ſand-ſtone, the whole maſs will never be capable of attaining ſuch a degree of firmneſs as in the former caſe; for when any force is applied to break it in pieces, although the cement ſhould keep its hold, the ſolid matter cemented by it would give way, and the whole would be eaſily broken to pieces. Whereas in mortar, the ſand that is added to it repreſents the ſtones of a ſolid matter in the compoſition, the particles of which are united together by the lime which had been formerly diſſolved, and now cryſtallized, which becomes an exceedingly ſolid and indiſſoluble concretion. And as the particles of ſand are of themſelves exceedingly hard, and the cement by which they are united equally ſo, it is plain that the whole concretion muſt be extremely firm, ſo as to require very great force to diſunite any particle of it from the whole maſs. But if, inſtead of employing ſand, the only ſolid body that is entangled among the cementing matter ſhould be chalk, (as in all caſes where the mortar conſiſts of pure lime alone,) or any other ſlightly cohering ſubſtance, let the cementing particles of that compoſition be ever ſo perfect, it is impoſſible that the whole can ever attain a great degree of firmneſs, as theſe chalky matters will be eaſily broken aſunder.

It is remarked, in addition, that a variety of conjectures have been made about the nature of the lime cement employed by the ancients. It has been thought that they poſſeſſed an art of making mortar, which has been long ſince entirely loſt; as the cement in the walls which have been built by them, appears to be, in many caſes, much firmer than that which had been made in modern times. Yet, when the mortar of theſe old buildings is analyſed, it is found to conſiſt of the ſame materials, and nearly in the ſame proportions, in which they are now made uſe of.

And

And it is thought probable, that their only fecret confifted in mixing the materials more perfectly than the rapidity or avarice of modern builders will permit, in employing their mortar in a much more fluid ftate than is done now, and in allowing it to dry more flowly, which the immoderate thicknefs of many of their walls would naturally produce, without any preconcerted defign on their part. Tradition has even handed down to the prefent times the memory of the moft effential of thefe particulars; as the lower clafs of people, in every part of the nation, at this moment invariably fuppofe and believe that thefe old walls were compofed of a mortar fo very thin, as to admit of its being poured, like a fluid, between the ftones, after they were laid in the wall: and the appearance of thefe old walls, when taken down, feems to favour this popular tradition. Nor is it doubted but that this may have been the cafe. The ftones in the outer part of the wall, it is thought, were probably bedded in mortar nearly as is practifed at prefent; and the heart, after being packed well with irregular ftones, might have the interftices between them entirely filled up with fluid mortar, which would infinuate itfelf into every cranny, and in time adhere as firmly as the ftones themfelves, or even more fo, if the ftones were of a fandy friable nature. And that, as thefe walls were ufually of very great thicknefs, it might often happen, that the water in this mortar, by acting fucceffively upon different particles of cauftic lime, would at length be entirely abforbed by fucceffive cryftallizations, fo as to become perfectly dry, without any evaporation at all; in which cafe, a very large proportion of the original lime muft have been regularly cryftallized in a flow and tolerably perfect manner, fo as to attain a firmnefs little inferior to lime ftone or marble itfelf.

It is fuppofed that, upon thefe principles it is eafy to account for the fuperior hardnefs of fome old cements, when compared with that of modern times, in which a practice very different is ufually followed, without having recourfe to any wonderful *arcana* whatever.

Monfieur Loriot, a late French writer, imagined that he had made a perfect difcovery of the way in which the ancients employed their quick-lime, fo as to obtain fuch an extraordinary firm cement; from which difcovery, he conceived, very important benefits might be derived to fociety. According to his opinion, the ancient cement confifted of lime and fand nearly in the fame proportions as are commonly employed for that purpofe at prefent. But inftead of making it of flaked lime entirely, as is done now, he contends that they employed a certain proportion of their lime *unflaked*, which they mixed with their mortar immediately before it was ufed. And it is further noticed, that this newly difcovered cement dries and hardens almoft under the hand of the operator, without cracks or flaws of any fort; that it neither expands nor contracts with the air;—that it is impervious to moifture, and may not only be employed for making roofs of houfes that are fubjected to the continual dropping of water, bafons, aqueducts, canals, &c. which will inftantly contain water in any quantities, but even finer works of the pottery kind; that it perfectly refifts frofts, and has a variety of other interefting qualities. The trials of Dr. Anderfon with the fame fort of materials do not, however, confirm the great certainty and utility of this difcovery. "That fuch effects as the writer defcribes," fays the doctor, "will invariably be produced, merely by adding a certain proportion of unflaked lime in powder to mortar, or even by making the mortar entirely with powdered quick-lime, I may without hefitation venture to deny, not only from the reafoning that has been given, but from actual experiment, again and again repeated by myfelf; and which is likewife, in fome meafure, corroborated by the experience of Mr. Doffie."

On thefe accounts, it is fuppofed, that if Monfieur Loriot, has really experienced thefe uncommon effects from the mortar he has tried, it muft have been occafioned by fome other unobferved peculiarity, and not merely by the circumftance to which he feems to afcribe it. Poffibly the doctor fuppofes the lime he employed may have been impregnated with a gypfum, or the fulphate of lime, as is probable, for many reafons. The effects and qualities of which, as to becoming a fine powder, and of fuddenly fetting, are well known, but it never acquires the ftony hardnefs that lime cement is fometimes endowed with, although it takes the fmootheft polifh of any cement we know: on which account, it has long been employed as a plaifter where fine ornaments are required.

There are unqueftionably, however, many doubtful and myfterious circumftances connected with this matter, which require the aid of further trials and experience in their full explanation.

There are ftill further a few other circumftances that may influence the quality of common lime-mortar. If lime-ftone be fufficiently calcined, it is deprived of all its moifture, and of all its carbonic acid gas, or fixed air. But experience fhews, that lime-ftone will fall to powder on the effufion of water upon it, when it is much lefs perfectly calcined, and while it ftill retains almoft the whole of its fixed air. And that as mafons have hardly any other rule for judging whether lime-ftone be fufficiently calcined, except this fingle circumftance of its falling to a powder when water is poured upon it, it may thus eafily be perceived, that the fame lime may be more or lefs fitted for making good mortar, according to a circumftance that, in a great meafure, eludes the obfervation of operative mafons; for if it fhould happen that all the pieces of lime drawn from a kiln at one time, were juft fufficiently calcined to make it fall to a powder with water and no more, that powder would be altogether unfit for making mortar of any kind. This is a cafe that can feldom happen: but as there are a great many intermediate degrees between that ftate and perfect calcination, it muft often happen that the ftone will approach nearer to one of thefe extremes at one time than at another; fo that the mortar may be much more perfect at one time than at another, owing to a variation in this particular.

All thofe who have written on the fubject of lime as a cement, have endeavoured to afcertain what is the due proportion of fand for making the moft perfect cement. But a little attention to the matter will fhew, that all rules, which could be prefcribed as to this particular, muft be fo vague and uncertain, as to be of little utility to the practical mafon; as, befides the variation which may arife from a more or lefs perfect degree of calcination as above, it is a certain fact, that fome kinds of lime-ftones are much more pure, and contain a much fmaller proportion of fand than others do; fome being found almoft perfectly pure, while others contain eleven-twelfths of fand and all the intermediate proportions of it. Therefore it would be abfurd to fay that pure lime would require as fmall a proportion of fand when made into mortar, as that which originally contained in itfelf a much larger proportion of fand than any writer has ever ventured to propofe for being put into mortar.

Befides, there are differences caufed by the different nature of the calcination in the different forts of lime-ftone, from which it may, upon the whole, be concluded, that about one-tenth of *pure* lime-ftone is not enough calcined to admit of being made into mortar; and that of the moft impure forts of lime-ftone, not above one-fourth part of the lime contained in it is fo much calcined as to be in a cauftic ftate.

The variation that is produced by thefe means in regard to the proportion of fand that will be required to the lime in the one or the other cafe, is found to be fo extremely great as hardly to be conceived. It is, however, ftated, that the beft mortar that has been feen made, was formed of lime which had been found to contain eleven parts of fand to one of lime: to this there was added between twice and thrice its whole bulk of fand by meafure; which may be allowed to have been at leaft three times its quantity *by weight*. Therefore, fuppofing that every particle of that lime had been fo perfectly calcined as to be in a cauftic ftate, there could not be lefs than forty-feven parts of fand to one of lime. As much may, however, be allowed for the uncauftic part of the lime as is pleafed, and the calculation made accordingly. But it is hardly poffible to fuppofe that above one-hundredth part of this mafs, independent of the water, confifted of pure cauftic calcareous earth.

On thefe confiderations it is conceived, that it is impoffible to prefcribe any determinate proportion of fand to lime, as that muft vary according to the nature of the lime and other incidental circumftances, which would form an infinity of exceptions to any general rule. But it would feem that it might be fafely inferred that the moderns in general rather err in giving too little fand, than in giving too much. It deferves, however, to be noticed, that the fand, when naturally in the lime-ftone, is more intimately blended with the lime than can poffibly be ever effected by any mechanical operation; fo that it would be in vain to hope to make good mortar artificially from pure lime, with fuch a fmall proportion of cauftic calcareous matter as may fometimes be effected when the lime naturally contains a very large proportion of fand. But there feems to be no doubt, that if a much larger proportion of fand were employed, and if that were more carefully blended and expeditioufly worked than is common, the mortar would be much more perfect than is ufual in modern times, as has been proved by actual trials.

Another circumftance that tends greatly to vary the quality of cement, and to make a greater or fmaller proportion of fand neceffary, is the mode of preparing lime before it is beaten up into mortar. When for plaifter, it is of great importance to have every particle of the lime-ftone flaked before it is worked up; for, as fmoothnefs of the furface is the moft material point, if any particles of lime fhould be beaten up in it, and employed in work before fufficiently fallen, the water, ftill continuing to act on them after it was worked up, would infallibly flake fuch particles, which forcibly expanding themfelves, would produce thofe excrefcences on the furface of the plaifter commonly termed blifters. Confequently, in order to obtain a perfect kind of plaifter that will remain fmooth on the furface and free of blifters, there is an abfolute neceffity to allow the lime to lie for a confiderable time macerating or *fouring* in water, before it is worked up. And the fame fort of procefs is neceffary for the lime when intended for ufe as mortar, though not fo abfolutely. Great care is, however, required in the management in this refpect; the principal things being the getting of well-burnt lime, and the allowing it to macerate or *four* with the water for only a *very fhort time* before it is ufed; but that which is the beft burnt will require the maceration of fome days in the water before it is fufficiently flaked in the whole mafs for this purpofe. See Souring *Lime for Mortar and Plaifter*.

It has been almoft univerfally admitted, that the hardeft lime-ftone affords a lime that will confolidate into the firmeft cement; and hence generally concluded, that lime made of chalk, produces a much weaker cement than what is made of marble or lime-ftone. It would feem, however, that if ever this be the cafe, it is only incidentally, and not neceffarily fo. As from the nature of calcareous matter, every kind of lime is equally fit for becoming a firm cement, if it be firft reduced to a proper degree of caufticity, and has afterwards a due proportion of fand properly mixed with it, before it be employed in work. Different forts of lime, without doubt, differ much from each other in the proportion of fand they naturally contain, and, of courfe, require very different proportions of fand to be added to them before they can be made equally perfect as a cement; which is an economical confideration, of no fmall moment in fome cafes, as it may make one fort of lime a great deal cheaper than another on fome occafions, and, of courfe, deferves the attention of builders in general. See Lime.

The excellencies and defects of other fubftances that may be occafionally mixed with lime in making cement may be juft noticed. Thofe commonly ufed as an addition to mortar, befides fand of various denominations, are powdered fand-ftone, brick-duft, and fea-fhells. And for forming plaifter, where clofenefs rather than hardnefs is required, they are lime that has been flaked and kept long in a dry place, till it has become nearly effete, powdered chalk or whiting, and gypfum in various proportions; befides hair and other materials of that nature. But fome others have been more lately advifed, fuch as earthy balls, flightly burnt and pounded, powdered and fifted old mortar rubbifh, and others of a fimilar kind. All of which fubftances are found objectionable in fome refpect or other for this ufe, fand being the only perfectly fuitable material that can be eafily met with; on which account it has been always juftly preferred. Pure firm cryftallized fand is the beft, but all pure fands are not equally proper in this intention. See thefe fubftances refpectively. See alfo Cement and Sand.

It is ftated by fir Humphry Davy, in his work on "Agricultural Chemiftry," that there are two modes in which lime acts as a cement; in its combination with water, and in its combination with carbonic acid. When quick-lime is rapidly made into a pafte with water, it foon lofes its foftnefs, and the water and the lime form together a folid coherent mafs, which confifts of feventeen parts of water, to fifty-five parts of lime. When this hydrate of lime, while it is confolidating, is mixed with red oxyd of iron, alumina, or filica, the mixture becomes harder and more coherent than when lime alone is ufed; and it appears that this is owing to a certain degree of chemical attraction between hydrate of lime and thefe bodies; and they render it lefs liable to decompofe by the action of the carbonic acid in the air, and lefs foluble in water. It is thought that the bafis of all cements that are ufed for works which are to be covered with water muft be formed from hydrate of lime; and that the lime made from impure lime-ftones anfwers this purpofe very well. Puzzolana, it is faid, is compofed principally of filica, alumina, and oxyd of iron; and it is ufed mixed with lime, to form cements intended to be employed under water. It is ftated that Mr. Smeaton, in the conftruction of the Eddyftone lighthoufe, ufed a cement compofed of equal parts, by weight, of flaked lime and puzzolana. Puzzolana, it is faid, is a decompofed lava. Tarras, which was formerly imported in confiderable quantities from Holland, is found to to be a mere decompofed bafalt: two parts of flaked lime and one part of tarras form the principal part of the mortar ufed in the great dykes of Holland. It is fuppofed that fubftances which will anfwer all the ends of puzzolana and tarras, are abundant in the Britifh iflands. An excellent red tarras may be procured in any quantities from the Giant's Caufeway, in the north of Ireland: and decompofing bafalt is abundant in many parts of Scotland, and in the northern diftricts of England in which coal is found.

It is obferved that Parker's cement, and cements of the fame kind made at the alum-works of lords Dundas and Mulgrave, are mixtures of calcined, ferruginous, filiceous and aluminous matter, with hydrate of lime.

It is noticed, that the cements which act by combining with carbonic acid, or the common mortars, are made by mixing together flaked lime and fand. Thefe mortars at firft folidify as hydrates, and are flowly converted into carbonate of lime by the action of the carbonic acid of the air. It was found by Mr. Tennant, that a mortar of this kind, in three years and a quarter, had regained fixty-three *per cent.* of the quantity of carbonic acid gas, which conftitutes the definite proportion in carbonate of lime. The hardnefs of the mortar in very old buildings is alfo thought to depend upon the perfect converfion of all its parts into carbonate of lime. The pureft lime-ftones are the beft adapted, it is faid, for making this kind of mortar. The magnefian lime-ftones make excellent water cements, but act with too little energy upon carbonic acid gas to make good common mortar. The Romans, on Pliny's authority, made their beft mortar a year before it was ufed; fo that it was partially combined with carbonic acid gas before it was employed, it is fuppofed.
